Defence of the Government's Course.—One of the ablest and most moderate statements of the British view of the matter is that of Mr. W. E. H. Lecky, the historian. Having blamed the British government for what he considers its mistaken policy in withdrawing from the Transvaal after the battle of Majuba, he says: "I am far from contending that our conduct in other respects was impeccable. There are several pages in the history of the early English dealings in the Transvaal which are by no means to our credit. A mining population like that which had its centre in Johannesburg is never of the most desirable order, and in the present generation financial speculation has mixed far too much, both in England and in Africa, with South African politics. Party spirit runs violently in the Cape, and if there was a Dutch party aiming at complete ascendancy, there was also an English party which was violent, arrogant, and unscrupulous. The raid, though it was undoubt-

edly preceded by gross misgovernment, was both a great folly and a great crime. Our government had nothing to say to it, and the men who took part in it were tried and punished, but a section of the British public, shamefully misled by a very important part of the British press, adopted an attitude toward it which added largely and most naturally to the deep distrust of England which prevailed in the Transvaal. I do not think that the government can be justly blamed for not having prosecuted Mr. Rhodes. Though it is undoubtedly true that he prepared and contemplated a raid, the actual expedition was undertaken not only without his assent, but even without his knowledge; his complicity in the early stages could only be established by his own frank and voluntary statements before a parliamentary inquiry, and it is quite certain that on such grounds no English jury would have convicted him. He had rendered great services to the empire in the past, and there was much that was fascinating in his genius and his daring. But he had done things in connection with the raid which should have prevented a portion of London society from making him a hero, or an English minister from publicly acquitting him of all dishonorable conduct. Such language was at once made use of by the enemies of England in South Africa, and it had the worst effect upon the Boers.

"I do not think, however, that these things made the war. An incurable antagonism of sentiment, type, and ideals had grown up, and the situation I have described inevitably led to a collision. Mere isolated incidents, mere technical questions, have played too large a part in the discussions on this subject, and it can be best judged by looking on its broad features. In England no responsible politician desired the war, and almost to the last moment very few believed in it. There was not, I believe, the smallest desire among the ministers to annex the Transvaal, but there was a determination to put an end to the bad government at Johannesburg and to the constant unrest which it produced, and to secure for the English-speaking population the same kind of privileges which were enjoyed by the Dutch in our own colonies. When, after the raid, the high commissioner exhorted the Uitlanders to disarm, he promised in the name of the British government to endeavor to obtain a redress of their grievances. But, instead of redress, those grievances in the most essential respects had been steadily aggravated. A more patient policy might for a time have postponed the crisis, but it could scarcely have averted it, and there is much force in the contention of Sir Alfred Milner that the evil was a growing one and that the failure of the government to carry their point was undermining all the remaining confidence which the surrender after Majuba had left."

The Other Side.—Mr. Bryce has been one of the most influential critics of the government's policy, and the following quotation is a fair illustration of the position taken by the other side: "Under the convention of 1884, which fixed the relations of Britain and the South African Republic, the latter had the most complete control of its internal affairs, and Britain possessed no more general right of interfering with those affairs than with the affairs of Belgium or Portugal. The suzerainty which has been claimed for her, if it existed (for its existence under the convention of 1884 is disputed), related solely to the power of making treaties, and did not touch any domestic matter. When, therefore, the British government was appealed to by the Uitlander British subjects who lived in the Transvaal to secure a redress of their grievances, her title to address the Boer government and demand redress depended primarily upon the terms of the convention of 1884, any violation of which she was entitled to complain of; and, secondly, upon the general right which every state possesses to interpose on behalf of its subjects when they are being ill-treated in any foreign country. Under these circumstances it might have been expected that the questions which would have arisen before Britain went to war for the sake of her subjects living in the Transvaal would be these two:

"First. Were the grievances of her subjects so serious, was the behavior of the Transvaal government when asked for redress so defiant or so evasive, as to contribute a proper *casus belli*?

"Secondly. Assuming that the grievances (which were real, but in my opinion not so serious as has been frequently alleged) and the behavior of the Transvaal did amount to a *casus belli*, was it wise for Britain, considering the state of feeling in South Africa, and the mischief to be expected from causing permanent disaffection among the Dutch population; and considering also the high probability that the existing system of government in the Transvaal would soon, through the action of natural causes, break down and disappear—was it wise for her to declare and prosecute war at this particular moment?

"Strange to say, neither of these two questions ever in fact arose. That which caused the war was the discussion of another matter altogether, which was admittedly not a grievance for the redress of which Britain had any right to interfere, and which, therefore, could not possibly amount to a *casus belli*. This matter was the length of time which should elapse before the new immigrants into the Transvaal could be admitted to citizenship, a matter which was entirely within the discretion of

the Transvaal legislature. The Boers made concessions, but the British government held these concessions insufficient. In the course of this discussion the British ministry used language which led the Transvaal people to believe that they were determined to force the Boer government to comply with their demands; and they followed up their despatches by sending troops from England to South Africa. They justified this action by pointing out (and the event has shown this to have been the fact) that the British garrison in South Africa was insufficient to defend the colonies. But the Boers very naturally felt that if they remained quiet till the British forces had been raised to a strength they could not hope to resist, they would lose the only military advantage they possessed. Accordingly, when they knew that the reserves were being called out in England, and that an army corps was to be sent to South Africa, they declared war, having been for some time previously convinced, rightly or wrongly, that the British government had resolved to coerce them. They were in a sore strait, and they took the course which must have been expected from them, and indeed the only course which brave men, who were not going to make any further concessions, could have taken. And thus the question whether the grievances amounted to a *casus belli* never came up at all. The only *casus belli* has been the conduct of the two contending parties during a negotiation, the professed subject of which was in no sense a *casus belli*. Some have explained this by saying that a conflict was in fact inevitable, and that the conduct of the two parties is really, therefore, a minor affair. Others hold that a conflict might have been and ought to have been avoided, and that a more skilful and tactful diplomacy would either have averted it, or have at any rate so managed things that, when it came, it came after showing that a just cause for war, according to the usage of civilized states, did in fact exist. No one, however, denies that the war in which England will, of course, prevail is a terrible calamity for South Africa, and will permanently embitter the relations of Dutch and English there. To some of us it appears a calamity for England also, since it is likely to alienate, perhaps for generations to come, the bulk of the white population in one of her most important self-governing colonies. It may, indeed, possibly mean for her the ultimate loss of, South Africa."

GREECE, a kingdom of southeastern Europe, has an area of a little over 25,000 square miles, and a population (1896) of 2,433,806. Athens, the capital, had in 1896 about 111,500 inhabitants. There are many Greeks living outside of the kingdom, also, in the islands of Crete and Cyprus; about 2,000,000 are said to dwell in Asia Minor, and nearly 3,500,000 in European Turkey, making a total Greek population of over 8,000,000. Greece is divided into 16 provinces, grouped under the general heads of Northern Greece, Peloponnesus, Thessaly, and the Grecian Islands.

Industries.—Greece is largely an agricultural country, and the lands are mostly in the hands of peasant farmers, with a few large proprietors. Agriculture is not, however, as well developed as might be expected, considering the fertility of the soil. The chief products are cereals, including wheat, barley, rye, maize and mezzlin, fruits, especially the currant; olives, the grape, and the products of the silkworm. The chief exports from among these are currants, wines, fruit, and olive oil. Orbs also make up an important export, and among the minerals found are manganese, iron, zinc, speiss, lead and galena, magnesite ore, silicate of magnesia, barite, sulphur, emery, and gypsum. Manufactures, which are comparatively unimportant, include engines, leather, thread, cloth, glass, and flour.

Commerce.—The imports into Greece during 1898 amounted to \$29,601,557, an increase of \$7,452,622 over 1897, in the first half of which occurred the Græco-Turkish war; the exports in 1898 were \$17,409,232, an increase of \$1,827,556. In 1897, in spite of the war with Turkey, there had been an increase over the exports of 1896 to the amount of over \$1,500,000, and this increase, it will be seen, was not greatly exceeded by the gain of exports in 1898. The increase of imports, however, in 1898 was much greater than the increase of imports in 1897, which had shown a gain of but \$223,284; thus the 1898 imports showed an actual gain for the year of over thirty-three times the actual import gains of 1897. This increase of imports in 1898 would seem to indicate a growing prosperity in Grecian trade, and it may be noted that the increase in exports also was in 1898 really greater than indicated in the figures given above, owing to the fact that an actual decrease for the first eight months of 1898 was met by such a large amount of exports in the balance of the year as to make the final increase over 1897 of \$1,827,556. Piræus is the chief Hellenic port for imports. Goods are brought in by means of various weekly steamship lines, including 4 Italian steamers, 4 Austrian, 2 French, 2 German, 2 Russian, 2 Egyptian, and 1 English; fortnightly service embraces 1 English steamer, 1 Dutch, and 1 Danish; in all about 75 regular foreign arrivals monthly, besides numerous irregular calls. There is now proposed a direct line of steamships from the United States to ports of the eastern Mediterranean for the purpose of increasing American trade in that part of Europe.

Finance.—By the war with Turkey, Greece not only had to undergo the humiliation of defeat, together with an indemnity and territorial loss, but she also had to accept international control in financial affairs. Representatives of the mediating powers, Germany, Austria, Hungary, France, Great Britain, Italy, and Russia, constitute the international commission, which collects, as security for the loan which the Greek government was authorized to raise, the revenues from monopolies, tobacco, stamps, and the Piræus customs. This loan amounts to £6,800,000, at 2½ per cent., in two issues of £5,004,900 and £1,795,100. The first issue has been applied to the payment of the war indemnity due to Turkey, the indemnity being 4,000,000 Turkish pounds; and of private indemnities of the war, 100,000 Turkish pounds, the balance being applied in aid of Greek finance. In 1899, according to the estimated budget, the ordinary revenue amounted to 89,639,640 drachmæ, and the administrative expenditure to 64,051,326 drachmæ. In addition to the latter, the loan of 1833 (guaranteed by Great Britain, France, and Russia) and the external debt involved the payment of 15,658,750 drachmæ; certain special payments to old creditors, 1,780,000 drachmæ; internal debt and withdrawal of forced currency, 5,145,610 drachmæ; total expenditure, 86,635,686 drachmæ, leaving a balance of 3,003,954 for the new loan, the receipts of which were 8,000,000 drachmæ, making 11,003,954 the total available receipts. The expenditure paid on the new loan, etc., amounted to 13,054,186, making a deficit at the end of the year of 2,050,232 drachmæ. The amount of revenue which was collected by the commission on monopolies, stamps, tobacco, and customs was 35,420,000 drachmæ. The monopolies include the sale of salt, petroleum, emery, matches, playing cards, and cigarette paper. The heaviest branches of expenditure are the service of the public debt, and the ministries, the army, and the interior. The public debt in September, 1899, was estimated to be 701,374,500 drachmæ gold, and 93,775,974 drachmæ paper.

Army and Navy.—The total service in the Greek army, to which all able-bodied males above 21 years of age are liable, embraces enlistment in the colors, the reserve, and the militia. The standing army numbers about 25,000, and has a war footing estimated at 82,000 men. There is also a territorial army estimated at 96,000. The navy consists chiefly of five armor-clad vessels and a fairly large number of miscellaneous craft; the complement of the navy includes 3165 men. Both branches of the service are overestimated on paper, the war with Turkey having shown the army to be ill-disciplined and poorly officered, while the navy showed no efficient fighting qualities. The wealthy Greek philanthropist, George Averoff (*q. v.*), at his death in 1899 left an estate valued at \$18,000,000 to be devoted to the improvement of the navy.

Government.—Government is administered by a king and a legislature, or Boulé, which meets annually and comprises a chamber of 207 representatives elected for four years. The present monarch, King George I., the second son of the king of Denmark, was elected in 1863, after the expulsion of King Otho. The king's council consists of the ministers of interior, finance, justice, marine, war, and public instruction. The Greek Orthodox Faith is the state religion, but freedom of worship is guaranteed.

HISTORY.

Political Parties.—In 1899 the political party known as the Tricoupists came into power. As their name indicates, they were followers of M. Tricoupis, who at the time of his death, April 11, 1896, had been a prominent figure in Greek political history for twenty years. In April, 1875, M. Tricoupis formed his first cabinet, and the party dates from that time. His work was characterized by a very progressive spirit, and many go so far as to say that he started a new era in Hellenic politics. Among the benefits claimed for the influence of M. Tricoupis are the doubling of the financial resources of the kingdom, the founding of the present railway system, the organization of the police on a military basis, the reform of the military and civil education, the improvement of the administrative service, and the creation of the fleet. M. Tricoupis was several times premier, and it is said that no important organic law of the country was framed independently of him. His rival was M. Delyannis, whose programme was negative and under whom the various elements of opposition were united. After 1890 a part of the followers of M. Delyannis left him to form the so-called Neo-Hellenic party under M. Ralli. In 1895 the Tricoupists were overthrown and M. Delyannis came into power, remaining in office until April, 1897, when the military disgrace of Greece led to his dismissal. Then followed the brief ministry of M. Ralli, which lasted until the close of September, 1897, when it was succeeded by that of M. Zaimis. After the death of Tricoupis his followers determined to continue their party organization on the principle of political reform, and since then they have rapidly gained new adherents. The ministry of M. Zaimis lost popularity, and in the general elections of February, 1899, the Tricoupists won a com-

plete victory under the leadership of M. Theotokis, who, on April 2, 1899, was summoned to form a ministry.

Condition of Greece Since the War.—The chief reason for the triumph of the Tricoupists was the general feeling since the defeat of Greece that political reform was necessary, especially in the civil administration, in the army, and in the department of justice. Following the war there was a sort of interregnum, during which parliament exercised but little power. The chamber, having voted the treaty with Turkey and the convention in regard to the international control of the Greek finances, seemed to have no further work to do and was dissolved. The people, accustomed during thirty-seven years to the parliamentary form of government, were distrustful of this change and of the ministry of M. Zaimis, who was said to have persuaded the king to make the fullest possible use of his prerogatives and conduct the government without the aid of parliament. The electoral contest of February, 1899, expressed plainly the general view on this matter, and resulted in the establishment of the first parliamentary ministry since the war.

The New Chamber.—The ministry of M. Theotokis, formed on April 14, was constituted as follows: M. Theotokis, president of the council and minister of the interior; M. Simopoulos, finance; M. Athos Romanos, foreign affairs; M. Coumoundoros, war; M. Boudouris, marine; M. Carapavlos, justice; M. Eftanias, worship and public instruction. Among the first measures of the new chamber were the ratification of acts enforced by royal decree during the parliamentary interregnum, and the passage of a bill of indemnity for the anti-parliamentary acts of the government. During the session, which lasted until June, the chief work of the chamber was in the domain of administrative reform. The finances received the first attention. There was confusion in the system of imposts, and an imperative need of making up the budget deficit. An interesting feature of the financial changes was the introduction of the system of assessment as practised by western nations. This came about through the levying of a direct tax on vineyards. The next matter that came up was the economic policy of the government. Protection for home industries was advocated. No very extensive protection was demanded, but it was urged that some slight protection for nascent industries would give valuable results. The improvement of agriculture in Thessaly by a better system of drainage and by other agricultural reforms was also advocated in the hope of enabling Greece to raise enough food products for home consumption. Among the other reform measures introduced the following may be mentioned: A provision for the redivision of the country, the establishment of a better system of local self-government, and the substitution for the military police of a police force organized on a military basis, under the direction of the minister of the interior. The chamber discussed the question of responsibility for the war with Turkey, and finally appointed a commission of inquiry to investigate the causes of the war and the responsibility for its results.

GREEK CHURCH in the United States consisted in 1899 of the Greek Orthodox Church, with 5 ministers, 5 churches, and 6000 communicants; and the Russian Orthodox Church, with 40 ministers, 31 churches, and 43,000 communicants.

GREENE, CONYNGHAM, M.A., C.B., British agent to the South African Republic, with the rank of *chargé d'affaires*, left Pretoria upon the outbreak of the war in October, 1899. Born in Ireland October 29, 1854, he was educated at Harrow and at Pembroke College, Oxford, where he took his bachelor's degree in 1877. In this year he entered the foreign office; was acting third secretary at Athens in 1880 and *chargé d'affaires* at Stuttgart and Darmstadt from 1883 to 1887; in 1889-91 he was second secretary at The Hague and in 1891-93 at Brussels. From the latter year to 1896 he was secretary of legation and *chargé d'affaires* at Teheran, and was then transferred to Pretoria.

GREENE, General GEORGE SEARS, died at Morristown, N. J., January 28, 1899. He was born at Apponaug, R. I., May 6, 1801, and in 1823 was graduated from the United States Military Academy at West Point. After serving at various garrisons and as instructor at West Point until 1836, he resigned from the army; having entered the engineering profession, he built many railroads in Maine, Massachusetts, Rhode Island, New York, Maryland, and Virginia. He was on the engineering staff of the Croton Aqueduct Department (New York) in 1856; he built the reservoir in Central Park and the enlargement of High Bridge. In 1862 he entered the Union service as colonel of the Sixtieth New York, and in April of that year was made a brigadier-general of volunteers. At Cedar Mountain he commanded his brigade and at Antietam the second division of the Twelfth Army Corps. In the battle of Gettysburg, having in command the right wing of the Army of the Potomac, he rendered excellent service at Culp's Hill. In September of the same year (1863) he was transferred to the West, and on the 28th of the following month, in an engagement near Chattanooga, received a wound that prevented further service until January, 1865, when he joined Sherman's army in North

Carolina and took part in the engagement against Johnston. In March he was breveted major-general of volunteers. Retiring from the army, he accepted the position of chief engineer and commissioner of the Croton Aqueduct Department, where he served until 1871, when he became chief engineer of public works in Washington, D. C. In 1875-77 he was president of the American Society of Civil Engineers. General Greene was the father of General Francis Vinton Greene.

GREENLAND, an island northeast of North America, is a Danish colony, having an estimated area of 46,740 square miles and a population, as reported in 1890, of 10,516, of whom 309 were Europeans and the rest natives. The capital, so called, is Godthaab, situated on the west coast, not far from the 64th parallel. The interior of Greenland is covered with the ice cap, but parts of the coast in the south and west are habitable. The trade constitutes a monopoly of the Danish government. In 1897 exports to Denmark amounted to 368,000 kroner, and imports from Denmark, 767,000 kroner. The chief exports are whale and seal oil, seal, fox, and reindeer skins, feathers, eiderdown, and cryolite. Reference is made to Greenland in the article ARCTIC EXPLORATION.

GREKOFF, DIMITR PANAJOTOFF, Bulgarian statesman, in January, 1899, succeeded M. Stoiloff upon the latter's resignation as premier, and organized a ministry, in which he took the portfolio of foreign affairs. M. Grekoff was born in 1847 of Bulgarian parents at Bolgrad, in the Russian province of Bessarabia. After studying law in Paris, he settled as an attorney in Roumania; he went to Bulgaria after its liberation, and in 1878 was elected to the national assembly at Tirnova, in which he was one of the leaders of the Conservatives. In 1879-80 and 1882-83 M. Grekoff was minister of justice, and in 1890 he assumed the portfolio of foreign affairs in the Stambuloff cabinet; this position he resigned when the premier resigned in May, 1894. He then resumed his practice of the law, returning to political life in January, 1899. His ministry retired in October, 1899, the succeeding one being formed with M. Ivantchoff as premier. M. Grekoff is said to be the foremost counsel in Bulgaria. See BULGARIA.

GRENADA, an island of the British colony of the Windward Islands (*q. v.*), has an area of about 133 square miles and a population upward of 61,000. It contains the capital of the colony, St. George, population, nearly 5000. The government of Grenada is directed by the governor of the colony and by an executive and a legislative council. Its products include cacao, fruits, coffee, cotton, and spices. In 1897 the cacao export amounted to £132,642; spice, £13,503. The following statistics are for Grenada, together with the Grenadines, and relate to 1898. Exports: Cacao, £227,654; nutmegs, £19,740; mace, £2344; total exports, £257,274; total imports, £210,783. Revenue, £62,875; expenditure, £57,612; public debt, £127,670. The aggregate entrances and clearances in foreign shipping in 1897 amounted to 443,808 tons.

GRENADINES, a group of small islands, included in the British colony of the Windward Islands (*q. v.*), and lying between St. Vincent and Grenada, have an area of 8462 acres, or a little more than 13 square miles, and a population of about 6400. Some of the Grenadines are subordinate to St. Vincent and some to Grenada. All but a few hundred of the inhabitants live on the largest island, Carriacou, which is about seven miles long and has an area of ten square miles.

GRIER, WILLIAM MOFFATT, D.D., LL.D., president of Erskine College, Due West, S. C., died in Columbia, September 3, 1899. He was born in York County, S. C., February 11, 1843; in 1860 he was graduated at Erskine. In the Civil War he served as a private with the Sixth South Carolina Volunteers and lost a leg in the battle of Williamsburg. Subsequently he became a minister in the Associate Reformed Presbyterian Church, and from 1871 to the time of his death was president of Erskine College; here also he occupied the chair of mental and moral philosophy, and in the Erskine Theological Seminary he was professor of pastoral theology and homilectics. Dr. Grier was editor of the *Associate Reformed Presbyterian*.

GRIFFITH, ARTHUR F., a new arithmetical prodigy, attracted the attention of the scientific world in December, 1899, through the efforts of Professors E. H. Lindley and W. L. Bryan, of the University of Indiana. The present case is more than a mere curiosity, as he has been subjected to psychological investigation. This has been done in the case of only two rapid calculators before the present. M. Binet, of Paris, made a scientific investigation into the mental development and methods of Inaudi and Diamandi. The new American calculator is a youth nineteen years old by the name of Arthur Frederick Griffith, born in Milford, Kosciusko County, Ind. His father is a stone mason in poor circumstances. He is the eldest of six children, and began at an early age to exhibit signs of his present extraordinary facility with numbers. His mother could keep him still when a very young child

by getting him to count the various objects in the room, and this habit of enumeration gradually extended to counting for three succeeding summers the number of grains of corn fed to his father's chickens. There has been no very great aptitude for figures displayed by any of his ancestors or relatives as far as is known, nor has there been any mental or physical abnormality (with one slight exception) in himself or in his family. He was sent to the public school at the age of ten years, and continued there for seven years, making a good record in all studies, but astonishing his teachers by his wonderful command of numbers. His mathematical education went no higher than arithmetic. His progress in that branch will be appreciated when it is said that his teachers used to employ him to write on the blackboard perfect squares and cubes of numbers for the other pupils of his class to find the roots of. He began when twelve years old to invent short cuts in arithmetic for doing certain sums, a method which he has carried very far, and to which largely he owes his wonderful results. He was brought to the psychological laboratory of Indiana University in November, 1899, and Professors Lindley and Bryan made a careful examination of his physical and mental state, finding his nerve signs, his sensory and motor abilities normal. His memory for figures is extraordinary. He recalls 21 digits after a single hearing. His memory is not much above the normal in ordinary psychological retentiveness, but is systematic and highly trained in certain lines. He knows the multiplication table up to 130 by 130, and gradually increases this by remembering for months the problems given him. He has memorized the squares of all numbers up to 130, the cubes of all up to 100, the fourth powers up to 20, the fifth powers of many numbers, and all the powers of the numbers 2 and 5 up to and including the thirty-third power. He is one of the most rapid calculators on record, multiplying two-place figures in a second and a half, and a four by a three-place number in $3\frac{1}{2}$ seconds. He adds three columns of figures as quickly as an expert accountant, and extracts the square root of six-place numbers in about five seconds, and the cube root of nine-place numbers in a slightly longer time. His methods, which have been studied by Professors Lindley and Bryan, show that he has an extraordinary originality, anticipating many of the methods of higher mathematics and making discoveries of his own about the relations of numbers. He has fifty short methods of multiplying, some of which, though he never studied algebra, approximate the binomial theorem; he has six abbreviated methods for adding and the same number for dividing. One of his short cuts is illustrated by the fact that he raises 991 to the fifth power in 13 operations, a multiplication which ordinarily requires 339 operations. A further study of Griffith and his methods is in progress, and it is thought that it will be of great value, not only to psychology, but to mathematics as well. Griffith was exhibited before the annual meeting of the American Psychological Association at New Haven, Conn., December 27 and 28, 1899.

GRIPPE, LA. See INFLUENZA; PSEUDO-INFLUENZA; THERMOL; VITAL STATISTICS.

GRONLUND, LAURENCE, a socialistic writer, died in New York City, October 15, 1899. He was born in Denmark, July 13, 1846, and was graduated at the University of Copenhagen. Having come to America, he gained some prominence in the Socialist party; he made a tour through the West, lecturing on socialism, and in the State of Washington became the editor of a Socialist paper. Subsequently returning to the East, he secured a position under Mr. Carroll D. Wright, United States commissioner of labor statistics, in Washington, where he is said to have done much of the work upon the statistical reports. Shortly before his death he became engaged in editorial work in New York. He wrote: *The Co-operative Commonwealth*, which appeared before Henry George's *Progress and Poverty*; *Ca Ira, or Danton in the French Revolution*; *Our Destiny*; *Socialism and the Single Tax*; *The New Economy*, 1898.

GUADELOUPE, a French colonial possession in the Lesser Antilles, consists of two islands, Basse-Terre and Grand-Terre, separated by a narrow channel. Their area, together with five smaller dependent islands, is 583 square miles, and the population is about 167,000, of which 15,000 are coolies. The principal town and seat of government is the port Pointe-à-Pitre (population, 17,100). The colony is represented at Paris by a senator and two deputies and is administered by a governor and an elective council. There is a lyceum with 350 students and 97 elementary schools with about 11,000 pupils. In 1898 the public debt was 1,000,000 francs, and the local budget balanced at 5,774,564 francs; the expenditure of France in the budget of 1899 was 1,627,637 francs. The leading products are sugar, coffee, and cacao; other crops, chiefly for local consumption, are bananas, maize, tobacco, sweet potatoes, manioc, etc. About 62,760 acres are under sugar culture. In 1896 the exports to France amounted to 13,085,051 francs and the imports from France, 11,287,915 francs. Steam vessels of two companies ply between Guadeloupe and France and England. The total exports and imports in the following year amounted

to 9,909,038 francs and 15,034,901 francs, respectively. In the spring of 1899 a series of riots took place in Guadeloupe between the Hindu contract laborers and the French Creole laborers, and on April 17 over 400 houses were set on fire in Pointe-à-Pitre. The estimated loss was \$1,000,000. The riots continued, and the local authorities being unable to restore order, the British counsel appealed to his government for the protection of the interests of British subjects in the island. On August 7, 1899, a hurricane caused great damage to houses, crops, and shipping, while forty deaths and over two hundred persons injured were reported. The loss of property amounted to at least \$5,000,000. The western part of the island suffered least, but on the east the towns of St. François, Bertrand, Ause, Port Louis, Gosier, and the Moule were almost totally destroyed. The disaster coming so soon after the earthquake of 1897 and the serious fires in 1898 and 1899, while at the same time there was a financial crisis, threatened the island with famine, and it was thought that the colony might be forced to appeal to the outside world for help.

GUAM is the largest and most southern of the Ladrone (*q. v.*) or Marianne Islands, a group of about fifteen small islands discovered by Magellan in 1521. Guam is about 30 miles long and from 3 to 12 miles broad, with an approximate area of 150 square miles, and a population now estimated at about 9000. It lies 1350 miles south of Yokohama, about 1500 miles east of the island of Luzon in the Philippines, and a little over 5000 miles west of San Francisco. It is of little value in itself, but as it will probably be used as a coaling station by the United States, it is important on account of its relative position and the fairly good roadstead which it possesses. The harbor of Apra has already been charted, and the channel marked by the American government. There is also the Bay of Umata, where there is a town of 200 people, and Agaña, the capital, with a population of about 3000. The latter has been fortified by the Spaniards. The only product of any importance is copra, which is exported to some extent. The island, especially in the southern part, is reported to be quite fertile, but although half its area has been estimated as susceptible of cultivation, a very small percentage has been thus utilized. A small amount of rice, sugar, and vegetables, and cocoanuts, oranges, and lemons are grown. In regard to the fauna of the island, deer and wild goats abound, and are, with the species of bat known as "flying foxes," among the staple articles of food. Guam was peacefully captured in June, 1898, by the United States steamer *Charleston* en route to the Philippines, and on December 23 the *Bennington* (under Commander Taussig) was ordered from Honolulu to Guam, and early in the following year the American flag was raised over the government buildings, and Commander Taussig took formal possession. Later in the year Captain Richard P. Leary, U.S.N., was appointed governor-general of Guam. During the year he instituted many reforms, and made himself popular among the simple inhabitants, while occasioning considerable interest and amusement in this country by the unique methods by which he sought to Americanize the island. He prohibited slavery, drove from the island two friars whose methods he found to be corrupt, established proper customs duties, and requested that the War Department send additional tools, medical supplies, and other stores, and also an ice machine. He also asked for musical instruments and a library. He prohibited polygamy and concubinage, which were general, and ordered all offenders to marry at once. All persons who were following no trade were expected to plant corn, rice, and other vegetables, and to keep twelve hens, one rooster, and one sow. The paternal government instituted by Governor Leary has apparently met the needs of the situation. Drunkenness and indolence, two native characteristics, have been corrected, and the schooling of the children has been instituted. The usual Spanish neglect of sanitary conditions having prevailed in Guam, typhoid fever was prevalent when Governor Leary took charge. At the present time a water distillery has been constructed, and a pure natural supply of water is being planned for.

GUATEMALA, the most northern and western republic of Central America. The capital is Guatemala la Nueva.

Area and Population.—The country consists of 22 departments, the total estimated area of which is about 125,100 square kilometres (48,225 square miles), and the population (1897), 1,535,632. Very few of the inhabitants, except in the cities, are of pure European descent, about 60 per cent. being Indians, and the greater part of the remainder mestizos. Of the births among the whites about one-fourth and among the Indians about one-half are illegitimate. Besides the capital the principal towns are Totonicapán, Cobán, Quezaltenango, and San Pedro.

Government.—According to the constitution, the executive authority rests with a president, elected for six years, and ineligible for the ensuing term, who is assisted by a cabinet, the members of which manage the departments of government and justice, foreign affairs, war, hacienda and public credit, public instruction, and fomento.

The president is Señor Manuel Estrada Cabrera, who, as vice-president, assumed the executive functions upon the assassination of President J. M. Reyna Barrios in February, 1898; in the following September Señor Cabrera was elected for a full term as president. The legislative power devolves upon a national assembly, the members of which are chosen by popular vote for terms of four years in the proportion of one representative for each 20,000 inhabitants. Besides justices of the peace in the municipalities, there are 26 courts of first instance, 6 appellate courts, and a supreme court.

Army.—The effective army consists of men from eighteen to thirty years old, and is said to number 56,900; besides this there is a reserve of about 30,000 men between thirty and fifty years of age. The regular or standing army numbers about 7000 men. About one-tenth of the total public expenditure is for the maintenance of the army.

Finance.—The revenue is derived chiefly from customs and taxes on alcoholic liquors and tobacco; nearly three-fourths of the expenditure is for the public debt, war, and public instruction. The revenue and expenditure for 1896 were 15,150,741 pesos and 17,437,452 pesos respectively; the revenue for 1897 and 1898 (estimated) is reported at 12,479,741 pesos and 11,565,000 pesos respectively. Of the latter 3,926,000 pesos was from customs and 3,224,000 pesos from liquors. At the beginning of 1898 the public debt, including the foreign debt of 18,443,600 pesos, amounted to 40,185,424 pesos, against which the government showed assets valued at 17,383,513 pesos. The currency is chiefly paper. There are six banks of issue. The value of the peso in United States currency on October 1, 1899, was \$0.436.

The financial condition of the country in 1899 was very unsatisfactory. The currency is depreciated, and the distress was aggravated by the great falling off in the price of coffee. The financial strain borne by the government was seen in the early part of July, when, though greatly arousing the discontent of foreign creditors, President Cabrera ordered an extension of time until October for the settlement of accounts against the government. It was also rumored that the government was actually considering the repudiation of some of its foreign bonded debt. This called forth much hostile feeling in Great Britain and Germany, which nations for a time were expected to send four warships to the Guatemalan ports. During the stringency revolutionary plots were prevalent. Toward the close of 1899 the Guatemalan consul at Hamburg, Germany, reported that his government had successfully negotiated a foreign loan of \$15,000,000.

Industries.—The national land law enacted in 1894 provided for the survey and division of state lands for allotment to settlers, the maximum amount allowed to one person being 15 caballerías (1687.5 acres). According to their productive value, the price of these lands varies from 250 pesos to 500 pesos a caballería. The government reserves a strip of land 1500 metres (nearly a mile) in width on the coast, and 200 metres in width on the banks of navigable rivers; these lands, however, may be leased provisionally. Lands bordering on the frontiers may be acquired only by citizens of Guatemala. The government grants uncultivated lands gratuitously to municipalities, to educational institutions, to recently established villages, to immigrants and companies promoting immigration, and to persons undertaking the construction of national roads.

Agriculture is the chief industry, and coffee the principal crop. The leading coffee-producing districts are in Alta Verapaz, Chimaltenango, Esquintla, Quezaltenango, Retalhuleu, San Marcos, Santa Rosa, and Zacapa. About two-thirds of the export is sent to Germany. The cultivation and export of bananas is increasing; the fruit grows best on the Atlantic side of the country, and the export trade is confined to the southern ports of the United States. In 1893 the shipments amounted to 364,851 bunches; since that time the trade has increased, but definite statistics are not obtainable. Tobacco also is grown in the eastern part of the country; the culture covers about 2500 acres, yielding 2,250,000 pounds. In 1899 a law taking effect July 1 was promulgated, declaring that tobacco culture be free from tax, national or municipal. Maize is one of the staple crops, but is not exported. Cacao is grown in small quantities; it is the most valuable kind on the market, the price, even in Guatemala, being 50 per cent. greater than for other cacao. Other products include hides, rubber, and sugar. In 1899 the government took measures for encouraging the cultivation of the rubber tree. Various metals and other minerals are found, but hitherto have been little exploited; among them are gold, silver, copper, lead, tin, salt, and sulphur. There are a number of factories, some of them fairly prosperous, for cotton and woollen goods, the preparation of the grass-cloth plant, furniture, earthenware, etc., besides foundries, breweries, and distilleries, and sugar mills.

Commerce and Shipping.—The foreign trade is chiefly with the United States, Great Britain, and Germany. In 1894 imports came from these countries in the following proportions: United States, 26 per cent.; Great Britain, 24; Germany, 13. In 1896 the percentages were: United States, 34; Great Britain, 23; Germany, 22;

and in 1898, United States, 34; Germany, 24; Great Britain, 18. For 1896 the imports and exports amounted to 26,287,145 pesos, and 23,085,544 pesos respectively; for 1897, imports, 21,462,053 pesos, and exports, 19,775,800 pesos. The reported values of imports and exports for 1898 were about 22,320,000 pesos, and 19,641,000 pesos respectively. In 1896 the coffee export was 68,572,634 pounds, value 22,349,623 pesos; in 1897, 82,475,586 pounds, but though the quantity was much greater than in 1896 the value was but 18,875,700 pesos. Of the crop of 1896, 44,268,079 pounds, and of that of 1897, 54,380,672 pounds went to Germany. Among the chief imports are cottons, cereals, alcoholic liquors, iron goods, and woollens. The tonnage entering the Guatemalan ports in 1897 aggregated 782,076 tons, carried in 614 vessels, most of which belonged to the United States.

Communications.—There are a number of good roads in Guatemala, but much traffic is still effected by pack mules. Railroad construction progressed in 1899. There is a line connecting the capital with Iztapa, one connecting the capital with San José on the Pacific coast and passing through Esquintla (85 miles), one between Champerico on the Pacific and Retalhuleu (32 miles), and one still shorter between Retalhuleu and San Felipe. The Puerto Barrios and Northern Railway was projected a number of years ago from a point on the Gulf of Amatique, along the Motagua River to Guatemala city and thence to San José, a total distance of about 230 miles. In the spring of 1899, when only 59 miles remained to be built, it was reported that the government had sold the road to an American company. It is expected that this road will divert much of the coffee traffic from the Pacific routes to the gulf ports of the United States. Upon the completion of this road there will be about 450 miles of railway in operation. In 1897 there were reported 3093 miles of telegraph lines, with 171 offices and 272 post-offices.

Religion and Education.—There is no state church and the principle of religious toleration is recognized, though Roman Catholicism is dominant. Education is gratuitous and nominally compulsory. The number of primary schools under government control in 1895 was reported at 1266, with an attendance of 64,015 pupils. The private schools for primary and secondary instruction numbered 49. There were 13 schools for special or professional instruction, and 6 normal schools and institutes. The government expenditure for education in that year was 95,062 pesos. In 1896 there were published 37 periodicals, of which 7 were dailies and 14 weeklies.

A Revolutionary Attempt.—A revolutionary movement culminated on December 14, 1899, when the insurgents captured the town of Tacona in the state of San Marcos and near the Mexican border. The insurrection, however, was soon suppressed, the government troops surrounding the town and capturing nearly all of the rebel leaders.

GUÉRIN, EUGÈNE, French politician, was born at Carpentras, July 27, 1849. After studying law in Paris he took part in the Franco-Prussian war of 1870-71, after which he settled as an advocate in Carpentras, and later became mayor of that town. He was elected to the senate in 1890, and from April, 1893, to the following December, and from May, 1894, to January, 1895, was minister of justice in the cabinet of M. Charles Dupuy. For an account of his siege in the Rue Chabrol, see FRANCE (paragraphs on History).

GUILLOU, CHARLES F., surgeon, U. S. N., retired, died in New York January 1, 1899. He was born in Philadelphia July 26, 1813; was graduated at University of Pennsylvania. He was surgeon on the *Peacock* in the Wilkes expedition, the first American expedition to the Polar seas. He served in the Mexican War; in 1854 took charge of a hospital in Honolulu, where he acted as Italian consul, and was court physician.

GUZMAN-BLANCO, ANTONIO, ex-president of Venezuela, died in Paris, France, July 29, 1899. He was the son of the once well-known statesman, Lococadio Guzman-Blanco, and was born in Caracas in 1829. While still a young man he gained some prominence in politics, and the usual revolutionary disturbances, and in 1863 became vice-president of the republic. During the Civil War of 1866-67 he fought with the federalists under General Falcon. In 1868 he was forced out of office, and anarchy again threatened the country; he headed a successful revolution, and in April, 1870, became provisional president. It was three years before order could be well established throughout the country, and during this time Guzman-Blanco, supported by the congress, ruled with dictatorial power, but was so successful in introducing beneficent reforms that, in February, 1873, he was elected as regular president for a term of four years. This period was one of the happiest in the history of Venezuela, though the president's dictatorial policy continued, and he amassed great wealth by very questionable methods; nevertheless, he improved the public credit, increased the revenues, established closer relations with European powers, founded schools for both the whites and the Indians, established museums and academies, built canals, opened the first railroad in the country, effected various

municipal improvements, and introduced a new code of law. On February 20, 1877, he was succeeded as president by Señor Alcantara, whose administration was so unsuccessful that strong party strife arose; a revolution followed, which, on May 12, 1879, again made Guzman-Blanco provisional president. At this time he was in Paris, whence he hastened, and was greeted with enthusiasm. In a few months he had restored order. He retired from the office in 1884, being succeeded by Joaquin Crespo, but two years later was again chosen president of the republic; he resigned on August 10, 1887, and went to Paris as envoy to the European powers. In 1889 he was practically deposed by the congress on account of alleged corrupt contracts made in Paris. He erected in Venezuelan cities, it is said, many statues commemorative of his virtues; but these embodiments of his vanity have been torn down.

GYMNASIA, MUNICIPAL. See MUNICIPAL GYMNASIA.

GYMNASTICS. Gymnastics have become specialized, from the all-embracing gymnasia of the ancient Greeks, which covered more nearly our modern field of athletics, to exercises for the purposes of building up and maintaining the health of the individual, and to contests on certain specified pieces of gymnasium apparatus, as the rings and the horizontal bar. The first department of gymnastics, physical exercise, is found to-day among the enforced curricula of many American schools and colleges, and to a still greater degree among the educational institutions abroad. In the case of gymnastics as relating to contests, far less attention has been paid to them in this country than to the athletic games which have sprung from them, but their number is annually increasing. In 1899 the first important intercollegiate gymnastic association meeting was held, the result being as follows: Horizontal bar, E. B. Turner, Princeton, and R. G. Clapp, Yale, tied, 12 points; side horse, F. J. Belcher, New York University, 10½; parallel bars, R. G. Clapp, 12¼; flying rings, R. G. Clapp, 11½; club-swinging, R. G. Clapp, 13½; tumbling, W. L. Otis, Yale, 10; all-around championship, R. G. Clapp, Yale, 7½ points. Delegates from Princeton, Yale, Union, New York University, Haverford, Amherst, and Columbia met in November and formed a permanent intercollegiate Gymnastic Association. The first regular championship meeting will probably be held for 1900 at Columbia. Word was received that Harvard and Pennsylvania would also be represented in the association. The general amateur championships for 1899 were won as follows: Horizontal bar, C. Berndt, Anchor Athletic Club; side horse, J. F. Bessinger, New York Turn-Verein; parallel bars, O. Steffen, New York Turn-Verein; flying rings, C. Berndt; club-swinging, F. Metz, Jr., Newark Young Men's Christian Association; tumbling, George Stefer, Pastime Athletic Club; long horse, O. Steffen, 39½ points; rope-climbing, 22 feet from floor, E. Kanuth, Anchor Athletic Club, 6¾ seconds; all-around championship, O. Steffen, 16½ points.

GYPSUM. The production in the United States for the last two years was, 1897, 288,982 short tons, valued at \$753,864; 1898, 291,638 short tons, valued at \$755,280, the latter being the largest known. The important producing States in the order of their output, are: Michigan, Iowa, Kansas, New York, and Texas. Over 80 per cent. of the domestic production is now used for plaster of Paris, and its application for this purpose is increasing. The imports showed a total value of \$240,844. The United States still remains the second producer in the world, the total production of the latter amounting to \$4,015,502. Among the recent developments was the discovery of gypsum near Panasoffkee, Fla. An important report, issued by the Kansas Geological Survey, treats of the Kansas deposits of gypsum and its technology.

GYPSY MOTE. See ENTOMOLOGY (third paragraph).

HADLEY, ARTHUR TWINING, M.A., LL.D., thirteenth president of Yale University, was elected to his present position by the Yale corporation on May 25, 1899, to succeed President Timothy Dwight, whose resignation, tendered on November 17, 1898, was to take effect July 1. President Hadley is the son of James Hadley, for many years professor of Greek at Yale, and was born in New Haven, April 23, 1856. He prepared for college at the Hopkins Grammar School, New Haven, and having entered Yale, was graduated in 1876. Here he continued his work for a year, specializing in political science, and then passed two years at the University of Berlin, studying history and political and economic science. Having returned to the United States, he was a tutor in various subjects at Yale from 1879 to 1883; the next three years he lectured at the university on railroad administration. It was in about 1883 that he began his study of the history and science of railroad transportation, in which subject he has come to be recognized as an authority. As commissioner of labor statistics from 1885 to 1887, Professor Hadley published two reports that have been highly regarded by students of labor problems. During the next two years he acted as associate editor of the *Railroad Gazette*, New York, his special work being the direction of the department of foreign railways. From 1886

to the time of his election to the presidency in 1899 he was professor of political science in the graduate department at Yale, and during the absence of Professor William G. Summer, from 1891 to 1893, he took charge of the latter's work in the academic department. In 1899 he was president of the American Economists' Association. Professor Hadley's writings, which have insured him a prominent place in the foremost rank of contemporary economists, include the following: A series of articles on *Transportation* in *Lalor's Cyclopædia of Political Science*, 1883; *Railway Transportation: Its History and Its Laws*, 1885; the labor reports of Connecticut for 1885-86 and 1886-87; a part of the article on *Railways* in the *Encyclopædia Britannica*, 1886; the chapter on the business relations of railways in *Scribner's American Railways*, 1888; *Economics: An Account of the Relations Between Private Property and Public Welfare*, 1896. The last-named book is his most important work, *Railway Transportation* ranking second. Dr. Hadley was inaugurated as president of the university on October 18, 1899. His address was "marked by the courage of an assured leadership and high purpose that feared to face no problem squarely, but also no less by loyalty to a noble Christian past."

HAGUE CONFERENCE. The famous circular issued by the Russian court on August 12-24, 1898, inviting a conference to consider the question of gradual disarmament and the maintenance of peace was described in the preceding YEAR BOOK. It was received with scepticism in certain quarters and with indifference or suspicion in others. In the first place, many thought that the idea of a limitation of armaments, not to say gradual disarmament, was purely visionary. In the second place, some took the pessimistic view that the Czar's proposal might even result in bringing about the very thing that he aimed to avoid—namely, a general war. But as time went on it came to be the general opinion that the conference would certainly do no harm and might do some good, although it would fall far short of what its authors hoped for it.

In a second circular issued by Count Muravieff, January 11, 1899, the Czar's proposals respecting disarmament and the maintenance of peace were more definitely stated. This circular requested a conference which should discuss the following points:

"1. An understanding not to increase for a fixed period the present effective of the armed military and naval forces, and at the same time not to increase the budgets pertaining thereto; and a preliminary examination of the means by which a reduction might even be effected in future in the forces and budgets above mentioned.

"2. To prohibit the use in the armies and fleets of any new kind of firearms whatever and of new explosives, or any powders more powerful than those now in use either for rifles or cannon.

"3. To restrict the use in military warfare of the formidable explosives already existing, and to prohibit the throwing of projectiles or explosives of any kind from balloons, or by any similar means.

"4. To prohibit the use in naval warfare of submarine torpedo-boats or plungers, or other similar engines of destruction; to give an undertaking not to construct vessels with rams in the future.

"5. To apply to naval warfare the stipulations of the Geneva Convention of 1864, on the basis of the articles added to the convention of 1868.

"6. To neutralize ships and boats employed in saving those overboard during or after an engagement.

"7. To revise the declaration concerning the laws and customs of war elaborated in 1874 by the conference of Brussels, which has remained unratified to the present day.

"8. To accept in principle the employment of the good offices of mediation and facultative arbitration in cases lending themselves thereto, with the object of preventing armed conflicts between nations; an understanding with respect to the mode of applying these good offices, and the establishment of a uniform practice in using them.

"It is well understood that all questions concerning the political relations of states and the order of things established by treaties, as generally all questions which do not directly fall within the programme adopted by the cabinets, must be absolutely excluded from the deliberations of the conference."

This basis for discussion was generally accepted, but when it came to issuing the invitations some difficulties were encountered. The United States had already revealed its unwillingness to commit itself to a continuance of the present status, in view of the smallness of its military and naval forces as compared with those of European states. Italy opposed the representation of the papacy in the conference, and Great Britain opposed that of the Transvaal. These objections were sustained, and the invitations were not extended either to the Pope or to the government of the Transvaal. It was appointed that the conference should meet at The Hague on May 18. Invitations were issued by the Dutch government to nineteen European

states, and to the United States, Siam, Persia, Japan, and China. Including Russia, there were twenty-six states represented at the conference, thus comprising a majority of the minor powers. The South American states, however, were not represented, it being assumed that the United States would be their spokesman. The meetings of the conference were held in the Palace in the Wood (*Huis ten Bosch*), about two miles from the centre of The Hague.

The Delegates.—The American delegates were Andrew D. White, United States ambassador to Germany, who was the head of the delegation; Stanford Newel, United States minister to the Netherlands; Captain William Crozier, of the Ordnance Department of the United States Army; Captain A. T. Mahan, of the navy (retired); Seth Low, president of Columbia University, and Frederick W. Holls, of New York, the last named being the secretary of the delegation.

A striking fact in regard to the conference was the complete change in the character of the original programme. In the circular letter of August 24 the limitation of armaments or their progressive reduction was the principal feature, while matters pertaining to arbitration and mediation were altogether secondary. By the time the conference met this order was completely reversed, as appears from the speech which Baron de Staal, the chief delegate from Russia and the president of the conference, made on May 20. In this arbitration and mediation play the principal part. It was to these especially that the attention of the delegates was invited. After this they were requested to consider plans for mitigating the horrors which are inseparable from war when war has once broken out; and not till toward the end of the speech was anything said on the subject of disarmament, which was disposed of in these few words: "It is worth while, moreover, to ask if the welfare of the people does not require the limitation of progressive armaments. It behooves the governments in their wisdom to adjust in this respect the interests with which they are charged." Thus, it was evident from the first that if the peace conference accomplished anything, it would be by way of facilitating arbitration and mediation, which were the main objects of its attention. Even within this limited sphere many feared that the conference would fail. The chief obstacle, it was thought, was the importance of rapid mobilization as an element of success in modern warfare. It was predicted that those powers which, like Germany, were able to mobilize large forces quickly would refuse to submit an important matter to arbitration, since they would thus give the hostile power a chance to perfect its mobilization while the arbiters were in conference and so deprive its better equipped foe of its advantage. It might be decided to prohibit either party from beginning mobilization until the arbiters had decided that they could not adjust the matter in dispute; but this was not only difficult in practice, but was thought by some to be inadmissible in law. Again, the arguments of Baron de Staal in favor of arbitration were scouted by some as wholly Utopian. He said, for instance, that between nations there existed a community of material and moral interests, and that even should a nation desire to remain isolated, it could not do so. On the other hand, the reality, as judged by historical events, did not seem to correspond to this theoretical conception, for not only have wars often profited the conqueror, but they have indirectly benefited third parties to such an extent that outside nations have frequently tried by secret means to involve others in war. The scepticism in regard to the results of the conference was most marked in France and Germany. Many writers for the continental press were so convinced of the futility of the conference that they even began to impute blame for its failure in advance. In Germany it was said that France would be the chief obstacle to the realization of the Czar's project, since France was too thoroughly possessed with the idea of revenge for Alsace-Lorraine. On the other hand, the French thought that Germany would be the stumbling-block, and it was noted that the Emperor William in his famous speech at Porta Westphalica had said that the best guarantee of peace was a strong army, and implied that Germany was not disposed to think seriously of disarmament. They also noted that the delegate whom William II. chose to represent Germany in the conference was Baron de Stengel, professor of law at the University of Munich, who a short time before had published under the title of *Eternal Peace* a brochure, in which he had ridiculed the idea of disarmament. In short, very little was expected to result from the conference, which at best was regarded as an evidence of the amiable wishes of the Czar.

Mediation and International Commissions of Inquiry.—The most important work at the conference was that of the committee organized to consider the regulation of international conflicts. M. Léon Bourgeois, chairman of the French delegation, was president of this committee. Its members, appointed by him, were Count Nigra (Italy), Sir Julian Pauncefoot (Great Britain), Baron d'Estournelles de Constant (France), Asser (Netherlands), Chevalier Descamps (Belgium), Holls (United States), Lammasch (Austria), De Martens (Russia), Odier (Switzerland), and Dr. Zorn (Germany). The Russian proposal was submitted on May 22 and the

debate began a week later. The first topic discussed was mediation as preliminary to arbitration. This principle was not altogether a novelty in international affairs. The treaty of 1856 had contained a clause that if disputes arose between the Porte and one of the signatories, the Porte or some of the other powers should try mediation before having recourse to arms. The same principle was followed at the convention of the Berlin Conference, February 26, 1885, defining the limits of the Congo Basin. It was here again provided that, in the event of a dispute between the signatories of the convention, mediation should be attempted before recourse was had to arms. The important thing in the Russian proposal, however, was that when disputes arose between civilized states the powers which were not involved should offer their good offices or mediation, in order to remove, if possible, the existing differences and to propose an amicable solution. Thus, a state involved in a controversy with another state would not have to apply for mediation, the other powers offering it of their own free will, nor could this act of intervention be regarded as an unwarrantable interference. It was the object of the Russian proposal to establish the practice of such intervention so that it would be regarded as a matter of course and in nowise indicative of a hostile or meddlesome spirit.

Still further to strengthen the cause of peace, it was provided in the Russian proposal that there should be international commissions of inquiry (*commissions internationales d'enquête*) whenever a dispute arose between any of the signatory powers which could not be adjusted by the ordinary diplomatic means, but in which neither the honor nor the vital interests of the conflicting states were involved. The governments concerned should establish an international commission of inquiry in order to subject the points at issue to an impartial examination. Each government should name two members, and these four members should meet and choose a fifth. The object of this commission would be to bring out the truth and to make a report, which report was not to be binding upon the parties to the dispute. The mind of the committee was divided on the subject of these proposals. Some of the states tried to weaken their force by rendering them more vague and elastic, while others sought rather to strengthen them. But after some discussion the clause relating to mediation on the initiative of other powers was voted, with the additional phrase, "in so far as circumstances admit." The opposition to the establishment of commissions of inquiry was more determined. It was objected by some that this arrangement threatened the independence of the smaller states, while others held that it was altogether too much in favor of the smaller states. Some said that it would lead to obligatory arbitration and others that it would prevent arbitration altogether. The main point at issue was the obligatory character requiring the interested parties to institute an international commission of inquiry, and at length it was proposed that the clause should merely state that the signatory powers judged it advisable that these commissions of inquiry should be appointed. This proposition was discussed before the whole conference, but it did not meet with the approval of the representative from Roumania, who demanded a more radical wording. The original wording of the clause was finally retained, but modified by the proviso that the dispute should involve neither the honor nor the essential interests of the powers concerned, and that the international commission should be appointed in so far as circumstances permitted. It was made perfectly clear that the report of the commission was confined to the determination of the facts and that it left the parties to the dispute entirely free to accept or reject its decision. An important addition was made to the original project of mediation by the American representative, Mr. Holls. He argued that, as in private life on the eve of a duel the seconds are left to discuss the various points and questions in connection with the affair, in the event of an international controversy the states in dispute should be encouraged each to choose another power as a second, and that the two powers thus chosen should meet and discuss the points at issue. Mr. Holls explained that the effect of this arrangement would be to prevent any change in the subject-matter of the dispute, and it would also really continue diplomatic intercourse. The proposal was adopted in the following form: The signatory powers voluntarily recommend the application, in so far as circumstances permit, of a special mediation under the following form: In case of a serious difference compromising the peace, the conflicting states should each choose a power to which it would intrust the mission of entering into direct relations with the power chosen by the other party, in order to prevent the rupture of peaceful relations. So long as this mandate continues, whose term, except for stipulation to the contrary, must not exceed thirty days, the states in dispute should cease all direct discussion of the point at issue, which is considered as given over exclusively to the mediatory powers. These should make every effort to compose the differences. In case of a complete rupture of the peaceful relations these powers should continue charged with their common mission of taking advantage of any chance to restore peace.

So much for mediation and the establishment of the international commissions

of inquiry. It will be seen that nothing in the shape of obligatory arbitration has been established. The direct mediation of the other powers and the founding of the international commission are purely facultative; but although they have no binding force, there is no doubt that they will tend to prevent war. Before the conference a power was entitled to offer its good offices and mediation, but the offer had not the same sanction of international approval that the conference has given to it. When a power now offers its mediation, it does so in the name of a large part of the civilized world.

International Arbitration.—On the subject of international arbitration, properly so called, the Russian proposals were very far-reaching. While they recognized that matters involving the honor or dignity of nations were not fit subjects for arbitration, they aimed to render arbitration obligatory in a great number of specified cases which did not touch the honor or vital interests of states. After some discussion, in the course of which a number of alterations were made, the substance of these proposals was as follows: Arbitration to be obligatory in the following cases in so far as they do not touch the honor or the vital interests of the powers. (1) In disputes arising from matters relating to pecuniary claims. (2) In disputes over the interpretation or application of conventions relating to posts, telegraphs, and telephones; conventions relating to the protection of submarine cables; conventions concerning railway transportation; conventions and rules having to do with the prevention of collisions at sea; conventions concerning aid to the sick and wounded in time of war; concerning the safeguarding of literary, artistic, and industrial property, including patents and trade-marks; concerning the system of weights and measures; concerning mutual aid for the infirm and dependent; sanitary conventions; conventions for the prevention of the cattle plague and phyloxera; extradition conventions; conventions of delimitation in so far as they are technical and not political in character. The debate on these proposals showed remarkable unanimity among the delegates, and for the moment it seemed as if the principle of obligatory arbitration would be admitted on all these points. This was prevented by the attitude of the German delegate, Dr. Zorn, who suddenly announced that Germany did not accept the principle of obligatory arbitration, except in so far as certain treaties into which she had entered had already accepted that principle. As a result of the discussion, the word obligatory was struck out, and it was said merely that arbitration was recognized as the best means for settling the differences above mentioned, and that it was recommended. Thus, the commission confined itself to recommending international arbitration as the most effective and most equitable means of settling disputes. It was added, however, that, independently of general and particular treaties which actually stipulate that it shall be compulsory for the signatory powers to have recourse to arbitration, these powers reserve for themselves the right of concluding, either before or after ratification of the act of the convention, any new agreement, general or particular, with a view to extending the principle of obligatory arbitration to all the cases to which they judge it applicable.

A more important work was accomplished at the instance of the British representative, Sir Julian Pauncefote, in the establishment of a permanent court of arbitration. Sir Julian proposed that there should be established in some European city a central bureau which should receive applications for the calling together of the court of arbitration, at the request of the parties in dispute, and that it should keep the records of that court. This central bureau should also keep on file the names of persons recommended by the different governments as fitted to serve on the international tribunal. Each of the signatory powers should give the names of two persons recognized in their own country as jurists or publicists of merit and having a high reputation for integrity, and the persons thus designated should become members of the tribunal and have their names inscribed in the records of the central bureau. This list of names should be furnished by the central bureau to such of the signatory powers as made known their desire to resort to arbitration. From this list the parties in dispute should select the number of arbiters that they had agreed upon and it was also their right to add other arbiters whose names were not included in the list. These should constitute the court of arbitration, which should assemble at a date fixed by the litigants. These propositions were accepted with but slight changes, among which was the increase of the number of persons to be named by each country from two to four. The design of this, of course, was to facilitate arbitration by the establishment of machinery which should always be in readiness. It was made clear that the powers were in nowise bound to apply to the permanent court.

An indirect result of the conference, but one which was thought to promise important consequences, was the establishment of a permanent council of administration, which should have a general supervision over the central bureau. This council should be made up of the ministers of the signatory powers accredited to

The Hague. It was distinctly stated that the functions of the council were to be purely administrative, but the hope seems to have been entertained by some of the champions of universal peace that it would serve as a sort of standing committee on international affairs and would make for peace in a manner that was not intended by its creators.

HAITI, a republic occupying the western portion of the island of the same name, the eastern part being the republic of San Domingo. The capital is Port-au-Prince.

Area, Population, Education.—The estimated area of the country is 10,204 square miles. The population has been variously estimated, one authority placing it at 572,000, another (1887) at 960,000, while for the year 1894 it was stated to be 1,216,625; this last figure, it is safe to say, is more nearly correct than the others. Very few of the inhabitants are of pure European blood, about 90 per cent. being negroes and nearly all of the remaining 10 per cent. mulattoes. The population of Port-au-Prince is about 50,000; of Cape Haitien, about 29,000, and of Les Cayes, about 25,000.

Public instruction of an elementary nature is free, but is in a very backward condition. Besides private schools and five public lyceums there are about 400 public schools. The official language of Haiti is French, but the vernacular is a dialect known as creole French. The prevailing religion is Roman Catholicism.

Government, etc.—The chief executive authority rests with a president, who by the terms of the constitution is chosen by popular vote; so frequent, however, have been the civil disturbances and insurrections that he is often chosen by the assembly, by the army, or in some other irregular manner. The presidential term is nominally seven years. The president is General Tiresias Simon Sam, who was elected in April, 1896. The legislative power is vested in a national assembly of two houses, the senate and the house of representatives; members of the former, thirty-nine in number, are nominated by the lower house, one-third retiring every three years, while the representatives are chosen by direct vote of the people. The army, which is chiefly infantry, consists nominally of 6828 men; six small vessels of the cruiser type comprise the navy.

Finance.—The chief items of revenue are import and export duties. The total revenue for the fiscal year 1895 was 7,406,321 gourdes, gold; the expenditure for the same year was 8,042,705 gourdes, and for the fiscal year 1897 it was estimated at 8,984,539 gourdes. The total external debt in April, 1897, amounted to 13,476,113 gourdes, gold; of this amount 4,176,113 gourdes were at 5 per cent., and 9,300,000 gourdes at 6 per cent. The internal debt was 4,437,103 gourdes gold, and 10,812,574 gourdes, paper. The value of the gourde silver piece in United States gold is \$0.965. During 1899 the condition of national finance in Haiti was very unsatisfactory, not to say deplorable. There was a serious falling off in revenue due in large part to the depreciation of coffee and to the consequent decrease of trade; this decrease in revenue is seen in the statement that for first quarter of the fiscal year 1897-98 the import customs amounted to 1,104,452 gourdes, while for the same period of the year 1898-99 they amounted to 759,489 gourdes.

Industries, Commerce, etc.—Agriculture is the principal industry; the leading exports are coffee, cacao, and logwood; other exports are cotton, hides, skins, honey, mahogany, and turtle shells. Exports and imports in 1896 amounted to 9,463,903 gourdes and 6,053,835 gourdes respectively; in 1897, exports 12,549,848 gourdes, imports 6,363,798 gourdes; the figures reported for 1898 are, exports £2,655,820 (13,391,939 gourdes), imports £821,625 (4,143,033 gourdes). The quantities of the chief exports for the year ending September 30, 1897, were: Coffee, 73,057,307 pounds; cacao, 2,120,242 pounds; logwood, 112,756,225 pounds. The imports in 1897 from the four countries leading in the foreign trade were: From the United States, 4,379,000 gourdes; from France, 943,000 gourdes; from Germany, 529,000 gourdes; from Great Britain, 309,000 gourdes; total from these countries, 6,160,000 gourdes. The cacao crop for 1898 was 4,032,736 pounds—almost double that of the preceding year. The logwood industry, however, is suffering severely from the competition of other dye stuffs; in 1899 it was reported that in less than five years the export had fallen from 142,015,972 pounds to 64,473,588 pounds. Subsequent to 1897 the import trade in general has shown a serious falling off, and in 1899 the business situation was very grave. Largely responsible for this is the depreciation of coffee, together with an export tariff thereon of about \$3.80 a hundred pounds. It is said that at present this duty cannot be modified, since it constitutes a guarantee for several internal debts. The reported shipping at the ports of the republic in 1897 was, for entrances and clearances, each, 793 vessels, of 1,136,530 tons.

Boundary Question.—The boundary dispute between Haiti and San Domingo promised in 1899 an early settlement. On May 28 of that year President Sam and President Heuraux, meeting at Môle Saint Nicholas, came to an agreement, by which it was thought the delimitation of the frontiers could be satisfactorily determined.

Political Conspiracy.—In the early part of August, 1899, a conspiracy, on the very

point of manifesting itself, was discovered against President Sam in favor of an ex-minister of finance, M. Fouchard. The leaders of the plot were put under arrest and imprisoned.

HAMBOURG, MARK, pianist, born in South Russia, June 1, 1879, the son of Professor Michel Hambourg, who gave him his first musical education. Subsequently he studied under Leschitzky in Vienna, and obtained the Liszt scholarship in 1894. He appeared in Moscow, London, Vienna, visited Australia in 1895-96, gave concerts in Paris and Berlin in 1897, and came to the United States on a concert tour in 1899. His compositions for the piano include a romance and a minuet.

HAMILTON, WALTER, an English author, died February 1, 1899. He was born in London January 12, 1844, and was educated at the Collège de Dieppe. He was a fellow of the Royal Historical Society, vice-president of the Société Française des Collectionneurs d'Ex Libris, and vice-president of the Ex Libris Society. His publications include: *Memoir of George Cruikshank*, 1878; *History of the Poets Laureate of England*, 1879; *The Aesthetic Movement in England*, 1882; *Dated Book-Plates*; *French Book-Plates*; *Collection of Parodies of the Works of British and American Authors*.

HAMILTON COLLEGE, at Clinton, N. Y., was founded in 1812. The chapel, built in 1827, has recently been reconstructed, toward the refurnishing of which an organ costing \$4000 was given by Henry H. Benedict, '69; in 1899 four stained-glass memorial windows were placed in the chapel, in commemoration of Alexander Hamilton, by the class of '88; of Samuel Kirkland, by Joseph Rudd, Esq., '90; of President Simeon North, by Mrs. C. C. Goldthwaite, and of Moses Earl Dunham, '47, by his son. The much-desired hall of philosophy, to complete the new scheme of recitation halls, has been promised by one whose name is withheld, and beginnings have already been made, while the main work will be pushed in the summer of 1900. The college lost a painstaking and true-hearted teacher by the death, July 27, 1899, of Professor Abel Grosvenor Hopkins, who for exactly thirty years had filled the chair of Latin. The gifts to the library during the year were 420 volumes and 2235 pamphlets. The degrees conferred, June 29, 1899, were: A.B., in course, 33; B.Ph., in course, 12; A. B., *nunc pro tunc*, 2; B.Ph., *nunc pro tunc*, 1; A.M., *ex gratia*, 3; A.M., in course, 10; D.D., honorary, 4; LL.D., honorary, 3. For statistics, see UNIVERSITIES AND COLLEGES.

HANDEL AND HAYDN SOCIETY, an oratorio society incorporated in Boston in 1816, holds four annual concerts with the Boston Symphony Orchestra. Conductor, Emil Mollenhauer; secretary, William F. Bradbury, 369 Harvard Street, Cambridge, Mass.

HARBOR IMPROVEMENTS. The most important piece of harbor work undertaken in the United States during 1899 was for the improvement of the ship channels leading into New York harbor. These improvements comprise the construction of what is known as the East Channel, at the entrance to the harbor, and of the Bay Ridge and Red Hook channels. The new East Channel will be made 4000 feet wide and 40 feet deep, and will necessitate the dredging out of 30,000,000 cubic yards of material. The amount of excavation in the Bay Ridge and Red Hook channels aggregates about 16,000,000 cubic yards. The contract for this dredging was awarded to Mr. Andrew Onderdonk, of New York City, for 9 cents per cubic yard. (See DREDGES.) By far the most comprehensive and radical scheme which has ever been suggested for waterways and harbor improvements on the Great Lakes was proposed in December, 1899, by the Government Board of Engineers on Deep Waterways. In substance, the plan proposed is to dam the Niagara River so as to raise the level of Lake Erie three feet above the normal low-water stage during the close of the navigation season. This rise in Lake Erie by backing up the water in the lakes above will, it is estimated, raise the Detroit and St. Clair Rivers and Lake St. Clair about two feet, and Lakes Huron and Michigan about one foot. The cost of the proposed dam in the Niagara River is estimated to be about \$800,000. As designed the dam will consist of a submerged wire or overflow section 2000 feet long, and of thirteen 86 feet wide and 20 to 24 feet deep sluice gates, which can be opened or closed at will. Very careful studies have been made for this plan of lake regulations by the engineers of the Deep Waterways Board, and it is asserted that it is perfectly feasible as an engineering work. Late in December, 1899, a bill was introduced in Congress authorizing the work to be carried out by the Deep Waterways Board, and appropriating \$800,000 for the purpose.

HARDY, ARTHUR SHERBURNE, Ph.D., American author and diplomat, was transferred on April 18, 1899, from the embassy at Teheran to the post of minister to Greece, to succeed Mr. William W. Rockhill, resigned. He was born at Andover, Mass., August 13, 1847. In early life he studied for a time in Switzerland, and later pursued courses at Phillips Academy (Andover) and Amherst College; he then

entered West Point, being graduated in 1869. The next year he left the army, and became professor of civil engineering and mathematics in Iowa College; subsequently he taught the same subjects in Dartmouth. He was associated at one time with the publishers of the *Cosmopolitan Magazine*. From 1897 to 1899 he was United States minister to Persia. He was succeeded at Teheran by Mr. Herbert W. Bowen. Besides several mathematical works, Mr. Hardy has written a number of volumes, chiefly romances, the best known of which is *But Yet a Woman*.

HARLAN, JAMES, former United States senator from Iowa, died at his home in Mount Pleasant, Ia., October 5, 1899. He was born in Clarke County, Ill., August 25, 1820. After his graduation in 1845 from Asbury University, at Greencastle, Ind., he accepted the presidency of a new college in Iowa City. This was not a successful venture, and he turned to the law. In 1850 he was nominated for governor by the Whigs, but was too young to accept the nomination. He was called to the presidency of the Iowa Wesleyan University in 1853, and two years later was elected, as a Whig, to the United States Senate. He was re-elected, and in 1865 resigned to accept the portfolio of the interior in President Lincoln's cabinet; in this position he was retained, but resigned in 1866 to accept a third election to the federal Senate. At the expiration of this term in 1873 he was again a candidate, but was defeated by Mr. William Boyd Allison, who since then has represented Iowa in the Senate.

HARRIMAN EXPEDITION. See ZOOLOGICAL STATIONS.

HARRIS, ADDISON C., United States minister to Austria-Hungary, was appointed to that position by President McKinley on January 10, 1899, to succeed Mr. Charlemagne Tower, promoted to the embassy at St. Petersburg. Mr. Harris was born in Wayne County, Ind., in 1840; was educated at the Northwestern University, studied law, and has practised in Indianapolis. He has served one term in the Indiana Senate. In 1882 he was defeated, as a Republican, for Congress by Mr. William D. Bynum. In the Indiana legislature in 1897 he was a candidate for United States senator.

HARRIS, REV. GEORGE, D.D., president of Amherst College, was elected to his present position on June 27, 1899, to succeed President Merrill Edwards Gates, resigned. At the time of his election Dr. Harris was president of Andover Theological Seminary. He was born at East Machias, Me., April 1, 1844. After preparing for college at Washington Academy in his native town he entered Amherst, and was graduated in 1866, when he became a student at the Bangor Theological Seminary. Here he remained a year, and then entered Andover Theological Seminary, where he was graduated in 1869. During the next three years he was pastor of the High Street Congregational Church, in Auburn, Me., and in 1872 accepted a call to the Central Congregational Church, Providence, R. I. Here he remained until 1883, when he was made Abbott professor of Christian theology at the Andover Seminary; this position he retained until elected to the presidency of Amherst. From 1896 to 1899 he also acted as president of the Seminary. From 1894 to 1899 he was one of the college preachers for Dartmouth, and in 1898-99 for Harvard. He has contributed many articles on theological subjects to various journals, and from 1884 to 1893 was one of the editors of the *Andover Review*. His *Moral Evolution* (1896) and *Inequality and Progress* (1897), which in part were attempts to answer Kidd's *Social Evolution*, were remarkable for their vigor and originality, and made no small impression among theological and philosophical scholars. Dr. Harris was inaugurated October 11, 1899. The subject of his address was *The Man of Letters in a Democracy*.

HARRIS, JUDGE HENRY C., Supreme Court judge of the Choctaw nation, died at Harris, Ind. Terr., on November 28, 1899. Judge Harris had long been associated in legal work with the Indians and the white settlers in the West. He was a member of the commission which collected about \$2,000,000 lease money from the United States for the Choctaw nation. He had held many positions of trust, and was one of the strong friends the white people had among the Choctaws.

HARRIS, SAMUEL, D.D., LL.D., professor emeritus of systematic theology in the Yale Divinity School, died at Litchfield, Conn., June 25, 1899. Born at East Machias, Me., June 14, 1814, his collegiate course was taken at Bowdoin, where he was graduated in 1833, after which he studied at the Andover Theological Seminary, being graduated there in 1838. In 1833-34 he taught at the Limerick (Me.) Academy, and at the Washington Academy in 1834-35 and 1838-41. Entering the Congregational ministry, he held pastorates at Conway and Pittsfield, Mass. In 1855 he accepted a call to the chair of systematic theology in the Bangor (Me.) Theological Seminary, which position he held until 1867, when he became president of Bowdoin College. From here he went to Yale in 1871 as professor of systematic theology, and continued in active work until 1896, when he was made professor emeritus. Dr. Harris has a place in the first rank of American theologians. His

published works include: *Zacchus, a Prize Essay on the Scriptural Plan of Benevolence*, 1844; *The Kingdom of Christ on Earth*, 1874; *Christ's Prayer for the Glorification of His Redeemed*; *The Philosophical Basis of Theism*, 1884; *The Self-Revelation of God*, 1887; *God, Creator and Lord of All*, 1897. More than on any other of his writings his reputation rests on *The Philosophical Basis of Theism*.

HARRISON, CARTER HENRY, mayor of Chicago, was re-elected to this office, as a Democrat, on April 4, 1899, by a vote of 149,000 against 107,000 for Mr. Zina R. Carter, Republican, and 46,000 for ex-Governor John P. Altgeld, independent Democrat. The campaign attracted wide attention. In 1898 "certain notorious measures, which would have extended for half a century a series of monopoly transit franchises worth \$100,000,000," would have been enacted by the Chicago Board of Aldermen had it not been for the veto power of Mayor Harrison. The attitude of the aldermen was in defiance to public opinion, and bribery was freely charged. It was largely on account of his action on these franchise measures that Mayor Harrison received his support at the polls; his platform concerned itself principally with local issues. The capitalists who had attempted to secure the franchises supported the Republican candidate. This opposition was based chiefly on the alleged laxity under Mayor Harrison in the enforcement of the laws against gambling and other vice, and these assertions seemed, in the main, to be true. Mr. Altgeld represented distinctly the Chicago platform of 1896, and the principle of the municipal ownership of public works. It was estimated that 40,000 Republicans supported Mayor Harrison. The campaign in Chicago disclosed three interesting results: "(1) The growth of independence and of attention to local issues; (2) the dominance of the street-railroad issue, and (3) the growth of sentiment in favor of municipal ownership." See ILLINOIS.

Mayor Harrison is the son of the late Carter H. Harrison, who was mayor of Chicago for five terms, and was assassinated October 30, 1893; he was born in Chicago, April 23, 1860. After studying in the Chicago public schools and the Altenburg (Germany) Gymnasium, he entered St. Ignatius College (Chicago), and was graduated in 1881; after his graduation at the Yale Law School, in 1883, he began the practice of law in Chicago, continuing until 1889, when he engaged in the real estate business. From 1891 to 1893 he was publisher and editor of the *Chicago Times*. On April 6, 1897, he was elected mayor of Chicago, and was re-elected April 4, 1899.

HARVARD UNIVERSITY, at Cambridge, Mass., non-sectarian, co-educational in summer schools only, was founded in 1636, and includes the following departments, the number of students in each of which for the year ending September, 1899, being given: Harvard College, 1902; Lawrence Scientific School, 495; the Graduate School, 326; the Divinity School, 27; the Law School, 613; the Medical School, 558; the Dental School, 131; the Veterinary School, 24; the Bussey Institution, 27; the summer schools, 856; total, including the summer schools, 4947. The faculty of arts and sciences adopted in May, 1899, a new scheme of requirements for admission to Harvard College and the Lawrence Scientific School. The range of election for individual candidates is extended so that the traditional subjects of requirement—Latin, Greek, elementary mathematics, and ancient history—may constitute as little as one-third of their secondary school studies. The proposal was also made to reduce the number of courses required for the degree of A.B. The Asa Gray professorship of systematic botany was assured by the subscription of \$20,000, and \$50,000 of a bequest of Henry Lillie Pierce was received for the library; \$100,000 was given to the Museum of Comparative Zoology, and \$175,000 for an engineering building out of the same fund. The bequest of Edward Austin, amounting to \$433,500, was received in 1899, the income of which is to be devoted to the assistance of needy, meritorious students and teachers. The Henry Clarke Warren bequest was received in the same year, amounting to \$144,000, besides real estate in Cambridge. A gift of \$156,000 was received for the foundation of a professorship of hygiene. Other gifts to the university were \$100,000 for researches for the cure of cancer, \$100,000 for the erection of a building for the department of architecture. The total amount received in bequests and gifts during the year was \$1,544,829. The library was increased by 23,745 volumes, making a total of 528,515 volumes and 427,822 pamphlets. President, Charles William Eliot, LL.D.

HAUER, FRANZ, RITTER VON, a distinguished Austrian geologist, died in Vienna March 20, 1899. He was born in that city January 30, 1822; he studied there and at the school of mines in Schemnitz. He was appointed to the board of mines in Eisenberg, and in 1843 attended the lectures of the geologist, Wilhelm Karl Haidinger, in Vienna. Three years later he became Haidinger's assistant, and in 1849 mining counsel and first geologist in the Imperial Geological Institution. He became director of this institution in 1866. In 1886 he was appointed superintendent

of the court museum of natural history. He was made in 1892 a life member of the upper house of the Austrian parliament. His scientific works treat of the geological and paleontological condition of Austria. Hauer's writings include *Die Cephalopoden des Salzkammerguts aus der Sammlung des Fürsten Metternich*, 1846; *Geologische Übersicht der Bergbaue der österreichischen Monarchie*, 1855, written in collaboration with Franz Fötterle; *Geologische Übersichtskarte von Siebenbürgen*, 1861; *Geologie Siebenbürgens*, 1863, in collaboration with Guido Stache; *Geologische Übersichtskarte der österreichisch-ungarischen Monarchie*, 1867-73; *Die Geologie und ihre Anwendung auf die Kenntnis der Bodenbeschaffenheit der österreichisch-ungarischen Monarchie*, 1875; *Geologische Karte von Österreich-Ungarn*. In 1886 Hauer established at Vienna the *Annalen des naturhistorischen Hofmuseums*, which he thereafter edited.

HAUPTMANN. See GERMAN LITERATURE.

HAWAII, or SANDWICH ISLANDS, consists of about a dozen islands in the Pacific Ocean, of which the most important are Hawaii, Maui, Oahu, Kauai, Molokai, Lanai, Nihau, and Kahoolawe. The total area of the islands is 6640 square miles. The population, according to the census begun in September, 1890, was 109,020. The *Statesman's Year Book* estimates an increase up to January 1, 1899, of over 8000, due mostly to immigration, largely Chinese and Japanese. According to the census, the Americans in Hawaii number 3086, a number which is probably considerably larger at the present time. The capital is Honolulu, on the island of Oahu, a flourishing city, with about 30,000 inhabitants. The soil is very fertile, and the chief product is sugar, together with steadily increasing amounts of rice, coffee, hides, wool, etc. Considerable whale oil and bone are exported also.

Commerce and Communications.—The group is connected by steamer lines with the American continent, Australia, and China. The islands of Hawaii, Maui, and Oahu have each a railway system, in aggregate length about 71 miles, and about 250 miles of telegraph, including connection between Hawaii and Oahu. Honolulu has many miles of telephone, as well as a fairly extensive street railway system. One of the prominent subjects of discussion in the United States in 1899 in regard to Hawaii was the project of building a Pacific cable to Hawaii, and eventually to the Philippines, under government ownership or protection. For the year ending June 30, 1899, the trade of Hawaii amounted to \$17,831,463 for exports, and \$9,365,470 for imports. For the calendar year 1899 the exports were \$22,188,206, and the imports \$11,305,581, which shows a substantial gain over the first-mentioned period of twelve months. The exports are sent almost entirely to the United States, and under the existing reciprocity treaty the larger part enter this country free of duty. Of the total amount of exports mentioned for the year ending with June, 1899, nearly \$17,300,000 represent sugar and molasses, the amount of sugar being 462,423,600 pounds, and that of molasses 15,300 gallons, valued at \$542. The imports from the United States average about 76 per cent. of the total imports into Hawaii.

Finance.—The public revenue, 1897, was \$5,042,504.94, and the expenditure \$4,654,926.27, leaving a balance of \$456,804.43 the largest since 1890. In 1896 there was a favorable balance of \$245,967, in 1895 only \$69,226. The bonded debt at the close of 1897 was \$4,119,174.

Education.—Education is general. Recent statistics are not available. In 1897 the sum of \$144,389 was set aside for the purposes of general instruction. There were at that time about 200 schools, with 507 teachers and 14,522 pupils. Of the latter there were 5330 Hawaiian children, 2479 half-castes, 3815 Portuguese, and 1638 Asiatics. Just half of the teachers, or 253, were American, and 69 were British. The remaining 119 were Hawaiian or part Hawaiian. The general intelligence of the inhabitants is high. Of the British, about 95 per cent. are able to read and write; of the French, 92 per cent.; part Hawaiian, 91 per cent.; Germans, 86 per cent.; Hawaiian, 84 per cent.; Americans, 82 per cent.; Norwegians, 80 per cent.; Hawaiian-born foreigners, 68 per cent. Since the natives and part-Hawaiians number about 40,000, the Japanese nearly 25,000, the Chinese over 20,000, and the Hawaiian-born foreigners over 14,000, against but a few thousand Americans, the foregoing figures do not reveal the actually small number of illiterate Americans and other foreigners. Quite a large number of prominent American residents are included with the foreign-born Hawaiians.

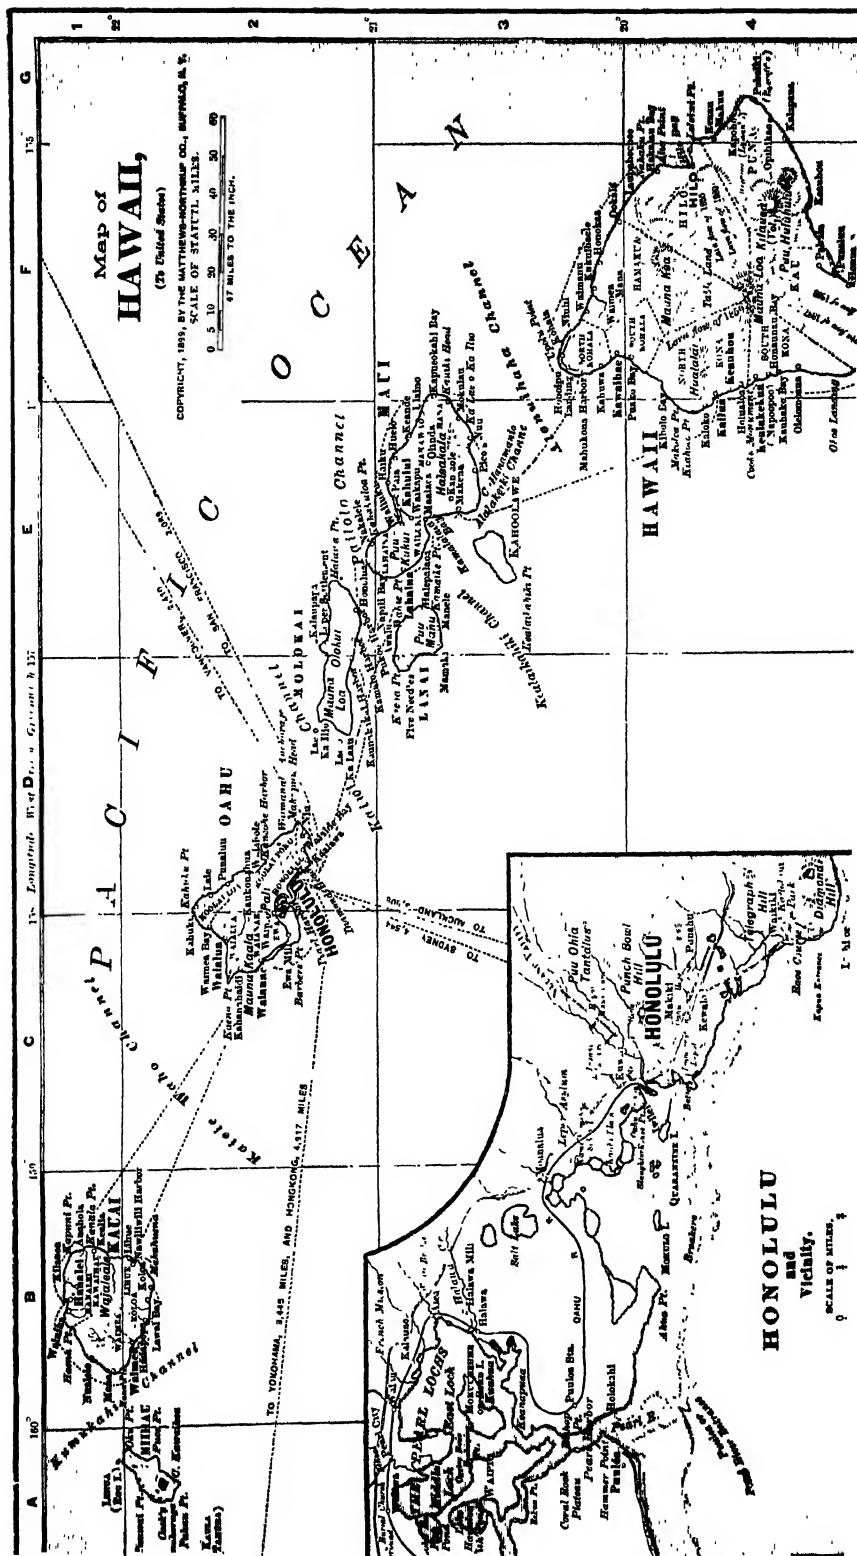

History.—The joint resolution of Congress effecting the annexation of Hawaii declared that "until Congress shall provide for the government of the Hawaiian islands all the civil, judicial, and military powers exercised by the officers of the existing government in said islands shall be vested in such person or persons, and shall be exercised in such manner as the President of the United States shall direct; and the President shall have power to remove said officers and fill the vacancies so occasioned." Nothing was done by the Fifty-fifth Congress toward the organization of the newly acquired islands. Bills were introduced in Congress, but they were opposed on account of their implied intent to make the islands a State of the Union.

and because they placed them on the same footing as States or Territories. Another objection was that the admission of Hawaiian produce to the United States duty free would be a dangerous precedent for the government of our new dependencies. A bill was also introduced to check Chinese immigration to the islands, which took place in spite of the clause in the resolution of annexation, forbidding such immigration. There was a difference of opinion in Hawaii on the question whether the contract labor laws of the United States applied to the islands, and this bill was intended to remove all doubt on that point by asserting definitely that the contract labor laws did so apply. Congress adjourned on March 4, 1899, without taking action in these matters, and the undetermined status of the Hawaiian islands occasioned some anxiety. An important question arose in the matter of the customs relations between Hawaii and the United States. The resolution of annexation contained the following clause on this point: "Until legislation shall be enacted extending the United States customs laws and regulations to the Hawaiian islands, the existing customs regulations of the Hawaiian islands with the United States and other countries shall remain unchanged." The question arose whether such laws as were in force in Hawaii before its annexation to the United States, as were contrary to the constitution and the laws of the United States, were *ipso facto* abolished in consequence of the transfer of sovereignty. When the matter came before the Supreme Court it refused to consider this question, but decided that the constitution and laws of the United States as such had no application to the islands. President Dole, of Hawaii, reported that the general conditions of the country had improved under annexation, and that in certain lines of business, as, for example, in real estate and sugar, there was a considerable rise of values. See VOLCANOES.

HAWKINS, Sir HENRY, the eminent English jurist, was born in Hitchin, England, September 14, 1817, educated at Bedford School, and was called to the bar in the Middle Temple, London, in 1843. He soon acquired a large practice, and after becoming Queen's counsel in 1858, was engaged in nearly every important case that came before the superior courts. He distinguished himself especially in the Tichborne trial for his clever cross-examination. He acted for the crown in the purchase of lands and improvements in London, including property for the Holborn Viaduct, the Thames Embankment, and other new streets. In December, 1898, he resigned from the bench, having served as a judge for more than twenty-two years, and in 1899 he was raised to the peerage as Baron Brampton, of Brampton, in the county of Huntingdon. He is now qualified to sit as a Lord of Appeal.

HAY. The following table, published by the Department of Agriculture, division of statistics, shows the acreage, production, and value of hay in the United States in 1899:

STATES AND TERRITORIES	Acreage.	Average yield per acre.	Production.	Average farm price per ton December 1.	Farm value December 1.

HAYTI. See HAITI.

HAYWARD, MONROE LELAND, who was elected, as a Republican, to the United States Senate by the Nebraska legislature on March 8, 1899, died at his home in Nebraska City, December 5, 1899. His early life was passed at Willsboro, Essex County, N. Y., where he was born December 22, 1840. After the outbreak of the Civil War he joined the Twenty-second New York Volunteers, and later was transferred to the Fifth Cavalry, with which he served until December, 1862, when on account of disability, caused by illness, he was discharged. He then entered the Fort Edward (New York) Collegiate Institute, at which he was graduated in 1866. Not long after he went to Whitewater, Wis., where he read law and was admitted to the bar. Having removed to Nebraska City, he attained prominence as a lawyer, in 1875 was a member of the State constitutional convention, and in 1886 was appointed judge in the district court to fill out an unexpired term. In 1898 he was the Republican candidate for governor, and though defeated by Mr. William A. Poynter, Fusionist, he reduced the Fusion plurality to less than 3000. In 1899, after a prolonged deadlock in the legislature, he was elected to the Senate by a vote of 74 to 58 for Senator William V. Allen, Populist. The latter was appointed by Governor Poynter on December 13, 1899, to take the seat of Mr. Hayward for the term ending March 3, 1905.

HEART, WOUND OF THE. In the *Revue de Chirurgie* of February 10, 1899, Loison reports in brief ninety cases of wounds of the heart and pericardium in which the diagnosis was verified by operation or at the autopsy. In seventy-eight cases the heart itself was injured. Death resulted in 87 per cent. of the latter cases, in most instances without surgical intervention. In five cases the wounds in the heart were closed by sutures, two of these operations resulting in recovery. In one case which recovered without surgical intervention a healed wound was found some time later, after the man's assassination. Some people have lived for a considerable time with a bullet in the heart. Loison located a bullet, by means of the X-rays, in the heart of a patient. After draining the pericardium he was unable to remove it; but the man made a good recovery. Pagenstecher, of Elberfeld, successfully sewed a stab-wound $3\frac{1}{2}$ centimetres long, near the apex of the heart, in a lad of seventeen. Ophuls reports the case of a patient who lived for a considerable period with a foreign body in his heart, in *Occidental Medical Times*, San Francisco, 1899, XIII., p. 426.

HEMATITE. See IRON.

HENDERSON, DAVID BREMNER, speaker of the House of Representatives in the Fifty-sixth Congress, is a citizen of Dubuque, Ia., and was born at Old Deer, Scotland, March 14, 1840. In 1846 he was brought to Illinois and three years later to Iowa; here he was educated in the public schools and at the Upper Iowa University. He lived on a farm until 1861, when in September he entered the Union service as a private in Company C of the Twelfth Iowa Volunteers. He was commissioned lieutenant of his company and served with it until discharged on account of a wound received in action, resulting in the loss of a leg, February 26, 1863. In the following May he was appointed commissioner of the board of enrolment of the third district of Iowa, serving as such until June, 1864, when he re-entered the army as colonel of the Forty-sixth Iowa Volunteers. Henderson studied law in Dubuque, and was admitted to practice in the fall of 1865; in

November of this year he was appointed collector of internal revenue for the third district of Iowa, and served until 1869, when he resigned to give his whole attention to the law. From this year to 1871 he was assistant United States district-attorney for the northern division of Iowa, and thereafter was engaged in private practice in Dubuque until 1883, when he was elected to the Forty-eighth Congress as a Republican from the third Iowa district. He has been returned to all succeeding Congresses. In the Republican National Convention of 1888 Mr. Henderson was one of the managers of Senator William B. Allison's canvass for the nomination, and in 1896 he presented Mr. Allison's name to the convention at St. Louis. In Congress his principal work has been on the committee on appropriations, the judiciary committee, of which he became chairman in 1894, and the committee on rules. He was chairman of the judiciary committee and ranking member, next to the speaker, on the committee on rules in the Fifty-fifth Congress.

When Speaker Thomas B. Reed retired from politics with the close of the Fifty-fifth Congress, the names of several prominent Republicans appeared in the press of the country as probable candidates for the speakership, but by June Mr. Henderson seemed to be without opposition in his party. When Congress convened on December 4, 1899, Mr. Henderson's name was presented by Mr. Charles H. Grosvenor, of Ohio; the Democratic nominee was Mr. James D. Richardson, of Tennessee, while the Populists named Mr. John C. Bell, of Colorado, and the Silverites Mr. Francis J. Newlands, of Nevada. The vote was: Henderson, 177; Richardson, 153; Bell, 4; Newlands, 2.

HENDRICKS, DR. GEORGE A., professor of anatomy in the University of Minnesota, died September 24, 1899. Dr. Hendricks was the originator of the graded system in anatomy, and introduced it in his courses at the Minnesota university, to which he came in 1889 from the University of Michigan.

HENRY, GUY VERNOR, brigadier-general, U.S.A., died of pneumonia in New York City, October 27, 1899. He was the son of Major William S. Henry, and was born at Fort Smith, Ind. Ter., March 9, 1839; in May, 1861, he was graduated from the Military Academy at West Point and immediately entered the active service. He was a second and then a first lieutenant in the First Regular Artillery until November, 1863, when he was appointed colonel of the Fortieth Massachusetts Infantry. Among the engagements in which he participated were the Bull Run campaign, during which he was an aide on the staff of General McDowell, the operations at Key West and at Hilton Head, S. C., the battle of Pocotaligo, the bombardment of Fort Sumter, and the battle of Cold Harbor. For his services in the war Henry received several brevets and Congress voted him a medal of honor for "noteworthy and conspicuous gallantry while colonel of the Fortieth Massachusetts Volunteers when leading the assaults of his brigade upon the enemy's works at Cold Harbor, Va., June 1, 1864, where he had two horses shot under him, one while in the act of leaping over the breastworks of the enemy."

In military circles, however, Henry's reputation rests more upon his subsequent service against the Indians; from 1870 to 1892 he was on the frontiers and saw much hard fighting. He commanded under General Crook a squadron in the Big Horn and Yellowstone expeditions, and in the battle of Rosebud Creek, Mon., he was shot through the face and lost the sight of one eye. For his bravery in this action he was breveted a brigadier-general. He served with distinction in the Wounded Knee campaign of 1890-91, at which time he was a major in the Ninth Cavalry; the next year he was made lieutenant-colonel of the regiment and in 1893 was transferred to the Third Cavalry. In 1897 he became colonel of the Tenth Cavalry. Soon after the outbreak of the Spanish-American war he was made a brigadier-general of volunteers, and on October 11, 1898, was promoted to the rank of brigadier-general in the regular establishment. In the war he commanded a brigade under Major-General Nelson A. Miles in Puerto Rico, of which island from December, 1898, to May, 1899, he was military governor, succeeding Major-General John R. Brooke. In the same month (December) he was made a major-general of volunteers. About a week before he died General Henry was appointed to the command of the Department of the Missouri. He was regarded as an officer of great efficiency. Among his publications is *Military Records of Civilian Appointees in the United States Army*.

HEREDITY. See BIOLOGY; ZOOLOGICAL SOCIETIES (paragraph British Association for the Advancement of Science).

HERRERA, General TOMASO, a Colombian politician, died in New York, June 27, 1899, at the age of sixty-two years. He was born in Panama, and was educated in that city and in Cartagena. He entered politics and became a leader of the Conservative party. At one time during a revolutionary period Herrera was arrested and condemned to be shot; the sentence, however, was commuted to banishment, and he passed ten years as an exile in Guatemala. Having returned to

Colombia, he served as prefect of Panama and as secretary of the interior under Ricardo Arango. He was ex-president of the Colegio del Istimo at Panama and was president of or a director in various commercial, agricultural, and political associations. He founded the Bolivar Asylum at Panama.

HERSCHELL, First Baron, FARRER HERSCHELL, G.C.B., D.C.L., LL.D., chairman of the Anglo-American Joint High Commission (see CANADA), created in May, 1898, by the British and American governments, died in Washington, D. C., March 1, 1899. He was born of mixed Jewish and Christian parentage November 2, 1837. He was graduated at the University of London in 1857, receiving his B.A. degree with classical honors. He was admitted to the bar at Lincoln's Inn in 1860, and became a bencher of the Inn and Queen's counsel in 1872; in the latter year he was also appointed examiner in common law at the University of London. He sat in Parliament, as a Liberal, for the city of Durham from 1874 to 1885, when he unsuccessfully stood for the Commons in the North Lonsdale division of North Lancashire. He was made recorder of Carlisle in 1873, serving until 1880, when he was called to the solicitor-generalship in Gladstone's ministry and was knighted. His term as solicitor-general ended in 1885; the following year he was raised to the peerage and served as Lord High Chancellor from February to June. He was president of the Royal Commission, the investigations by which resulted in the act of 1888, which caused the Metropolitan Board of Works to be superseded by the London County Council. In 1890 Lord Herschell was appointed Warden of the Cinque Ports, and in Gladstone's last ministry, 1892-95, served again as Lord High Chancellor. He was appointed in 1897 a member of the tribunal of arbitration for the settlement of the boundary dispute between British Guiana and Venezuela. His son Richard, born in 1878, succeeded to the title.

HERVÉ, AIMÉ MARIE ÉDOUARD, French journalist, died in Paris, January 4, 1899. He was the son of a professor of mathematics at St. Denis, Réunion Island, where he was born May 28, 1835. He was educated at the Collège Napoléon, Paris, receiving there the philosophical prize in 1854, whereupon he entered the École Normale, but left soon after to devote his entire attention to journalism. After a period of service upon the *Revue de L'Instruction Publique* and the *Revue Contemporaine*, he was successively editor of the *Courrier du Dimanche* in 1863, of the *Temps* in 1864, and of the *Epoque* in 1865. The hostility of the government soon rendered it almost impossible for him to maintain connection with a French newspaper; he therefore transferred his services to the *Journal de Genève*, of which he became one of the chief correspondents. On January 19, 1867, an imperial letter was issued, instituting a new system for the press; taking advantage of this, Hervé, together with Jean Jacques Weiss, founded the *Journal de Paris*. This paper soon achieved note by its persistent attacks upon the government. In the general elections of May, 1869, Hervé was the candidate of the Liberal opposition under the patronage of Louis Adolphe Thiers, but was defeated by the government candidate. Upon the retirement of Weiss he became sole editor of the *Journal de Paris*, and as a branch of this paper, being conducted by the same literary staff, he established the *Soleil* in 1873. It was about this time that Hervé and Edmond About, editor of the *Dix-Neuvième Siècle*, became involved in a controversy which led to a duel, in which About was slightly wounded. In 1876 the *Journal de Paris* was discontinued, and Hervé's editorial work was given wholly to the *Soleil*, at head of which paper he remained to the time of his death. He published in 1869 a series of articles on English elections, entitled *Une Page d'Histoire Contemporaine*. He received the cross of the Legion of Honor in 1873, and in February, 1886, was elected to the French Academy to succeed the Duc de Noailles. In the *Soleil* Hervé frequently wrote over the pen name Raoul Valnay. His journalistic style was notable for its qualities of conciseness and dignity.

HERZEGOVINA. See BOSNIA AND HERZEGOVINA.

HETH, General HENRY, a Confederate leader, died at his home in Washington, D. C., September 22, 1899. He was born in Virginia in 1825 and was graduated from the Military Academy at West Point in 1847. In 1855 he had risen to the rank of captain, and in 1861 he resigned and entered the Confederate service as a brigadier-general. He became a major-general in May, 1865, commanded a division of General A. P. Hill's corps in Virginia, and served with distinction at Gettysburg, at Chancellorsville, and throughout the campaigns of 1864 and 1865. Through his experience in the United States Army Heth had acquired a wide knowledge of Indian affairs. In those early days he had been a friend of Ulysses S. Grant; when the latter became President, he offered Heth, who was then in straitened circumstances, the opportunity of taking charge of the Indian bureau. Heth declined, but subsequently accepted from the President the position of personal adviser in relation to certain frauds that were being investigated. In recent years General Heth lived

in Washington, where he was engaged in writing the history of the various campaigns through which he had passed.

HEUREAUX, General ULISES, president of the republic of San Domingo, was shot and killed by Ramon Caceres near Moca, in the northern part of the island, on July 26, 1899. (See SAN DOMINGO, paragraph Assassination of Heureaux.) Heureaux was born of negro parentage in Puerto Plata, San Domingo, in 1846. He was a man of unusual intellectual and will power. He was self-educated, was an accomplished linguist, and had a long military career, in which he proved himself both brave and capable. At the age of sixteen he entered the army as a private, and in three years rose to the rank of colonel. From 1863 to 1874 he was prominent as a leader in the insurrections against Bonaventura Balz and twice was exiled. In 1876 a rebellion led by him against General Gonzalez brought his party into power. In 1882 he was elected president, and he retained the office until the time of his death. The presidential term of office in San Domingo is four years, and the constitution forbids the election of a president for the ensuing term, but Heureaux's power was so great that for eighteen years he ruled as a despot with only the forms of republican government. He was accused of immorality in both his private and his public life, and his financial policy has involved San Domingo in grave difficulties. In his defence it can be said, however, that during his régime peace and order prevailed in the republic to a greater degree than they had for many years.

HILBORN, SAMUEL GREELEY, ex-member of Congress from California, was born at Minot, Me., in 1834; died in Washington, D. C., April 19, 1899. After his graduation at Tufts College he studied law, and being admitted to the bar in 1861, began practice at Vallejo, Cal. He served in the State Senate in 1875-79, and in the latter year was a member of the constitutional convention. Being appointed United States district attorney in 1883, he removed to San Francisco, removing upon the expiration of his term to Oakland, where he resumed private practice. He was elected to the Fifty-third Congress, but was not allowed to take his seat; he was a member, however, of the Fifty-fourth and Fifty-fifth Congresses.

HILLIS, NEWELL DWIGHT, M.A., D.D., pastor of Plymouth Church (Congregational), Brooklyn, accepted the call to this charge January 22, 1899, to succeed the Rev. Dr. Lyman Abbott, whose resignation of the preceding November was to take effect March 1. Dr. Hillis came from the Central Church (Independent), Chicago. He was born at Magnolia, Ia., September 2, 1858, and was educated at Iowa College, Lake Forest University, and McCormick Theological Seminary. Having entered the Presbyterian ministry, he had the following charges: Peoria, Ill., 1887-90; Evanston, Ill., 1890-94; Central Church, Chicago, 1894-99, succeeding in the last position Professor David Swing. Dr. Hillis is a brilliant preacher and a man of literary tastes. He has written: *The Investment of Influence*; *How the Inner Light Failed*; *A Man's Value to Society*; *Foretokens of Immortality*.

HILTON, HENRY, sometime judge of the Court of Common Pleas in New York City, died at Saratoga, N. Y., August 24, 1899. Judge Hilton is remembered chiefly as the counsel of A. T. Stewart, the "merchant prince." He was born at Newburg, N. Y., October 4, 1824, and in childhood went with his father to live in New York City. At about fifteen years of age he entered the employ of the law firm of Campbell and Cleveland; subsequently he was admitted to the bar and became managing clerk of the firm. It was in this capacity that he came to have a thorough knowledge of Stewart's affairs, and in 1850 the latter made him his private counsel and secretary. From 1857 to 1863 Hilton was judge of the Court of Common Pleas in New York and then he became a park commissioner; but he continued his connection with the Stewart business and his care for the investment of the merchant's immense income. When Stewart died in 1876 Hilton became executor, a bequest of a million dollars having been made to pay for his services. In payment of this legacy Mrs. Stewart transferred to him the great business that had been built up by her husband. The Stewart store was then the largest in New York. In 1886 Mrs. Stewart died, and by her will Hilton was intrusted with the distribution of a large part of the estate. Litigations arose, but were finally adjusted by compromise. Hilton's career was eminently successful until he attempted to carry on for himself the mercantile business of his former client. The firm name of A. T. Stewart was changed to Hilton, Hughes, and Denning; dissensions arose, annual losses ensued, the firm was repeatedly reorganized, and finally in August, 1896, failure came. The debts of Mr. Hughes, who was a son-in-law to Hilton, were paid by the latter, though he was not compelled to do so. The old store at Broadway and Tenth Street is now occupied by John Wanamaker.

HINKS, Rev. THOMAS, F.R.S., English Unitarian clergyman, died January 25, 1899. He was born at Exeter, July 15, 1818, and was educated in Belfast and at Manchester College, York, which is now at Oxford. On account of vocal difficulty he retired from the ministry and devoted himself to literary and scientific work,

having special reference to biology. He published *History of British Hydroid Zoophytes* (1868) and *History of the British Marine Polyzoa* (1889).

HIRSCH, BARONESS CLARADE DE, widow of the late Baron Maurice de Hirsch de Gereuth, the Austrian Jewish financier and philanthropist, died in Paris, April 1, 1899. At the time of the Baron's death, which occurred near Pressburg, Hungary, on the 20th of April, 1896, it was reported that he had acquired a fortune estimated at \$200,000,000, and had an income of between \$15,000,000 and \$20,000,000 a year. It was also said that the estimated benefactions of himself and wife amounted to about \$100,000,000. These benefactions were chiefly for the promotion of the education and welfare of Jews in various parts of the world. Baroness de Hirsch continued the work after her husband's death, giving enormous sums in Europe and America; and the bulk of her vast estate, estimated in 1899 at \$125,000,000, she bequeathed to charities. See **BARON DE HIRSCH FUND**.

HISTORICAL ASSOCIATION, AMERICAN, organized in 1884, and incorporated by Congress in 1889, had in 1899 a membership of 1550. Its object is the "promotion of historical studies, the collection and preservation of historical manuscripts, and kindred purposes in the interest of American history and of history in America." It has published five volumes of *Papers*, ten annual *Reports*, and eight volumes of *Church History Papers*. General meeting for 1900 at Detroit, Mich., December 27-29. President, Edward Eggleston; secretary, Herbert B. Adams, Johns Hopkins University, Baltimore, Md.

HOANG NAN. See **LEPROSY**.

HOBART, GARRET AUGUSTUS, Vice-President of the United States, was born in Monmouth County, N. J., June 3, 1844, and died November 21, 1899. Mr. Hobart was one of the ablest and most popular men who have taken up the difficult and somewhat anomalous duties of the Vice-Presidency. With the active functions of his office practically limited to the work of presiding over the Senate, and with no official, public relations with the President, and no portfolio in the cabinet, Mr. Hobart was nevertheless in close touch with the policy and operations of the government. He was the intimate friend and councillor of President McKinley, and undoubtedly exercised a strong influence on the conduct of public affairs. In the Senate he was popular with members of both parties, whom he served equally by his fair ruling. He is said to have had a high regard for the dignity of his office, which he believed to have been intended as one of real influence and power. Mr. Hobart had, indeed, reached the most successful period in a life of widespread interest. He was prominent as a successful business man, honorably known in New York financial circles, the possessor of a large fortune, and a type of politician of the best kind. He was one of the foremost political figures of his own State, New Jersey, and extensively acquainted with Republican leaders throughout the country. Though born poor, he entered college, and graduated from Rutgers in 1863, at the age of nineteen. He became a counsellor-at-law in 1869, having studied during the previous six years in the office of his father's friend, Socrates Tuttle. Two years later he made his appearance in politics as city counsel of Paterson, and in support of Mr. Tuttle, candidate for mayor. His subsequent political career made him a power in the State Republican councils, and to him is generally given the credit for removing New Jersey, in 1895, from the list of Democratic States. He served in both the house and senate of his State, in each becoming presiding officer. In 1884 he received the complimentary nomination for United States senator, in which year the Democratic majority elected John R. McPherson to that office. Mr. Hobart appeared averse to accepting political positions that would take him out of his State, and several times refused nominations for Congress. He was twice offered the candidacy for governor; one of these offers was in 1895, when, instead of accepting, he devoted his entire time to procuring the nomination of his friend, John W. Griggs, the present United States attorney-general. Mr. Hobart was a delegate to all the national Republican conventions from that of 1876 up to the one which nominated him for the Vice-Presidency. He was chairman of the New Jersey State Republican Committee (1880-90), and in 1884 became a member of the National Committee. Upon his nomination in 1896, on the ticket with William McKinley, he came out uncompromisingly for the gold standard, this stand being generally regarded as having an important influence on the campaign. In business, Mr. Hobart was regarded as of unquestionable integrity. His wide activities included the presidency and general managership or directorship of a large number of corporations, some sixty in all. To many of these he had acted as general counsel. In 1895 he was appointed one of the arbitrators of the Grand Trunk lines and General Traffic Association of the United States, at an annual salary of \$15,000. This position he resigned upon his election as Vice-President. Mr. Hobart married Jennie Tuttle, daughter of Senator Tuttle, in 1869. Mrs. Hobart survives him, as does his son, Garret A. His home was in Paterson, N. J.

HOCKEY, ICE. See ICE-HOCKEY.

HOFFMAN, Dr. WALTER J., United States consul at Mannheim, Germany, died November 8, 1899, at the age of 53 years. He was a native of Reading, Penn., and a graduate of Jefferson Medical College. He was formerly connected with the Smithsonian Institution, and before that with Western scientific expeditions. He had received decorations from a number of foreign rulers and scientific bodies.

HOFFMEYR, JAN H., a South African journalist, and leader of the Afriander Bond, was prominent in 1899 for his part in the negotiations that followed the conference of President Kruger and Sir Alfred Milner, at Bloemfontein, on May 30. He visited Pretoria, and partly through his influence the president offered better conditions of franchise, but could not be persuaded by Mr. Hofmeyr to grant the "five years' franchise." Mr. Hofmeyr was one of the Cape representatives at the Ottawa conference; he spoke at the Colonial conference in 1887, and has represented the Cape at other conferences. Formerly he was an ally of Mr. Cecil Rhodes, but his friendly political relations with the latter were broken off after the Jameson Raid in 1895, and in the Bond caucus of 1898 was in active opposition to him. Mr. Hofmeyr has long been active in Cape politics, and has served as a mediator between the Cape government and the Boers. He has edited the Cape Town *Volksstem*.

HOG-CHOLERA. See SERUM THERAPY.

HOGGE, Rev. MOSES DRURY, D.D., pastor of the Second Presbyterian Church of Richmond, Va., died in that city, January 6, 1899. He was born in Hampden-Sidney, Va., September 17, 1819. He was a man of remarkable persuasiveness and eloquence, and was recognized as one of the greatest preachers of the South. He had been pastor of his church in Richmond for fifty-two years. During a part of the Civil War he was a chaplain in the Confederate army, in which position he devoted himself to the welfare of the men; at one time he ran the blockade to England in order to obtain Bibles and other religious literature for the soldiers, and was successful through the assistance of the Earl of Shaftesbury, from whom he received Bibles and Testaments valued at £4000. In 1874 he was moderator of the General Assembly of the Presbyterian Church, South, which met in Savannah, and in the face of much opposition he successfully advocated the establishment of "fraternal relations" with the Presbyterian Church, North. Not only as a pastor, but as a citizen of wide influence, was Dr. Hoge regarded with esteem throughout Virginia.

HOGG, JABEZ, a prominent English ophthalmic surgeon, died April 23, 1899. He was born at Chatham, April 4, 1817; was educated at the Rochester Grammar School, the Hunterian School of Medicine, and the Charing Cross Hospital. He held several positions of honor in various medical societies, and practised as an ophthalmic surgeon from 1850 to 1895. In 1843 he accepted a position on the London *Illustrated News*, and from 1845 to 1895 he edited the *Almanack* of that paper. Among his publications are: *A Manual of Photography*, 1845; *A Manual of Domestic Medicine*, 1848; *English Forests and Forest Trees*, 1853; *Experimental and Natural Philosophy*, 1854; *The Microscope*, 1854; *The Ophthalmoscope*, 1858; *A Manual of Ophthalmoscopic Surgery*, 1863; *The Treatment and Cure of Cataract*, 1871-72.

HOLBURN, JOHN GOUNDRY, member of the British Parliament, died January 23, 1899. He was born April 12, 1843, and was self-educated. From 1871 to 1875 he was president of the Edinburgh and Leith Trades Council, and was a member of the Leith Town Council from 1890 to 1895. Holbourn was engaged in the tinplate business. He represented in Parliament Northwest Lanarkshire, in the interests of the Liberal and Labor party.

HOLLAND. See NETHERLANDS.

HOLLS, GEORGE FREDERICK WILLIAM, D.C.L., a prominent lawyer of the New York bar, was appointed by President McKinley secretary of the American delegation to the peace conference which met at The Hague in May, 1899. The appointment of the delegation was announced by Secretary of State Hay on April 6, 1899. Mr. Holls was born at Zelenople, Penn., July 1, 1857; was graduated at Columbia College in 1878, and at the Columbia Law School in 1880. In 1883 he was defeated, as a Republican, for State senator. Since 1889 his home has been in Yonkers, N. Y. He has been actively associated in the work of the Legal Aid Society of New York, and the Charity Organization Society. In 1894 he was a delegate-at-large to the New York State constitutional convention, and rendered most valuable services in the deliberations of that body. In 1898 he received the degree of Doctor of Civil and Canon Law from the University of Leipsic. Besides numerous papers, essays, and lectures on political subjects, he has written *Franz Lieber*, a sketch, and *Sancta Sophia and Troitsa*.

HONDURAS, a Central American republic, bordering on the Caribbean Sea and touching Pacific waters at the Gulf of Couchagua, between Salvador and Nicaragua. The capital is Tegucigalpa.

Area and Population.—The republic comprises 15 departments, the total area of which is about 43,000 square miles, and the population (1895) about 400,000. Only a small part of the inhabitants are of Spanish descent, the great majority being Indians. The population of the chief towns are: Tegucigalpa, 13,000; Comayagua, 13,000; Truxillo, 4000; Yoro, 4000.

Government and Education.—The present constitutional law of the country is a charter proclaimed in October, 1894, by which the executive authority is vested in a president, who is elected by popular vote for a term of four years, and is assisted by a ministry, the members of which direct the departments of the interior, finance, war, public instruction and justice, and public works. The president is Señor Terrencio Sierra, who was inaugurated February 1, 1899. The legislative power devolves upon a congress of deputies, who represent the people in the proportion of one to 10,000. The national militia consists of 20,000 men, but the regular army is said to number only 500. There is no state church and the principle of religious liberty is recognized, though Roman Catholicism is the dominant faith. Education is gratuitous, secular, and nominally compulsory. Besides 11 so-called colleges, there are about 690 schools, with about 23,800 pupils. English is taught in the schools.

Finance.—The chief items of revenue are customs duties and imports on alcoholic liquors and tobacco. For the fiscal year 1896 the revenue was 1,901,606 pesos, and the expenditure 2,264,586 pesos. For the fiscal year 1898 the revenue and expenditure were reported to be £217,288 (2,424,900 pesos) and £215,129 (2,400,800 pesos) respectively. The internal debt in 1896 was about 6,000,000 pesos. The external debt in July, 1898, with interest arrears, amounted to \$84,529,860. The interest on this has not been paid since 1872. On October 1, 1899, the value of the peso in United States currency was \$0.436.

Industries and Commerce.—The chief industry is agriculture, and the most important product bananas. Other products are tobacco, coffee, sugar, indigo, and cacao, while wheat and maize are grown for domestic consumption. For purposes of agriculture or mining, individuals or companies may acquire state lands from the government. Cattle breeding has come to be an important industry. The forests and uncultivated lands abound with various valuable products, including aloes, copaiba, tamarinds, vanilla, dye woods, medicinal plants, vegetable ivory, cabinet woods, and rubber. The mineral resources of the country are unusually great, but mining as yet is not well developed. About seventeen companies of some importance are said to be in operation, but statistics of their production are not available. Among the metals and other minerals in Honduras are gold, silver, platinum, iron, lead, tin, zinc, copper, nickel, bismuth, coal, salt, sulphur, and opals. The value of the gold washings is estimated at from \$150,000 to \$250,000 annually. In 1898 about seven-tenths of the imports came from the United States, and about four-fifths of the exports went to that country. The value of the imports for that year, in United States gold, was \$1,166,441, and the exports \$1,235,952. The export of bananas amounted to \$424,591; bar silver, \$374,153; cattle, \$116,954. One of the principal imports is cotton goods. During 1898 the Spanish-American war interfered seriously with the trade of Honduras. From January to November, 1899, upward of 200,000 bunches of bananas were exported from Omoa.

Communications.—There are 60 miles of railway, connecting Puerto Cortez on the Gulf of Honduras with La Pimienta by way of San Pedro Sula. Two other lines have been projected, one from La Pimienta to the Pacific coast and one from Puerto Cortez along the Caribbean coast to Truxillo. In 1897 there were 155 telegraph offices, with lines aggregating 2732 miles. Post-offices in 1896 numbered 237.

HONG KONG, an island near the mouth of the Canton River, China, is a British crown colony, administered by a governor, with an executive and a legislative council. It is the chief centre of British trade with China, and is a British naval and military station, strongly fortified and of the first rank, forming also the headquarters of the China squadron. A portion of the mainland, embracing an area of about 376 square miles, was in 1898 leased to Great Britain by China for 99 years, and this territory is administered as a part of the colony of Hong Kong. Included in this lease are the waters of Mirs Bay and Deep Bay, and the island of Lan Tao. The formal taking over of the outlying districts occasioned a riot, in the course of which the natives fired on the police. The area of Hong Kong proper is 32 square miles, and the population is 236,382, exclusive of the military and naval population. Including the latter, there are about 14,000 whites in Hong Kong. The capital is Victoria, commonly known as Hong Kong, which extends for several miles along the bay. The harbor is one of the finest in the world. There is no customs house at Victoria, the port being free, and estimates regarding the value of the trade are chiefly made from mercantile returns. Great Britain has developed a large trade with China

through this possession, however, amounting annually in imports and exports to the value of nearly \$15,000,000, and as much more is divided among India, Australia, the United States, and Germany. Hong Kong is a trade centre of many kinds of goods. There are some important local productions and industries.

HOPKINS, ABEL GROSVENOR, D.D., professor of Latin in Hamilton College and dean of the faculty, died at his home in Clinton, N. Y., July 27, 1899. He was born at Avon Springs, Mass., December 5, 1844. After his graduation at Hamilton in 1866 he studied theology at Auburn Seminary, in which his father was a teacher. Subsequently he accepted the chair of Latin at Hamilton, which he held until the time of his death.

HORNBY, Sir WINDHAM, K.C.B., British admiral, retired, was born July 23, 1812; died June 28, 1899. He was educated at the Royal Naval College, Portsmouth. He was made a lieutenant in 1833; his subsequent promotions were as follows: Commander, 1841; captain, 1846; rear-admiral, 1865; admiral, 1877. From the last-named year till 1892 he served as a prison commissioner, and for his services as such he was made a K.C.B. in 1892. Admiral Hornby was recognized as one of the best English authorities on naval evolutions and tactics.

HOSPITAL ABUSE. The pauperization of a community through indiscriminate reception of free patients into hospitals is analogous to, though far less frequent than, the same process with regard to dispensaries. This fact has been recognized in Paris, and the year 1899 has seen the first propositions formulated by French physicians for the correction of the condition. The following is a compendium of the suggestions: The hospital shall offer free treatment to the poor and needy only; payment shall not be required of domestic servants, workmen, and employees whose wages do not exceed a given small sum; no one whose rent exceeds \$200 a year or who pays rates shall be received at all, except in cases of those who are unable to pay usual fees for a serious operation; before admission every case shall be investigated by persons designated by the hospital authorities, or shall be endorsed by medical men connected with the hospital; but in an emergency a person may be received into the hospital without inquiry. It is stated that similar regulations have been in force for years in Providence, R. I.

HOTCHKISS, Major JED, topographer and mining geologist, died at his home in Staunton, Va., January 17, 1899, in his seventy-second year. He was born at Windsor, N. Y. During the Civil War he was topographer for General Robert E. Lee and General "Stonewall" Jackson, and prepared many of their campaign maps. Almost all the maps of Virginia made from the time of the war to the beginning of the work of the United States Geological Survey in that State are due to the efforts of Major Hotchkiss. When in 1882 William B. Rogers, State geologist of Virginia, died, leaving much of his work in manuscript, Major Hotchkiss was chosen to prepare the papers for publication. He was a member of the National Geographic Society from the time of its organization in 1888, and contributed largely to its success.

HOWARD, Lieutenant-Colonel Guy, the eldest son of General O. O. Howard, was killed in action October 21, 1899, in the Philippines. Colonel Howard was chief quartermaster at the front with General Lawton, who himself was killed on December 19. At the time of his death Colonel Howard was in charge of the work of establishing a base at San Isidro, and was killed near that vicinity while supervising the transportation of supplies. Colonel Howard had grown up to an army life. He was with his father in the Indian campaign of the Northwest, and was given a lieutenant's commission in recognition of his services at the time of the Custer massacre in 1876. In 1883 he became a captain, and was transferred to the quartermaster's department. In May, 1898, he was appointed quartermaster and a major of volunteers, and in August, 1898, he was advanced to the office of chief quartermaster, with the rank of lieutenant-colonel. He was on General Young's staff when killed.

HOWELL, Commander CHARLES P., U.S.N., chief engineer on the battleship *Maine* at the time of its destruction in Havana Harbor, died December 8, 1899. He was fifty-one years of age. He was a graduate of the United States Naval Academy at Annapolis, and had served twenty-seven and a half years, which included about eighteen years of sea duty. At the time of his death he was stationed at the Brooklyn Navy Yard as chief engineer.

HOWELL, GEORGE R., archivist of New York State, died in Albany, April 5, 1899. He was born at Southampton, New York, in 1833; was graduated at Yale in 1854, and at Princeton Theological Seminary ten years later. For many years he was assistant State librarian, and for a time acting State librarian. In 1889 he was appointed State archivist. Mr. Howell was a man of considerable literary ability. He wrote a number of works on historical subjects, and was an authority on local history and genealogy.

HUGUENOT SOCIETY OF AMERICA, an association of persons descended from Huguenots, founded in 1883. President, Frederic J. De Peyster; Secretary, Mrs. James M. Lawton, 105 East Twenty-second Street, New York City.

HUMANE EDUCATION SOCIETY, AMERICAN, founded in 1889 for the dissemination of books, pamphlets, etc., encouraging the humane treatment of animals, had in 1899 a membership of 300. Its work is carried on in connection with the Massachusetts Society for the Prevention of Cruelty to Animals (*q. v.*). President, George T. Angell; secretary, Joseph L. Stevens, 19 Milk Street, Boston.

HUNGARIAN LITERATURE. *History.*—A survey of the literary output for the past year in Hungary shows, on the whole, fewer works than usual which may be ranked as of permanent interest. History, however, and especially their own national history, is always the strong point among Magyar writers, and in this respect 1899 has not proved an exception. First in point of interest is the tenth and concluding volume of the monumental *History of the Magyar Nation*, which the late Sándor Szilágyi left unfinished at his death, and which his successors, Sándor Márki and Gusztáv Beksics, have brought down to date, the present volume covering the last fifty years, or "Modern Hungary." This really colossal work is now being rivalled by one of equal magnitude in the field of universal history—a *Great Illustrated History of the World*, edited by Henrik Marczali, the leading historian of Hungary, who will have the help of numerous specialists. The work will be complete in twelve sumptuous volumes, two of which have already been issued. Another comprehensive publication, which has this year reached its fourth volume, is Professor Gyula Schvarcz's *History of Democracy*, a work of recognized merit, which has already won the author fame. Professor Schvarcz is an original thinker, and in his new volume, which deals with the Roman republic down to the year 275 B.C., he places himself in direct opposition to Mommsen and most other modern historians of Rome. A volume which possesses an interest no less biographical than historical is the sixth in the series of Louis Kossuth's complete works, now being issued posthumously, under the editorship of his son Francis. The new volume contains his *Historical Studies*, and there is an appendix reproducing part of his political correspondence with King Victor Emmanuel, Prince Jérôme Napoleon, and others.

Fiction.—In this department there is little that is really noteworthy. The veteran novelist Jókai, although as active as ever in other branches of literature, has added nothing to his already formidable list of romances. The two volumes which easily head the list for the year are the new novels of Ferencz Herczeg and Sándor Bródy. The former's *Story of a Girl* is praised as a vigorous and truthful picture of social life in a small Hungarian town, while the characters are drawn with considerable felicity and a mild touch of satire. *The Silver Goat* is regarded as Bródy's most mature work, and has been pronounced by some critics the best novel that Hungary has produced in the last five or six years. In tracing the career of a poor law student, who ultimately becomes a member of Parliament and a highly influential politician, the author has set before us a series of striking pictures of the various social strata which go to make up contemporary life in Budapest, in which he has proved himself a realist of the best sort. Other works of fiction worthy of mention are István Szomaházy's *Unseen Wednesdays*, and a volume of short stories, *Autumn Hunting*, by Árpád Berczik, who is better known as a writer of comedies.

Poetry.—Three volumes only need separate mention—Dezso Ambrozovics's *Verses* are mildly melancholy and are saved from monotony only by a remarkable versatility. *Songs and Stories*, by Antal Radó, offers a decided contrast, being full of gentleness, and a homely, cordial warmth, with an occasional tinge of mild sarcasm. The third volume contains the *Recent Poems* of Emil Makai, showing the deep feeling and finished versification which his readers have learned to expect from him.

HUNGARY, the eastern part of the dual monarchy of Austria-Hungary, has an area of 125,039 square miles, with a population in 1896 of 18,550,512, and embraces, besides Hungary proper, the kingdoms of Croatia-Slavonia and Transylvania. The capital is Budapest, with a population in 1890 of 500,384. The next largest towns are Szeged, population, 87,410, and Szabadka, population, 73,526. Agriculture, though carried on in a primitive manner, is the chief industry, supporting over half of the population. The principal crops are wheat, maize, barley, rye, and oats, the total production of which exceeds the home consumption. Forests are abundant, covering nearly 30 per cent. of the kingdom. In minerals Hungary is one of the richest of countries, the principal ores being gold, silver, lead, copper, iron, coal and lignite, manganese ore, etc. Internal communication is chiefly by means of the navigable rivers and canals, which have a total length of over 3000 miles. The railway mileage at the beginning of 1898 was 9784, of which 4680 belonged to the state. The entrances and clearances at Hungarian ports was about 18,700 in 1897,

representing a tonnage of about 1,845,000. The home merchant marine included 502 vessels, of which all but 76 were coasting and fishing vessels and only 70 were steamers. Education is said to have progressed considerably since 1890, the statistics of which year showed about one-half the population to be illiterate. Attendance in the elementary schools is compulsory, and there are also gymnasias and other preparatory schools, colleges, and technical schools, and three universities. In 1896-97, of 3,270,755 children of school age, 2,437,330 attended school. About half of these were of the Hungarian (or Magyar) race. Other peoples in Hungary, whose population presents greater racial diversity than that of almost any other country, are principally Servian and Croatian (especially in Transylvania), German, Bohemian, Moravian and Slovak, Ruthenian, Roumanian, and Gypsies. The great variety of races is matched with an equally large number of religious sects, including Roman Catholics, Calvinists, Lutherans, Orthodox Greeks, Armenians, Unitarians, Israelites and Nazarenes, and others. The largest sect is the Roman Catholic, numbering about 9,000,000. Religion is entirely free, with perfect equality between all denominations, and great tolerance toward one another is shown. The upper clergy especially are said to be of marked liberalism. The Catholic clergy are said to resemble the American branch of the Roman Church in their enlightenment and the spirit of toleration which they display.

Government.—Hungary joined with Austria in 1867 to form the dual monarchy of Austria-Hungary under the common sovereignty of Franz Joseph, Emperor of Austria and King of Hungary, each country being under its own constitution a limited monarchy, with its own parliament. Legislation regarding common affairs is accomplished by the delegations, which are two in number, and consist each of sixty members, representing the legislatures of Austria and Hungary. Under the control of the delegations, which meet annually at Vienna and Budapest, are the executive departments of foreign affairs, war, and finance. Besides these, matters of interest common to the two parts of the monarchy are commerce, indirect taxation, coinage, railways, military and naval matters, and defence. Hungary's parliament, or diet, comprises an upper house, the house of magnates, and a lower house, the house of representatives. The former includes life peers, appointed by the crown; ex-officio members, who are state officers; certain dignitaries of the Roman Catholic and Orthodox Greek churches; representatives of the Protestant confessions; the archdukes, and three members from Croatia-Slavonia. The lower house is elective, voters being subject to a low property qualification, from which scientific and certain other professional classes are exempt. The diet has jurisdiction over Croatia-Slavonia, which has also its own provincial diet, in such matters as are the common concern of those provinces and Hungary. Transylvania is legislatively united with Hungary. The agreement known as the *Ausgleich* binds the two in respect to financial and commercial affairs and in respect to the quota to be paid for the common financial needs of the empire. This treaty expired in December, 1896. Hungary hoped to obtain a more favorable division of the contribution to the common expenses. After long negotiations, the treaty was provisionally extended. See AUSTRIA-HUNGARY.

Political Parties.—The chief political parties are the Liberals, the Independents, and the Nationalists, who vote sometimes with the Liberals and sometimes with the Independents. The Croatian delegates usually vote with the Liberals. The Hungarian People's party, formed in 1895, is anti-Semitic and anti-Liberal, and represents in general the Catholic opposition to Liberal measures. From 1895 until the early part of the year 1899 the Banffy ministry was in power. There were after the general elections of October, 1896, 282 Liberals, 37 Nationalists, and 48 Independents, or Kossuthists; but toward the end of the year 1898 there were signs of division in the Liberal majority, and in the early part of 1899 the Liberal support of the Banffy ministry failed completely and that ministry was overthrown.

Political Situation in 1899.—The Hungarian diet was in session from September 5, 1898, to March 1, 1899, during which not a single law was passed, with the exception of the memorial on the death of Queen Elizabeth, who had been assassinated at Geneva in 1898. The failure of legislative action was due to the obstructive tactics of the minority, which wasted the session in fruitless interpellations of the government. On December 21, 1898, the Austrian *Reichsrath* was dismissed, in order that the government might have a free hand to renew the *Ausgleich* by ordinance. The *Reichsrath* met again on January 17, 1899, but was prorogued by the government within two weeks. Baron Banffy made an arrangement with Count Thun, the Austrian premier, for a renewal of the *Ausgleich*. It was to be renewed by ordinance in Austria and by legislative action in Hungary, but the opposition in the Hungarian diet prevented the necessary laws from being passed. Not only this, but there was no action on the budget or on the military contingent. At last a manifesto, signed by 243 Liberals, and known as the *lex Tisza*, declared that the ministers should, in case of necessity, carry on the administration without legal

warrant. This measure led to a division in the Liberal party, many refusing to sign, but was heartily favored by Liberals outside the diet, who, although taxes were not legally collectible, voluntarily paid the imposts at the tax offices and in some cases paid them a year in advance. This state of affairs could not continue, and efforts were soon made to restore peace and make parliamentary action possible. This was accomplished after the resignation of Baron Banffy and three of his colleagues. The different parties having reached an agreement, accepted the ministry of Koloman de Szell (*q. v.*), who assumed office on March 1. It was understood that the obstructive tactics would be abandoned as soon as this minister came into power. He was regarded as the only prominent member of the diet whose ministry would allay the factional disputes. A final agreement on the *Ausgleich* with Austria was reached early in July. This agreement conceded to Hungary nearly all the points that she demanded. The *Ausgleich* was to be prolonged until 1907. The customs union between the two countries and the commercial treaties with foreign countries were to cease at that date. Hungary's quota for the imperial expenses was reduced. See the article AUSTRIA-HUNGARY.

HURLEY, DENNIS M., member of Congress, died at Hot Springs, Va., February 26, 1899. He was born in Limerick, Ireland, March 14, 1843; in 1850 he came to Brooklyn, N. Y., where he thereafter resided, except during the period 1854-66, when he lived in New York City. He learned the carpenter's trade and became a contractor. In 1881 and 1882 he was an unsuccessful candidate for member of assembly. In 1896 he was elected from the second district to the Fifth-fifth Congress as a Republican, and was re-elected to the Fifty-sixth Congress.

HUTCHINSON, BENJAMIN P., a well-known speculator and member of the Chicago Board of Trade, died at Lake Geneva, Wis., March 11, 1899. He was born at Lynn, Mass., in 1829. Chiefly by speculation in wheat he came into possession of a large fortune, but lost it, his financial overthrow coming finally with the failure of an attempted deal in 1891.

HYBRIDIZATION. See BIOLOGY.

HYDE, HENRY BALDWIN, founder and president of the Equitable Life Assurance Society of the United States, died in New York, May 2, 1899. He was born in Catskill, N. Y., February 15, 1834. In 1852 he was given a clerkship in the office of the Mutual Life Insurance Company of New York, of which his father was the New England manager. He became cashier, but in March, 1859, resigned for the purpose of organizing a new company. This was accomplished the following July, when the Equitable Society was incorporated, and Hyde was elected vice-president and general manager. Upon the death of President Alexander in 1874 Hyde succeeded him, and retained the position to the time of his death. It was well said that the history of the Equitable was the story of his life; and this history shows that he was "in a high sense a philanthropist and benefactor." A minute adopted upon his death by the directors of the Equitable contained the following: "His company, during its forty years of existence, has paid to those who trusted to it their savings for the safety of their families \$377,000,000, and it holds \$265,000,000 for its many policy-holders. This unparalleled result was the work of Henry B. Hyde. No fortune of \$200,000,000 was ever piled up in a single life. But our president, from the age of twenty-five to sixty-five, accumulated for the society \$572,000,000. This sum far exceeds the fortune of the most famous financiers." Although it was said that President Hyde received one of the largest salaries in the world, his private fortune amounted to only about \$500,000.

HYDE, General THOMAS W., a well-known American ship-builder, died at Old Point Comfort, Va., November 14, 1899. General Hyde achieved distinction both as a military man and as a marine architect and builder. His parents were natives of Bath, Me., but he was born in Florence, Italy, in 1841. He was graduated from Bowdoin College, and afterward from the old University of Chicago, becoming one of the first graduates in 1861. He fought throughout the Civil War, and was afterward granted a medal by Congress for exceptional bravery. Returning to Bath after the war, with the rank of brigadier-general of volunteers, he entered upon the business of ship-building. The Bath Iron Works, which he leased and ran with a small force, later developed into the "northern division" of the Bath Iron Works. The business developed to large proportions, and General Hyde became the principal owner and one of the best-known ship-builders in the United States. General Hyde served several terms in the State senate, of which he was president for two terms. He wrote *Following the Greek Cross, or Memories of the Sixth Army Corps*.

HYDRAULIC CEMENTS. The United States has grown within the last few years to occupy a place in the front rank of the cement-manufacturing countries of the world. In 1898, which is the last year for which definite figures are available, the

production, importation, and consumption of hydraulic cement in the United States were as follows:

ITEM.	No. Barrels of 400 Pounds.	Per Cent. of Total.
Natural rock cement.....	8,418,924	59.6
Imported Portland cement.....	2,018,318	14.26
American " ".....	3,692,384	26.14
Total consumption.....	14,125,086	100.00

It is estimated by competent authorities that the production of Portland cement in the United States in 1899 reached probably 5,000,000 barrels. The production of natural cement will not vary greatly from that of 1898 or, say, 8,500,000 barrels. Germany now produces annually about 18,000,000 barrels, practically all of which is Portland cement. England manufactures about 8,000,000 barrels of Portland cement each year, and France produces about 3,000,000 barrels of Portland cement, and 7,000,000 barrels of various other classes of hydraulic cement. Other European countries which manufacture hydraulic cement, mostly Portland cement, in smaller quantities, but which are yet large producers, are Russia, Belgium, Austria, and Scandinavia. Nearly every country where modern engineering work is carried on produces hydraulic cement to some extent. The accompanying table shows the principal centres of Portland cement manufactured in the United States:

STATE.	No. of Works.	Barrels.	STATE.	No. of Works.	Barrels.
California.....	1	50,000	Ohio.....	6	263,872
South Dakota.....	1	81,000	Pennsylvania.....	8	2,095,141
Indiana.....	1	2,500	Texas.....	1	8,000
Maryland.....	1	10,000	Utah.....	1	11,250
Michigan.....	2	77,000	Total.....	31	3,692,384
New York.....	1	554,358			
New Jersey.....	2	587,163			

Natural cement is made in 16 States by 76 factories, distributed as follows:

STATE.	No. of Works.	Barrels.	STATE.	No. of Works.	Barrels.
Florida.....	1	7,500	Pennsylvania.....	5	499,956
Georgia.....	1	18,000	Tennessee.....	1	10,000
Illinois.....	3	630,000	Texas.....	1	11,000
Indiana and Kentucky.....	19	2,040,000	Virginia.....	3	8,836
Kansas.....	2	160,000	West Virginia.....	1	42,874
Maryland.....	4	297,475	Wisconsin.....	1	879,970
Minnesota.....	2	128,436	Total.....	76	8,418,924
New York.....	29	4,157,917			
Ohio.....	3	26,724			

These figures are for the year ending December 31, 1898.

Hydraulic cement is one of the most important structural materials used by the engineer, and its use is constantly increasing. The principal use of cement by engineers is in the form of concrete, which is an artificial stone composed of cement, sand, and gravel or crushed stone. Concrete is made simply by mixing the aggregating material in the proper proportions with water and depositing the mixture in moulds or masses to harden, which it will do either in air or under water. It is

used for foundations for bridges and buildings, in the place of stone masonry, for walls, arch bridges, dams, fire-proofing, and for a great variety of other purposes.

Classification.—Portland cement is the product obtained by calcining to incipient vitrification an intimate artificial admixture of two or more raw materials, consisting principally of lime, silica, and alumina (limestone and clay), the product then being ground fine. Natural cement is the product attained by calcining at a low temperature a natural limestone of a certain suitable composition and finely grinding the clinker. Puzzolana is a term applied to a combination of silica and alumina, which, when mixed with the common lime, and made into mortar, has the property of hardening under water.

Development of Manufacture.—Natural cement was first manufactured in England in 1796 by James Parker. Joseph Aspdin, of Yorkshire, England, invented Portland cement in 1824, and began its manufacture, commercially, about the same year. Portland cement began to be manufactured on a commercial basis in France in 1846, and natural cement some twenty or twenty-five years before. Portland cement was manufactured in Austria in 1850, in Germany in 1855, in Russia in 1857, and in the other continental European countries at various dates between 1850 and 1870. Natural cement was first manufactured in the United States in 1818, and Portland cement in 1872. Puzzolana was used by the Romans in their early engineering works, and is yet made in Italy and Greece, and in the Rhine valley in Germany.

Process of Manufacture.—The principal constituents of Portland cement are lime, alumina, and silica. The natural materials which supply the lime for cement-making are limestone and chalk or marl; those which supply the alumina are clay or shale. The lime and clay materials are first mixed intimately in a powdered form. Where marls, or chalks and soft clays, which can be easily dissolved in water, are employed, the mixing is done by the wet process. Where hard limestone and shales are employed, the mixing is done by the dry process. Mixing by the wet process consists in agitating the proper proportions of marl and chalk and clay with water in a wash-mill, from which the resulting creamy fluid is conveyed to large, shallow settling-basins, where the solid matter settles and the water is decanted and evaporated off. The sludge of the settling-basins is taken to drying-floors or drying-chambers and thoroughly dried. In the dry process the hard limestone and shales are mixed and ground dry to a fine powder by millstones or some other form of grinding machinery, and the powder is wetted and made into bricks, which are then dried on drying-floors or in drying-chambers. The semi-wet process is a modification of the wet process in which the mixture is accomplished in pug-mills with a smaller proportion of water, and the paste is conveyed directly to the dryers, no settling-basins being employed. Many factories also use a combination of the wet and dry process, one material being reduced to powder by water and the other ground dry, and the mixing done afterward. The proportions in which the lime and clay materials are mixed are carefully regulated by chemical analysis.

After being dried the mixture is burnt at a temperature approximating 2000° F. in kilns. These kilns are of four types, (1) intermittent kilns, (2) chamber kilns, (3) continuous kilns, and (4) rotary kilns. Intermittent kilns are bottle-shaped structures of masonry, which are filled with alternate layers of raw mixture and fuel, which is usually coke, although coal is sometimes employed. When full the kiln is fired and it burns until the fuel is all consumed, after which the contents are allowed to cool off and the calcined clinker is withdrawn and the kiln is filled with a new charge. The chamber kiln is a modification of the bottle kiln in which a horizontal chamber takes the place of the vertical chimney. This chamber is used for drying the wet raw mixture by the waste heat given off from the burning kiln. Continuous kilns are of various form, but they are all so designed that the burning is continuous, the burnt clinker being regularly removed at the bottom and raw material and fuel being added at the top to take its place. The rotary kiln is an American development, and consists of a sheet-iron cylinder lined with firebrick and mounted at a slight inclination from the horizontal. The raw mixture, either dry or wet, is fed by a spout into the upper end of the cylinder and gradually works its way to the other end, owing to the rotation of the cylinder, which is accomplished by suitable power mechanism. The heat for calcination is supplied by burners using gas, oil, or powdered coal fuel, which are placed at the lower end of the cylinder. About 60 per cent. of the Portland cement made in America is calcined in rotary kilns. They are not used outside of America.

The burned or calcined cement clinker is a hard, greenish-black substance having a very porous texture. As produced by all but rotary kilns, it is in quite large lumps, and previous to grinding has to be crushed in crushers of the jaw or rotary type, such as are commonly used for crushing stones for road materials. The clinker from rotary kilns is comparatively small, and does not usually require crushing previous to grinding. For grinding, ordinary millstones are used extensively,

particularly in Europe. The other common forms of mills are edge-runner mills, whose essential characteristic is a series of heavy rolls which travel on a metal track and crush the clinker by riding over it as a wagon-wheel crushes the pebbles on a road, and ball-mills, which are of two principal types. One type of ball-mill operates similarly to the edge runner-mills just described, except that heavy balls take the place of rolls, and the other type consists of a metal cylinder lined with hardened metal or tile plates and partly filled with small balls or flint pebbles. The clinker is run into the cylinder, which is made to rotate so that the tumbling and rolling of the balls grind it to powder. The powder from these mills is sifted to exclude the coarser particles, which are reground, and the sifted powder is packed in barrels or bags for shipment to the consumer. Many of the best Portland cements are now ground so fine that they leave a residue of only from 1 per cent. to 5 per cent. of the total on a sieve having 10,000 meshes per square inch, and from 60 per cent. to 70 per cent. of which will pass a sieve having 40,000 meshes per square inch.

In manufacturing natural cement the rock is broken by blasting into small fragments, which are burned in continuous kilns of the kind commonly used for burning lime. The crushing, grinding, and sifting processes are conducted exactly as in the manufacture of Portland cement.

Puzzolanic cements are made by mixing certain natural and artificial puzzolanas in powdered form with slack lime. Natural puzzolanas are volcanic lifters of certain composition which are found most plentifully in Italy, Greece, and the Rhine valley near Cologne, in Germany. The most important artificial puzzolana is the slag from blast furnaces, and cements made from it are called slag cements. Slag cements are made in America, but the manufacture of natural puzzolanic cements is confined practically to continental Europe.

HYGIENE. The twenty-fourth (German) Congress for Public Hygiene was held at Nuremberg, September 13 and 14, 1899. Of the membership of 1560, 286 people were present. The subjects discussed were: (1) Artificial light, (2) the need of greater cleanliness in the handling of food materials, and (3) the school physician. To the last topic one whole day's session was devoted. The school physician's work should include, it was argued, the sanitation of the building, and the hygiene of the eyes, ears, nerves, and teeth of the children, while instruction in hygiene should receive special attention.

Hygiene of School-life.—An active discussion of the condition of the school children in Washington, D. C., has led to the publication by the Government Printing Office of a report of a committee of investigation, which contains many valuable suggestions. In it Dr. W. W. Johnston makes the following recommendations:

"1. All investigations made into the health of school children in this country or in Europe show that a large percentage present signs of ill-health.

"2. Departures from health in school children are primarily and chiefly in the nervous system and in the eye, although the general nutrition, the blood-making processes, and the digestion are also disordered.

"3. The same conditions of disease are seen in different countries and climates, and are so uniformly associated with school-life that there is a reasonable presumption of a close relation between school instruction and these disorders.

"4. The facts show that there is a progressive increase in the sum total of disease with advance from class to class; that the percentage of disease varies also with the number of hours devoted to study and with the extent to which the brain of the pupil is taxed.

"5. Careful observations show that during the first eight years of life the brain is rapidly growing in weight and size and complexity of structure; that after eight years there is but little further increase in the size and development of the brain. The first eight years, therefore, demand such a degree of rest of the brain as will best favor its growth and avoid overstrain of an immature organ. The premature strain put upon a growing organ, as yet unfit to perform its function, hinders its proper development, and brings about disorder in the function or disease of the organ.

"6. The beginning of school instruction before the age of eight years is one of the causes of the prevalence of disease among school children. The rapidly progressive deterioration in the eye shows how injurious is the overstrain of an immature organ, and the progressive increase of the so-called 'school diseases' show the effect of continued strain upon the nervous system of the young.

"7. Another cause of disease is the admission of children who are physically and mentally unfit to begin school instruction or who cannot bear the restraints of school-life. Overstrain of an enfeebled nervous system quickly causes disease.

"8. The remedies suggested by these considerations are the fixing of eight years as the proper age to begin school instruction, instead of from four to six years, as at present permitted, and the demand for a proper medical certification as to the fitness—mental and physical—of each child who seeks admission to the schools."

In Philadelphia the Board of Health began to inspect schools by means of a corps of fifteen assistant medical inspectors in June, 1898, adopting, though on a very small scale, the system in use in New York City for many years. During the thirteen weeks ending February 1, 1899, more than 1000 cases of disease were reported from the Philadelphia public schools, principally skin diseases, inflammations of the ear, and diseases of nose and throat and lungs. The New York Institution for the Blind states that there has been a steady decrease in the number of blind children in that city for the past twelve years, or since active steps have been taken to prevent indiscriminate use of towels and wash basins in homes for children, and to secure periodical medical inspection. In the last census the figures given regarding blindness were as follows: One blind person to every 2500 of the population in the counties of New York and Kings (the latter including Brooklyn); while in Alleghany, Clinton, Oswego, Madison, and Schuyler—all rural counties—there is one blind person for every 650 of the population. The city council of Würzburg, Bavaria, took action in 1899 to provide free attention to the teeth of school children. It is contemplated to care for diseases of nose and throat similarly, if the experiment proves of avail.

Hygiene and Drinking Water.—Water-filtration is employed in Liverpool. A regular examination is made every two weeks of the condition of the water with regard to pathogenic bacteria. Examinations are also made of the filter beds, and of the water standing in "dead ends" of mains. In all cases the water has been found free from contamination and from harmful bacteria. Tests have been made during a long series of experiments in Rome, during 1899, with a number of agents by which the sterilization of drinking water may be accomplished. Tincture of iodine has been used, as well as ozone. The Bergé process consists in treating the water with chlorine peroxide, a powerful and energetic oxidant and a searching bactericide. Three grammes of chlorine peroxide will sterilize completely a cubic metre of water, at a cost of less than half a centime. Professor Henry Bergé is lecturer on chemical technology at the Brussels Polytechnic School.

Hygiene of the Barber Shop.—The Pennsylvania Board of Health recently issued a tract entitled *Hygienic Hints for Barbers and Hairdressers*. Persons suffering from contagious disease, or nursing cases of contagious disease at home, should not act as barbers. The shop and the instruments and towels should be kept scrupulously clean. Persons afflicted with communicable disease should not be allowed in barber shops, but should be attended at home, and instruments used on them should be disinfected. Customers should be urged to provide their own instruments and brushes. Razors and clippers may be disinfected by boiling in alkaline water; brushes, combs, and strops, by subjecting them to formalin vapor; shaving brushes by boiling. Powder puffs should be abandoned. Alum lumps should not be used on a second customer. Vaseline should be removed from the jar with a spatula. Sponges should never be employed. Careful sweeping and ventilation should be practised.

Hygiene and Tenement-House Reform.—The recommendations of the Tenement House Committee of the Charity Organization Society of New York City, in order to secure reform in the erection and construction of tenement houses, are as follows: "That in all new tenement houses no air-shaft should be less than 6 feet wide in any part, nor less than 150 square feet in superficial area; that no new tenement house should exceed 6 stories in height unless it be fire-proof; that all living rooms in tenement houses should have a capacity of at least 600 cubic feet of air-space; that for every new tenement house containing 20 families or more there should be provided at least one bath tub or shower bath in a separate apartment for the use of the tenants and when there are more than 20 families in any such house there should be provided additional bath tubs; that every tenement house hereafter erected or altered, 4 stories or more in height, should have the first story made fire-proof; that the walls of all tenement houses hereafter erected should be carried up 3 ft. 6 in. above the roof on all four sides, so that the roof might be used as a playground; that no wooden building of any kind whatever should be placed on the same lot with a tenement house within the fire-limits of the city; that in every new tenement house the stairway connecting the cellar with the first floor should not be located in whole or in part underneath the stairs leading from the first story to the upper stories; that no closet should be constructed underneath any staircase in any tenement house; that every new tenement house and every existing tenement house in which the halls are not light enough in the daytime on all floors to permit an ordinary person to read easily without aid of artificial light should have every door leading from the public halls to rooms provided with ground-glass panels of an area of not less than 6 square feet; that in every new tenement house all interior shafts should be fire-proof and provided with fire-proof self-closing doors to all openings; that the following provisions of the existing building laws be continued in effect—namely, that the bulk-head doors of all tenement houses should at no time be locked, but they might be fastened on the inside with a hook or bolt; that in all tenement houses where wooden stud partitions rest over each other, the space between the studs should be filled in

solid with fire-proof material, to prevent the spread of fire from floor to floor; that the cellar floor of every tenement should be covered with concrete not less than 3 inches thick; and that when a kitchen range or stove is placed within 12 inches of a wooden stud partition the woodwork should be cut away and filled in with fire-proof material."

Practical Instruction in Public Hygiene.—The Chicago Department of Health has offered graduates in medicine and senior undergraduates courses of practical instruction and work in sanitary science and public hygiene. Applicants must pass a preliminary examination in physics, chemistry, bacteriology, and biology. The course for graduates covers three hours daily for two weeks each in general bacteriological work, bacterial diagnosis of disease, chemical analysis and bacteriological examination of water, ice, and food, with special work in the examination of milk. Certificates of proficiency will be given to those whose work is satisfactory and whose qualifications are determined. The course for undergraduates consists of one term of four weeks, three hours a day, in preparing culture media and culture outfits, in incubation, sterilization, and the care and use of instruments and apparatus. On completing the course satisfactorily the students receive certificates, on which they may enter the advanced course without examination. The department also offers special courses in sanitary inspection, the registration of vital statistics, and in methods of dealing with contagious diseases and of disinfection. Lighting, plumbing, drainage, ventilation, and the removal of waste receive attention in the special courses, as well as vaccination, the preparation of glycerinated lymph, the use of diphtheria-antitoxin, and formaldehyde disinfection. It is now announced that the experiment, now two years old, of offering these courses, has proved very successful.

Legislation.—In June, 1899, a special commission composed of officers of several departments of the city of Norfolk, Va., recommended to city councils the adoption of an ordinance prohibiting expectoration on the sidewalks, in public halls, street cars, reception rooms, etc. The penalty for infraction of this ordinance is to be a fine of from \$1 to \$5 for each offence.

HYLTON, Second Baron, HEDWORTH HYLTON JOLLIFFE, died October 30, 1899. Born at Merstham, June 23, 1829, he was educated at Eton and at Oriel College, Oxford. He entered the Fourth Light Dragoons, and for his service in the Crimea received several decorations. He took part in the charge at Balaclava. From 1856 to 1858 he was a Conservative member of Parliament from Wells, retiring when in the latter year Wells was disfranchised pursuant to the Reform bill. His heir was his son, H. George Jolliffe, M.P.

HYPNOTISM. During 1899 many marvellous stories of cures by hypnotism have been exploited in the sensational newspapers, absurd claims have been made, and impossibilities asserted. Authentic reports by scientific investigators have been published largely in scientific publications, which show that the field in which hypnotism is available is smaller than most people believe. Cases of cure of morphinism, chloralism, nicotinism, dipsomania, and kleptomania have been reported, but in the large majority of instances sufficient time has not elapsed to judge of the resultant condition after the use of suggestion. Claims of cures dependent upon change or removal of pathological conditions are viewed with suspicion. The present status of the therapeutic value of hypnotism is stated in the following excerpt from the *Philadelphia Medical Journal*, for March 4, 1899: "It is highly desirable at the present day that a distinction should be drawn between hypnosis as a psychic state and hypnotism as a therapeutic method. We wish to emphasize this point, because a great part of the discredit into which hypnotism has fallen is due to the abuse and exaggeration of its powers as a medium of healing. The two aspects of the subject are entirely distinct. Hypnosis is a genuine physiological phenomenon—not nearly so common and attainable, however, as some observers claim—and it presents some most interesting and recondite problems in psychology. We think this much is certain, and is generally accepted as a fact. Moreover, this state of hypnosis yet requires the conscientious and critical study of experts in psychology, and suffers because it is still too much abandoned to the dilettanti of science and literature. The theory of hypnosis, in other words, is still an open field for profitable research.

"Unfortunately, under the influence of certain sensational writers in France, hypnotism has been exploited beyond all reason as a means of healing. This aspect of the subject seems to be the only one that has importance in the eyes of some enthusiasts. This has led perilously near to charlatanism in some cases, and in others has blinded some sincere but zealous practitioners. We are far, however, from denying that hypnosis sometimes opens an avenue of approach to a patient's mind by which most salutary suggestions may be introduced and made operative.

"The healing power of hypnotism may be expressed in an aphorism: Hypnosis prepares the soil for suggestion. It does this and nothing more; and, in fact, can do nothing more. Consequently, the only therapeutics possible under hypnosis is by

mental impression, and the only diseases curable are those that can be influenced by the mind. Reduced thus to its baldest expression, hypnotism presents nothing miraculous or unintelligible. Hypnotism will not cure organic disease or eradicate microbes from the blood. The ritualism employed, the scholastic distinctions and definitions used, only cloud and confuse the subject.

"This should remind practitioners of hypnotism of two things. First, there is a *normal* suggestibility of mind that is often just as useful as, and sometimes even more so than, the artificial state provoked by hypnosis. All wise practitioners use this normal suggestion whenever they are able—it simply denotes the influence of mind upon mind, and of mind upon body. Second, the susceptibility to hypnotism, and to cures wrought in this state, is often not a good prognostic sign. What we mean is this: An hysterical or neurasthenic patient who is readily hypnotized and cured, shows by this very fact that she is a confirmed neurotic. Her ready hypnosis is a sign of her degeneration. Her permanent cure is by no means assured—her relapse is often merely a question of time." See SUGGESTION.

ICE-BOATING. See ICE-YACHTING.

ICE-HOCKEY. Ice-hockey in America, as a scientific sport, is a development of the last few years, and has become especially prominent since the building of artificial ice-skating rinks, where suitable training and exhibition quarters are assured during all weather conditions. These rinks have practically brought into existence the prominent teams of New York City, and the matches played there by club and college teams are offered as one of their principal attractions. The Amateur Hockey League, composed of the New York Athletic Club, Crescent Athletic Club, Brooklyn Skating Club, St. Nicholas Club, Montclair Athletic Club, and the Hockey Club of New York, played its championship series for the year 1898-99 in the St. Nicholas and Clermont rinks, in the boroughs of Manhattan and Brooklyn, N. Y. City. The Brooklyn Skating Club won the title by 8 won games and none lost, and 43 won goals and 9 goals against them. The Hockey Club was second, with 5 games won. The Intercollegiate Hockey League, formed during the season of 1898-99, with Yale, Brown, Columbia, and Pennsylvania, played its games in the ice rinks of New York and Philadelphia, Yale winning the series for 1898-99 by 3 won games, none lost, 10 goals scored and 4 against. Pennsylvania was second, with 2 out of 3 games. In March, 1899, the Victoria team, of Montreal, defeated the New York team by a small score. In December the McGill University team was defeated in New York by the N. Y. A. C. team, 1 to 0, and by an all-American team, composed of players from the New York Athletic, St. Nicholas Skating, and New York Hockey clubs, the score being 10 to 6. The games were hard fought.

ICELAND is a large island of volcanic origin, lying in the North Atlantic Ocean, about 250 miles east of Greenland; it has an area of about 39,756 square miles, being somewhat larger than Ireland, and a population estimated in 1899 at 75,663. The capital is Reykjavik, a city of about 5000 inhabitants. It is believed that the climate of Iceland has changed greatly since the first settlement of the island, which is at present a bleak and almost treeless land. In recent years there has been a considerable emigration, which has lately been directed largely toward Manitoba. There are minerals of some value in Iceland, but they have not been worked to any extent, and as manufactures are entirely of a domestic nature the imports are largely confined to the necessities of life. Besides foodstuffs and clothing, the principal imports are timber, for building; hardware, tobacco and spirits. Exports include principally wool, cattle, ponies, and fish, and in addition may be mentioned Iceland moss, seal-skins, oil, sulphur, eider-down, and bird skins.

ICE-YACHTING. The sport of ice-boating is necessarily confined to a few, but as one of the most distinctive and characteristic of American sports it occupies an important place. Its rise and progress, as sketched in this article, have brought it with the close of the year 1899 to a high degree of development among the scientific sports. On the Hudson River, whose name has long been associated with the building and sailing of famous water-yachts, both steam and sail, and with notable amateur and professional sculling and oared-crew races and regattas, is found the home and original centre of skating and ice-yachting. The Hudson River and the Orange Lake ice-yacht clubs, with the Shrewsbury River clubs, have made the name of America a formidable one to winter sportsmen abroad. The Hudson River models have been adopted among ice-yachtsmen throughout the country, and are, according to reports for the winter opening in December, 1899, being bought and shipped West in unprecedented numbers for the ensuing season. One of the newest organizations in this sport, the Irondequoit Ice-Yacht Club, of Rochester, N. Y., is but one of many which have adopted also the Hudson River rules, with the Orange Lake time allowances for mixed classes. But the spread of the sport has long included localities far removed from the limits of New York State. The list of

clubs prominent in the season of 1898-99 is a large one, and has shown a marked increase for the season of 1899-1900. In the West the sport has had a remarkable growth, especially among the lakes of Michigan, Wisconsin, and Minnesota. Sportsmen at Winnebago Lake, Wis., have over 100 ice-boats. The most prominent organization is the Oshkosh I. Y. Club. The principal trophies are the *Evening Wisconsin* cup, the Oshkosh cup, and the Oshkosh club pennant. The most rapid development among Western clubs has been made by the Lake Minnetonka I. Y. C., with a new club-house and over 35 large yachts. Lake Minnetonka has seen famous rowing regattas in the past and bids fair to become a centre also of winter sports. The Lake St. Clair (Detroit) and Kalamazoo clubs, of Michigan (the latter the pennant holder of Gull Lake) and Lake Pepin, Wis., and White Bear Lake, Minn., organizations, are among other active Western ice-yachting clubs. At Madison, Wis., Lakes Mendota and Monona have many ice-yachtsmen. Still more a centre of ice-yachting in Wisconsin is Lac la Belle. There is a triangular three-mile course on this lake, the race being three times around, plus tacks. It is reported that early in 1900 the *Expense*, Commodore Thompson, established a new record for the region west of the Hudson by sailing this course in 14 minutes, a distance of 12 miles, counting the course covered in working to windward. Scores of other organizations were active during the year, from Bar Harbor through Lakes Champlain and George to the far Western lake region.

The principal races of 1899 occurred about January. The ice-yachting championship pennant of America and the world, a trophy comparable to the *America's* cup in the eyes of ice-yachting sportsmen, was again won on the Hudson River by John A. Roosevelt's *Iceicle*; second, *Jack Frost*; third, *Santa Claus*. Western sportsmen are casting longing eyes toward this pennant, and there was talk of sending East as a competitor in 1900 the *Irene*, the holder of the northwestern championship pennant. The race for the latter pennant will be sailed, 1900, on Lake Minnetonka, and the Hudson River Ice-Yacht Club signified its intention of sending the *Iceicle* or some other club flyer to compete in the race. These two proposals are the first serious considerations yet given toward any prominent Eastern-Western regattas in ice-yachting. There is an international trophy, however, in the Walker cup, won by the Kingston Club last year by victories over boats representing the Cape Vincent (N. Y.) I. Y. C., at Kingston, Ontario. At Orange Lake the Higginson cup was won by the *Snowdrift*, which won also the Van Nostrand cup and the Kidd championship pennant, in the last two races the *Cold Wave* and *Arctic* being second and third, respectively.

ICHTHYOLOGY. See FISH AND FISHERIES.

IDAHO, a northwestern State of the United States, has a land area of 84,200 square miles. The capital is Boise City. Idaho was admitted to the Union, July 3, 1890.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Wheat, 3,440,103 bushels, value, \$1,720,052; oats, 1,099,968, \$417,988; barley, 405,510, \$186,535; potatoes, 593,960, \$362,316; and hay, 539,895 tons, \$3,401,338. Farm animals, January 1, 1900, comprised horses, 127,821, \$2,863,504; mules, 889, \$32,810; milch cows, 33,075, \$1,055,092; other cattle, 364,853, \$8,672,748; and sheep, 2,658,662, \$7,444,254.

Mineralogy.—Completed reports for the calendar year 1898 showed an output of gold valued at \$1,716,900, and of silver, 5,073,800 fine ounces, of a commercial value of \$2,993,542. As in other mineral sections, Idaho received much attention during 1899 from copper developers. Work was undertaken on several large copper ledges on North Boise River, east of Idaho City, and on a number of newly discovered gold and copper quartz ledges on Little Salmon River, between Salubria and Grangeville. The extension of the railroad into the Seven Devils country attracted a considerable rush of prospectors, for the mountains extending north and south through Washington County are known to contain much undeveloped mineral wealth. In this district an immense graphite deposit was discovered. About 25 miles east of Idaho City a rich cinnabar ledge was found, which, besides being high grade in quicksilver, contains a profitable proportion of gold; and on Salmon River, not far from Bear Valley, a new ledge was struck, rich in gold, carrying telluride and mercury, and holding considerable native quicksilver. The old State wagon road from Banner to Cape Horn, which had become impassable, and which was the only means of reaching central Idaho, was put into repair, and a new one was constructed from Idaho City to the telluride mines on Badger Creek.

Banks.—On October 31, 1899, there were 9 national banks in operation and 5 in liquidation. The active capital aggregated \$550,000; circulation, \$165,153; deposits, \$3,555,450; and reserve, \$1,397,853. The State banks, June 30, 1899, numbered 7, and had capital, \$172,165; deposits, \$524,007; and resources, \$742,067.

Education.—At the close of the school year 1897-98 the school population was 47,960; enrolment in public schools, 29,737; and average daily attendance, 21,528.

There were 848 teachers, 648 buildings used as school-houses, and public school property valued at \$597,718. The revenue was \$296,846; expenditure, \$274,377, of which \$205,849 was for teachers' salaries. There were 6 public high schools, with 23 teachers and 346 students; 7 private secondary schools, with 17 teachers and 176 secondary students and 522 elementary pupils; and 2 public normal schools, with 9 teachers and 124 students. The State University at Moscow reported 21 professors and instructors, 248 students, 5000 volumes in the library, \$35,000 invested in scientific apparatus and \$130,000 in grounds and buildings, and \$45,680 in total income. In 1899 there were 74 periodicals, of which 5 were dailies, 3 semi-weeklies, 62 weeklies, and 3 monthlies.

Railways.—During the calendar year 1898 the new railway construction amounted to 21.09 miles, and during 1899, 164.26 miles, giving the State a total mileage of 1283.15.

Finances.—In 1899 the assessed property valuations aggregated \$46,548,313, an increase in a year of \$16,124,642; the tax rate (1898) was \$8.31 per \$1000; total bonded debt, \$393,000, and floating debt, \$204,469. The greater part of the bonded debt was incurred for building wagon roads.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 180,000.

Legislation.—All the laws made by the legislatures since the admission of the State in 1890 were re-enacted during the lengthy session of 1899, because they had not had the different readings required by the constitution. Among the more important of the new laws enacted are to be noted: The appointment of a State engineer to inspect dams and dikes; the appointment of a game warden, with stringent protective provisions; the creation of a State board of examiners to examine and license physicians and surgeons, and another State board of examiners for dentists; a State board of horticultural inspection, with power of inspection of all fruit orchards and nurseries; a bureau of immigration, labor and statistics; a State board of arbitration, and a State inspector of mines, with much power invested in him. In civil actions hereafter verdicts may be rendered by three-fourths and in misdemeanor by five-sixths of a jury of twelve. In the interests of labor, eight hours were made a day's labor on public works; and employees are prohibited from making any agreement with employers not to become or continue a member of a labor organization, under penalty of fine or imprisonment. Employers of labor on railroads, ditches, buildings, and in mines must record and publish names of owners and agents, times when workmen are to be paid, and statements of all mortgages and liens. Police officers cannot be brought into the State and specially deputized. The State appropriated \$150,000 to build a wagon road, and a commission was appointed to supervise the same. A State board of public instruction and a State board of text-book commissioners were also created.

The Wardner Riots.—On April 24, 1899, the Wardner Miners' Union demanded of the Bunker Hill and Sullivan Company \$3.50 per day for all men in their employ working underground, and that they should employ no non-union miners. The superintendent agreed to pay the wages demanded, but refused to discharge non-union miners. On April 29 the Bunker Hill and Sullivan mill was blown up by means of sixty 50-pound boxes of dynamite, about 1000 men taking part in the riot. Property worth \$250,000 was destroyed, and one man was killed. The following day the State authorities, aided by federal troops under General Merriam, stood guard in the Cœur d'Alene mining district. On May 8 Governor Steunenberg proclaimed the district under martial law. Nearly 400 arrests were made for the fatal rioting at Wardner, and a prison known as the "bull pen" was hastily constructed. This at one time contained as many as 250 arrested persons. Eight men were indicted as ringleaders. The first trial was that of Paul Corcoran, financial secretary of the Miners' Union at Burke. The verdict rendered in his case, July 29, was murder in the second degree. He was sentenced to seventeen years' imprisonment. In the meantime miners had left the country in such numbers that every mill in the district had closed down; for when the governor proclaimed the district under martial law he also forbade mine owners, during its continuance, to employ members of organizations which had shown themselves criminal in purpose. Consequently, men belonging to such unions had to renounce their allegiance to them before they could be employed. The mill that was destroyed has been rebuilt and provided with an armor-lined blockhouse.

State Officers and National Representatives.—Governor, Frank Steunenberg. lieutenant-governor, J. H. Hutchinson; secretary of state, M. Patrie; treasurer, L. C. Rice; auditor, B. Sinclair; attorney-general, S. H. Hays; superintendent of public instruction, P. French; adjutant-general, J. L. Weaver; State engineer, D. W. Ross. Supreme Court: Chief justice, J. W. Houston; associate justices, I. N. Sullivan, Ralph P. Quarries; clerk, Solomon Hasbrouck. The State legislature consists of 27 Democrats, 9 Populists, 20 Republicans and 14 Silver Republicans. Senators:

George L. Shoup (Rep.), from Boise, and Henry Heitfeld (Pop.), from Lewiston. Representative: Edgar Wilson (Sil.), from Boise.

ILLINOIS, a central State of the United States, has an area of 56,650 square miles. The capital is Springfield. Illinois was admitted to the Union December 3, 1818.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 247,150,332 bushels, value, \$64,259,086; wheat, 12,665,410, \$7,979,208; oats, 127,278,948, \$28,001,369; barley, 395,502, \$185,886; rye, 1,154,325, \$542,533; buckwheat, 71,430, \$41,429; potatoes, 15,648,192, \$6,415,759; and hay, 2,365,710 tons, \$18,334,252. Live stock, January 1, 1900, comprised horses, 983,233, \$48,486,673; mules, 78,936, \$4,245,658; milch cows, 1,021,236, \$37,070,867; other cattle, 1,303,018, \$41,197,518; and sheep, 637,719, \$2,532,383.

Industries.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$47,359,523, the largest amount paid in any State. There were 406 manufacturers of tobacco, and 2960 of cigars, and the total output was 245,333,666 cigars, 2,183,110 cigarettes, 750,752 pounds of plug tobacco, 2,789,996 pounds of fine cut, 8,163,098 pounds of smoking, and 494,164 pounds of snuff. Grain and fruit distilleries in operation numbered 23; the production of fruit brandy was 861 gallons; amount of spirits rectified, 6,283,520 gallons; distilled spirits gauged, 78,869,366 gallons; production of fermented liquors, 3,549,534 barrels; and production of oleomargarine, 38,897,603 pounds. Reports for the calendar year 1898 showed an output of coal from 329 mines of 18,599,299 short tons, valued at \$14,567,598, a decrease from the output of the previous year of 1,473,459 tons, due to strikes. The principal quarry product was limestone, to the value of \$1,421,072. Manufactures of pig-iron aggregated 1,365,898 long tons; of Bessemer steel ingots, 1,105,040 long tons; of open-hearth steel, 183,103 long tons; and of all kinds of rolled iron and steel, 1,071,327 long tons.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the port of Chicago aggregated in value \$12,153,814, an increase in a year of \$2,012,401; and the exports, \$7,674,812, an increase of \$185,926. The movement of gold and silver coin and bullion was, imports, \$83,209; exports, none, making the total foreign trade of the year \$19,913,835, a gain of \$2,267,909. During the month of June, 1899, the tonnage of the vessels engaged in the foreign trade of the port was: Entered, American, 30,097; foreign, 2666; total, 32,763; cleared, American, 34,486; foreign, 2666; total, 37,152; grand total, 69,915. Of the total American tonnage, 59,953 was steam, and of the total foreign, 2070.

Railroads.—The new railroad construction in the calendar year 1898 amounted to 24.15 miles, and in 1899 to 126.30 miles, giving the State, according to one official report, a total mileage of 10,941.36, and enabling her to maintain the first place in steam railroad mileage. In the construction work of 1899, the Illinois Central led all the railroads in the country, completing 64 miles for new lines in Mississippi and other States, and making the total mileage operated by it 3864. The Chicago, Rock Island and Pacific built 49 miles of new lines, making the total controlled by it 3617.

Banks.—On October 31, 1899, there were 218 national banks in operation and 96 in liquidation. The active capital aggregated \$35,771,000; circulation, \$8,987,822; deposits, \$222,245,054; and reserve, \$62,453,955. The State banks, July 1, 1899, numbered 148, and had capital, \$16,708,000; deposits, \$155,185,881; and resources, \$198,658,082; and private banks, 100, with capital, \$1,844,884; deposits, \$8,926,490; and resources, \$11,498,673. The exchanges at the United States clearing-houses at Chicago, Peoria, and Rockford in the year ending September 30, 1899, aggregated \$6,477,829,256, an increase of \$1,028,997,283 in a year.

Education.—At the close of the school year 1897-98, the school population was 1,525,442; enrolment in public schools, 939,163, and average daily attendance, 729,227. There were 25,267 teachers, 12,740 buildings used as school-houses; and public school property valued at \$43,705,943. The revenue was \$17,463,396; expenditure, \$16,468,055, of which \$10,939,318 was for teachers' salaries. There were 328 public high schools, with 1267 secondary teachers, 35,068 secondary students, and 3256 elementary pupils; 62 private secondary schools, with 349 teachers, 4022 secondary students, and 3630 elementary pupils; 3 public normal schools, with 82 teachers and 2848 students in all departments; and 9 private ones, with 107 teachers and 2631 students. Normal training was also given in 12 colleges and 17 public high schools. Thirty-one colleges and universities for men and for both sexes reported 81 fellowships, 295 scholarships, 1206 professors and instructors, 13,787 students, 601,050 volumes in the libraries, valued at \$533,720; \$565,580 invested in scientific apparatus, \$8,073,235 in grounds and buildings, and \$10,499,217 in productive funds; \$1,613,185 in total income; and \$553,204 in benefactions. Four colleges for women reported together 1 fellowship, 2 scholarships, 58 professors and instructors, 533 students, 11,850 volumes in the libraries, \$6500 invested in scientific apparatus, \$360,000 in grounds and buildings, and \$57,880 in productive funds, \$90,856 in total income, and \$14,350

in benefactions. In 1899 there were 1732 periodicals, of which 181 were dailies, 1152 weeklies, 293 monthlies, and 20 quarterlies.

Finances.—The total assessed valuation in 1898 was \$772,431,976, a reduction in a year of \$23,938,642; tax rate, \$5.60 per \$1000; debt, none, excepting \$18,500 in bonds probably lost. Hereafter real estate is to be assessed every four years instead of annually, and property will be appraised at full value and assessed at one-fifth thereof.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 4,785,000.

Municipal Ownership.—The biennial report of the State Bureau of Statistics of Labor, issued at the close of 1899, contains an interesting comparison of some of the results of municipal and private ownership of public utilities. The report treats particularly of electric light and power plants, and waterworks in the cities and towns of the State, and, incidentally, of the cost and production of gas, which is supplied throughout the State by private corporations. According to the statements and figures given, where plants are owned and operated by municipalities the service is in the main much cheaper and more satisfactory. Municipal plants cost less for general expenses, repairs, and renewals, and more for wages and supplies. The report also shows that there are in the State 57 gas plants, all under private ownership; 236 electric light and power plants, of which 197 are under private and 39 under municipal ownership; and 165 waterworks plants, of which 35 are under private and 130 under municipal ownership.

Municipal Affairs.—Carter H. Harrison (*q. v.*) was re-elected mayor of Chicago, April 4, by 149,000 votes. It is estimated that from 20,000 to 40,000 independent Republicans voted for Mr. Harrison on account of his record as the champion of popular rights against the recent attempts of the street-railway combination to buy the city council. Ex-Governor John P. Altgeld was the candidate of the free-silver wing of the Democracy, and received 46,000 votes. His candidacy was designed to affect the national rather than the local political situation, and represented a protest against the supposed combination between Mr. Harrison and Mr. Richard Croker, the Tammany Hall leader, for control of the Democratic National Convention in 1900; it combined with the Chicago platform of 1896 a plank for the immediate municipal ownership of public utilities, which compelled both Mr. Harrison and Zina R. Carter, the Republican candidate, to emphasize their own adherence to municipal ownership of street railways as a principle and aim. A decision of the Supreme Court early in the year put an end to the separate municipal existence of the town of Pullman, and merged it in the city of Chicago.

Labor Troubles.—The last of the troops who had for months been on guard to preserve the peace between the union strikers and the non-union negroes at the coal mines in Pana, Ill., were removed March 25, the situation being regarded as sufficiently secure against a renewal of disorder to warrant it, and the grand jury adjourned without finding indictments against the miners and negroes who had participated in the riots which made the presence of the troops necessary. On April 11, however, another riot broke out between the black and the white miners, in which it was reported that five men and one woman were killed and eight persons wounded, and the trouble was settled only by the mine owners agreeing to recognize the union and send away the negro miners brought in from other localities. At Fredonia, Ill., a party of negroes was attacked by strikers, and in retaliation the negroes burned Union City, a town inhabited by union miners, who were driven to the woods, where the fight continued until reinforcements were sent to the aid of the union men. Early in July the strike at the stock-yards and packing-houses in Chicago was checked temporarily by increasing the wages of 5000 men. About the same time the importation of non-union negro miners to take the places of union white miners at Cartersville, Ill., made it necessary to call out the State militia, which remained in the town for ten weeks. As soon as they were withdrawn the negroes were again attacked, and seven of them were killed; the troops were therefore ordered to return. In view of the seriousness of the general situation, Governor Tanner expressed his determination to use every means in his power to bring the guilty to justice. It is estimated that during 1899 thirteen whites and fifteen negroes were killed, and about twice as many wounded, in these combined race and labor feuds.

Legislation.—The Allen law, passed by the legislature in 1897, which gave city councils the right to grant fifty-year franchises to street car lines, with five cents as the minimum fare, was repealed March 7, when Governor Tanner signed the Alling Street Railway bill, under which no franchises can be granted for a longer period than twenty years, and the city councils may stipulate for fares less than five cents. This change in the law was brought about by the remarkable uprising of popular indignation caused by the attempt of the Chicago city council to extend for fifty years the franchises controlled by the street car combination. The legislature created a board of inspectors, with power to inspect and license commission merchants, con-

sisting of one member from each of the following organizations: The Horticultural Society, the Dairymen's Association, the Retail Dealers' Association, the Butter and Egg Board, and the League of Commission Merchants. The office of State entomologist was created, with power to inspect orchards and nurseries; without his certificate of freedom from dangerous insects or contagious plant disease, no stock can be sold, and infected orchards and nurseries, pronounced by him incurable, may be destroyed without compensation to the owner. Parties must abide by the decision of the State Board of Arbitration under penalty of fine. A "Juvenile Court" was established, distinct from all other courts, in counties of over 500,000 inhabitants, for the trial, care, and disposition of all dependent, neglected, and delinquent children; and "Parental or Truant Schools" were established in cities, in which children guilty of habitual truancy or of habitual violation of public school rules are to be confined and taught. The Board of Pardons was granted greater powers, including the right to parole criminals confined in the State Penitentiary. A statute worthy of imitation was the prohibition of the public exhibition for pecuniary gain of persons who have been conspicuous through some criminal act, which has a tendency to degrade morals, of their pictures or of articles belonging to them, as well as the exhibition of persons whose deformity would attract public curiosity. The use of the national flag for advertising purposes, or its desecration, was prohibited. The office of State food commissioner was created, with power to inspect all food and see to the punishment of those who adulterate the same. The State Board of Health was authorized to examine and license all physicians and surgeons, and to supervise all lodging houses, the amount of air space therein to each person in every sleeping room being fixed by law.

The efforts to avoid future repetitions of the year's labor troubles resulted in the following legislation: Deception, misrepresentation, false advertising, false pretences, and unlawful force in the procuring of employees to work were prohibited, and failure to state the existence of a strike, lockout, or other labor trouble will hereafter be deemed false advertisement and misrepresentation, punishable by fine and imprisonment. It was declared a felony, with imprisonment in the penitentiary for from one to five years, to hire persons to guard with arms or deadly weapons other persons or property, and any person coming into the State with deadly weapons to guard other persons or property, without a written permit from the Governor, will be similarly punished. Free employment offices were established, one in each city of over 50,000 inhabitants, and three in cities of over 1,000,000, the offices and officials to be sustained and all expenses paid by the State. A State mining board of five members was created, to have supervision of mines, in addition to which the governor is to appoint seven inspectors of mines, having important powers and to be paid by the State. No inspectors of mines, mine managers, hoisting engineers, or mine examiners can be employed until they have been declared qualified by the State board. The character of construction and the machinery of all mines were regulated by very minute legislation, and many kinds of safety appliances were specifically required.

State Officers and National Representatives.—Governor, John R. Tanner; lieutenant-governor, W. A. Northcott; secretary of state, James A. Rose; treasurer, F. K. Whittemore; auditor, J. S. McCullough; attorney-general, E. C. Akin; adjutant-general, J. N. Reece; superintendent of insurance, J. R. B. Van Cleave; superintendent of education, Alfred Bayliss. Supreme Court: Chief justice, Joseph N. Carter; associate justices, J. W. Wilkin, J. H. Cartright, A. M. Craig, Jesse J. Phillips, B. D. Magruder, C. C. Boggs; clerks, A. D. Cadwallader, C. Mamer and Jacob O. Chance. The State legislature consists of 87 Democrats, 115 Republicans, 1 Populist, and 1 Prohibitionist. Senators: Shelby M. Cullom, from Springfield, and William E. Mason, from Chicago—both Republicans. Representatives: James R. Mann (Rep.), from Chicago; William Lorimer (Rep.), from Chicago; George P. Foster (Dem.), from Chicago; Thomas Cusick (Dem.), from Chicago; Edward T. Noonan (Dem.), from Chicago; Henry S. Boutell (Rep.), from Chicago; George E. Foss (Rep.), from Chicago; Albert J. Hopkins (Rep.), from Aurora; Robert R. Hitt (Rep.), from Mount Morris; George W. Prince (Rep.), from Galesburg; Walter Reeves (Rep.), from Streator; Joseph G. Cannon (Rep.), from Danville; Vespasian Warner (Rep.), from Clinton; Joseph V. Graff (Rep.), from Pekin; Benjamin F. Marsh (Rep.), from Warsaw; W. E. Williams (Dem.), from Pittsfield; Benjamin F. Caldwell (Dem.), from Chatham; Thomas M. Jett (Dem.), from Hillsboro; Joseph B. Crowley (Dem.), from Robinson; James R. Williams (Dem.), from Carmi; W. A. Rodenberg (Rep.), from East St. Louis; George W. Smith (Rep.), from Murphysboro.

ILLINOIS, UNIVERSITY OF, between Urbana and Champaign, Ill., opened in 1868, non-sectarian, co-educational, has the following schools, to each of which is added the number of students for the academic year 1898-99: The Graduate School (49 men, 9 women; total, 58); the colleges (629 men, 238 women; total, 867); the Biological Station (11 men, 4 women; total, 15); the Winter School in Agriculture

(26 men); the Law School (69 men, 2 women); the School of Medicine (479 men, 35 women; total, 514); the School of Pharmacy (151 men, 7 women); and the Preparatory School (132 men, 47 women); total in the University, 1492 men and 332 women, in all 1824. President, Andrew Sloan Draper, LL.D.

IMMIGRATION. No important bills have been passed or amendments to laws made regarding immigration in this country since the submission of the report of 1897-98 of the commissioner of immigration. In the report for the fiscal year ending June 30, 1899, mention was made, however, of important immigration regulations affecting the Hawaiian Islands, and also Cuba, Puerto Rico, and the Philippines. By the terms of the joint resolution of Congress, approved July 7, 1898, whereby the Hawaiian Islands were annexed to the United States, it was provided that all laws in the islands then in force should so continue, except that the federal statutes in relation to the exclusion of Chinese should be extended thereto. In the following session of Congress a bill was introduced to extend the anti-contract law of the United States to Hawaii, but it failed to become a law. The result, reports the commissioner of immigration, through unofficial information, is the introduction into the new territory since the passage of the resolution of annexation, of not less than 25,000 Japanese coolies under contract to work on the sugar plantations, besides an unknown number of Portuguese and Italians. He also reports the news of the arrangement for wholesale importation of Italian peasants into Hawaii. In striking contrast to the conditions prevailing in Hawaii, the islands now held under the rules of military occupation have been subjected to the immigration laws and regulations by action of the secretary of war. These islands are not, however, under the jurisdiction of the Bureau of Immigration. This bureau recommends, among amendments to the general immigration laws for the year, some action to prevent the frequent evasion of the laws effected at our larger ports by aliens who enter this country under the guise of sailors, and who thus gain entrance without their fitness to land being determined. There is recommended, also, careful legislation affecting immigration from Canada and Mexico. Amendment is also recommended for that section of the act of March 3, 1893, which prescribes the compilation by oceanic transportation lines of a list of the aliens in cabin passage, whether first or second class. Owing to the lateness of cabin passengers to arrive on board ship, and the consequent impossibility of making up the list in time to be sworn to before a United States consul at the port of embarkation, the agents of the various steamship lines have been unable, though reported willing, to comply with the law. This state of affairs, according to the commissioner-general of immigration, not only lessens the chance of detecting infringements of the law by cabin passengers, but has, besides, he says, induced the most objectionable class of aliens to secure cabin transportation as a means of escaping the vigilance of the inspection officers. This vigilance can be effectively exercised as to steerage passengers by reason of the lists or manifests containing complete information regarding each person. Of the arrivals of cabin passengers in this country during the period to which the report of the commissioner for the fiscal year ending June 30, 1899, relates, there were 25,000 who intended to remain here and who would have been classed as immigrants had they travelled in the steerage.

Reference is also made, in the current immigration report, to the increasing number of Japanese, of the class known as "coolies," coming in at the Pacific ports. There is evidence of an elaborate and ingenious system by means of which this class are brought over under contract made through agents in the principal cities on the Pacific coast, to work under contractors for various kinds of construction in which cheap and unskilled labor can be utilized. Present indications point to a steadily increasing immigration of this character.

Immigration to the United States, which had been decreasing since 1896, showed an increase of 82,416 for the fiscal year 1899. The figures for the years ending June 30, for 1896, 1897, 1898, and 1899 are respectively 343,267, 230,832, 229,299, and 311,715, the increase in immigration of 1899 over 1898 being 36 per cent. Europe supplied 297,349 of the total 311,715; Asia, 8972; Africa, 51; all other lands, 5343. The increases were: From Europe, 79,563; Asia, 335; Africa, 3; other countries, 2515. The total of 311,715 does not include immigrants from Canada and Mexico. Italy shows an increase of 32 per cent. for 1899, and Austria-Hungary, 57 per cent., while the Russian Empire, with Finland, shows an increase of 104 per cent. Italy sent to this country nearly 80,000 immigrants, and Hungary and Russia over 60,000 each. Great Britain sent 45,123. Out of the total number of immigrants there were 195,277 males and 116,438 females. The number under 14 years of age were 43,983; over 45 years, 19,545, and between 14 and 45 years of age, 248,187. Of the number over 14 years of age who were illiterate, 1022 persons could not write, and 60,446 could neither read nor write. As many as 174,613 immigrants landed in this country with less than \$30 each. The number debarred from landing were returned for the following causes: Convicts, 8; insanity, 20; assisted in immigration, 82; diseased, 348; under contract labor, 741; paupers, 2599. About 800 paupers and 300 contract

laborers were debarred on the borders of the United States. The expense incurred for the enforcement of the immigration laws for the fiscal year ending June 30, 1899, was \$288,022.26, and the receipts aggregated \$421,457.64. The balance on hand, \$418,326.43, is a gain over that of the foregoing year of \$133,445.38. An appropriation of \$100,000 was made for the enforcement of labor alien laws, of which \$87,725.08 was expended.

IMMUNITY. See SERUM THERAPY; TYPHOID FEVER.

IMPERIAL ACADEMY OF SCIENCES OF ST. PETERSBURG, founded by Peter the Great in 1725, comprises three divisions: (1) The physical and mathematical; (2) the Russian language and literature; and (3) the historical and philosophical. There are also three classes of academicians. The academy has a library of 180,000 volumes and 13,000 manuscripts, and receives 300,000 roubles from the government annually.

IMPORTS AND EXPORTS. See UNITED STATES and the articles on foreign countries.

INDEPENDENT ORDER OF ODD FELLOWS. See ODD FELLOWS, INDEPENDENT ORDER OF.

INDIA, BRITISH, a dependency of Great Britain, including those parts of Hither and Farther India which are under British administration. India has an area of 1,068,314 square miles, or with the feudatory states, 1,800,253. Its total population, according to the revised census statistics for 1891, is 287,223,431 inhabitants, of which about 66,000,000 are included in the feudatory states.

Government.—The secretary of state for India, a member of the British cabinet, has control of Indian affairs, and is assisted by a council of fifteen members. The executive authority is vested in a viceroy or governor-general, who becomes resident in India. The latter is appointed by the crown, and acts under the authority of the secretary of state for India. He also has a council, consisting of five members appointed by the crown, and of the commander-in-chief as an extraordinary member, each in charge of an executive department. There is a legislative council, consisting of the members of the executive, together with from ten to sixteen members nominated by the viceroy. British India was formerly divided into the three presidencies of Bengal, Madras, and Bombay, but with the extension and gradual reorganization of the dependency the expression "presidency" has lost its meaning. British India is at the present time really divided into thirteen local governments or administrations, as follows: Madras and Bombay (still termed presidencies), under governors; Bengal, northwest provinces, with Oudh, the Punjab, and Burmah, under lieutenant-governors; Assam, central provinces, Berar, Ajmere Merwara, Coorg, British Baluchistan, and the Andaman Islands, under chief commissioners. These several local governments are allowed a large measure of financial and administrative independence. The governors of Madras and Bombay are appointed by the crown, and are assisted by legislative and executive councils like those of the governor-general. The present (1899) governor-general or viceroy is the Lord Curzon, of Kedleston (formerly the Right Hon. George N. Curzon), who was appointed in 1898 and in the same year raised to the peerage under his present title.

Army.—The defence of India is provided for by an army consisting in 1897-98 of a European corps of 74,288 (74,466 on January 1, 1899), including 3616 European officers, and of a native corps of 140,640 (148,000 in 1899), including 1578 European and 3209 native officers, or a total of 214,928. According to the estimates of 1898-99, the total strength of the Indian army was about 219,370. The service is divided into the four commands of Bengal, Madras, Bombay, and the Punjab. Besides these troops, there are some 30,000 volunteers for active service in cases of emergency, and a trained reserve of natives, the imperial service troops, numbering in 1899 at least 19,000. Under the administration of Lord Curzon an important change of frontier policy has been introduced. To save great expense and the loss from the regular army of large numbers of men stationed at the distant frontier positions, it has been proposed to enlist the tribes in the defence of their own country, thus allowing a partial withdrawal of regular troops from the advanced fortified positions of the country. The provision of adequate military security for these positions will be supplied by the maintenance of camps or movable columns at neighboring points within or upon the administrative border of India. These cantonments will, where possible, be connected by light railways with the military bases of British India, so that it will be possible to push forward, almost at a moment's notice, the forces required for the suppression of disturbances or the support of the militia. Large bodies of troops were sent from India to South Africa in September and October, 1899. The

smoothness and facility of their transportation was a subject of favorable comment among military observers.

Justice and Crime.—There are high courts of justice in Madras, Bombay, Bengal, and the northwest provinces (from which appeal can be had to the privy council). The Punjab has a chief court with five judges, and the central provinces, Oudh, and Lind have each a judicial commissioner. Burnah also has a judicial commissioner as well as a recorder. In Assam the highest judicial authority is the high court at Calcutta. In 1896 the police numbered 142,600. The number of prisoners in jail at the end of 1896 was 109,934. During 1896, 840 persons were convicted in criminal cases.

Currency.—The monetary unit of India is the rupee, the value of which in United States currency, October 1, 1899, was 20.7 cents. The closing of the mints to silver in 1893 was due to the steady losses suffered by the Indian government from the depreciation of that metal. The government had incurred a large debt in European markets, and this had to be paid in gold, but the government revenues were paid in silver, and with the falling off in the value of that metal the financial burden constantly increased. Taxation was proposed, but considered inexpedient as likely to foster popular disturbances. The land taxes upon which the government relied were determined for long periods of time and could not be increased. When the closing of the mint to silver was decided upon in 1893 provision was made that when the rupee rose to the value of 1s. 4d. the mints should be reopened to the coinage of silver. The value of the rupee gradually rose, and so far as the government was concerned the financial conditions greatly improved. But complaint was made that the native growers and European planters were suffering severely from the change. It was argued that these classes were obliged to pay labor on the old scale, in spite of the appreciation of the currency. Hence, while industrial expenses remained nominally the same, the employers received lower profits. Heavy losses fell also upon the natives, who as times grew hard were obliged to turn their hoards of silver into money. The official classes were heartily in favor of the continuance of the new system, and showed their hostility to anything like a retrograde movement by the reply which they returned in 1898 to the proposals of the United States monetary commission of 1897. Finally in the spring of 1898 a currency committee under the chairmanship of Sir Henry Fowler was appointed to investigate the monetary situation in India. This committee reported in July, 1899, in favor of maintaining the gold standard and making it more effective. They declared that the British sovereign should be legal tender and that there should be free coinage of gold as in the branch mints of Australia. The government was advised to exchange gold for rupees at the rate of 1s. 4d. It was argued that this was absolutely necessary as a measure of stability and that any other course would be dangerous to India, four-fifths of whose trade is with gold countries. The project for the borrowing of gold to constitute a reserve was not favored, and it was pointed out that a considerable amount of gold had already been accumulated and that after the definite adoption of the gold standard a further accumulation would be facilitated. Trade was to be relied upon, and not the expedient of borrowing, which was considered wasteful. The committee opposed the policy of binding the government to redeem current rupees in gold. As to the course which India might take in the improbable event of an international agreement in regard to silver, the committee pointed out that none of its proposals would prevent India from taking part in such an agreement. The report of the committee became the basis of a law which was enacted in September, 1899.

Revenue, Expenditure, etc.—In 1897-98 (revised estimate) the revenue was Rx96,561,500 and the expenditure was Rx101,844,600. The large deficit of that year was due to widespread famine and to military operations on the northwestern frontier. In 1898-99 (budget estimate) the revenue was Rx99,085,400, and the expenditure, Rx98,194,000. The financial statement of March 20, 1899, estimated the surplus for 1899-1900 at Rx3,930,000. The largest branch of expenditure in ordinary years is for the army, which cost Rx27,073,100 in 1897-98. The army estimate for 1898-99 was Rx25,055,900. In regard to revenue the most important items are land, contributing (budget estimate) Rx27,568,200 in 1898-99; opium—contributing Rx5,329,800, and salt, contributing Rx8,728,000. There are also incomes from stamps, excise, customs, provincial rates, railways, irrigation, assessed taxes, and forests. Also the post, telegraph, and mint.

Railways.—The total length of railways open for use or under construction on March 31, 1899, was 26,059 miles, being a net increase of 604 miles during the previous twelve months. Of this mileage 3568 miles were still under construction or sanctioned. The total capital outlay on railways open on December 31, 1898, was \$857,600,000, an increase of \$27,000,000 over 1897; the gross earnings were \$87,885,561, or a gain of \$5,981,012. The number of passengers carried was 152,584,320, an increase of 1,320,505. The rolling stock was 4335 locomotives, 12,814 passenger

coaches, and 80,708 freight cars. The roads are divided into those which are owned and worked by the state, those which are owned by the state and worked by companies, lines worked by native guarantee companies, lines worked by assisted companies, and lines owned by native states. On March 31, 1898, out of a working mileage at that time amounting to 21,157, 10,422 miles were state lines worked by companies.

Agriculture.—Nearly 200,000,000 are dependent upon agriculture in India, and since 1870 the government has made special efforts to introduce improved methods and increase the production. The chief crops are rice, wheat, and other food grains, oil seeds, cotton, sugar-cane, tobacco, tea, jute, and indigo. Rice is the staple product and principal article of food. In 1896-97 the total acreage of rice was 66,234,485; wheat, 16,183,987; other food grains, 78,237,544; sugar cane, 2,651,721; cotton, 9,458,842; oil seeds, 10,531,864; jute, 2,215,105. Over 77,000 square miles of forests had been reserved in 1899, a state policy which is being vigorously pushed.

Manufacture.—After agriculture in importance comes manufacturing, especially in cotton, silk, and jute goods, and various articles of luxury, fine textile products and highly wrought work in ivory and precious metals. In 1896-97 there were 154 cotton mills in operation in India, and there were 145 collieries. See COTTON AND THE COTTON INDUSTRY.

Commerce.—The year 1898-99 was a prosperous one for Indian trade, as compared with the previous two years, when commerce was affected by the famine, the bubonic plague, and monetary conditions. In 1898-99 the exports of foreign trade were Rx120,213,000, of which Rx112,801,000 represented merchandise and the remainder gold and silver. The principal items were rice, raw and manufactured cotton, raw and manufactured jute, opium, seeds, hides and skins, tea, wheat, and indigo. The principal countries taking India's goods are, in the order of importance, the United Kingdom, China (Hong Kong and treaty ports), Germany, France, Straits Settlements, Egypt, the United States, Japan, Ceylon, Belgium, and Italy. In regard to imports for 1898-99, India received cotton manufactures, metals and metallic goods, sugar, oils, machinery, railway plant and rolling stock, silk, woollen goods, apparel, etc., to the value of Rx72,111,000. Counting gold and silver treasure, the total imports were Rx90,007,000. In addition to the foreign maritime trade India has a flourishing frontier land trade, the imports of which were in 1898-99 valued at Rx6,092,943, and the exports at Rx5,289,725, according to the incomplete returns available. The countries contributing to the foreign imports were the United Kingdom, Belgium, Germany, China, Russia in Asia, Straits Settlements, Mauritius, Austria-Hungary, and the United States. About 4000 vessels engaged in the foreign trade, with a tonnage of nearly 4,000,000. United States trade is gradually increasing. With Russia, this country furnishes most of the kerosene oil to India, a product which at the present time makes up the bulk of her imports into India, while she takes from that country chiefly hides and jute. American imports of raw jute are large, and of gunny-bags this country takes a very large proportion of the whole produce of India, and over two-thirds of the output of jute cloth. This is in spite of the high Dingley tariff on jute. Of gunny-bags the United States and the United Kingdom each took over \$40,000,000 in 1898-99, and of the cloth the United States took over 180,000,000 yards, against 35,000,000 by South America and 20,000,000 by Great Britain and Ireland. It is said that the principal clothing of over 250,000,000 of the inhabitants of India is of cotton, which means a considerable importation of the manufactured article, and much of this is of American origin. The export of the native article, both raw and manufactured, has in recent years been reduced by the increased purchases in Europe of American cotton, due to the cheapness and abundance of the latter. Within the past two or three years, notably 1899, the import of sugar into India has greatly increased. It has been said that the closing of the American market by the Dingley tariff has diverted the refined sugar exports of Germany, Austria, and France eastward, and quantities are being sent to India.

Language, Religion, and Education.—The languages spoken in India, excluding the European and other tongues in use among comparatively small groups, are 78 in number, contained in a dozen different families; 20 languages belonging to five families are, it has been estimated, spoken by not less than one million persons each. The Hindoo is the most important, being spoken by 85 per cent. of the population. In all, according to the census of 1891, 118 linguistic groups are recognized. The English language was spoken by 238,499, a large number, since those of British origin number only about 100,000. The Hindoo religion, like the Hindoo language, prevails in India, being adopted by about three-fourths of the population. The Mohammedans numbered 57,321,164 in 1891; the so-called Animistics, 9,280,467; and the Buddhists, 7,131,361, of whom the great majority were in Burmah. The number of Christians was estimated at 2,125,000. There are five universities in the educational system of India, the universities of Calcutta, Madras, Bombay, the Punjab, and Allahabad. There are examining bodies. On March 31, 1897, there were 152,025

schools and colleges, with an attendance of 4,356,870, of which number only about 400,000 were girls.

History.—Lord Curzon, the new viceroy, landed in Bombay, December 30, 1898, and received an enthusiastic welcome. The policy of the administration was outlined in August. It involved in the first place some measures of military retrenchment. The large and costly fortifications which had been planned in the Chitral Valley and Khaibar were abandoned, and the railway through Khaibar was also given up. For the protection of the Khaibar it was proposed to strengthen and reorganize the Khaibar Rifle Corps. In general the policy was to do away with the existing system of shutting up the regular forces at points on the frontier. A native militia under British officers was to be stationed at certain points on the frontier, and these points were to be connected with movable camps on the border, which camps were in turn to be joined by light railways and connected with the military bases. Another object of the administration was to check the growth of bureaucratic power by granting a greater degree of independence to the collectors of the districts. Important legislative measures of the year were an act passed by the legislative council in February for the protection of persons against unfairly contracted bargains, and an act passed in March imposing countervailing duties on imported bounty-fed sugar. The latter aroused much opposition in England, where it was regarded as a violation of free-trade principles, but it was defended on the ground that it protected the sugar producers against their bounty-fed competitors in European countries. The British government had made many attempts to secure some concerted action on the part of European governments in this matter of sugar bounties. These had failed, and the present expedient marked a new line of policy. As to the foreign relations of India, the most noteworthy event was the threatened bombardment, February 16, of the Sultan of Oman's capital to make him withdraw the grant of a coaling station to France. (See FRANCE, paragraphs on History.) The mortality from the plague was reported to be diminishing in April, but the number of deaths down to the beginning of the year was estimated at 250,000, 134,000 occurring in Bombay, and this estimate was probably too low. Toward the close of the year the plague became more virulent, especially in Bombay, where the daily death rate was estimated at 200. (See PLAGUE.) The Famine Commission appointed to investigate the causes of the famine of 1897 reported that the land-owning and land-cultivating classes, the skilled artisans, and the commercial classes showed an improved condition, and did not appear to be in serious danger from famine, but among the poorer professional classes and the lower classes whose subsistence was precarious, there was still danger of distress. Toward the close of the year the famine was spreading widely, and covered the greater part of the central provinces and the southeast Punjab. The viceroy made a personal tour of the famine-stricken districts late in the autumn.

INDIANA, an east central State of the United States, has an area of 36,350 square miles. The capital is Indianapolis. Indiana was admitted to the Union December 11, 1816.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 141,852,594 bushels, value, \$38,300,200; wheat, 25,361,175, \$16,231,152; oats, 34,301,248, \$7,889,287; barley, 153,300, \$68,985; rye, 464,633, \$223,024; buckwheat, 85,296, \$50,325; potatoes, 8,214,232, \$3,532,120; and hay, 2,093,376, \$16,328,333. Live stock, January 1, 1900, comprised horses, 577,220, \$29,337,792; mules, 38,734, \$2,141,258; milch cows, 605,855, \$20,447,606; other cattle, 629,075, \$20,536,787; and sheep, 677,905, \$2,713,993.

Industries.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$17,213,070, an increase in a year of \$7,190,796. There were 98 manufacturers of tobacco and 869 of cigars, and the total output was 73,675,969 cigars, 130,424 pounds of plug, 139,031 pounds of smoking, and 540 pounds of snuff. Grain and fruit distilleries in operation numbered 27; the production of fruit brandy was 2003 gallons; amount of spirits rectified, 1,192,662 gallons; distilled spirits gauged, 28,526,150 gallons; production of fermented liquors, 766,896 barrels; and production of oleomargarine, 5,435,330 pounds. The annual report of the State geologist, issued in 1899, caused much alarm throughout the State, as it declared that the centre of the natural gas field had been reduced to less than 150 square miles. This opinion was sustained by the State gas inspector, so far as the near exhaustion of the field is concerned. The last officer reported that the great natural gas reservoir of the State, which at one time contained 2800 square miles, has narrowed to little more than 200 square miles of first-class territory, while the entire gas-producing territory can be included in 500 square miles, almost entirely in Grant, Delaware, and Madison Counties. On these reports natural gas supply companies began cutting off all consumption, excepting in residences, in November, and notified consumers to stock up with coal and wood.

In the northwestern part of Delaware County is a region covering nearly an entire township that is rich in both gas and oil. A number of corporations are using all the

gas they can obtain in order to exhaust the supply and get at the greater quantity of oil more quickly. This proceeding is upheld by State laws, which prohibit the mining of oil wherever gas may escape. Further development of the newly discovered beds of asphaltum lying beneath the eastern part of the city of Logansport shows that the area is much larger and the quality much better than the experts first supposed. The beds extend four miles from the city limit, and the asphaltum can be seen oozing out from between the rocks on the banks of the Wabash. At one point, and at a depth of 64 feet the bed was found to be four feet thick. During the calendar year 1898 the output of 141 coal mines was 4,920,743 short tons, valued at \$3,994,918, an increase of 769,574 tons over that of 1897, which was the largest in the history of the State. The principal quarry product was limestone, valued at \$1,686,572.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the delivery ports of Evansville and Indianapolis aggregated in value \$327,761, an increase in a year of \$22,469; exports, none.

Railways.—The new railway construction during 1898 was 32.50 miles, and in 1899, 61.23, giving the State a total mileage of 6502.15.

Banks.—On October 31, 1899, there were 113 national banks in operation, and 77 in liquidation. The active capital aggregated \$14,192,000; circulation, \$5,893,746; deposits, \$57,027,123; and reserve, \$23,128,962. The State banks, July 27, 1899, numbered 97, and had capital, \$4,514,190; deposits, \$15,100,945; and resources, \$20,859,520; loan and trust companies, 5, with capital, \$2,010,900; deposits, \$2,942,415; and resources, \$5,236,153; private banks, 52, with capital, \$1,146,615; deposits, \$5,188,894; and resources, \$6,692,153; and mutual savings banks, 5, with depositors, 20,191; deposits, \$5,323,607; and resources, \$5,907,372. The exchanges at the United States clearing-house at Indianapolis in the year ending September 30, 1899, aggregated \$147,373,443, an increase of \$13,525,330 in a year.

Education.—At the close of the school year 1897-98 the school population was 754,905; enrolment in public schools, 566,157; average daily attendance, 432,931. There were 15,223 teachers, 9754 buildings used as school-houses, and public school property valued at \$21,536,212. The revenue was \$7,441,546; expenditure, \$7,846,139, of which \$4,762,347 was for teachers' salaries. There were 349 public high schools, with 983 secondary teachers, 22,812 secondary students, and 5970 elementary pupils; 29 private secondary schools, with 165 teachers, 2048 secondary students, and 2760 elementary pupils; 3 public normal schools, with 40 teachers and 1463 students, and 11 private ones, with 181 teachers and 6597 students. Normal training was also given in 6 colleges and 7 public high schools. Fourteen colleges and universities for men and for both sexes reported 1 fellowship, 298 professors and instructors, 4344 students, 200,905 volumes in the libraries, valued at \$293,300; \$185,750 invested in scientific apparatus, \$3,710,000 in grounds and buildings, and \$2,041,283 in productive funds; \$491,073 in total income; and \$171,550 in benefactions. In 1899 there were 851 periodicals, of which 147 were dailies, 588 weeklies, and 81 monthlies.

Finances.—The total assessed valuation of property in 1899 was \$1,343,099,379, the highest on record, and an increase in a year of \$57,134,323. The State tax rate for the general fund was \$0.90 per \$1000, and for all State purposes, \$2.96. The debt was, foreign, all subject to call, \$4,916,615; domestic, all held by Purdue and Indiana Universities, \$484,000—total, \$5,400,615, carrying annual interest of \$176,925. The foreign debt was reduced by \$593,385 in 1898.

Population.—As estimated by federal officials the population on June 30, 1899, was about 2,635,000.

Legislation, etc.—Two constitutional amendments will be voted on at the general election in 1900: (1) To change the number of Supreme Court judges from "not less than three nor more than five" to "not less than five nor more than eleven judges," and (2) to change the provision that "every person of good moral character, being a voter," shall be entitled to admission to practise law in all courts of justice, to "the General Assembly shall by law prescribe what qualifications shall be necessary for admission to practise law in all courts of justice." The present "wide-open door" policy has been found prolific of mischief to a confiding public. The Board of Health was charged with the duty of inspection and the enforcement of the law prohibiting, under heavy penalties, the adulteration of food, drugs, liquors, and confectionery, and requiring the destruction of the adulterated articles. The importation of indigent children was forbidden, under heavy penalties, except as permitted by the State Board of Charities, which is granted great power. Voting machines were authorized, with penalty of fine and imprisonment of those who tamper with or deface them; and a voter selling or offering to sell his vote at any general, special, or primary election or convention, for any consideration whatever, shall be disfranchised for not less than ten or more than twenty years.

The new laws punish lynching with great severity. A "mob" was declared to be any collection of individuals assembled for any unlawful purpose, intending to

injure any person by violence and without authority of law, and the act of violence committed was declared to be "lynching." When such violence results in death those participating or aiding and abetting shall suffer death or imprisonment for life, and those present but not participating shall be imprisoned for not less than two nor more than twenty-one years. The law also provides for impeachment of officers from whose custody prisoners are taken by mobs, and bystanders who, being called upon, refuse to assist the officer in defending the prisoner are subject to fine and imprisonment.

A labor commission, consisting of two members, was organized; one member must have been for not less than ten years an employee for wages and must be affiliated with the labor interest, the other must have been for not less than ten years an employer of labor; they must not be under forty years of age, must not belong to the same political party, and neither must hold any other office. Whenever this commission hears of any labor complication, the members shall at once put themselves in communication with the parties to the controversy, with a view to induce them to arbitrate, the arbitration board to consist of the two commissioners, the circuit judge, and one to be selected by each of the contending parties; the courts are charged with the duty of enforcing the award. A department of inspection was created to carry out the provisions of a drastic and far-reaching law that provides with much detail for the safety and health of those who labor in factories and mercantile houses; the chief inspector is given most unusual powers, and the penalties for the violation of the statute are severe, inflicting both fine and imprisonment.

An act was passed providing that no ordinance for the purchase or establishment of any water-works or lighting plant or the granting of any franchise for the establishment or operation of any water-works or lighting plant, street railroad, telephone, or telegraph company in any incorporated town shall go into effect until thirty days after its passage and until voted upon at the polls, if within thirty days a referendum is demanded by 40 per cent. of the legal voters of such incorporated town. Trade combinations were prohibited, with a fine and imprisonment provided for each person taking part in the making of such combination. The miners' strike at Evansville, Ind., assumed a serious aspect June 21, when thirty negro miners were attacked by armed strikers lying in ambush. Five of the negroes, who had been imported by the Sunny Side mine from Kentucky, and one white man having them in charge, were shot, with the result that the mine was closed and the imported men were kept in hiding.

State Officers and National Representatives.—Governor, James A. Mount; lieutenant-governor, W. S. Haggard; secretary of state, U. B. Hunt; treasurer, L. Levy; auditor, W. H. Hart; adjutant-general, J. K. Gore; attorney-general, W. L. Taylor; superintendent of instruction, F. L. Jones; commissioner of insurance, C. W. Neal; commissioner of public lands, L. G. Rothschild; chief of bureau of statistics, J. B. Conner; geologist, W. S. Blatchley. Supreme Court: chief justice, John V. Hadley; associate justices, James H. Jordan, A. Dowling, L. J. Monks, F. E. Baker; clerk, R. A. Brown. The State legislature consists of 89 Republicans and 61 Democrats. Senators, Charles W. Fairbanks, from Indianapolis, and Albert J. Beveridge, from Indianapolis—both Republicans. Representatives, James A. Hemenway (Rep.), from Boonville; Robert W. Miers (Dem.), from Bloomington; W. T. Zenor (Dem.), from Corydon; F. M. Griffith (Dem.), from Greensburg; George W. Faris (Rep.), from Terre Haute; James E. Watson (Rep.), from Rushville; Jesse Overstreet (Rep.), from Franklin; George W. Cromer (Rep.), from Muncie; Charles B. Landis (Rep.), from Delphi; F. D. Crumpacker (Rep.), from Valparaiso; George W. Steele (Rep.), from Marion; J. M. Robinson (Dem.), from Fort Wayne, and Abram L. Brick (Rep.), from South Bend.

INDIANA UNIVERSITY. See UNIVERSITIES AND COLLEGES; PSYCHOLOGY, EXPERIMENTAL.

INDIANS OF THE UNITED STATES. *Population and Languages.*—The territory within the present limits of the United States was originally occupied by hundreds of native tribes and confederacies, speaking a multiplicity of diverse languages and dialects, but all closely resembling each other in physical characteristics, the population being greatest along the coast and the large streams, and sparsest in the arid regions of the West. The total number within the territory in question may have reached 600,000, which has now been reduced by war, famine, and disease to about 240,000, the destruction having been greatest along the Atlantic coast, where whole tribes have been so completely wiped out that their very names are forgotten. The early slave trade had more to do with this result than is generally known, thousands of Indians having been deported to the West Indies and sold as slaves by Spaniards, French, and English almost up to the end of the last century. The decrease has also been great among the Western tribes, although a few seem to

have held their own, while one or two which have been least disturbed may have actually increased. Within the past seventy years most of the Eastern tribes have been removed to the Indian Territory, which was originally set aside for this purpose by the government, while others have emigrated to Canada and a few to Mexico. About 25,000 Indians still remain east of the Mississippi, among these being the Penobscots and Passamaquoddies in Maine, the Six Nations in New York, the Pamunkies and others in Virginia, the Cherokees and so-called Croatans in North Carolina, the Catawbas in South Carolina, the Seminoles in Florida, the Choctaws in Mississippi, the Miamis in Indiana, and the Ottawas, Chippewas, Winnebagos, Menominis, Pottawatomis, and Oneidas in Michigan and Wisconsin.

The hundreds of native languages and dialects formerly spoken within the limits of the United States are reducible to about fifty distinct linguistic stocks. Of these, the Algonquian—extending along the Atlantic coast from the St. Lawrence almost to Cape Fear and northward quite to the Rocky Mountains—stands first in historical importance and wealth of literature. Tribes of this lineage greeted the discoverers at Penobscot, Plymouth, and Manhattan Island, at Jamestown and Roanoke, and under such leaders as Philip and Tecumtha they afterward contested every step of the conqueror's advance for more than two centuries. Other important stocks were the Iroquoian and Muskogean in the East and the Siouan in the West. The Cherokees alone have their own alphabet, invented by Sequoyah, a member of the tribe, about the year 1820 and now in general use among the full-bloods. Each of the five civilized nations in the Indian Territory—the Cherokees, Creeks, Choctaws, Chickasaws, and Seminoles—publishes all official documents in the language of the tribe, while the Cherokees have also their own national newspaper, printed partly in the language. There is also a small journal published in the Sioux language. Besides the dialects of regular development, there were "trade jargons," among which may be noted the Mobilian trade language, a corrupted Choctaw, formerly in use among the Gulf tribes; the Chinook jargon of the Pacific coast, from California far up into Alaska, and the curious "sign language" of the plains.

Houses.—The style and construction of the dwelling was determined by the necessities of habit and surrounding. Broadly speaking, the sedentary Indians built substantial structures, while nomadic tribes were content with temporary shelters, each using always the material most convenient to hand. Along the Atlantic coast and in the Ohio Valley the prevailing type was that commonly known under its Algonquian name of *wigwam*, having the shape of an old-fashioned wagon top, and made of bark laid over a framework of poles. Around the inside were raised platforms, which served both as seats and beds. The smoke escaped through a hole in the roof, and the only light came from the open door or from the fire almost constantly burning in the centre of the floor. The Iroquois "long house" was a variant of this type, having partitioned rooms opening upon a central passageway, so as to accommodate a number of families. In the Gulf States the houses were commonly of logs, planted upright in the ground, either in square or circular arrangement, chinked with clay and sometimes thatched with grass. Each family had also its own provision house, built of bark and raised upon poles to protect it from prowling animals. In every principal settlement was a council house, or "townhouse," a large circular structure of logs, with high conical roof thatched with grass and frequently further protected by a covering of earth. Inside were platform seats, sometimes ranged in tiers one above another to accommodate a greater number of spectators. In this were held the public functions, such as councils and dances. Among the Creeks the larger towns had each a public square with special buildings along the sides for the representatives of each clan, and a clear space in the centre for games and other ceremonials. Some tribes of the gulf region had immense dead-houses, or mortuaries. The houses of the settlement were usually widely scattered, but a few towns were compactly built and enclosed in strong palisade defences.

The Ojibwa, or Chippewas, of the lakes lived in conical bark lodges, while the Winnebagos and Sauks of the upper Mississippi covered their wigwams with mats woven from rushes. The houses in the permanent villages of the Mandans, Arikara, and Pawnees along the Missouri were solidly built of logs covered with earth, while along the whole extent of the plains the only shelter of the roving buffalo-hunting tribes was the conical *tipi* of buffalo skins laid over poles brought together at the top. In winter this was protected from the keen prairie blast by a circular wind-break of woven brushwood. The Wichitas on upper Red River built houses of long grass laid over a framework of poles. On the Columbia the houses were usually rectangular in shape, built of boards split from the cedar and elaborately painted with symbolic designs. The winter hut was partly sunk below the surface of the ground. With some tribes the house was a communal structure of two hundred feet or more in length, sheltering a whole band under the same roof. California had several very distinct types, among which the principal were the round-topped, clay-covered huts of the Sacramento, and in the warm South the

rush-mat lodges with arbors running along the front. The Papagos, south of the Gila, had a circular hut of grass thatch and a more substantial house of rectangular form, of clay plastered over laths or cross-pieces of cactus wood. The *wikiup* of the Piutes and Apaches was hardly more than a brushwood shelter, but the Navaho *hogan* was a permanent structure of logs filled in with earth, while the stone or adobe house of the Pueblo tribes, with its thick walls and well-squared corners, was built to endure for centuries. So far as known, Indian invention had never devised a chimney, unless perhaps among the Pueblos.

Food.—The majority of the tribes depended for subsistence chiefly upon agriculture, while hunting was rather a secondary occupation, excepting upon the buffalo plains. Corn, beans, and squashes were the staples of cultivation, and in the arid regions of the southwest the fields were rendered fruitful by a laborious system of irrigation. The woman was always the miller as well as the cook, the corn being beaten in wooden mortars or ground upon stone metates. In the lake region, where the season was too short for Indian agriculture, the wild rice supplied the place of corn. Several tribes, notably on the upper Missouri and among the Pueblos, cultivated a native tobacco, but the ordinary "tobacco" in use was a mixture of various barks and leaves. Sunflowers were sometimes cultivated for their seeds, which were beaten into an oily paste. Peaches, introduced by the whites, were adopted by the agricultural tribes at a very early period. Nuts, persimmons, wild plums, cranberries, and other wild fruits were gathered and used in large quantities. A delicious oil was obtained by beating up hickory nuts and treating the paste with water. The Columbia River tribes subsisted largely upon salmon, with camas and other marsh roots, while those of the coast range and the Sierras may be said to have depended entirely upon acorns and piñons. In the Sacramento Valley whole communities went out into the meadows in the summer season to feast upon the red clover blossoms. Fish, oysters, and clams were much used along the coast, the lakes, and in the well-watered timber region. Game, according to the nature of the country, was hunted by all of the tribes, particularly upon the plains, where the buffalo was almost the sole dependence. The art of making sugar from the sap of the maple is an Indian discovery, and among the Northern tribes the sugar-making season in early spring was always a time of busy industry. Distilling was probably unknown north of Mexico, but mild ferments were prepared from corn and the maguey by some tribes of the southwest, and a species of cactus was chewed for its exhilarating effect among those of the southern plains. Certain peculiar drinks were also used on ceremonial occasions. Ceremonial cannibalism was widely prevalent, but genuine cannibalism as a means of food supply was probably unknown within the United States.

Arts and Industries.—The native arts were well adapted to the simple necessities of the tribes, and the primitive product was often beautiful in design and execution, but degenerated rapidly after the coming of the whites in consequence of the ease with which manufactured goods could be obtained from the traders. The principal materials employed were wood, shell, bone, and teeth, stone, skins, mica, and copper. Stone was used for hammers and hatchets, knives, scrapers, lance blades, and arrow heads, pipes and gaming wheels, pots and metates. Some of the finest art of the Indian was expended upon his pipes. Arrow points and knife blades were shaped by flaking from flint or obsidian. Some of the most beautiful art specimens were the circular stone gaming disks of the southern tribes. Shells were fashioned into gorgets, or cut or bored to make the celebrated wampum beads which supplied their chief decoration. Bone and teeth were used for tipping arrows, for knife blades, and sewing awls, while spoons were fashioned from horn. Wood and bark were used in the heavier constructions, such as houses, scaffolds, and canoes. The dug-out canoe was shaped by alternate burning and chipping, and those of the tribes about Puget Sound, carved from a single cedar trunk, were sometimes nearly one hundred feet in length. The Pueblos were noted for their wooden figurines. Mica was quarried for breastplates and mirrors, for which there was an extensive intertribal demand.

Skins were dressed for clothing, tipi covers, saddles, and other articles, most of this work being done by the women. The native copper of Lake Superior was beaten and stamped into shape for knives, awls, pendants, and breastplates, which found their way by trade over large areas. Meteoric iron and nugget gold were used, when they could be found, but iron in the ordinary sense was unknown, and in spite of contrary assertions there is no good evidence that any of the tribes within the limits of the United States understood either smelting or gold-washing. Since the advent of the whites, however, the Navahos have developed a considerable silver-working art, melting down silver coins for the purpose. Pottery and basketry were made by nearly all the tribes excepting those upon the plains, the Pueblo pottery and California basketry being especially beautiful. Weaving, for which the Navahos have become so famous, was a native art among the Pueblos, the material used being a

species of wild cotton. Some of the Eastern Indians spun and wove cordage from various vegetable fibres and the hair of animals, while feather weaving was also practised among a few tribes. The labors of war, hunting, the making of weapons, canoes, and traps, the heavier house building, and a part of the agricultural work were assumed by the men, while upon the women devolved the care of the household, the procuring of wood and water, the setting up of the tipi, the skin dressing and sewing, the pottery and basket making. The dog is the only animal certainly domesticated before the coming of the whites, with the exception of certain birds kept for their feathers.

Dress.—The differences of dress among the tribes were chiefly a matter of minor detail. In general the Indian wore but little clothing. The ordinary costume of the Eastern warrior consisted of a fringed shirt of buckskin, leggings and moccasins of the same material, and a breechcloth around the loins, with beads, pendants, feathers, and paint as his fancy dictated. In some tribes tattooing was practised. Some tribes allowed the hair to fall loosely at full length, others wore it in two long plaits hanging down in front; others again cut it off just above the eyes, and others shaved nearly the whole head. Everywhere east of the Rockies the scalp lock was worn, a small plait of hair hanging down behind from the very centre of the head, and elaborately set off with pendants and other ornaments. This was the trophy so eagerly prized by the warrior as the evidence of victory over his enemy. The woman's dress consisted usually of a short-sleeved tunic, belted in at the waist, with leggings and moccasins made in one piece. Among the Hopi the unmarried girls were distinguished by a peculiar arrangement of the hair, somewhat resembling the outspread wings of a butterfly. Children usually went naked until about the age of ten years. Head flattening was common among the Choctaws and some Carolina tribes, and almost universal among those of the lower Columbia and Puget Sound.

Games and Ceremonials.—The time not occupied in war, hunting, or other serious occupations was largely given over to ceremonial feasts and dances and to games of various sorts. Many dances were religious in character, while others were purely social. Among those most often noted were the war dance, the scalp dance, the solemn thanksgiving of the green corn dance, the great annual sun dance of the plains tribes, and the snake dance of the Hopi. The dance usually began and ended with a feast. The ball play was the chief athletic diversion of the Eastern tribes, and was played with a ball and a netted ballstick somewhat resembling a tennis racket. Next in popularity came the game known among some of the Gulf tribes as *chúnki*, played with a small stone wheel and a stick curved at one end, the object being, by a nice calculation of speed, to slide the stick after the wheel in such a manner that both would fall together at a certain point. Target shooting and foot races were also common, while at night both sexes played hunt-the-button games, moving their hands in time to the accompaniment of a song. The women had also their own games, such as football, shinny, and a sort of dice played with marked pieces of wood or bone, and the awl game, played around a blanket on which were painted lines and dots to indicate the score. Gambling was a part of every contest, and the Indian would stake his last possession upon the result. Children imitated their elders, the boys practising upon prairie dogs or grasshoppers with their small bows, the girls learning to cook and sew under the instruction of their mothers, or building little play-houses for their buckskin dolls. All Indians were very fond of music, and there were songs for every occasion, the principal instruments being the drum, rattle, flute, and whistle.

Mortuary Customs.—The various methods of disposing of the dead depended chiefly upon the necessities of environment and the religious ideas of the particular tribe. Inhumation, either immediate or final, was probably most general, but almost every other method known in any part of the world was also practised. Ordinary inhumation prevailed among the Eastern tribes, but with the Choctaws and Nanticoques the body was only temporarily buried until the flesh had rotted, when the bones were dug up, carefully cleaned, and tied into bundles, which were thereafter kept always in the house of the surviving relatives. The Hurons exposed the body upon a scaffold until the recurrence of the annual Feast of the Dead, when all the skeletons were collected and the bones deposited in a common sepulchre. Burial mounds in the Eastern States give evidence that this custom was once quite general. Among some of the ancient Southern tribes the mummified bodies were preserved in dead-houses, guarded constantly by priests. On the plains the corpse was sometimes laid away in the branches of a tree, while among the Winnebagos and Eastern Sioux it was placed in a bark coffin upon the surface of the ground. On the lower Columbia the body was usually deposited in a large canoe, supported upon a platform, a smaller canoe being inverted over the bundle to keep off the rain. Cremation was general in the arid region of Nevada and the lower Colorado. In every case the property of the deceased was buried with him, or otherwise destroyed, together with his horse, dog, and sometimes—in the Columbia region—his slaves or even his wife. Food also was

frequently placed near the grave for the use of the soul while on its journey to the shadow world, and some tribes kept a small fire burning for several nights to light the soul on its way. The relatives cut off their hair to throw it as a last offering upon the tomb, and women gashed their arms and bodies with knives in token of their grief. During the period of mourning the friends neglected their personal appearance, and every night and morning the women retired to some solitary place to wail over their loss. The name of the dead was never mentioned if it could be avoided.

Government and Religion.—Excepting perhaps among certain Western tribes Indian society was based upon the clan. Under this system the tribe was organized into family groups or clans, all the members of one clan being considered as near relatives. Those of the same clan were not allowed to intermarry, and descent was almost universally reckoned in the female line. Certain hereditary duties or privileges were frequently in the keeping of particular clans. Chieftainship was hereditary, but the warriors never hesitated to set aside an incompetent successor, and the ordinary war captain held authority solely through personal merit. Women frequently occupied a high position in the scheme of government. Among the Iroquois no important measure could be enacted over the veto of a council of the mothers, and among the Cherokees the "war woman" had the power of life or death in regard to the fate of captives, and spoke in councils with as much authority as the chiefs. Female rulers were frequent among the Southern tribes, a notable instance being that of the queen of Cofitachiqui, mentioned in the De Soto chronicles. Tribes were sometimes united into confederacies, often of complex organization, as in the case of the celebrated Iroquois league. There were numerous military orders, dance societies, and secret medicine fraternities.

Indian theology had no supreme god, such a conception being far above the mental stage of the savage, but his imagination saw in every animal, tree, rock, and power of nature its own deifying anima, which he invoked for help or protection as the occasion required. The animal gods were naturally appealed to most by the hunter, while the agricultural tribes invoked the gods of the rain and the wind, and all alike, from ocean to ocean, paid reverence to the sun as the most glorious manifestation of superhuman power and beneficence. By the nomads of the plains the buffalo was regarded as an animal personification of the sun, while with the Pueblos, as among some oriental nations, the snake was an embodiment of the rain god. The celebrated Hopi snake dance was in reality a solemn prayer for rain upon the crops. There was frequently a tribal palladium, and every individual had also his own protecting "medicine." The sacred rituals were usually couched in an archaic dialect fully understood only by the priests, who refused to reveal the secrets to any but their own initiates. Abstract morality had but little place in the system. Among the tribes of northern California, as appears from recent researches of Professor McGee, there was found a peculiar language cult, under which the tribal dialect was regarded as a living entity, in which was centred the social custom and very existence of the tribe itself.

INDIANS OF THE UNITED STATES, OFFICIAL REPORT ON. The report of the Commissioner of Indian Affairs for the year ending June 30, 1899, shows an aggregate appropriation of \$8,237,675, of which a little less than half was used in the fulfilling of treaty obligations and for the support of schools. Appropriations for the current year ending June 30, 1900, amount to \$7,678,963, a decrease of \$558,812 below the expenses of the year 1898-99. The questions given the fullest attention in the report of the commissioner are the progress of education, Indian commissions, allotments and sales of lands, the work of irrigation on the various reservations, the sale of liquor to the Indians, Indians exhibited at expositions, etc., and the matter of guardianship for citizen Indians.

Education.—The guardianship of the American Indian assumed by the United States government is not a policy of mere sentiment, but a recognition of the justice of his claim to be given a support by those who had taken from him his means of subsistence. In the scheme of government protection education has been found the most powerful factor in fitting him for the benefits of civilization. The educational system is therefore a broad and comprehensive one, and includes studies of a more practical nature than those generally taught the white boy and girl in our public schools. The success of the Indian school may be inferred from the words of the commissioner: "Of the children attending the public schools of any of the great cities which draw their material from the slums, a greater percentage sink back into the degradation of their parents and revert to the life from which they were taken, than is the case with the Indian boys and girls who have received proper training in Indian schools." At present the principal objection to Indian education lies in the fact that adequate provision cannot at all times be made for the future of the student. "The government lays the foundation, and the pupil must thereafter build his own superstructure." The entire educational system of the Indian office is predicated upon the

final abolishment of the Indian reservation system. Since the dignity and necessity of labor are taught, along with mental and manual instruction, it is hoped that the present generation of young Indians may become self-supporting, and learn to appreciate individual rather than communal holdings. "When this result has been accomplished," says the commissioner, "the necessity for Indian reservations will cease." While the Indian population has remained stationary, there has been such a steady increase in the number being educated that the commissioner hopes that during the next quarter century there will be not a diminution of the Indian "population," but an extinguishment of Indian "tribes."

With an appropriation for the year of \$2,638,390, the enrolment and average attendance at the Indian schools were 25,202 and 20,522 pupils respectively, included in 296 schools of all classes. The following table exhibits the attendance for the fiscal year 1899, compared with the fiscal year 1898:

KIND OF SCHOOL.	ENROLMENT.			AVERAGE ATTENDANCE.			Number of Schools in 1899.

* Decrease.

† Thirty-six public schools in which pupils are taught not enumerated here.

‡ These schools are conducted by religious societies, some of which receive from the government for the Indian children therein such rations and clothing as the children are entitled to as reservation Indians

Of the 296 schools conducted under various auspices, 243 are exclusively under the control of the Indian Department, an increase of one in the number of government schools. In 1899 the present value of government schools was \$3,562,760.

The growth in average attendance from 3598 pupils in 1877 to 20,522 in 1899 is an actual growth, the population having remained practically stationary during that time. The average attendance in 1898 was 19,648.

Indian Exhibitions.—In a number of instances the department has granted authority for the taking of Indians from their reservations for exhibition or show purposes. Thus, Mr. Cody ("Buffalo Bill") and Mr. Salisbury took 100 Indians from the Pine Ridge and Rosebud reservations, South Dakota, for general show purposes, giving a bond in the sum of \$10,000. Fifty Jicarilla Apaches and 40 Utes were sent to the Denver Carnival in October, 1898. In these and similar cases permission has been granted upon condition that the government shall be under no expense, and that the Indians could be spared without detriment to their interests. The commissioner puts himself on record in this report as strongly opposed to the practice of granting the increasing demands for Indians for show purposes. The demoralizing effect of promiscuous exhibitions is pointed out as largely offsetting the work of elevating and civilizing the Indians. Civilized Indians are not wanted by the show people, and the Indians are thus taught that savagery has a market value and is worth retaining. "The boys in the day school know it, and speak longingly of the time when they will no longer be required to attend school, but can let their hair grow long, dance Omaha, and go off with shows."

Allotments and Patents.—During the year patents were issued and allotments confirmed among a number of tribes on reservations. Regarding the allotments made outside of reservations, investigations were continued concerning alleged fraudulent Indian applications, particularly in Minnesota and Wisconsin. There were originally 400 of these applications, most of which have been made by mixed bloods, in order to obtain the timber or for speculative purposes. Many fraudulent

applications have already been cancelled; others found to be made in good faith have been allowed to stand.

Commissions.—The work of commissions included conferences among the Crows, Flatheads, etc., the Chippewas, the Puyallup Indians, and the Five Civilized Tribes. The commission to the Five Tribes, otherwise known as the Dawes Commission, under the authority of the act of June 10, 1896, continued to exercise jurisdiction over citizenship matters in the Five Civilized Tribes. This act ordered the commission to hear applications and determine the eligibility of all persons petitioning for citizenship in any of the said nations. On November 29, 1898, it was decided that the jurisdiction of the commission superseded whatever jurisdiction may have been possessed by the tribes previous to the act. It is necessary, however, according to a recent ruling, that enrolments of the commission shall be approved by the secretary of the interior. The rolls of the Choctaw, Chickasaw, and Seminole Indians are about completed, but have not yet been submitted. An enrolment of the Mississippi Choctaws, who have been identified under a clause in the act, has been submitted, but not yet approved. The Choctaws of Mississippi retain their right to enrolment in the Choctaw nation, provided they remove and settle among that tribe in the Indian Territory. They shall not, however, be entitled to receive annuities. Provision was made in 1899 also for the allotment of all the tribal lands of the Territory equally among all the citizens. It was provided, in this connection, by an act of July 1, 1898, that the United States should secure from the Creek nation the cession of such an amount of land adjoining the Seminole lands as when added to their present reservation would give to each Seminole an adequate allotment. The Dawes Commission reported, however, that the Creek legislature had not responded and that in their opinion it would be impossible to secure from the Creeks any cession of lands for the purpose named. In pursuance of the per capita allotment of the lands of the nations in the Indian Territory, the commission has appointed a large number of appraisers, and is now engaged in appraising the lands of the Choctaw and Chickasaw nations and of the Seminole nation with a view to permanent allotment within those nations under their several agreements. Among the most important matters, perhaps, of all the duties to be performed under the Curtis act, are the matters of town-site provisions. This is especially so on account of the opportunities in the execution of this law for land-grabbing in the way of claims to lots, etc. The importance of this matter of laying out, surveying, appraising, and selling the lots of the towns is demonstrated, says the commissioner, by the fact that the people in the Indian Territory very soon after the passage of the Curtis act took a feverish interest in town-site affairs and seemed to regard the town-site provision as far overshadowing the others. It may be recalled that by this statute white residents in the Territorial towns, who had previously been unable to obtain title, can now purchase at a fair appraisal the land upon which they have built their homes and business houses. In regard to land-grabbing, warning has been given that good faith must be proved in every instance in order to secure title to lots. The laying out of towns has been facilitated during the year by two congressional appropriations and the appointment of two town-site commissioners, one to the Choctaw nation and one to the Chickasaw. On account of the small appropriation and of the strong opposition in the Cherokee and Creek nations, no commissioners were appointed for those nations. The town of Muscogee, of the Creeks, was destroyed by fire early in 1899, and on petition a commission was appointed to lay out this town. This is one of the most important towns in Indian Territory. It has between 5000 and 6000 inhabitants, and is the headquarters of the Union Agency, the Dawes Commission, and the inspector of the Indian Territory. It is also a place of session for the United States Court. The town of Wagoner also experienced a destructive fire, and a commission has been appointed for that place. See INDIAN TERRITORY.

As to the work of other commissions, the cession of lands to the United States by the Flathead and Yakima tribes has not yet been brought about. The Crow Indians, however, agreed in August, 1899, to cede the northern portion of their reserve, comprising about one million acres, for \$1,150,000. About 200,000 acres lie along the Big Horn and Yellowstone Rivers. The commission to the Chippewa Indians continued during the past year the work of allotting lands on the White Earth reservation. This work was finished in the fall of 1899. The Puyallup commission had sold and reported to the Indian Bureau up to June 30, 1899, about 1884 acres of land in the reservation to which they were appointed, the sale price being \$98,859. The Puyallup Indians also consented to the sale of an agency tract of 598 acres, excepting a portion reserved for church, school, and farm purposes. The remainder was surveyed and platted into lots and blocks as an addition to the city of Tacoma.

Miscellaneous.—Since the passage of the act of January 30, 1897, prohibiting the sale of intoxicants to Indians, the Bureau of Indian Affairs has been able to cope

in a large degree with illicit liquor sellers. During 1899 many prosecutions were instituted and numerous convictions obtained. The Department of Justice conducted several investigations, notably among the Seminoles in Florida and the Chippewas of the Leech Lake Agency, Minn. An injustice to the Indians, mentioned in the 1899 report, is the generally irresponsible character of administrators and guardians and their sureties, appointed or approved for citizen Indians by local courts under the method now in vogue. Instructions have been sent to all Indian agents and school superintendents having citizen Indians under their care. These men are directed to co-operate with their county probate judge, and if possible effect an arrangement whereby in the future only such administrators and guardians as first meet with their approval and whom they adjudge to be proper persons as guardians shall be appointed. They are also directed to examine their records and ascertain the name and character of all holding these positions of trust. If these guardians are found to be irresponsible or improper, the payments of annuities shall be withheld, subject to future disposition for the benefit of the annuitant under the direction of the Indian office.

The chief work of the year in irrigation was the conclusion of an agreement for the completion of the irrigation system of the Crow Indians. The sum of \$100,000 of the grazing fund of the tribe was set aside for this purpose. Miscellaneous appropriations of small amounts have been expended during the year for irrigation, among the Indians, as follows: Southern Ute in Colorado, Uintah in Utah, Wind River in Wyoming, Yakima in Washington, Flathead in Montana, Pyramid Lake in Nevada, Navajo in Arizona, Lemhin in Idaho, San Carlos in Arizona, Western Shoshone in Nevada, Colorado River in Arizona. The first act of Congress authorizing the construction of a telephone line through Indian lands was passed on February 9, 1899, and grants the Missouri and Kansas Telephone Company the right to construct and maintain lines and offices for general business purposes in the Ponca, Oto, and Missouria reservations in the Territory of Oklahoma. The company shall pay the natives or tribes through whose territory its line extends the sum of \$5 for each ten miles of line constructed and maintained. The most important matter of legislation during the past year in connection with the railroads across Indian lands was the passage of the act of Congress of March 2, 1899. Under the provisions of this act, and subject to the rules of the Indian Department, authority has been granted for the survey of railway lines through Indian lands to the following companies: Arkansas Valley and Gulf; Gulf and Northern; Kansas, Oklahoma, and Texas; Rio Grande, Pagosa, and Northern; St. Louis, Tecumseh, and Lexington; Shawnee, Oklahoma, and Indian Territory; Tecumseh and Shawnee; Eastern Oklahoma, and Chicago, Milwaukee, and St. Paul. Special railroad grants made since the last report include: In Indian and Oklahoma Territories: Arkansas and Choctaw, Little River Valley, and Fort Smith and Western railroads; Nez Percé Indian lands: Idaho-Clearwater and Clearwater Short Line railroads; Omaha and Winnebago reservations: Sioux City and Omaha Railroad.

INDIAN TERRITORY, an unorganized Territory of the United States, set apart by Congress in 1834 for Indian reservations, originally had a land area of 69,830 square miles, from which 38,830 square miles were taken in 1890 to form Oklahoma Territory (*q. v.*).

Mineralogy.—Coal continues to be the chief production, the peculiar laws of Congress applicable to the Territory, and based on the treaty rights of the different Indian nations, preventing a general exploitation of other known mineral resources. Mining operations are carried on under lease from the Chickasaw and Choctaw nations. During the calendar year 1898 the output of 22 mines was 1,381,466 short tons, valued at the mines at \$1,827,638, an increase in a year of 45,086 tons, and the largest in the history of the Territory. Commercial sales aggregated 1,310,178 short tons. Prior to 1898 the operators had been paying a royalty of 17½ cents per short ton of screened coal, a rate nearly three times the average rate paid in competitive fields. Early in 1898 the royalty was fixed by agreement and ratified by Congress at 15 cents per short ton for mine-run coal. Operators claimed that this rate was practically prohibitive, and an appeal to the secretary of the interior secured a reduction by that officer to 10 cents per short ton of screened coal, in January, 1899. Funds arising from lease of mineral lands and from royalties on output of coal and asphaltum are reserved for schools for children of Indian blood, excluding colored freedmen; and the mineral royalties received in the fiscal year ending June 30, 1899, aggregated \$110,145, which was placed to the credit of the Chickasaw and Choctaw nations. See ASPHALTUM.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$24,241. There were 9 cigar factories, which had a combined output of 232,600 cigars. The coking industry showed a healthful development during the calendar year 1898, when two plants

with 130 ovens used 73,330 short tons of coal, and produced 34,110 short tons of coke, valued at \$96,639, the largest output in the history of the Territory.

Education.—For the first time in the history of the Indian Territory a general superintendent of its schools was appointed in February, 1899, to have a general supervision of all Indian schools, with supervisors in the Choctaw, Chickasaw, Creek, and Cherokee nations. This action was taken on the urgent and repeated recommendations of the Dawes Commission and of successive secretaries of the interior department, who had represented that a most serious condition existed by reason of the great number of non-citizen children who are growing to manhood and womanhood without school advantages. At the close of the school year 1897-98 there were 3 public high schools, with 9 secondary teachers, 98 secondary students, and 381 elementary pupils, and 9 private secondary schools with 24 teachers, 416 secondary students, and 1305 elementary pupils. Two colleges for men and for both sexes reported 20 professors and instructors, 134 students, \$60,000 invested in grounds and buildings, and \$13,800 in total income. Of two boarding schools maintained by the federal government, that of the Quopaw Agency, 7 miles from Baxter Springs, Kan., had capacity, 90; enrolment, 119; average attendance, 96; teachers, 4; farm land, 325 acres, and school buildings valued at \$11,570; and the Seneca School, at Wyandotte, had capacity, 130; enrolment, 145; average attendance, 130; teachers, 4; farm land, 160 acres, and school buildings valued at \$19,683. There are no available reports of the schools maintained by the several nations. In 1889 there were 79 periodicals, of which 5 were dailies and 72 weeklies.

Banks.—On October 31, 1899, there were 15 national banks in operation, the full number organized. The active capital was \$860,000; circulation, \$215,518; deposits, \$1,884,618; and reserve, \$569,533. Seven private banks, June 30, 1899, had capital, \$90,000; deposits, \$219,426; and resources, \$330,762.

Railways.—The new railway construction during the calendar year 1898 was 61.67 miles and during 1899, 78.99 miles, giving the Territory a total mileage of 1342.59. Congress passed a general enabling act (approved March 2, 1899), by which any company may acquire right of way through Indian lands for railroad, telegraph, or telephone lines by complying with the regulations of the interior department. Under this act the department granted authority to the Arkansas Valley and Gulf, the Gulf and Northern, and the Kansas, Oklahoma, and Texas railroads to build across Indian lands in the Territory, and special acts granted rights of way through the Choctaw, Chickasaw, and Creek nations to the Little River Valley and the Fort Smith and Western railroads.

Work of the Dawes Commission.—The annual report of the commission to the Five Civilized Tribes for the fiscal year ending June 30, 1899, shows greater progress in the work of the commission than during any preceding year. Much of it is taken up with the narrative of proceedings under the Curtis act of Congress regarding the new agreements with the respective nations. The most difficult and complex duty devolving upon the commission is that of preparing the citizenship rolls of the various tribes, to determine exactly who are citizens under classifications recognized by Congress. These rolls not only contain the names of legal citizens, but a description of each one to aid personal identification. An interesting part of the report politically is the opinion of the commission regarding the immediate future of the Territory. The time has not yet arrived for the installation of either a Territorial or a State government. The lack of uniform land tenures is urged against the measure, as the class ownership of the soil is confined to approximately 85,000 citizens as against approximately 400,000 non-citizens who do not own a foot of land, save as provision has been made recently for the sale of town lots. An agreement with the Seminoles, ratified by Congress July 1, 1898, permits the continuance of the Seminole government in a limited way, and one with the Choctaws and Chickasaws explicitly extends their government till March 4, 1906. Other complications exist which would render impracticable the immediate establishment of a new form of government. See INDIANS OF THE UNITED STATES, OFFICIAL REPORT ON (paragraph Commissions).

Population.—Reports of the population of Indian Territory are unsatisfactory, even official reports being obscure and contradictory. The secretary of the interior, however, reported on November 27, 1899, as follows: "The Five Civilized Tribes, numbering 62,500, with 18,000 freedmen and a white population of 200,000, inhabit Indian Territory."

INDO-CHINA includes the French possessions on the Anamese or Indo-Chinese Peninsula—namely, Anam, Cambodia, Cochin-China (French, or Lower), and Tonquin, of which separate accounts will be found under their respective headings. Indo-China is administered by a governor-general, M. Paul Doumer, resident at Hanoi, and a superior council, which decides upon the budget of Cochin-China, and advises regarding the budgets of Anam, Cambodia, and Tonquin. The total area is estimated at 196,422 square miles, and the population at 21,752,034. France has de-

veloped a large trade with Indo-China, and under the protection of the French tariff laws imports from France are said to have trebled within the past ten years. In 1898 French imports into Cochinchina amounted to \$4,800,000, and the exports to France were \$3,400,000. The principal imports are tissues, passementerie, and cotton ribbons; other items include wine, tools, etc., woollen goods, toys, fans, and other manufactured articles. Exports are rice, pepper, raw hides, exotic resins, copra, cocoa, volatile oil or essences, and albumen. Rice, by far the most important, was valued in 1898 at \$2,409,847. This article makes up four-sevenths of the exports, and fish makes up nearly two-sevenths. The trade policy of France in Indo-China aroused considerable interest in 1899 through the efforts of Governor-General Doumer to create a large Indo-Chinese loan in France for railway development in these colonies. A bill providing for a loan of 200,000,000 francs was finally passed late in 1899 by the French Assembly, the revenues of the colony to be collateral for the loan and the interest thereon; the first issue, 110,000 500-franc $3\frac{1}{2}$ per cent. bonds, was immediately subscribed for by the French public. The railroads to be built under the new loan are from Haiphong to Hanoi and Kaokay (300 miles); from Hanoi to Nam-Dinh and Vinh (240 miles); Tourane to Hué and Quang-Tri (150 miles); Saigon to the Khanh-Hoa and Lang-Bian, and Mytho to Cantho. Construction was to begin at once. A line 300 miles long, between Tonquin and Yunnan, is expected to extend French influence over Yunnan, and develop coal, copper, and tin mines there. China is said to have been induced to agree to build this railroad, with the help of French engineers. These various new roads—together with the Anamese Railroad, which has already been extended into China by virtue of the Franco-Chinese treaty of 1895 (see CHINESE EMPIRE) are expected to play an important part in the development not only of Indo-China itself, but of the trade of the French. Referring to the matter in a speech before the Paris chamber of commerce, Governor-General Doumer said: "As governor-general, I have, in the interest of the colony, expended all I possibly could in public works. We have expended not less than 1,000,000 francs in irrigating the soil, and 2,000,000 francs in cutting canals, making rivers navigable, and building railroads," and added that the loan of 200,000,000 asked for further development could not be considered as so much money withdrawn from circulation, since more than two-thirds of it would be expended in France, thus enriching French industries.

INFLUENZA, EPIDEMIC. During December, 1899, there were 342 deaths in London, England, from la grippe, or epidemic influenza. The epidemic of this disease increased during the last quarter of the year. Of these 342 deaths, 193 were registered during the last week in the month. The greatest proportional mortality was found in Paddington, St. George's, and Marylebone, from which one must infer that the richer classes have suffered most severely. As a majority of the cases of influenza were typical, it was possible to prevent to some extent the spread of the infection to the public as well as the exposure of the patients to unfit environment. The average number of deaths from influenza in London during December for the past ten years has been 100. See PSEUDO-INFLUENZA; THERMOL; VITAL STATISTICS.

INGERSOLL, Colonel ROBERT GREEN, the eminent lawyer and orator, died at Dobb's Ferry, New York, July 21, 1899. His life was not so crowded with stirring incident that much discussion thereof was awakened by his death; but comments on the man's intellectual beliefs and ethical teachings were very widely made in the pulpit and the press. Robert Ingersoll was the son of a Congregational minister, and was born at Dresden, N. Y., August 11, 1833. He received a common school education, studied law, and, the family having removed first to Wisconsin and in 1845 to Illinois, was admitted to the bar in the latter State. In 1857 he began the practice of law in Peoria with his elder brother, and entered into politics as a Democrat. As a lawyer he soon was recognized as an excellent counsel in railroad litigation. In 1860 he was nominated for Congress, but after a brilliant campaign was defeated. Having entered the Union service in 1862 as colonel of the Eleventh Illinois Cavalry, he participated in two battles, and was captured by Forrest's cavalry. Upon his release he returned to his practice of law and became a Republican in politics; in 1868 Governor R. J. Oglesby appointed him attorney-general of Illinois. His reputation became national in 1876, when, in a masterly speech in the Republican national convention at Cincinnati, he nominated James G. Blaine for the Presidency. The following year he declined to accept from President Hayes the position of minister to Germany. After this time he successfully practised law in Washington and in New York. His defence of the so-called star-route conspirators in 1883, securing for them acquittal, added to his reputation as an advocate. For many years, however, and up to the time of his death, he was most widely known as an eloquent opponent of the Christian religion.

As an orator Ingersoll was pre-eminently a rhetorician. This fact, together with his wit, vigor, and personal "magnetism," gave him a power to interest and persuade

an audience that was equalled by few men of his time. It should be added, however, that this influence, particularly among the better educated classes, rarely extended much beyond the actual time of his speaking. Some of his orations on literary subjects—as, for example, the one on Shakespeare—gave evidence that while Ingersoll was far from being an acute literary critic, he was a man of great literary sensibility. His sentences were euphonious and florid, addressed to the ear; his thought took little account of the necessity of sound premises; it was lacking in logical consecutiveness and appealed to the emotions rather than to the judgment. He possessed a remarkable spontaneity of diction and strength of expression; he was wont to employ sarcasm often marked by a certain cheap smartness of phrase. It was to a great extent by these qualities that his influence was extended over that class of thinkers which does not care to be hampered by logic.

But Ingersoll, the controversialist, cannot be set aside with such generalization. Concerning God and a future life, his tone was usually against their possibility, though at times this atheistic position seemed to be superseded by a view more akin to agnosticism. The crux of his discussions lay in the fact that he considered the Christian religion not as a system making for righteousness and aspiration, but as a set of crystallized and unchanging dogmas based on Hebrew mythology and the credulity of the early church. The God against which he spoke was "Jehovah"; the scriptural inspiration he opposed was literal and special inspiration; the punishment for sin he decried was the ancient conception of physical punishment rather than the more recent and more philosophical idea of spiritual retribution.

His lectures will not have an abiding place in the literature of disbelief and agnosticism; he was not philosophic like Hume, or subtle like Voltaire, or broadly scientific like Herbert Spencer; moreover, he was wanting entirely in the power of construction that has marked the idealistic philosophers. He was a vigorous rhetorician, and he employed his talents solely in the work of destruction. Among his publications, which consist almost wholly of his lectures, are: *The Gods and Other Lectures*, 1876; *Some Mistakes of Moses*, 1879; *Prose Poems*, 1884; *Great Speeches*, 1887; *The Bible; Ghosts, Foundations of Faith*.

INHIBITION. See **PSYCHOLOGY, EXPERIMENTAL.**

INMAN, Colonel HENRY, author, plainsman, and soldier, who died at Topeka, Kan., November 13, 1899, was born in New York City in 1837. His father, Henry Inman, who was president of the National Academy of Design, and his brother, John O'Brien Inman, were well-known artists. Colonel Inman went West when a young man and became an associate of Colonel W. F. Cody ("Buffalo Bill"). He saw much Indian fighting in the company of Colonel Cody and in the service of the United States Army. He entered the army in 1857, and served in the Indian campaigns in the Far West up to the breaking out of the Civil War. In the Army of the Potomac he served as aide-de-camp to General George Sykes, commanding the division of the regulars of the Fifth Corps. He was severely wounded before Richmond, and was brevetted for gallantry in action. He was successively promoted to be major and lieutenant-colonel, the latter appointment being given for his services in the Indian winter campaign of 1868-69. Colonel Inman's writings, which brought him some literary fame and which met with considerable success, reflect the period of his life and adventures on the Western plains. His last book, *Buffalo Jones*, was published during the year 1899. Other books written by him are: *The Old Santa Fé Trail; The Ranch on the Ox-hide; Tales of the Trail; A Pioneer from Kentucky; The Delahoyles*; and *The Great Salt Lake Trail* (written with W. F. Cody).

INSANITY. Statistics show that there are 58 insane Indians in this country out of a total of 250,000 Indians. Of the 58 but 7 are now under care and treatment in various retreats. At the 1898-99 session of Congress an appropriation was made of \$42,000 for the erection of the first Indian insane asylum in the country, as well as an additional \$3000 for suitable grounds. A site was chosen in Canton, S. D., and work was begun on the structure in August, 1899. This action became necessary because of the absence of claim upon State asylums held by these wards of the government.

The Asylum Committee of the London County Council issued in December, 1899, its report for the year ending March, 1899. This council has under its charge the asylums at Banstead, Cave Hill, Clayburg, Colney Hatch, and Hanwell, sheltering a total of 15,000 patients. The increase in this total during 1899 was 500. The council is erecting two more large asylums at Bexley and Horton, with a view to future requirements. The London medical schools are allowed to use the great mass of psychological material thus available for practical teaching purposes.

INSECTS AND THE PROPAGATION OF DISEASES. The recent agitation of the question of the propagation of malaria by mosquitoes has called the attention of the lay world to the patient investigation of this matter by Italian scientists

during 1890. The theory upon which they and many other investigators worked is not new. It is claimed that it was first advanced by Crawford, an American, in 1807, and again independently by an American, Dr. A. F. A. King, in 1883. Finally the fact of the propagation of malaria by mosquitoes has been established by Manson, Ross, MacCallum, Bignami, Bastianelli, Smith and Kilbourne, Laveran, Koch, Grassi and others.

Simond's investigation regarding the spread of the plague, coupled with the results obtained by Yersin, favor the theory that the spread of this fell disease from rat to man is accomplished by the flea. Nuttall fed the bacillus of the plague to flies, and ascertained that they can carry the infection to man. Kobler's experiments lead him to accuse the ant of assisting the flea and the fly in this matter. In the matter of the mosquito transmission of malaria, the names of Manson and Ross should be specially mentioned, as their studies were perhaps the most painstaking and accurate. Kaposi has instanced a case of leprosy following a mosquito bite. The experiments of Alvarez, as quoted by Carmichael, support this theory of leprosy transmission. Carmichael believes that this disease may also be communicated by the bed-bug and the fly. Boeck favors the theory that the itch-insect is an active agent in the spread of leprosy. Smith and Kilbourne established the fact that the tick propagates Texas fever. A brother of a patient who had died of tuberculosis became infected with the same disease after sleeping in the dead man's bed. Denevre found that 60 per cent. of the bed-bugs that infested this bed had the power of infecting guinea-pigs with tuberculosis. Tiktin demonstrated the presence of the spirillum of relapsing fever in the blood of bed-bugs which had preyed upon a patient suffering with that disease. Moran, during experiments upon mice, reached conclusions warranting the statement that bed-bugs may disseminate cancer. The bacilli of anthrax (malignant pustule) has been found in flies, in fleas and in earthworms.

Thus, it is seen, insects propagate disease in two ways: (1) As carriers, bringing infection to a wound or to food and drink on the surface of their bodies, after crawling over an infected spot, or bringing the infection in the form of bacilli in their intestinal tracts; (2) as intermediary hosts, bringing to the victim the infection in the fluids of their bodies and inflicting wounds through which the poison is introduced into the body of the victim. The mosquito is a true intermediary host. The proteosoma Labbe, taken up from the marsh, undergoes some alteration in the stomach of the mosquito, and ultimately reaches the venimo-salivary gland, from which the lancet of the mosquito, anointed with saliva, transmits the poison to the victim. Very important and interesting experiments have been made by Professor W. M. L. Coplin, M.D., of Jefferson Medical College of Philadelphia, in 1899, in the line of researches made by Sangree. He caused roaches, flies, and bed-bugs to walk over cultures of various disease germs, and then to walk over sterile agar plates, many hours later, having been kept in the meantime in large jars, under as natural conditions as possible. Examinations of the agar plates made subsequently showed active cultures of the various bacilli of infection. The feet, the ventral portion of the body and the wings of the insects carry infection and plant the disease organisms in rows and small colonies throughout the surface of the sterile plates. Forty-eight hours of continuous infectivity was shown in the case of many disease germs thus transmitted. In one case the typhoid bacilli carried on the body of a roach retained their virulence for 96 hours. But one germicide has proved of avail in disinfecting bacteria-laden material, and this is formaldehyde. The great difficulty in rendering harmless the insect carrier of disease is easily appreciated. See **MALARIAL FEVER AND MOSQUITOES**.

INSTITUTE OF ELECTRICAL ENGINEERS, AMERICAN. See **ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF**.

INSTITUTE OF FRANCE, a French learned society, founded in 1795, comprises (1) the Académie Française (*q. v.*); (2) the Académie des Inscriptions et Belles-Lettres, organized for the study of archæological and antiquarian questions, and has 40 members; (3) the Académie des Sciences, which has divisions for mathematical sciences, including geometry, mechanics, astronomy, geography, naval architecture, and general physics, and for physical sciences, including chemistry, mineralogy, botany, agriculture, anatomy, zoology, medicine, and surgery; (4) the Académie des Beaux Arts, which has divisions of painting, sculpture, architecture, engraving, and music, and (5) the Académie des Sciences Morales et Politiques, having sections of philosophy and ethics. The members of the various academies receive an annual stipend.

INTERNATIONAL BROTHERHOOD LEAGUE. See **UNIVERSAL BROTHERHOOD**.

INTERNATIONAL DATE-LINE. The cession of the Philippine Islands to the United States directed much popular attention to the difference in time between Manila and this country. Differences of local time, as, of course, every traveller

knows, exist between all places on the earth. But the manner in which they are to be computed is peculiar when the places in question are separated by very wide distances. That there should be such time differences is unavoidable in the very nature of things. We call noon the moment when the sun reaches its highest altitude in the sky; or, as astronomers say, "passes the meridian." But as the sun rises in the east and sets in the west it must necessarily pass over the successive meridians in the direction east-to-west. Thus, easterly places have their meridian or noon-time first. At any given moment, if it be noon at a certain town, all towns to the east of it have already passed their noon, and others to the west are still in the forenoon. Of any two places near each other, the more easterly has the later time.

But the earth is a round globe or nearly so. Consequently, if two places are separated by a whole hemisphere, it is difficult to say which is east of the other. It would be possible to travel from the first to the second, either by going east or by going west. Evidently the difference in time between the two places will depend upon which one we elect to call the easterly. Thus, it becomes really more or less a matter of choice as to how the decision is to be made.

Nearly all the maritime nations have tacitly agreed to use as the initial or fundamental line for counting time and longitude the meridian passing through the centre of the transit instrument in the British national astronomical observatory at Greenwich, England. Furthermore, it is the custom of navigators to calculate on the supposition that they are west of Greenwich, provided they are less than 180° of longitude west of that place. When a vessel travelling westward across the Pacific has passed the 180th degree of west longitude, it is customary to change the count abruptly to east longitude. As soon as 181° west is reached, 179° east is substituted for it in the ship's records. But according to the usual method of computing time differences, a ship in 180° west longitude will have a local time 12 hours earlier than Greenwich, while one in 180° east longitude will have its local time 12 hours later than Greenwich. Thus, when the longitude is changed suddenly from west to east the local time must also be advanced suddenly by 24 hours. Instead of being 12 hours earlier than Greenwich, it becomes 12 hours later. In other words, the date and day of the week are changed, Saturday, for instance, becoming Sunday. In travelling eastward, the same change is made in the opposite direction. The whole thing is thus quite simple so far as navigators are concerned. But it is different with the islands and settlements in the Pacific. These originally took their dates from the count of the ships discovering them. And as some of the early European navigators reached the Pacific by way of Cape Horn, travelling westward, and others around the Cape of Good Hope, travelling eastward, a sort of confusion of dates has arisen.

The present state of affairs is as follows: An arbitrary zigzag line has been drawn on the map of the world, passing through the islands near the 180th meridian of longitude. All places to the right of this line are counted in west longitude from Greenwich, and have what may be called the American date. Places on the left of the line are counted in east longitude, and have the Asiatic date, one day later. Unfortunately, chartographic authorities differ greatly in the delineation of this date-line. To have such a line drawn with perfectly definitive authority, it would be necessary for the great powers to have the line determined by a joint commission, and then to adopt the commission's recommendations by international agreement. This has never been done, so in one sense it may be said there is no *international* date-line. The term has, however, come into general use, and may well be employed pending such governmental action. The matter might be dealt with very appropriately if there should ever be another Prime Meridian Conference.

But in the absence of international agreement it is possible at least to mark out the line as it is actually used in the Pacific islands. For this purpose it is merely necessary to find out by correspondence with all the various settlements whether the date in public use is the American or Asiatic one. Strange to say, this was apparently not done until very recently. Professor George Davidson, of the University of California, and formerly of the United States Coast and Geodetic Survey, has made the necessary investigations, and his results have just been published in the form of a chart by the United States government. The international date-line as determined by Professor Davidson is indicated on the accompanying map. It is unquestionably the most authoritative date-line so far placed at our disposal. The reader will notice that there are few very important differences from the chart published in the *YEAR BOOK* for 1898. The principal change transfers Morell Island to the east of the line. The change of the Samoan Islands from west to east, which was made by order of King Malietoa in 1892, had been already noted in our chart of 1898. It may now be confidently expected that no further changes in the date-line will be required for a considerable period of time.

IOWA, a Western State of the United States, has an area of 56,025 square miles. The capital is Des Moines. Iowa was admitted to the Union, December 28, 1846.

Industries.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$2,003,256. There were 111 manufacturers of tobacco and 638 of cigars, and the total output was 68,839,847 cigars, 19,280 pounds of fine-cut, 373,299 pounds of smoking, and 672 pounds of snuff. Grain and fruit distilleries in operation numbered 4; the production of fruit brandy was 952 gallons; amount of spirits rectified, 78,720 gallons; distilled spirits gauged, 150,998 gallons, and production of fermented liquors, 187,892 barrels. During the calendar year 1898 the output of 187 coal mines was 4,618,842 short tons, valued at \$5,260,716, an increase over that of 1897 of 6977 tons, and the largest since 1888. Quarrying yielded sandstone and limestone to the value of \$531,648.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the delivery ports of Council Bluffs, Des Moines, and Sioux City aggregated in value \$132,581, an increase in a year of \$57,203; exports, none.

Railways.—The new railroad construction during 1898 amounted to 47.47 miles, and during 1899 to 582.66 miles, giving the State a total mileage of 9138.68. The equalized assessed valuation in 1899 was \$44,736,070, an increase of \$130,070 in a year.

Banks.—On October 31, 1899, there were 173 national banks in operation and 76 in liquidation. The active capital aggregated \$12,345,000; circulation, \$5,283,974; deposits, \$52,898,678, and reserve, \$17,605,207. The State banks, June 30, 1899, numbered 207, and had capital, \$9,073,170; deposits, \$29,257,807, and resources, \$40,800,100; private banks, 114, with capital, \$2,671,331; deposits, \$8,232,292, and resources, \$11,683,225, and stock savings banks, 195, with capital, \$7,801,000; depositors, 132,986; deposits, \$48,147,861, and resources, \$57,904,448. The exchanges at the United States clearing houses at Des Moines and Sioux City in the year ending September 30, 1899, aggregated \$118,794,117, an increase of \$17,626,215 in a year.

Education.—At the close of the school year 1897-98 the school population was 727,456; enrolment in public schools, 548,852, and average daily attendance, 370,845. There were 28,694 teachers, 13,775 buildings used as school-houses, and public school property valued at \$17,450,534. The revenue was \$8,746,925; expenditure, \$8,451,504, of which \$5,315,157 was for teachers' salaries. There were 326 public high schools, with 1001 secondary teachers, 26,262 secondary students, and 5502 elementary pupils; 44 private secondary schools,* with 177 teachers, 2776 secondary students, and 3150 elementary pupils; 5 public normal schools, with 71 teachers and 2750 students in all departments, and 17 private ones, with 145 teachers and 4462 students. Normal training was also given in 12 colleges and 17 public high schools. Twenty-two colleges for men and for both sexes reported 8 fellowships, 177 scholarships, 431 professors and instructors, 6427 students, 130,506 volumes in the libraries, valued at \$145,600; \$287,850 invested in scientific apparatus, \$2,173,708 in grounds and buildings, and \$1,556,769 in productive funds; \$391,395 in total income, and \$153,356 in benefactions. In 1899 there were 1091 periodicals, of which 69 were dailies, 875 weeklies, and 90 monthlies.

Finances.—In 1899 the equalized assessed valuations were: Real estate, \$390,297,578; personal property, \$90,348,093; railroads, \$44,736,070; telegraph and telephone companies, \$1,028,836—total, \$526,410,577, a decrease in a year of \$17,837,205, largely on real estate. The bonded debt, January 1, 1899, was \$10,000, and by July 1 all outstanding warrants had been paid. The treasury had accumulated cash assets of \$464,462, and it also held a claim against the United States government amounting to \$43,435 for war expenses.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 2,212,000.

Party Platforms.—The Democratic platform was drawn up with great care by the convention at Des Moines, Ia., August 16, and had unusual significance for the country at large, because it was regarded as foreshadowing the positions that Mr. Bryan desired to have the national Democratic party assume in 1900 under his leadership and Presidential candidacy. It endorsed the Chicago platform of 1896 "in whole and in detail," announced that the party would support Mr. Bryan; condemned trusts; approved the successful war with Spain, but deprecated and condemned war against the Filipinos; opposed "conquest of the Philippines because imperialism means militarism, because militarism means government by force, and because government by force means death of government by consent, the destruction of political and industrial freedom, and the obliteration of equality of rights and assassination of democratic institutions." It concluded with denunciation of letting convict labor by contract, urged a careful study of the existing liquor laws, and condemned the admin-

istration of Governor Leslie M. Shaw. The Populist convention, held also at Des Moines on August 16, had only about fifty delegates; they endorsed the Democratic platform for the fall campaign.

The Republican platform, adopted August 2, commended the National Administration; declared that "the monetary standard of this country and of the commercial world is gold. The permanence of this standard must be assured by Congressional legislation, giving to it the validity and vitality of public law. All other money must be kept at a parity with gold. And we urgently call upon our senators and representatives in Congress to lend their best endeavors to enact these propositions into law." It denounced the Chicago platform and its declarations in favor of free trade and free silver coinage at the rate of 16 to 1; declared that "industry and commerce should be left free to pursue their method according to the natural laws of the world, but when the business aggregations known as trusts prove hurtful to the people they must be restrained by natural laws, and, if need be, abolished." It also favored the enactment of legislation which will regain for American ships the carrying of our foreign commerce.

Elections.—The State offices filled by the election on November 7 were governor, lieutenant-governor, treasurer, Supreme Court judge, superintendent of public instruction, and railroad commissioner. The Republicans had renominated for governor Leslie M. Shaw, who received 239,543 votes; the Democratic candidate, Fred. E. White, received 183,326; the Populist candidate, Charles A. Lloyd, 1694; the Prohibitionist candidate, M. V. Atwood, 7650; the Social Labor candidate, M. K. Kremer, 763; and the United Christian candidate, C. C. Heacock, 483 votes. The total vote cast was 433,459, and Governor Shaw was elected by 56,217 plurality.

State Officers and National Representatives.—Governor, Leslie M. Shaw; lieutenant-governor, J. C. Milliman; secretary of state, George L. Dobson; treasurer, John A. Herriott; auditor, F. H. Merriam; attorney-general, Milton Remley; superintendent of public instruction, R. C. Barrett; adjutant-general, M. H. Beyers. Supreme Court: Chief justice, C. T. Granger; associate justices, Scott M. Ladd, G. S. Robinson, Josiah Given, C. M. Waterman, H. E. Deemer; clerk, C. T. Jones. The State legislature consists of 116 Republicans and 34 Democrats. Senators: William B. Allison, from Dubuque, and John H. Gear, from Burlington—both Republicans. Representatives: Thomas Hedge, from Burlington; Joseph R. Lane, from Davenport; D. B. Henderson, from Dubuque; Gilbert N. Haugen, from Northwood; Robert G. Cousins, from Tipton; John F. Lacey, from Oskaloosa; J. A. T. Hull, from Des Moines; William P. Hepburn, from Clarinda; Smith McPherson, from Red Oak; J. P. Dolliver, from Fort Dodge; and Lot Thomas, from Storm Lake—all Republicans.

IOWA, UNIVERSITY OF. See UNIVERSITIES AND COLLEGES: PSYCHOLOGY, EXPERIMENTAL.

IRELAND, an island forming part of the United Kingdom of Great Britain, has an area of 32,583 square miles, and a population, according to the census of 1891, of 4,704,750 (estimated, 1898, 4,541,903), divided among the four provinces of Leinster, Munster, Ulster, and Connaught. Since 1845 the population has decreased nearly one-half, owing to emigration.

Emigration.—Ninety-seven per cent. of the emigration has been to the United States. It was especially heavy from 1840 to 1850, the period of the potato famine. In recent times it has been decreasing gradually. The emigration to the United States in 1899, according to the annual report of the United States commissioner of immigration, amounted to 32,345. Of this number 1158 could neither read nor write, and 22,321 brought less than \$30 apiece. About 6000 had been in the United States before. Nearly 12,000 settled in New York, over 8500 in Massachusetts, 3370 in Pennsylvania, 1600 in New Jersey, over 1400 in Connecticut and Illinois, respectively, and over 900 in California.

Government.—The executive government of Ireland is vested in a lord lieutenant or viceroy, who is assisted by the chief secretary, the lord chancellor of Ireland, the attorney-general for Ireland, and a privy council, Irish affairs being under the general direction of the ministry in London. The chief secretary of Ireland, who is the secretary to the lord lieutenant, is responsible to the House of Commons for his administrative acts, and is assisted by a permanent under-secretary. Ireland is represented in the British House of Lords by 28 peers, and in the House of Commons by 103 members. The first elections under the new Irish Local Government act were held on January 16. See GREAT BRITAIN.

Religion and Education.—Seventy-five per cent. of the Irish are members of the Roman Catholic Church, 12 per cent. belong to the Church of England, and 9 per cent. are Presbyterians. At the head of the educational system of Ireland are the University of Dublin and the Queen's Colleges of Belfast, Cork, and Galway. There is a Catholic university, which includes the University of Dublin, and seven

Catholic colleges. The secondary and primary schools are mostly under the commissioners of national education.

Statistics for production and trade are included in those for the United Kingdom. See the article GREAT BRITAIN, which article also contains references to Irish affairs in its paragraphs on History.

IRON AND STEEL. The year of 1899 was unparalleled in the history of iron mining in the United States, and while accurate figures are not yet at hand, the production will, it can be positively stated, exceed that of 1898 by several million tons; it is estimated by some that the total production in 1899 will equal 25 million tons. It is highly satisfactory to see also that the American steel manufacturers were not only able to meet the native demand, but also that from abroad.

The *Engineering and Mining Journal* gives the following figures of pig-iron production for 1898 and 1899:

	1898.	1899.
Foundry and forge irons.....	3,437,537	4,189,415
Bessemer pig.....	7,837,884	8,319,799
Basic pig.....	785,444	1,010,618
Spiegel and ferro.....	213,769	229,661
Total.....	11,773,934	13,649,493

This shows an increase of 15.9 per cent.

The world's production of pig-iron has been:

Country.	Year.	Production in Tons.	Country.	Year.	Production in Tons.
United Kingdom.....	1898	8,031,151	Germany.....	1898	7,402,717
Austria.....	1897	887,945	Italy.....	1897	8,393
Hungary.....	1897	420,478	Japan.....	1896	16,000
Bosnia.....	1897	16,000	Russia.....	1898	2,225,000
Belgium.....	1898	979,101	Spain.....	1897	297,100
Canada.....	1898	68,755	Sweden.....	1897	538,197
France.....	1898	2,534,427	United States.....	1898	11,773,934

Owing to this increased activity in the iron-ore industry during 1899 there has been an extraordinary shipment of ore from the Lake Superior region, and the question is whether the high-grade ore bodies will be able to stand the drain upon their resources. It is prophesied that there will be a call in the future for the low-grade jaspery ore, of which there are boundless supplies still untouched, to mix with the high-grade Mesabi ore. This unusual demand for iron has led to the opening up of many mines in all parts of the United States that had been abandoned or shut down temporarily, and also to the starting up of a number of old blast-furnaces. W. B. Phillips, in a report of the iron making in Alabama, notes that Alabama ranks third as a producer of iron ore. Phosphorus is present in the Alabama ores to such an amount that they yield no iron of Bessemer grade, but the iron is successfully used for the manufacture of steel by the basic open-hearth process. J. F. Kemp points out that the titaniferous iron ores are extremely widespread, and that everywhere with two exceptions they occur in basic igneous rocks of the gabbro type. The iron ores of the Oriskany formation in Virginia usually contain some zinc, which forms a deposit on the furnace walls, and yields a valuable by-product.

Not only in the mining but in the manufacture of iron the year 1899 was one of unparalleled prosperity and productiveness in the United States. During the year the enormous production of over 25,000,000 tons of iron ore was consumed to keep the iron and steel mills of the country in operation. All but about 8,000,000 tons of this ore was drawn from the Lake Superior mining region. The total amount of pig-iron produced was 13,649,493 tons, which was an increase of about 16 per cent. over the tonnage produced in 1898. Estimates made by prominent authorities place the output of steel at 10,000,000 tons, of which about seven-tenths were manufactured by the Bessemer process. Despite the enormous production of iron and steel the demand exceeded the supply throughout the year, and prices rose steadily. At Pittsburgh, Penn., Bessemer pig-iron started the year at the price of \$10.75, and by July it had risen to \$20, and it closed the year at \$25 per ton. Foundry irons kept pace with Bessemer, and there was a proportionate advance in other grades. Steel billets sold for \$16.25 in January, and for \$37 and \$40 during the last months of the year.

Nearly every form of manufactured iron and steel exhibits a similar advance, as the following table of prices for December of 1898 and 1899 will show:

	1898.	1899.		1898.	1899.
Bessemer.....	\$10.80	\$25.00	Billets.....	\$16.50	\$37.00
No. 1 Foundry.....	11.10	24.00	Billet ends.....	11.00	24.00
No. 2 Foundry.....	10.75	23.25	No. 1 scrap.....	12.00	24.00
Mill iron.....	10.65	21.50	Steel rails.....	17.50	37.00
White iron.....	9.25	30.00	Bar iron.....	1.18	2.15
Mottled iron.....	9.30	30.50	Iron nails.....	1.30	2.30
Silvery, No. 1.....	13.00	27.00	Steel nails.....	1.25	2.30
Charcoal, No. 1 Foundry.....	16.00	27.00	Wire nails.....	1.50	2.95
No. 2 Foundry.....	15.50	26.00	Coke at ovens.....	1.50	3.00
Cold blast.....	21.50	28.00	Ferromanganese, 80 per cent..	50.00	100.00
Warm blast.....	15.25	27.00	Old iron rails.....	14.00	30.00
Muck bar.....	18.85	33.00	Old steel rails.....	10.00	23.00

The process of combination and consolidation in the iron trade which was so active in 1898 continued into 1899, and with them a new era may be said with considerable truth to have developed. A number of these combinations, like the Federal Steel Company, and the great Carnegie combination, already own or are acquiring the ore mines, coal mines, coke ovens, steamers, railways, mills, and every other facility which will make true their adopted motto of "from the mine to the consumer."

Activity in the iron and steel trade was not confined to the United States, but extended to all the industrial countries of Europe. In the first half of the year Great Britain produced 4,782,868 tons of pig-iron, and 2,587,241 tons of steel, and the estimates made for the second half of the year indicate a total output of 9,700,000 tons of pig-iron and 5,200,000 tons of steel for the year. In Germany the blast-furnaces reported for the ten months ending with October a total of 6,719,853 metric tons of pig-iron, an increase of 10 per cent. over 1898, and the total for the year is estimated at 8,165,000 tons, by far the largest quantity ever reported. In Belgium the estimated result of the year is a production of 1,015,000 tons of pig-iron, 501,500 tons of wrought iron, and 719,500 tons of steel. In France, Austria-Hungary, and Sweden and Russia substantial increases have been made. In its annual summary of the year's iron and steel production the *Engineering and Mining Journal* estimates "that the total production of pig-iron in the world in 1899 was in round figures 41,000,000 metric tons, an increase of 3,500,000 tons over 1898; while steel making showed even a greater proportionate increase, and amounted to 27,000,000 tons, an advance of nearly 3,000,000 tons over the preceding year."

One feature of this enormous activity in the iron trade has been to delay somewhat the progress in metallurgy and the general technology of steel and iron manufacture, and there have been no great changes made during 1899, although improvements which were under way have been on the whole substantially extended. These improvements have been largely in the line of the perfection of mechanical devices for handling the product and increasing the output. Most American steel is made by the acid process, but during the past year a large plant has been completed for the manufacture of Basic steel at Ensley, near Birmingham, Ala. Chalmot writes that ferro-silicon containing 11-13 per cent. of silicon has been made in blast-furnace and used in the manufacture of iron and steel, but the percentage of silicon can be increased only by recourse to the electric furnace. In this way alloys with as much as 46 per cent. of silicon are made. Ferro-silicon with 26 per cent. can be melted in a brass furnace; when 32 per cent. is reached a blast is required, and above that point the electric furnace is needed for fusion. Low-grade silicides cast well, but higher grades crack and form blowholes. Lantz, in *Stahl und Eisen*, gives some interesting comparisons bearing on the improvements which have taken place in rolling-mills. *Die Geschichte des Eisens*, L. Beck; *Handbuch der Eisenhüttenkunde*, A. Ledebur; *Journal of the Iron and Steel Institute*, LIV.

Blast-Furnaces.—The number of blast-furnaces in operation during the year reached its maximum in December. The last preceding full period in the number of furnaces in blast was in February, 1892. A comparison of the significant features of these two periods gives the following results:

	February, 1892.	December, 1899.
Number of furnaces in blast.....	308	283
Total weekly output, tons.....	187,383	296,059
Average weekly output, each, tons.....	608	1,050
Average daily output, each, tons.....	87	150

These figures illustrate a most significant feature which is now being manifested in blast-furnace practice—namely, the enormous increase in the size of the furnace being employed. During the last two years furnaces were built or placed under construction having a daily capacity of output of from 500 tons to 800 tons. The last and largest of these having a capacity of 800 tons of pig-iron daily was begun in December, 1899, by the American Steel and Wire Company. Some idea of what the construction of such a monster furnace means to the iron industry in labor and capital involved may be obtained from the following rough estimates: A single furnace of 400 tons capacity daily requires approximately 800 tons of ore every 24 hours. It takes in round numbers $1\frac{1}{4}$ tons of coke to make a ton of pig-iron, so that the furnace must be fed with 500 tons of fuel. In addition, about 200 tons of limestone are required for fluxing, and there are also minor supplies of sand, coal, etc. Finally there are the 400 tons of finished iron to be taken away every 24 hours. Summed all up, about 2000 tons of freight of all kinds—ores, fuel, lime, finished pig-iron, and other materials—have to be moved daily to keep the stack going, making about 70 car-loads of 30 tons each. Somewhere between 250 and 400 men will have to work to get out the ore, this depending upon its locality, richness in metallic iron, etc. To mine the coal and make it into coke, to quarry the limestone and do all the hauling, at least 500 men will be required, and the furnace itself will give work to 250 men at the very least. In other words, the running of a single blast-furnace turning out 400 tons of pig-iron daily means the employment of 1200 men and of \$2,000,000 capital. When it comes to the gigantic institution now planned by the American Steel and Wire Company to turn out 800 tons daily, it is impossible at this time even for the projectors themselves to give exact figures; but it is probable that not fewer than 2000 men will find employment by it, in one way and another, and that it and its ramifications will mean utilization of between three and four millions of capital.

Casting-Machines.—The building of these enormous furnaces has brought into increasing use casting-machines for making pig-iron, as a substitute for the time-honored practice of running the molten iron tapped from the furnace into hundreds of little channels cut in the bed of sand covering the casting-floor at the foot of the furnace, each channel being the mould for casting one "pig." The Uehling casting-machine is the one most extensively used in America, and in this arrangement the cast-iron is tapped from the blast-furnace directly into a large ladle which is carried by rail to the casting-machine. This consists essentially of a "Jacob's ladder" or common bucket elevator, of which the buckets and their supporting belt are replaced by a series of horizontal trough-shaped, open, cast-iron moulds, their ends supported and carried by the two parallel endless chains which form the skeleton of the elevator. This, in rising very gradually, carries these moulds successively under and past the lip of the ladle which contains the molten iron from the furnace. The ladle tips progressively and fills the passing moulds one after another. They pass on slowly up the elevator, so slowly that by the time any of them has reached the top of the elevator the pig-iron which it contains has become solid. When the mould passes the sheave at the top, the pig is dumped out upon another conveyor, which is horizontal and partly submerged in water. Arrangements are also provided for sprinkling the moulds with water on their return journey, and sometimes also while they are travelling full.

Gas Utilization.—One of the most important developments in blast-furnace practice has been the utilization of the gases, which are produced in enormous quantities and which were formerly wasted, to preheat the blast, to raise steam, to run gas engines, etc. Competent authorities estimate that over and above the power consumed to preheat the blast and raise steam for the blowing-engine, the waste gases from a blast-furnace will produce from 6 to 10 horse-power per ton of pig-iron output per week.

Steel.—In the ordinary process of steel manufacture the molten iron from the blast-furnace is first cast into pigs, and then these pigs have to be melted in the steel furnaces for making steel. Much study is now being given toward developing a commercially successful process by which the molten iron from the blast-furnace may be run directly into the steel converter, without the intermediate operation of casting and remelting. It seems likely that the next few years will record some notable developments in this direction. In the Bessemer process the year 1899 showed a further extension of the car-casting system; carborundum has also come into use as a substitute for ferro-silicon. (See CARBORUNDUM.) In open-hearth-furnace practice the tendency which attracts most notice is the increasing use of rotary furnaces or furnaces which, instead of being fixed and stationary like a blast-furnace, resemble more nearly a Bessemer converter in the respect that they are mounted so that they may be tipped up and down in a vertical direction to allow the molten metal to be emptied out. The Pennsylvania Steel Company, of Steelton,

Penn., and the new steel works at Ensley, Ala., both have large plants of rotary open-hearth furnaces in operation.

In rolling-mill operation and equipment there has been little to signalize the year. Where new equipment has been installed it has naturally been machinery of the latest pattern, such as the extension of the continuous mill to the rolling of merchant iron and small billets, and the growing use of continuous heating furnaces for ingots and billets. In armor-plate making the Knapp process has forged rapidly to the front, largely, if not entirely, displacing the Harvey process for war-vessel protection. A large and increasing use of armor-plate is in the construction of bank-vaults. One of the principal developments in the use of manganese steel has been in the same line or for safe construction. Nickel steel has gained ground during the year, more particularly for making propeller shafts, crank and thrust shafts, piston rods, connecting rods, and other engine forgings.

Foreign Trade.—In the cruder forms iron exports from the United States in 1899 were less than for 1898. There was a notable falling off in pig-iron and in steel rails, the comparative figures being: pig-iron, 1898, 249,377 tons; 1899, 228,640 tons; steel rails, 1898, 291,038 tons; 1899, 171,272 tons. There was, however, an increase in steel plates, wire and wire nails, and structural iron. The values for some of the most important classes of iron and steel exports for 1898 and 1899 respectively were: Metal working machinery, \$5,741,750, \$6,840,924; locomotives, \$5,190,782, \$4,767,850; pipes and fittings, \$4,595,451, \$6,763,396; locks, hinges, and builders' hardware, \$4,308,799, \$5,464,913; sewing machines, \$3,062,471, \$4,103,828; pumps and pumping machines, \$2,300,811, \$3,016,645. The total values of exports of iron and steel and various manufactures of the same have been reported as follows: 1897, \$62,737,250; 1898, \$82,771,550; 1899, \$105,689,645. These figures do not include railroad or street cars, bicycles or carriages, or agricultural implements; by far the largest item in this list, and one that shows a rapid increase, is mowers and reapers, which have been exported as follows: 1897, \$3,149,625; 1898, \$6,551,741; 1899, \$9,739,129. The magnitude of the iron and steel industry becomes more apparent in view of the fact that exports represent but a small part of the American product.

The import trade, which formerly overshadowed the exports, now takes secondary rank, although it has been on the increase. The total values of iron and steel imports, exclusive of ore, have been reported as follows: 1897, \$13,835,950; 1898, \$12,474,572; 1899, \$15,790,206.

IRON OIL. See OCHRE.

IRRIGATION. The irrigable area of the arid region of the United States is estimated by the secretary of the interior in his last report as 74,000,000 acres, capable, he says, "of sustaining and comfortably supporting, under a proper system of irrigation, a population of at least 50,000,000." On some of the Indian reservations irrigation works have been provided by the United States government, with promising results. The United States secretary of agriculture devotes a part of his report to the alkali soils of the West, which often increase in troublesomeness with irrigation, especially where too much water is applied to the crops and there is poor drainage. Seepage or leakage of water from canals and other causes tending to keep the ground unduly wet increase the troubles from alkali. The serious problems of irrigation at present relate to the disposal of public lands and to water rights and their distribution. The United States Department of Agriculture is studying the question of water rights in the several States, and hopes to cover the whole arid West this year if sufficient money can be secured. The National Irrigation Congress, in session at Missoula, Mont., September 27, 1899, passed a series of resolutions, which may be summarized as follows: The lease of public grazing lands was recommended at a nominal rental and in limited areas to settlers on adjacent lands, the revenues so derived to go to the States and Territories concerned for use in irrigation development. The report of Colonel Hiram M. Chittenden, recommending the construction by the federal government of storage reservoirs to aid navigation and irrigation was endorsed, and the federal construction of irrigation works was favored "wherever necessary to furnish water for the reclamation and actual settlement of the arid public lands." United rather than divided ownership of land and water was approved, the enactment of harmonious irrigation laws by the several States urged, the establishment of a national commission to adjust differences regarding the appropriations of interstate waters favored, the preservation of forest lands urged in the interests of the lumber and water supplies, and opposition was expressed to "the cession of the public lands of the nation to the respective States and Territories, except upon conditions so strict that they will insure the settlement of such lands by actual settlers in small tracts and absolutely prevent their absorption in large bodies under private ownership."

The California Water and Forest Association was organized in 1899 to work for the storage of flood waters in that State in the interests of navigation and irrigation

and to prevent land and other damages by floods. The association intends to co-operate with the various government departments in the interests of irrigation and water conservation. Some of the irrigation works of Utah have adopted pipe lines, in place of open ditches, to convey water, as is commonly done in California and other sections where the importance of saving water otherwise lost by evaporation and seepage is realized. Experiments with vegetables at the agricultural experiment station, Logan, Utah, indicate that the best results may be obtained by applying water in furrows the first part of the season and by flooding the whole service later on. A company with headquarters near Lake Charles, La., is reported as having begun large irrigation works for rice culture, to cover 25,000 acres eventually. Several miles of canals and several pumping and repumping plants are proposed, capable of lifting 50,000 gallons per minute at the start and 180,000 gallons at a later period. (See DAMS.) The United States Geological Survey has issued a number of reports dealing with irrigation problems in different parts of the country. See GEOLOGICAL SURVEYS.

IRWIN, JOHN NICHOL, United States minister to Portugal, was appointed to this position on April 18, 1899, to succeed Mr. Lawrence Townsend, transferred to the embassy at Brussels. Mr. Irwin was born in Ohio in 1847; he attended the public schools in Keokuk, Ia., and for a time was a student in Miami University, Oxford, O. In 1864 he served as a private in the Forty-fifth Iowa Volunteers. Having entered Dartmouth, he was graduated there in 1867, and soon after engaged in business. He has been active in Western politics, and some years ago was elected mayor of Keokuk, receiving the support of both parties. In 1883 he was appointed governor of Idaho by President Arthur, and in 1890 governor of Arizona by President Harrison.

ISMAY, THOMAS HENRY, one of the leaders in the development of the commercial marine of Great Britain during the last quarter century, and the founder of the White Star Line steamship company, died in England, November 23, 1899. Mr. Ismay was born in 1837 in Maryport, Cumberland. After an apprenticeship with the shipping firm Imrie, Tomlinson and Company he entered the shipping business for himself. In 1866 he acquired the old White Star Line of wooden clippers to Australia; he substituted iron vessels, and founded the modern White Star Line of steamships. In the development of this company Mr. Ismay's fellow-apprentice, the son of his former master, Mr. Imrie, joined with him as junior partner to form the firm of Ismay, Imrie and Company. In 1885 Mr. Ismay built two vessels of the *Teutonic* type for government use as fast auxiliary cruisers in case of war.

ITALIAN LITERATURE. Although at first sight it would seem that Italy makes a very creditable showing for 1899 in the world of letters, yet a careful winnowing of the material reveals a somewhat scanty residue of volumes which are of really permanent and widespread interest. One cause of this may be sought in the unusual number of literary, historical, and artistic centenaries which have occurred within the past eighteen months. Amerigo Vespucci and Paolo Toscanelli, Savonarola, Leopardi, Moretto of Brescia, Bernini, and Giuseppe Parini have all been celebrated within that period, and each in turn has involved a shower of speeches, biographical writings, and critical studies of varying degrees of merit, but which taken as a whole may be summed up as more erudite than entertaining. A second explanation is to be found in the fact that among the writers who admittedly stand highest in contemporary literature few have even a single volume to their credit. This is especially true in the department of fiction, for while D'Annunzio, Verga, and Fogazzaro have each a new novel ready, the publication has been deferred until 1900.

History.—Among contemporary Italian historians there are probably few who are more illustrious, each in his own way, than Pasquale Villari, Ettore Pais and Isodoro del Lungo; and each of these has done important work during the past year. Professor Pais contributes the second part of his valuable *History of Rome*, which has already attracted much attention, and in which he applies still more radically than Mommsen the latter's destructive criticism of early myths, but goes a step farther than Mommsen by attempting to use these myths for the purpose of reconstructing the early history of Rome. Professor Villari's new work, which is not yet completed, also deals with the early history of Italy, and is to be entitled *Barbaric Invasions of Italy*. A work of interest to the student of the middle ages is a comprehensive *History of the Italian Marine*, by Camillo Manfroni, instructor in the Naval Academy at Leghorn, who covers the period from the incursions of barbaric tribes at the close of the fourth century down to 1261, the year in which Genoa formed an alliance with Michael Paleologus. Del Lungo is best known for his important studies on the history of Florence and for his contributions to Dante literature. In his new volume, *From Boniface VIII. to Henry VII.*, he traces the

fortunes of the Florentine democracy at the close of the thirteenth century and the beginning of the fourteenth—the period of Dante's life—in its relations to emperor and church, under the sway of the two great champions of Guelphs and Ghibellines, respectively. Of late years the number of works dealing with the war for Italian independence and the period of national regeneration which followed has steadily increased. Probably the most important of recent works of this class is Domenico Zanichelli's *Studies of the Political and Constitutional History of the Regeneration of Italy*. The author, who is professor of law in the University of Sienna, takes the ground that the unification of Italy and the establishment of a representative form of government are not the fruit of a spontaneous movement on the part of the people, but rather the effect of a slow and persistent effort on the part of their best thinkers and philosophers, statesmen, and poets. In this same category belongs the work of that veteran journalist and patriot, Luigi Chiala, *Giacomo Dina and His Part in the Vicissitudes of the Regeneration of Italy*, the first part of which appeared in 1897. The second volume covers the period from 1861 to 1866—that is, from the death of Cavour to the eve of the outbreak of the war for Venice. This is far more than a biography, and could justly have been called a history of the moderate liberal party. A third work of importance in relation to the history of this period is the posthumous volume by Marco Minghetti, *The Convention of September, 1864*. This volume, which Minghetti was unwilling to have published during his life, or until every doubt as to the political prudence of doing so was set at rest, was written not so much to justify as to explain his motives when as president of the council of ministers he concluded with France the famous convention of September. *Recollections and Impressions of Our Political History During 1866-67*, by Giuseppe Gadda, is also valuable. In conclusion, two volumes dealing with the history of the Italian possessions in Africa deserve mention: *From Adua to Addis-Abeba*, by Nicola d'Amato, being the record of the author's imprisonment during the war with Menelik, and *The Colony of Eritrea from Its Origin until March 1, 1899*, by Lieutenant B. Melli, who divides his work into three parts, the first ending when General Baratieri assumed authority, the second closing with the battle of Adua.

Critical and Biographical Studies.—Each year brings forth a goodly crop of minor studies and monographs upon the recognized Italian classics. Of those upon Dante, many find a permanent home either in the *Biblioteca Critica della Letteratura Italiana*, under the direction of Francesco Torraca, or in the recently established *Biblioteca Storico-Critica della Letteratura Dantesca*, under that of C. L. Passerini and P. Papa. The latest additions to the latter series are *The Historic Personality of Folchetto di Marsiglia in the Commedia of Dante*, by Nicolo Zingarelli, and *The Subjectivism of Dante*, by Egidio Gorra. A really excellent volume is a collection of studies by Isidoro del Lungo, entitled *Dal Secolo e dal Poema di Dante*. In view of Giuseppe Parini's recent centenary, special interest attaches to the edition of his selected poems, edited and annotated for the occasion by Professor Michele Scherillo. The latter also contributed to the August number of the *Nuova Antologia* an interesting study of Parini, in which he reminds us that Manzoni considered Parini's odes not only the best which Italian literature possessed, but also the finest which were ever written. The flood of monographs upon Leopardi abated somewhat in 1899; at the same time the long-promised *Pensieri Inediti di G. Leopardi* were being edited by a government commission from manuscripts formerly in possession of Antonio Ranieri, but claimed by the government on grounds of public utility. There are to be ten volumes of these *Pensieri*, of which four are already issued; they are of great psychological interest and will be indispensable to any one who wishes to make an exhaustive study of the poet of Recanati. An interesting evidence of the growing influence of France upon Italian literature is the increasing tendency among Italian critics to collect their essays, scattered in periodic literature, and republish them in volumes. Such a volume is the one upon Manzoni recently issued by Policarpo Petrocchi, who has written many articles on the author of *I Promessi Sposi*, and now gathers them together for the first time. Other interesting collections of essays are: *Letteratura d'Eccezione*, by Vittorio Pica, including studies of Paul Verlaine, Stéphane Mallarmé, Maurice Barrès, Anatole France, and Huysmans; *Studi Letterari*, by Giulio Pisa, which range from Leonardo da Vinci to Walt Whitman; *Conversazioni Letterarie*, by Professor G. A. Cesareo, and a third series of *Cronache Letterarie*, by the veteran Sicilian novelist and critic, Luigi Capuana. Finally, there is a curious and suggestive little volume by a young critic, Fausto Squillace, who by combining literary criticism with the methods of Nordau seeks to determine *The Present Tendencies of Italian Literature*. For this purpose he limits his researches to the novelists, whom he divides up into three groups—realists, mystics, and egotists; and the three writers whom he takes as the respective types of these three classes are Giovanni Verga, Antonio Fogazzaro, and Gabriele d'Annunzio.

Fiction.—Unfortunately, these three novelists, who stand to-day in the front ranks of Italian letters, published no novels during 1899, although Verga's *Duchessa di Leyra*, Fogazzaro's *Piccolo Mondo Moderno*, and D'Annunzio's *Fuoco* were announced for early issue. Meanwhile, Verga's earliest and almost forgotten story, *Una Peccatrice*, has been republished in a new and attractive series of writings by the best authors; *I Semprevivi*, issued by Sig. Gianotta, of Catania, who has also gathered together in the same series some fugitive pieces by Fogazzaro and published them under the title *Sonatine Bissarre*. To the *Semprevivi* also belongs the latest novel of Matilde Serao, the talented Neapolitan authoress, who has sometimes rather inaptly been called the George Sand of Italy. *La Ballerina* is a sombre and thoroughly realistic study of the life of a Neapolitan ballet dancer, and leads relentlessly and with unerring touch to the final and inevitable tragedy. The same author has to her credit a volume of travels in the Holy Land, entitled *Nel Paese di Gesù*, and is now putting the finishing touches to a new novel, *Dopo il Perdono*. Edmondo de Amicis, who is probably the most widely known of any living Italian writer outside of his own country, seems to have retired definitely from the ranks of novelists. Instead, he gives us this year a volume of *Memorie*, including many interesting souvenirs of his travels and of the many famous people he has known, Dumas among others. Girolamo Rovetta, whose success as a romancer rests mainly upon *La Baraonda*, has just completed *La Signorina*, a story of fashionable Milanese life, which is appearing serially in the *Nuova Antologia*, and, judged from the initial chapters, promises to be of interest. Other novels which deserve mention are: *La Roma che se ne va*, by Senator F. Nobili Vitelleschi, which gives a vivid picture of Roman society prior to 1870, and especially of the struggle then going on between church and state; *Clara Albiati*, an unpleasant study of morbid passion, by E. A. Marescotti, interesting only because it depicts in somewhat exaggerated colors the Milanese riots of 1898; *Raggio di Dio*, by A. G. Barrili, a highly romantic novel, based upon the supposed adventures of Columbus during one of his voyages to America, and *Natalia*, by Enrico Castelnuevo. Among the women writers of Italy there is none who gives more brilliant promise than the Sardinian novelist, Grazia Deledda. Her scenes are all laid in her native island, and her characters are taken from the peasantry. Yet with these simple materials she obtains remarkably effective results, and her Millais-like landscapes and Rembrandtesque portraits are not easily forgotten. She is a prolific writer, her volumes for the past year including two novels—*La Giustizia* and *Il Vecchio della Montagna*, and a book of short sketches, *Le Tentazioni*.

Drama.—It is curious to note how strong a fascination the stage exerts upon the great majority of Italian men of letters; sooner or later they yield to it. Even such a veteran as Salvatore Farina has this year (1899) succumbed to the temptation, and tried the theatre with his first comedy, *Tutto per il Mondo*. E. A. Butti, whose last novel, *Incantesimo*, proclaimed him a disciple of D'Annunzio, has tried his hand at a drama, *La Fine di un Idale*; and Federico de Roberto, the youngest member of the Sicilian school of realists, has cast his latest short sketch, *Il Rosario*, in dramatic form. But of course the most important events of the year in Italian drama are the production of D'Annunzio's *Gloria* and *La Gioconda*. The first of these did not bear the test of the stage, and therefore may be dismissed, since the question whether it may please when read is scarcely to the purpose. *La Gioconda*, however, held its audience, and is unquestionably a work of real dramatic power, although some features would hardly be found tolerable by an Anglo-Saxon audience. The reproach of immorality which has been made against the subject of the play is certainly unfounded, for while the plot turns upon the story of an illicit love, the development of the theme is obviously inspired by a high moral purpose. Briefly stated, the motive of the play is furnished by the infidelity of a young artist, Lucio Settala, weakly vacillating between his affection for his wife Silvia and his passion for his model, "La Gioconda;" and the crisis of the play is the verbal duel between the two women in the studio scene, culminating in the overturning of the statue, Settala's masterpiece, and the crushing of Silvia's hands in an attempt to save it. It is this incident, resulting in the amputation of the heroine's hands, which would probably be found intolerable to an American audience; and yet the pathetic figure of Silvia, deprived of her hands and wounded alike in heart and body, is presented to us with an antique pathos and a spirit of lofty poetry which are unfortunately rare in contemporary drama.

ITALY, THE KINGDOM OF, is contained chiefly on the middle one of the three peninsulas which project from the southern coast of the continent of Europe. It includes also the large islands of Sicily and Sardinia, the island of Elba, and about 66 minor islands. The total area is 110,623 square miles, and the population (December 31, 1897), 31,479,217, including a large settled and floating population of Americans and English. The principal towns are Naples, 536,073 (1897); Rome, 487,066; Milan,

470,558; Turin, 351,855; Palermo, 287,972; Genoa, 228,862; Florence, 209,540; and Venice, Bologna, Messina, Catania, and Leghorn.

Production.—Agriculture is the principal occupation. Wine, fruit, olives, and olive oil are largely produced, and the silk industry is important. The principal grain crops are wheat and maize. Tobacco is also grown. About 71 per cent. of the land is classed as productive. Three systems of land tenure hold: (1) Peasant proprietorships; (2) a form of partnership, including no wages, but a division of profits and losses; (3) the system of rent. Among the principal minerals of Italy are iron, lead, zinc, copper, manganese and antimony ores, sulphur, gypsum, amianthus, alum, and boracic acid, and there is some silver and gold. Salt is a government monopoly. About one-half the total annual mineral output is raw sulphur.

Commerce.—The total exports of Italy for 1898 are given from British statistics as £54,042,833, and the total imports, £61,786,723. The latter, consisting of cotton, wheat, coal, raw silk and cocoons, hides, timber, machinery, wool, fish, live stock, sugar, yarn, tobacco, etc., comes chiefly from Great Britain, Germany, France, Austria-Hungary, Russia, the United States, and Canada. According to a report of the Italian minister of finance, foreign trade during the first half of 1899 tells a story of prosperity. During this period the imports fell off from 741,000,000 lire (\$143,013,000) to 718,000,000 lire (\$138,574,000), a drop of 23,000,000 lire (\$4,439,000). But this was due to the importation of 111,000,000 lire less grain than during the same period of 1898, owing to the excellence of the last harvest. The importation of raw materials for manufacturing increased 71,000,000 lire. The exports for the first half of 1899 were 624,000,000 lire (\$120,432,000), a gain of 51,000,000 lire (\$9,843,000) over the same period of 1898. One of Italy's best customers is Germany, and efforts are being made to increase Italian shipments there, as well as to increase foreign commerce elsewhere, one field being Egypt.

Army and Navy.—The army organization is made up of a permanent force, a mobile militia, and a territorial militia. The army in June, 1898, had a strength of 3,221,726 men, of whom 310,602 were with the colors. Of the men on "unlimited leave," 503,875 were of the permanent army, 465,349 of the mobile militia, and 1,941,918 of the territorial army. The Italian navy, according to the classification adopted in this book for the other European fleets, consisted, as reported in June, 1898, of 15 battleships, and 2 building; 3 armored cruisers, and 2 building; 15 protected cruisers, and 3 building; 1 unprotected cruiser; 15 torpedo vessels; 1 torpedo boat destroyer in course of construction; 142 torpedo boats, and 2 building, and two ships for special purposes. Under this classification Italy had no coast defence ships. Lately the construction of new ships has had to be very much restricted, owing to lack of funds. In 1898 provision was made for the creation of an auxiliary fleet of merchant steamers. In 1899, 15 large and 11 small vessels were building, with a tonnage of 120,540. There were launched 2 battleships, 2 gunboats, 1 torpedo-boat destroyer, and 1 torpedo-boat.

Finance.—The budget estimates for the year 1898-99 showed a total revenue of 1,666,791,355 lire, and an expenditure of 1,686,793,409, leaving a surplus of 9,997,946. The revenue is derived mainly from income, land, and house taxes, of which the first is the most important. Also the customs and the state monopolies of salt and tobacco. The public debt on July 1, 1897, was 12,294,182,508 lire.

Religion and Education.—Roman Catholicism is the dominant religion, the Pope residing at Rome. (See ROMAN CATHOLIC CHURCH.) The Protestants and Jews make up a small part of the population. The state regulates public instruction, and maintains schools of every grade, on which a large amount is annually expended. In most parts of the country school attendance is compulsory between the ages of nine and twelve years, but it is said that the law is not strictly enforced. There are 21 universities, and, in 1899, about 50,000 secondary schools, with an attendance of about 2,550,000.

Colonies, Emigration.—Italy's foreign possessions are insignificant, including Eritrea and the Somaliland protectorate, in northeastern Africa. See the articles on those countries, and also AFRICA (paragraph on Italian Possessions.) Emigration is large, averaging nearly 300,000 annually. From 50,000 to 60,000 come directly to the United States from Italy, and many more by way of other European countries. In 1898-99 the number leaving Italy for the United States was 77,419, an increase of 18,806 over the previous year.

HISTORY.

Foreign Affairs.—Italy's foreign policy became the subject of much discussion early in the year through the announcement that the Chinese government had ceded to her the lease of the harbor of San-Mun in the province of Che-Kiang. The Italian minister at Peking, Signor di Martino, blundered in the negotiations, and complicated the situation by addressing what was practically an ultimatum to the Chinese government. He was recalled in the midst of his negotiations, and in his absence the

mission was intrusted to the British minister, Sir Claude Macdonald. The Italian government counted upon English support for its demands, but this support was not given, and the Chinese government, having shown itself sternly opposed, and having even threatened to resist by force the landing of Italian soldiers on the coast, the Italian squadron which had been sent to occupy the bay of San-Mun was forced to abandon the enterprise. The plan was not popular in Italy, and this check seemed to the Italian people a needless humiliation. Another point in which the foreign policy of the Italian government seemed to Italians lamentably weak was in connection with the hinterland of Tripoli. This region was involved in the Anglo-French convention of March 21, 1899 (see FRANCE, paragraphs on History), by which France acquired a portion of the hinterland. Certain classes in Italy had long cherished the hope that this part of the Ottoman Empire would belong to their country. The chief ground of anxiety was that France would gain control of the trade routes through the hinterland of Tripoli to Central Africa, but later it was reported to the chamber that France and England had given assurance that they had no designs on Tripoli, and that France had asserted that she had no intention of interfering with the lines of trade to Central Africa. On April 14 a French squadron visited Italian waters and saluted the Italian sovereign. A great deal was made of this in the press as a sign of a Franco-Italian *rapprochement*. Similar courtesies were extended to the Italians by an English squadron at the same time. An announcement of the new ministry's policy in the matter of foreign affairs was made by Signor Visconti-Venosta on December 12, 1899. He declared that the basis of Italy's foreign policy would continue to be the triple alliance, and that efforts would be made to maintain the friendly relations between France and Italy. As to the acquisition of Chinese territory, he announced that this policy had been definitively abandoned, and that henceforth the government would confine itself to developing commercial and industrial enterprises in China.

Social Defence Measures.—The Pelloux ministry came into power after the riots of May, 1898. These outbreaks necessitated the adoption of some severe measures of repression, and the Pelloux cabinet was formed with this purpose in view. A number of acts for public security were voted by parliament in order to supply the ministry with the means of suppressing the popular agitation. These special enactments, which were to endure only for a year, imposed certain restraints upon the press and upon the right of association and public meeting, and enabled the government to meet the danger of a strike in the public works. It was understood that before the end of the year the government would propose definite measures of a permanent character to take their place. These measures came up for discussion in the Italian chamber in February, 1899. They were concerned with the following subjects: (1) the right of public meeting; (2) the right of association; (3) the protection of the public service; (4) the press; (5) recidivists. Now that the revolutionary crisis had passed, the adoption of such stringent measures on a permanent basis seemed to many members unnecessary and oppressive, and there was a violent opposition to them from the first.

The Ministerial Crisis.—The overthrow of the Pelloux ministry was ostensibly occasioned by its failure in the department of foreign affairs. The government was blamed for not having prevented the arrangement between France and England which threatened the ultimate success of Italy's designs on Tripoli. Still sharper criticism was occasioned by the government's Chinese policy. The cabinet was accused of disrespect toward parliament in not referring to it so important a question as Italy's policy in China. Matters were not improved by General Pelloux's attempt to justify this action by pointing out the impossibility of leaving a matter of this sort to the hazards of parliamentary debate. This was construed as denying the parliamentary right of deciding upon a matter of external policy, and as implying that parliament was unable to understand what the honor and dignity of the country required. The ministry resigned May 2, 1899, in consequence of this adverse criticism, and in order to prevent the chamber from discussing the Chinese affair. Many believed that the real ground of opposition behind this matter of foreign policy was the hostility to the government measures of social defence.

The Reorganized Ministry.—General Pelloux was charged with the formation of a new ministry. As finally constituted, it showed an effort to conciliate the groups of the Centre and Right, especially those represented by Signor Sonnino, Signor Di Rudini, and Signor Visconti-Venosta. Its members were as follows: General Pelloux, prime minister and minister of the interior; Visconti-Venosta, foreign affairs; Bonasi, justice; Carmine, finance; Boselli, the treasury; General Mirri, war; Admiral Bettolo, marine; Baccelli, public instruction; Lacava, public works; Salandra, agriculture; San Giuliano, posts and telegraphs. It announced its policy on May 25, and the programme in regard to China showed a complete change. When General Pelloux at first addressed the chamber on this subject he said that he could not admit the right of the chamber to discuss the question of Italy's participation in the

division of China. Now the ministry promised to proceed very prudently in China, and, in resuming the negotiations, to take care not to commit itself or to take any important action without consulting parliament. It then entered upon the matter of social defence. There was much opposition to these measures for public security, but, an opportunity arising to test the sentiment of the chamber, it was found that there were 199 for the ministry's proposals and 118 against them. The debate which occurred in June occasioned several disorderly scenes in parliament. Members of the Left held that the renewal of such exceptional measures as were required by the revolutionary outbreaks was no longer necessary. The government replied that the existing state of affairs was due solely to this legislation, and that if it were not renewed the old disorders would break out again. The term of this provisional legislation was to expire on June 30, 1899. A vote taken on June 1 showed a strong majority for the ministry, but the obstructive tactics of the extreme Left prevented legislative action, and led to scandalous scenes in the chamber. Finally, the government had recourse to the extreme measure of putting the law in force by royal decree. On June 22 the king signed the decree, and the law was to operate from July 20. This is under the constitutional provision that when parliament cannot vote a measure it may be put into force by decrees, but the decree itself could not go into effect until it had received the approval of parliament. When the discussion of the decree came up in the chamber there were still more riotous scenes and some of the members came to blows. On June 20 the session was closed by a royal decree. Thus the law went into effect without having received the consent of the chamber, and the opposition had the chance of accusing the government of a violation of the constitution. The ministry, however, had virtually secured the approval of the chamber to the project, and it was only the obstructive tactics of the minority that prevented this approval from being formally expressed. The chief points in the measures for social defence were as follows: The police may prevent any public meeting when the safety of the community demands it. The displaying publicly of seditious emblems or flags was punishable by fine or imprisonment. Not only criminal associations, but all associations that tend to endanger social institutions, or the constitution of the state, may be dissolved by the minister of the interior. Attempts among the employees in the public works to organize a strike are punishable by fine or imprisonment. The press laws are extended to the publisher and to other persons taking part in the criminal publication.

IVES, WILLIAM BULLOCK, member for Sherbrooke of the Canadian House of Commons since 1878, died at Ottawa, Ontario, July 15, 1899. He was born at Compton, Quebec, November 17, 1841; studied law, and was admitted to practice in 1857, becoming a Queen's counsel in 1880. He was made president of the council in the cabinet of Sir John Thompson in 1892, and was minister of trade and commerce in the cabinet of Sir Mackenzie Bowell in 1894-95, and in that of Sir Charles Tupper in 1896.

JAMAICA, an island lying 90 miles south of Cuba and 100 miles west of Haiti, comprises, with the Turks and Caicos Islands, Morant Cays, Pedro Cays, and Cayman Islands, a British crown colony. The capital is Kingston.

Area and Population.—The area of Jamaica is 4200 square miles, and of the other islands politically attached 224 square miles. Jamaica's population in 1891 was 639,491, and in 1897 (estimated) 706,394; in the former year the inhabitants were classified as follows: Black, 488,624; mulatto or half-breed, 121,955; white, 14,692; East Indian, 10,116; Chinese, 481; unclassified, 3623. In 1896 the East Indian population amounted to 14,118. The populations of the principal towns are reported to be as follows: Kingston, 46,542; Spanish Town, 5019; Montego Bay, 4803; Savanna-la-Mar, 2952; Falmouth, 2517.

Religion and Education.—There is no state church. Statistics of the leading denominations in the island in 1897 were: Anglican, 41,872; Baptist, 35,033; Methodist, 24,429; Presbyterian, 11,370; Roman Catholic, 9300; Church of Scotland, 2400. For the year 1897-98 there were enrolled 98,205 pupils in the 913 government schools, and the average attendance was about 60,000. Besides the government schools there are several high schools and industrial schools, and two government institutions for the training of teachers.

Government, etc.—The colony is administered by a governor, appointed by the crown, together with a privy council and a legislature, the members of which are in part elected and in part appointed. The governor since February, 1898, has been Sir Augustus W. L. Hemming, who was previously governor of British Guiana. Local parish affairs are administered by elective boards. Besides a resident magistrate in each of the parishes there are circuit courts and a high court of justice. At the beginning of 1898, besides a militia, numbering 392, there were in Jamaica 1700 officers and men of the British army. The public debt in 1898 was £1,994,184. Appropriations were made to Jamaica in 1899 by the imperial government, under the Colonial

Loans Act, of £150,000 for the deficit in the general revenue account, £110,000 for railway completion, £88,000 for interest on railway debentures, £65,000 for public works, and £40,000 for water works—total, £453,000. Statistics of finance and commerce have been for fiscal years:

	Revenue.	Expenditure.	Imports.	Exports.
1896.....	£754,086	£807,975	£1,856,378	£1,470,241
1897.....	677,064	766,534	1,660,667	1,448,443
1898.....	672,535	796,749	1,814,793	1,662,543

Industries, Commerce, etc.—The principal industries are agricultural and pastoral; in 1897 the total number of acres under pasturage was 498,916, and under tillage 164,644. The number of acres given to the principal crops was as follows: Ground provisions, 80,656; sugar, 28,764; coffee, 22,387; bananas, 19,760; cocoanuts, 10,799. Statistics of imports and exports are given at the end of preceding paragraph. In 1897 the leading exports were as follows: Coffee, £165,494; sugar, £120,959; rum, £92,053; and the imports: cotton goods, £208,318; flour, £162,378; fish, £116,240; rice, £40,432. In 1897 the total tonnage entered and cleared in the foreign trade at the ports of the island was 1,560,944, and the Jamaica merchant marine comprised 125 vessels (all but one being sail) of 7153 tons. The railway lines aggregate 185 miles, the telegraph 937, and the telephone 831.

The only industry of importance in the Turks and Caicos Islands is salt raking, the annual product being about 2,000,000 bushels; from the Cayman Islands are exported cocoanuts and turtle grass.

A Political Crisis.—The increasing indebtedness of Jamaica, which by the end of March it was thought would be £172,000, caused the government of Sir Augustus Hemming to attempt a policy of retrenchment in the early part of 1899. The measures proposed included the discharge of district physicians receiving state pay, the closing of several public hospitals, and a reduction of salaries among minor officials, while to increase the revenue a tariff law, levying taxes, among other things, on industrial implements and literature, and promising to yield a permanent annual revenue of £350,000, was projected. These measures were opposed by the influential classes, and the tariff bill met with such bitter resentment from the people that in March a political crisis resulted. The legislature, refusing on the 15th of the month to pass the bill, was prorogued on the 21st by the governor; he, however, reconvened it on the day following, but increased the popular discontent by adding to the legislature four members, appointed by himself, who would give a majority for the tariff bill. So intense was the disapproval of this coercive measure that the governor attempted to effect a compromise, but the legislature would accept no terms without his relinquishment of coercion. The house then adjourned until April 4, while the governor conferred with the colonial secretary, Mr. Joseph Chamberlain; the result was a refusal of compromise on the part of the administration, and on April 5 the passage of the tariff bill was forced. Two days later the elected members of the legislature passed a vote of censure on the administration, and demanded the removal from office of the executive officials, including the governor. At this time the popular indignation against the administration was very strong. So critical was the situation that the governor yielded, and on April 11 withdrew the four additional members and appealed to the legislature for assistance in the fiscal troubles; thereupon the vote of censure was withdrawn, and an appropriation to meet immediate liabilities was made. On the 18th of May a new tariff bill was passed. This law being unfavorable to United States commerce called forth a protest from the American consul, who stated that in 1898 the United States had made proposals of reciprocity, and that these had been declined by the colonial secretary; for a 50 per cent. reduction of the tariffs on imports from the United States the latter country had offered a large tariff reduction on Jamaica oranges and sugar, and the free admission of all other products of the island. It was feared that the bill of May 18 would cause retaliatory measures on the part of the United States, and accordingly arrangements were made for a reciprocal treaty, which was concluded on July 1. This treaty provided for certain reductions of import duties on American goods and for a tariff reduction of 12½ per cent. on the sugar and 20 per cent. on the oranges and other fruits of Jamaica.

In order to secure necessary revenue the British colonial secretary, in September, 1899, ordered the imposition of an income tax and an increase in the land tax and in stamp duties; he said also that in the future the finances of the colony would be controlled by the colonial office. This will probably obviate such friction as occurred over financial matters in the spring.

JAMES, CHARLES P., sometime associate justice of the Supreme Court of the District of Columbia, died at his home in Leesburg, Va., August 9, 1899. He was born

in Cincinnati, May 11, 1818. He studied law, was admitted to the bar, and from 1850 to 1856 was a professor in the law department of Cincinnati College. Subsequently he was judge of the Superior Court in Cincinnati. In 1864 he moved to Washington, and for four years was professor of law in Georgetown University; he was a member of the commission appointed to revise the statutes of the United States. In 1879 he was appointed to the supreme bench of the District of Columbia.

JAPAN, THE EMPIRE OF, consists of four large and many small islands, numbering altogether over 4000, the estimated area of which is 148,456 square miles. The four principal islands have an area of 147,655 square miles, with a population on December 31, 1897, of 43,228,863. The foreign population in Japan on January 1, 1898, was 10,531, of whom 5206 were Chinese, 2118 English, and 1076 Americans. Japanese residents of foreign countries on December 31, 1897, numbered 58,785. The largest island is commonly known as Hondo, or Honshin (mainland). The other principal islands are the Chii-Shuna (Kurile) Islands; Yezo (Hokaido); Kinshin (the nine provinces); Shi-Koku (the four provinces); Liu-Kiu (Loo Choo); the Ogasawara (Bonin) Islands; the Goto, Oki, and Iki groups, and the islands of Sado, Tsushima, and Awaji. In 1895 Japan acquired from China the island of Formosa (area, 13,541 square miles), population, December 31, 1897, of 2,728,817), and the Pescadores Islands (area, 49 square miles; population about 44,820). The chain of islands stretches from Kamchatka in Siberia almost to the Philippine group. The largest city is Tokio, population, 1,300,000; Yokohama, the capital, has about 180,000 inhabitants. The system is of volcanic origin, and there are a number of active volcanoes.

Production and Industry.—Japan is coming to occupy in the Orient the position occupied by Great Britain in Europe—that is to say, confined as she is to an insular position, Japan will in time find herself unable to produce sufficient foodstuffs for home consumption, necessitating large foreign imports, while, on the other hand, many believe that she will in time become a great manufacturing centre for the East. Although the latter event may be postponed for a long time, there has been a wonderful industrial development within the past few years. Agriculture is at present the chief occupation, and rice is the chief product. Great care is bestowed on agriculture, and there is a well-planned system of irrigation. Besides rice, there are grown tea, cotton, tobacco, wheat, barley, oats, sugar-cane, vegetable wax, indigo, maize, buckwheat, millet, potatoes, turnips, beans, and peas. The persimmon is the fruit most successfully cultivated. Most of the other fruits, it is said, are not very palatable. The estimates as to the rice crop of 1899 place the amount at 214,649,424 bushels, a decrease of 11.7 per cent. from the production of 1898, and an increase of 6.5 per cent. over the production of ordinary years. As to her industries, Japan has silk and cotton mills and manufactories of matches, paper, glass, japanned ware, porcelain, and bronze ware. Her production of the latter three articles, together with silk goods, has long been famous. Copper, iron, and sulphur abound, and the sea fisheries are important. See, further, AGRICULTURE (paragraph Experiment Stations).

Commerce.—The foreign commerce of Japan for 1898 was as follows: Exports, 165,753,752 yen; imports, 277,502,156 yen. The most important recent events in the history of Japan are the substitution of the gold standard for the silver standard in 1896; the substitution of a moderately protective tariff for the former tariff, which imposed a uniform rate of about 5 per cent. *ad valorem*, and the abolition of extra-territoriality. The new protective tariff, the duties of which range from 5 to 40 per cent., went into effect on January 1, 1899, and the abolition of extra-territoriality, by which some 5000 foreign residents in Japan were placed under the jurisdiction of the native courts, instead of the consular courts, as formerly, also went into effect in that year. It is too early to ascertain the influence of these two changes upon the commerce of Japan. As to the first, the substitution of the gold standard, it has often been stated with confidence that its effect upon the import and export trades has been in every way beneficial. It was not expected that the moderately protective tariff would have much effect in checking importation at the present stage of manufacturing industries in Japan, but it was estimated that during the first seven months of 1899 imports declined 37 per cent. The apprehensions shown in some quarters in regard to the abolition of extra-territoriality, as likely to interfere with foreign commerce, are not shared by some observers who seem to have an expert knowledge of the actual conditions. The latter urge that this change is not likely to render the position of the foreign trader untenable in Japan, since such a result would be against the interests of the Japanese themselves. For even if the Japanese merchants should acquire a large part of the foreign trade, it would not necessarily reduce the demand for foreign merchandise. During the last ten years the proportion of foreign goods imported by Japan's merchants has rapidly increased, rising from 15.6 per cent. in 1887 to 36.4 per cent. in 1897, and this does not seem to have prevented a very rapid expansion of the

foreign trade. Whatever may be the ultimate effect of these changes, it is certain that down to the present time the foreign commerce of Japan has advanced with remarkable rapidity, and that to-day Japan is of great importance as an importing and consuming country. It remains to discuss the condition of the trade of the United States with Japan, and in so doing we make use of the statistics and comments published by the chief of the United States Bureau of Statistics.

Trade of the United States with Japan.—The subject of our trade with Japan assumed especial importance in 1899 in connection with speculations as to the probable results of the tariff and the judicial changes above mentioned. The importance of Japan as a market for the products of the United States has greatly increased. In 1881 Japan imported from the United States goods to the value of 31,128,125 yen, and in 1898 the value of imports from this country had risen to 277,270,228 yen. While in 1881 the United States supplied 5.72 per cent. of the imports, she supplied 14.57 per cent. of them in 1898, far outstripping her chief rival, Great Britain, whose products, though increasing absolutely, made up a much smaller proportion of the total imports in 1898 than in 1881. As to the imports to the United States from Japan, they have formed an exception to the usual rule in that they have steadily increased, rising from \$14,217,600 in 1881 to \$26,716,493 in 1899, while our total imports from the world at large have increased but slightly, and during the last few years have actually decreased. The steady increase of our imports from Japan is due to the fact that it includes materials used in some of our rapidly expanding industries, as, for example, raw silk and articles which cannot be produced at home, like tea and camphor gum. The latter class of articles is likely to increase with an increasing population. The chief article which Japan imports from the United States is raw cotton, the importation of which has greatly increased in the last few years, owing to the development of the cotton spinning industry in Japan. It is a staple whose consumption in Japan seems likely to continue increasing, in spite of the competition of British India and China. These latter countries, with their cheaper labor and lower cost of transportation, can afford to undersell the United States, and yet the importation from the United States rose from 16.8 per cent. of the whole in 1896 to 32.5 per cent. in 1898, and the total value of the cotton importations from the United States in 1898 was three times as much as those from China. And the same holds true of the cotton imports from India, which, though nearly four times as much as those from the United States in 1896, were but 66 per cent. more than the latter in 1898. The success of the American cotton in the face of this competition is attributed to its superior quality, and taking into consideration the firm hold that it has already acquired in the Japanese market, there is reason to think that with the lowering of the cost of transportation that would follow the opening of the Nicaragua Canal, the importation would rapidly increase. In the case of sugar, which is next in importance as an article of import, the United States naturally has no chance to compete. Cotton yarn stands next on the list of imports, and here again Japan derives her supply from other sources than from the United States, but the importation of this article is likely to decrease with the development of the Japanese cotton industries. In the case of kerosene oil, which stands next to cotton yarn, the imports from the United States have increased, in spite of the appearance of new rivals in the last two or three years. Tobacco is another article which the United States supplies in increasing quantities. An examination of the list of articles which make up the imports of Japan shows that the greatest number of them can be produced in the United States. It was estimated that in 1898 out of 275,000,000 yen only 75,000,000 yen represented the value of the imports which could not readily be supplied by the United States. The chief of the United States Bureau of Statistics mentions the following articles as all having shown a great increase in the amount exported from the United States to Japan: Raw cotton, leaf tobacco, iron and steel manufactures, flour, machinery, locomotive engines, cigarettes, and distilled spirits. The future of the trade of the United States with Japan will depend, of course, upon the rapidity with which the developing industries of Japan can suffice for supplying the needs of her population and also upon the condition of her agriculture. As to the latter, the figures for the last few years seemed to show that Japan is making larger and larger demands upon foreign countries for her food supply. In regard to manufactures, it has often been said that with so clever and adaptable a people improved methods of production would rapidly be introduced and the time would soon come when Japan would supply her home market with manufactured products. The recent history of Japanese manufactures does not seem to bear this out. The chief of the United States Bureau of Statistics cites the case of the watch factory at Osaka, which has in nowise met the home demand for watches, the importation of watches having rapidly increased. He also shows how a similar prediction that Japan would soon find a way of making bicycles to take the place of those which were imported has failed to come true, the number of bicycles imported in 1898

being double the number imported in 1896. Nor does it appear that the demand for foreign iron and steel manufactures has been seriously affected by the competition of native producers. The iron supply of Japan is not large, although the coal supply appears to be sufficient for her needs. Japan has not been able to devote the requisite amount of capital to the establishment of expensive factories for the making of iron manufactures. The chief of the United States Bureau of Statistics therefore sums up the conditions which seem to indicate the future of the United States trade with Japan in the following words: "As a whole, then, it may be concluded: First, that in the principal agricultural importations of Japan, raw cotton, tobacco, flour, and other foodstuffs, she is likely to increase her demands, and to look more largely to the United States than to any other part of the world to meet them. Second, that in cotton manufactures it is probable that she will supply the home demand, her cotton manufactories having rapidly increased during the past few years, until, as already indicated, their spindles now number more than 1,300,000, while her importations of manufactures of cotton have already begun to decrease by reason of the rapid increase in home production. Third, that in the large proportion of other manufactures—iron and steel and their various classes of manufactures, machinery of all sorts, printing-paper, leather goods, woollen goods, glass and glassware, fertilizers, material for her railways, and the thousand and one things which American ingenuity and modern appliances produce and make a matter of convenience or necessity—it seems likely that Japan will continue to call upon the outside world, as will also be the case with reference to foodstuffs other than the staples which she now produces in quantities usually sufficient to meet local demands."

Finance.—In the budget estimates for 1899 the expenditure for the year was estimated at 226,344,700 yen, and the revenue at 188,738,400 yen, showing a deficit of 37,606,300 yen. To meet this deficit the minister of finance proposed to increase the land tax and the tax on *saké*, or rice-beer, the national beverage, and to make certain additions to the income and registration taxes, by which the revenue for the year would be increased about 34,000,000 yen. The remainder of the deficit he proposed to make up from the Chinese war indemnity. He stated that these increases in the taxes should in 1900 make an increase in the revenue of nearly 45,000,000. Besides the items mentioned, important sources of Japanese revenue are the taxes on malt and *soy*, and the excises, posts, and telegraphs, state services, etc. The public debt was in 1897-98 about 428,241,302 yen, a considerable increase over the previous year. The added amount was, however, borrowed for railway construction and other internal improvements. The last dollar of Japan's foreign debt was paid in that year, leaving a blank for that item in the debt account of 1897-98.

Currency.—Japan has had a single gold standard since 1897. The legal ratio of silver to gold is $32\frac{1}{4}$ to 1. The monetary unit is the gold yen, containing 0.75 gramme of gold. The paper money of Japan formerly consisted of government notes, national bank-notes, and Bank of Japan notes, but the law of 1883 provided for the gradual retirement of the national bank-notes, whose circulation was prohibited by the law of 1896 after December 9, 1899; and since 1890 the government notes have been gradually redeemed, their circulation being prohibited by the law of June, 1898, after December 31, 1899. Thus, at the close of the year 1899 the Bank of Japan notes were the only paper money in Japan. This institution issues notes upon the currency principle—that is, it must keep an equal amount of specie reserve for all notes issued, but may issue 120,000,000 yen in addition on good security. Further issues are subject to a 5 per cent. tax. The main interest in the currency history of Japan has been the adoption of the gold standard and the withdrawal of silver from circulation. The means by which this was brought about and its effect upon the industrial and financial conditions of the country have been the subject of much discussion. The law establishing the single gold standard was promulgated in Japan on March 26, 1897. The new unit was to be the gold yen, one-half the mint value of the old gold yen. Every effort was made to prevent the change of standard from affecting prices and wages. The government adopted the ratio of 32.34 to 1 in the expectation that as the value of silver declined this would be the market ratio. It was hoped that this measure might have a steady effect upon the value of silver and prevent its depreciation much below that point. The new standard was introduced in the following manner: In the first place, the government coined the stock of gold which it purchased from Europe with the Chinese indemnity money. It then exchanged the new gold coins for the old silver coins. This was accomplished with great rapidity, the two chief depositories of silver—namely, the Banks of Japan and Yokohama, exchanging their silver coins for gold on the day after the law went into effect. But silver depreciated below the legal ratio, and it was feared that counterfeited pieces of silver would be imported, in order to be exchanged for gold. To prevent this a law was passed prohibiting the circulation of silver yen after April 1, 1898, and another law

provided that the exchange of silver for gold at par could not be made after July 31, 1898. As a result of this policy the withdrawal of silver was completed by the close of the year 1898. The next serious question was how the government should dispose of the silver thus acquired. This was accomplished in these three ways: First, by recoinng the silver as subsidiary currency; second, by sale, and third, by exportation for circulation. The change of standards in Japan was brought about in a most skilful manner. The government disposed of the silver without loss, in spite of the great fall in its value, and the change was accomplished without causing any disturbance in the money market or affecting prices or wages, or the relations between debtors and creditors. The advantages claimed by the Japanese gold monometallists are that it has placed industries and commerce on a sound basis, rendered prices more stable, and vastly improved the condition of foreign trade. The frequent fluctuations of price on the former silver basis had imparted an element of risk to all industrial affairs and had especially retarded Japan's foreign trade with gold standard countries. As to the effect upon the government, it was claimed that the gold standard would save the losses often sustained by the government in its foreign payments on contracts, and there were already many signs that the national credit had improved.

Railways, Posts, and Telegraphs.—Japan possesses an extensive and well-managed railroad system. In 1872-73 the first state railway was built, 18 miles in length. In 1884-85 the first railroad was built by private capital, 63 miles long, at which time there were 181 miles of railway in the empire. According to the annual report of the imperial railway bureau for the fiscal year ending March 31, 1899, the total mileage was 3420, an increase of 472 miles for the year. About 770 miles were state roads. If there be added those railways under construction the total mileage of Japanese railways in 1898-99 reached the figure of 5810 miles. The total rolling stock of the 3420 miles open comprised 7103 locomotives, 3811 passenger coaches, and 14,088 freight-cars. Posts and telegraphs are under government control. In 1897-98 there were 12,539 miles of telegraph and 1555 miles of submarine and subfluvial cables; the telephone mileage was 528. The mails carried were 561,931,551 letters, postal-cards, packages, etc.

Army and Navy.—The army is organized, equipped and drilled upon the European system, and its officers have been trained in Europe. There is also a national military college of considerable efficiency. All males of the age of 20 are liable for three years' active service in the standing army, four years in the reserve, and five years in the territorial army. Every male from 17 to 40 years of age not in the above branches belongs to the national army, carrying liability to service in times of emergency. At the close of the Chinese War the peace-footing was about 70,000 and the war-footing 268,000. It is proposed to increase these numbers to 145,000 and 520,000 respectively. The navy, according to the classification adopted in this book for the European fleets, was reported in July, 1898, as consisting of 3 battleships, and 3 building; 1 armored cruiser, and 6 building; 10 protected cruisers, and 6 building; 8 unprotected cruisers, and 1 building; 3 coast defence ships, 1 torpedo vessel, 8 torpedo-boat destroyers in course of construction; 44 torpedo boats, and 12 building. The naval programme contemplates the creation by 1903 of a navy of 67 large ships and 12 torpedo-boat destroyers, with a total displacement of 260,000 tons. In 1899, 13 large and 52 small vessels were building, with a tonnage of 130,113. In that year 2 battleships, 2 cruisers, and 6 torpedo boats destroyers were launched.

HISTORY.

Internal Politics.—The Anglo-Russian agreement in regard to China (*q. v.*) was a subject of much discussion in Japan during the first half of the year 1899. The prevailing opinion seemed to be that this agreement meant the eventual dismemberment of China, and England's action occasioned some disappointment in Japan, since many had hoped for an alliance with that country for the purpose of developing China and maintaining its integrity. On the other hand, some of the prominent statesmen like Count Okuma were confident of the future of China, holding that such conventions did not in any way affect the interests of other powers or threaten the integrity of the Chinese Empire. It was a mistake, Count Okuma declared, for the powers to judge the Chinese people by the worthless Manchu dynasty that was on the throne. He held that at any time some man of spirit and influence might arise to awake in the people a consciousness of national interests. There were some disturbances in Corea in 1899, that country having been the scene of palace intrigues and internal revolts ever since the war with China. Some of these disturbances were traced to foreigners and certain criminal attempts were laid at the door of Japanese residents. The Japanese government in 1899 prohibited by ordinance all Japanese from going to Corea without special authorization. A new political party was formed in 1899 under the name of Hokken-to—that is, the national constitutional party. One of its objects appeared to be the support of the old national religions of Japan,

Shintoism and Buddhism, against the increasing power of Christianity. But this object was not popular, and the party gave up the religious feature of their platform and declared their sole purpose was to execute the purposes of the constitution. It was opposed in the press on the ground that it said too much about the prerogatives of the Mikado. The increase of the Japanese civil list was shown by some figures published in 1899. The number of government officers rose from 40,727 in 1896 to 70,123 in 1898, and the salaries increased in a still greater proportion. The lack of capital threatened an economic crisis in the early part of the year, but by midsummer affairs seemed to be on a prosperous footing. The government negotiated a foreign loan amounting to 250,000,000 francs, issued at 90 per cent. of the par value and bearing interest at 4 per cent. The expenses of the war with China appeared from figures published during the year. The total for the period of the war—that is, from June 1, 1895, to March 31, 1896, was 200,475,508 yen, of which 164,520,371 yen were for the army and 35,955,137 for the navy.

Foreign Relations.—On July 17, 1899, the treaties with foreign powers placing Japan's relations with them on a basis of common international law went into force. The countries with which these treaties had been made were Great Britain, United States, France, Germany, Russia, Austria, Italy, Spain, Portugal, Belgium, Holland, Denmark, Sweden and Norway, Peru, and Switzerland. This abolished the foreign consular jurisdiction and placed Japan on terms of equality with western nations. Foreign residents were thenceforth subject to Japanese courts. The entire country was thrown open to foreign trade, and the foreign residents were to have the same privileges as well as to be subject to the same obligations as natives. Formerly there had been only six treaty ports. Just before the treaties went into effect the Mikado ordered his ministers and officials to take the utmost care that foreigners should have the same privileges and advantages as natives. The government also announced that Christianity should receive equal protection with the national religions, and warned the people against any attempt to oppose Christianity by force. In spite of the non-sectarian attitude of the government there were signs before the close of the year of a reaction against the influence of Christianity. The department of education requires that religion be excluded wholly from the national system of education, and does not countenance private schools in which religion is taught. Since the war with China the progress of Christianity has been slow, and there has been a conservative reaction in favor of native creeds.

JAVA, the principal island of the Dutch East Indies, and the most important of the colonial possessions of the Netherlands, has been cited as an example for the United States to consider, in forming its government over the half-civilized peoples which have recently come under its jurisdiction. (See COLONIES.) It is acknowledged by all fair observers that the Dutch have governed Java well, with the result that it is now a prosperous colony. One of the characteristics of the Dutch rule has been the effort to elevate gradually the condition of the people, who are mostly ignorant and imbued with deep religious and caste prejudices. It has been a policy to rule the country through the natives, instead of forcing upon it a paternal government administered wholly by an alien people, and the Dutch have thus won the confidence and co-operation of the native chiefs. The latter do the work of governing under the advice of a Dutch resident or assistant resident, who gives orders under the form of recommendations. These recommendations are obeyed, and yet the native ruler has the show of power, and the people more readily acquiesce in his rule. The population is legally divided into Europeans and persons assimilated with them, and the natives and persons assimilated with these, and it is the fundamental principal of the Netherlands colonial policy to give to each of these divisions the kind of government best suited to its condition and desires. The former class, therefore, is generally living under the same laws as the inhabitants of the Netherlands itself, while jurisdiction over the natives considers the customs and institutions of the latter and is largely carried on through their chiefs, who are in constant intercourse with the Netherlands officials. Java and Madura are together administered by a governor-general of the Dutch Indies, with a council of five members, and by local officials. The "culture system" employed by the Dutch in Java has been the subject of some criticism, but on the whole it appears to have been productive of good. Some years ago the Dutch employed a forced system of labor among the natives, in the coffee, sugar, indigo, pepper, tea, tobacco, and other industries, but this was finally abolished, except in a few industries, principally the cultivation of coffee. It may be explained that the greater part of the soil of Java is government property, with some private estates in the western part of the island, and the great majority of the people are agricultural laborers. The government or private landowners can enforce one day's gratuitous work out of seven, or more, which work is largely confined, as already stated, to the coffee industry. Thus the natives, who are poor and naturally indolent and improvident, are forced to labor regularly. Much of the government property is let on hereditary lease, and the coffee

plantations being under government control, the cultivation of coffee by the natives is allowed to stand as the payment of taxes. Thus what at first seems a system of partial bondage proves to be a fairly good arrangement, whereby the ignorant native can contribute to the support of the government by giving his labor in the cultivation of the crop which furnishes the island's chief source of revenue. In addition, the native has paid, since the abolition of the culture system in other branches of agricultural production, the nominal sum of one guilder annually to the government.

The area of Java, together with the neighboring island of Madura, with which it is generally included, is estimated at 50,554 square miles, and the population of the two islands at the close of 1897 was estimated to be 25,697,701. The European population, largely Dutch, was about 52,000. There are also about a quarter of a million Chinese and 17,000 Arabs. The native population is Malaysian. The capital, Batavia, has 115,000 inhabitants, including 9500 Europeans; Surabaya and Surakarta have each over 100,000 inhabitants, and in the former about 7000 Europeans reside. The port of Samarang contains about 3400 foreigners. The principal Javanese occupation, agriculture, is facilitated by a fertile soil which has made Java a garden-spot in the Orient, and a large trade centre. No government land has been alienated since 1816, but by the agrarian laws of 1870 large leases have been made, those in 1896 aggregating 848,204 acres, distributed as follows: To 711 companies and Europeans, 814,427 acres; to 47 Chinese, 30,746 acres; to 6 natives, 3031 acres. Lands now the property of Europeans amount to 2,069,733 acres; Chinese, 639,999 acres; other foreign Orientals, 34,856 acres. The productions of Java include coffee, sugar, indigo, pepper, tea, tobacco, cinchona bark, and opium; among minerals are tin, coal, salt, and petroleum; in stock-raising are included (1895) about 2,650,000 buffaloes, 2,572,000 oxen and cows, and 485,500 horses. The last named are not used for agricultural purposes. Java yielded 118,881,288 pounds of coffee in 1898, mostly on government plantations; in 1899 it was estimated that the crop would amount to 149,672,776 pounds. About 547,000 tons of sugar were produced, according to the figures for 1897. The remaining crops are estimated for 1896: Cinchona, 3,797,828 kilogrammes; tobacco, 13,360,013; tea, 3,916,398; indigo, 721,719; tin, 15,600 tons; coal, 25,150 tons; petroleum, 111,387,385 litres. Among these various productions the chief exports are coffee, sugar, teas, cinchona, tobacco, indigo, tin, and petroleum. The imports include textiles, haberdashery, petroleum, spirits, wine, machinery, powder, and metals. Batavia, Samarang, and Surabaya are the principal ports. In 1896 the imports amounted to 168,348,635 guilders; exports, 199,630,711 guilders. The revenue of Java is largely obtained by the government sale of coffee, but a considerable income is also derived as follows: From land, a house-tax, tax on estates, customs duties, licenses, personal imports, the state monopolies of salt and opium, railways, and indirect taxes. The revenue for 1898 was 139,412,904 guilders, of which taxes made up 36.3 per cent., monopolies 24.1 per cent., the sale of government coffee, and cinchona, tin, and coal 22.4 per cent., and 17.2 per cent. came from other sources. The expenditure was 154,519,438 guilders. The budget estimates for 1899 gave the revenue as 132,742,514, and the expenditure as 146,085,944. The army is purely colonial and embraces about 41,660 men, including 1466 officers. Over 16,000 of the soldiers are Europeans. There is a military school near Batavia. The navy is partly colonial and partly royal, and the expenses are jointly borne by Java and the Netherlands. About 2600 men (including 1700 Europeans) are with the Indian marine, 25 ships; some 1500 Europeans and 400 natives serve with the auxiliary squadron.

JEFFERSON, CORNELIA (Mrs. Jackson), American actress, died in New York, March 3, 1899. She was the sister of the veteran actor, Mr. Joseph Jefferson, and was born in Baltimore, October 1, 1835. On the 17th of May, 1849, she appeared at Chanfrau's National Theatre, New York, as Little Pickle in *The Spoiled Child*. Subsequently, 1857-58, she acted in Laura Keane's theatre, New York; this was afterward called the Olympic, and here in the fall of 1867 Miss Jefferson appeared as Titania in *A Midsummer Night's Dream*. For many years she lived in retirement, but about ten years before her death entered the company of her brother Joseph and attracted much attention by her fine rendering of Tilly Slowboy in a dramatization of *The Cricket on the Hearth*.

JEWETT, SARA, a well-known American actress, died in Cambridge, Mass., February 27, 1899, in her fifty-third year. She was born in Buffalo, N. Y.; was educated at a school in Lenox, Mass., and privately in Cambridge. Here she attained a marked success in amateur theatricals, and when subsequently financial reverses came she determined upon the stage as a means of livelihood. She entered upon professional study in New York with Fanny Morant, through whom she met Augustin Daly; at his theatre, the old Fifth Avenue, she made her debut September 3, 1872, as Mabel Wyckoff in Bronson Howard's *Diamonds*. She continued in Daly's company for a number of years; at this time she played, it is said, on a tour covering 9000 miles. In 1879 she became the leading actress of the Union Square

Theatre Company, with which she played in all of the principal cities of the United States. Miss Jewett was never a very forcible actress, but her rôles were characterized by intelligent and sympathetic rendering. At the old Fifth Avenue Theatre she is remembered as Anne Page in *The Merry Wives of Windsor*, Mrs. Lynx in *Married Life*, and Maria in *The School for Scandal*. At the new Fifth Avenue Theatre she appeared in many rôles. Among her best remembered characters at the Union Square Theatre were Lillian Westbrook in *The Banker's Daughter*, the young wife in *Miss Multon*, Lea Henderson in *Daniel Rochat*, and Adrienne in *A Celebrated Case*. Her last appearance in New York was at this theatre in the spring of 1885, and the following year she retired from the stage.

JEWISH WOMEN, COUNCIL OF, an association of Jewish women, organized in 1893, had in 1899 a membership of 5000. The purposes of the association are "to bring about closer relations among Jewish women, to furnish by an organic union a medium of communication and a means of prosecuting work of common interest, and to foster united efforts in behalf of Judaism by supplying means of study, and in the work of social reform by the application of the best philanthropic thought." General meeting for 1900 at Cleveland, O. President, Mrs. Hannah G. Solomon; secretary, Miss Sadie American, 3130 Vernon Avenue, Chicago, Ill.

JEWS. *In the United States.*—In 1899 the Jews in the United States showed much progressive spirit both in benevolent and educational work. The National Hospital for Consumptives, established the past year in Denver, Col., was largely contributed to by the Jewish order of B'nai B'rith. In New York the Baron de Hirsch Trade School, the Clara de Hirsch Working Girls' Home, and the Hebrew Charities Home have been added to the list of Jewish charitable institutions. The National Association of Hebrew Charities was organized at Cincinnati; and the Jewish Women's Council, the Jewish Chautauqua, and the National Farm School at Doylestown, Penn., report satisfactory growth. Zionism was confined to Russian-American Jews. The Jewish Theological Seminary of New York chose as its director Professor Schlechter. The immigration of Jews into the United States for the year ending June, 1899, was 37,415. In 1899 the Jews reported 301 ministers, 570 congregations, and 1,043,800 members.

Zionist Movement.—In August, 1899, the third Zionist congress was held at Basle, Switzerland, and was attended by about 300 delegates. Dr. Theodor Herzl, one of the foremost men in the movement, presided over the congress. The objects of the Zionists have been summed up by one of their leaders as follows: (1) To acquire a legally secured home in Palestine for the Jewish people; (2) to foster a national spirit among them; (3) to hold international congresses to consider the condition of Jews all over the world; (4) to support the existing colonies and found new ones; (5) to encourage the study of Hebrew literature and the use of Hebrew as a living language. In its most recent aspects Zionism aims at the settlement of Jews in Palestine and the placing of them on a footing of independence. It has been said that the Jewish colonies in Palestine have hitherto been too dependent upon charity. The former society of Zion was largely philanthropic in character and its concern was limited to the Jews of Palestine and of Roumania and Russia. Zionism in its present form applies to the whole Jewish race, and is no longer a plan for the establishment of pauper colonies from those regions where the Jews are in an especially distressed condition. It aims to create an independent Jewish community in Palestine, and the first requirement is to obtain from the Sultan legal guaranties for the autonomy of this community. The total population in Palestine is estimated at 250,000, of whom the Jews form more than one-third. The agricultural resources of the country are said to be ample for the support of a large population. The work of the Zionist organization is carried on by a central committee in Vienna, with Dr. Herzl at its head. Each Zionist pays a shilling to the central fund. The members of the committee are elected from the Zionists all over the world. The local societies hold frequent meetings in the different countries. In Vienna is published the newspaper organ of the society.

The Jewish Population.—The following figures, compiled from the *American-Jewish Year Book*, shows the Jewish population in various parts of the world. In Russia, 5,700,000; in Austria-Hungary, 1,860,106; in United States, 1,043,800; in Germany, 567,884; in Turkey, 350,000; in British possessions, 148,130; in various other parts of the world, 1,058,571—total, 10,728,491.

JOACHIM, AMALIE SCHNEEWEISS, a well-known contralto, died in Berlin, February 4, 1899. She was born at Marburg, in the Austrian province of Steiermark, May 10, 1839. In early life she sang in minor parts in Hermanstadt and Vienna and later in the Hanover Court Opera. She was regarded by some critics as the greatest German singer of ballads, *lieder*, and oratorios. In 1863 she married the violinist, Joseph Joachim; she soon gave up the opera for concert work, and became famous throughout Germany. She appeared in Boston in 1892.

JOACHIM, JOSEPH, violinist, whose sixtieth anniversary as an artist was celebrated in Berlin in the spring of 1899, was born of Jewish parents, near Presburg, Hungary, July 15, 1831. At an early age he studied in the Conservatory of Vienna, and when twelve became a violinist in the famous Gewandhaus orchestra of Leipzig, where he remained for seven years, studying the violin meanwhile under Ferdinand David and theory under Moritz Hauptmann. In 1850 he was appointed director of concerts in Weimar; in 1853 he was made master of the Chapel Royal in Hanover; in 1869 member of the senate of the Berlin Academy and director of the school of instrumental music in the conservatory of that city. In 1882 he became conductor of the Royal Academy of Music in Berlin and musical director of the Royal Academy of Arts. Joachim has frequently appeared in London since 1844, and is nearly as popular in England as in Germany. He has never visited the United States. Cambridge University gave him the degree of Mus. Doc. in 1877, Oxford has given him that of D.C.L., and Glasgow that of LL.D. His compositions for the violin are numerous; the best known is the *Hungarian Concerto*. At the celebration in Berlin in his honor the Emperor bestowed on him the order "Pour le Merite." Dr. Joachim is president of the Oxford and Cambridge Musical Club, founded in London in 1899.

JOHNS HOPKINS UNIVERSITY, at Baltimore, Md., organized 1876, had in the year 1898-99, 128 instructors and 649 students. For the same year the following degrees were granted: B.A., 41; M.D., 32; Ph.D., 42; proficients in applied electricity, 51. The library had 91,082 volumes. Professor Minton Warren resigned the Latin professorship, in order to accept a similar position in Harvard University. A new building was opened for the laboratories of physiology, pharmacology, and physiological chemistry. Two members of the medical faculty, Dr. Flexner and Dr. Barker, were granted leave of absence, in order to make a study of diseases prevalent in the Philippines. A preliminary report of their work was appended to President Gilman's annual report. The Maryland Geological Survey and the Maryland Weather Service operate in connection with the university. A number of courses of public lectures were given. Several series of scientific periodicals are published at Johns Hopkins University, among them the *Journal of Chemistry*, *Journal of Philology*, and *Modern Language Notes*. For statistics see UNIVERSITIES AND COLLEGES.

JOHNSTON, Colonel WILLIAM PRESTON, LL.D., president of Tulane University, New Orleans, died at Lexington, Va., July 16, 1899. He was the son of General Albert Sidney Johnston, and was born in Louisville, Ky., January 5, 1831. After preparing for college in Kentucky he entered Yale, and was graduated in 1852; in the following year he was graduated at the Louisville Law School, and began practice in that city. At the outbreak of the Civil War he entered the Confederate service as a major in the First Kentucky Regiment. Subsequently (1862) he was appointed by Jefferson Davis his aide-de-camp with the rank of colonel. Remaining with Davis after the surrender, Johnston was captured with him; after his release he passed a year in Canada, and then resumed his law practice in Louisville. Soon after General Lee became president of Washington and Lee University, Johnston accepted (1867) there the chair of English history and literature, which he held until 1877. From 1880 to 1883 he was president of the Louisiana State University at Baton Rouge; this position he relinquished when Tulane was founded, becoming its president in 1883. Colonel Johnston was recognized as one of the most prominent educators of the South. He wrote *The Prototype of Hamlet*; *The Johnstons of Salisbury*; *The Life of General Albert Sidney Johnston*, and the poems *Pictures of the Patriarchs*; *My Garden Walk*, and *Seekers After God*.

JONES, HENRY ("Cavendish"), the leading authority on whist, died February 15, 1899. He was born in London, England, November 2, 1831; was educated at King's College School and St. Bartholomew's Hospital. He became a member of the Royal College of Surgeons in 1852, and from that year till 1869 practised medicine. In the latter year he relinquished his practice, in order more fully to devote his time to literary and editorial work. He made a special study of the laws of games, and wrote many books on the subject; the more important of these are: *The Laws and Principles of Whist Stated and Explained*, 1862; *The Laws of Piquet, with a Treatise on the Game*, 1878; *Whist Developments*, 1885. In 1873 he edited *Billiards*.

JONES, SAMUEL M., mayor of Toledo, O., was prominent in 1899 as a leader in the widespread trend of public opinion in this year toward the municipal ownership and management of public works. In 1897 Mr. Jones, as a Republican, was elected mayor of Toledo. His administration antagonized capitalists and franchise seekers, and in the spring of 1899 he failed of nomination by the Republican organization. Thereupon he ran as an independent candidate, and on April 3 was elected, receiving about 17,000 votes against about 4000 and 3000 for his Republican

and Democratic opponents, respectively. On the 23d of August, 1899, Mr. Jones announced himself an independent candidate for governor of Ohio on the platform of "direct legislation, public ownership of public utilities, union wages, hours, and conditions for skilled labor, and an eight-hour day with living wages for unskilled labor on all public works." The vote he received was surprisingly large, especially since the contest between the Republicans and Democrats was unusually bitter and was fought out chiefly on national lines. The vote in round numbers was: Nash, Republican, 417,000; McLean, Democrat, 368,000; Jones, Independent, 106,000.

Mr. Jones was born in Wales in 1846, and came to the United States with his parents when he was three years old. His family was poor, and in childhood he was obliged to work. He went to Titusville, Penn., in 1864, and was employed in the oil fields. Having later engaged in the business for himself in Pennsylvania, Ohio, and West Virginia, he invented an improved oil-well appliance and established the Acme Sucker Rod factory at Toledo. Here he introduced a number of labor reforms.

JOUBERT, PETRUS JACOBUS, commander-in-chief of the Transvaal forces in the war which broke out in October, 1899, has for many years been prominent in the political and military life of his country. He was born about 1831. General Joubert is regarded as an able military leader and tactician, and has won eminent success in making his troops a formidable body by employing the ambuscade methods so well adapted to the veldt and kopjes. In the fall of 1899 he was in personal command of the troops in northern Natal; it was his men who fought the first battles of the war and afterward besieged Ladysmith and repulsed General Buller near Chieveley. A report toward the close of the year stated that General Joubert had been wounded; this was afterward denied with the statement that the general was ill and had gone to Pretoria; still later it was asserted that he had returned to the front. It was he who defeated Sir George Pomeroy Colley at Majuba Hill, February 27, 1881. The commander-in-chief at this time was Paul Kruger. In January, 1896, the surrender of Dr. Leander S. Jameson, leader of the famous Raid, was chiefly due to Joubert. In 1893 and in 1898 he stood for the presidency of the republic, but was defeated by President Kruger. From his treatment of British prisoners toward the close of 1899 General Joubert came to be regarded as a very humane leader.

JULIAN, GEORGE WASHINGTON, ex-member of Congress, died at his home in Irvington, Ind., July 7, 1899. He is remembered especially as one of the more prominent antislavery leaders. He was born near Centreville, Ind., May 5, 1817; was educated at the district schools, taught for three years, studied law, and was admitted to the bar in 1840, beginning practice at Centreville. In 1845 he was elected as a Whig to the legislature, and in 1849 was elected to Congress on the Free Soil ticket. In the Congressional election of 1851 Julian was defeated; the following year he was the Free Soil candidate for Vice-President, the ticket being headed by John P. Hale. In Congress he supported the homestead policy and opposed the compromise measures. In 1856 he was a delegate to the first Republican national convention. From 1861 to 1871 he again represented his district in Congress, where he was a member of the committee on the conduct of the war, and later of the committee on reconstruction. Julian's speeches in the House of Representatives are placed by many among the ablest antislavery utterances of the war period. In 1872 he joined the Greeley movement, after which he remained a member of the Democratic party. He was surveyor-general of New Mexico from 1885 to 1889. He published: *Political Recollections; Speeches on Political Questions*, 1872; *Later Speeches*, 1889; *The Life of Joshua R. Giddings*, 1892.

KAIULANI, Princess, heiress-apparent to the Hawaiian throne in the time of the monarchy, died in Honolulu, March 6, 1899. She was the daughter of a Scotchman, A. S. Kieghorn, and the late Princess Likelike, sister of former Queen Liliuokalani, and was born October 16, 1875. She had received a good education, chiefly in England. She was declared heiress-apparent by Queen Liliuokalani when the latter came to the throne in March, 1891. Upon the establishment of the Republic of Hawaii, Princess Kaiulani took the oath of allegiance, and thereafter received a pension from that government.

KALAGUA. See TUBERCULOSIS (paragraph on Treatment).

KANSAS, a central western State of the United States, has an area of 82,080 square miles. The capital is Topeka. Kansas was admitted to the Union January 29, 1861.

Agriculture.—The report of the State Board of Agriculture for the calendar year 1899 gave the yield of winter wheat as 42,815,471 bushels. The yield of corn was 225,183,432 bushels, the largest crop on record excepting that of 1889, and more valuable than any preceding crop by \$1,134,627. Wheat, corn, and oats yielded a combined crop of a home value of \$80,888,622, an increase over the value of the same

grains in 1898 of \$13,384,621. Secretary Coburn, speaking of the conditions of 1899, said the farmers of Kansas were in a most gratifying state of prosperity and contentment. Almost every farmer is replacing his old machinery with up-to-date improvements. "I cannot give detailed statistics, but, judging the whole State by several sample counties I am familiar with, I think it is safe to say that not less than \$200,000,000 of farm and home mortgages have been paid off in Kansas during the last few years."

Industries.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$866,228. There were 57 manufacturers of tobacco and 307 of cigars, and the total output was 22,036,125 cigars, and 34,719 pounds of smoking tobacco. Grain and fruit distilleries in operation numbered 5; the production of fruit brandy was 43 gallons; amount of spirits rectified, 2402 gallons; distilled spirits gauged, 15,375 gallons; production of fermented liquors, 7812 barrels; and manufacture of oleomargarine, 14,132,277 pounds. In 1899 the entire lead and zinc mining district of Missouri-Kansas was the scene of marked activity. Many new properties were developed, a large number of combinations perfected, and, stimulated by the increased market price of zinc, numerous abandoned mines were reopened and worked to large advantage. The output of ore for the first quarter of 1899 was an increase of 560 carloads, representing an advance of \$1,198,822 over the corresponding period of 1898, and by December 10 the output exceeded \$10,000,000 in value, and bid fair to equal \$12,000,000 by the end of the year. On October 25 the wheels of the first cotton mill established in Kansas, in Independence, were started for the first time. Only twine was made at the start, but in the spring of 1900 the plant is to be enlarged in building and machinery for the manufacture of white duck cloth and seamless sacks. The first effect of this new enterprise was the enlargement of the cotton-growing area of the State. In all lines of industry, the year 1899 was one of extraordinary prosperity in Kansas, and special results are noted under paragraphs Agriculture and Banks.

In 1898 Kansas regained the third place as a producer of salt, changing ranks with Ohio, with an output of all kinds of 1,538,327 barrels, valued at \$488,022. Coal from 110 mines yielded 3,406,555 short tons, valued at \$3,703,014, an increase over the production of 1897 of 352,543 tons, and the largest in the history of the State. The most productive counties were: Crawford, 1,654,493 tons; Cherokee, 1,110,527; and Leavenworth, 305,576. Quarrying yielded \$325,133, chiefly in sandstone and limestone.

Banks.—On October 31, 1899, there were 98 national banks in operation and 122 in liquidation. The active capital aggregated \$8,137,100; circulation, \$2,616,305; deposits, \$25,364,367, and reserve, \$9,577,480. The State and private banks, June 20, 1899, numbered 368, and had capital, \$6,438,050; deposits, \$23,753,675, and resources, \$33,041,702. The exchanges at the United States clearing-houses at Topeka and Wichita in the year ending September 30, 1899, aggregated \$54,013,222, an increase of \$4,191,206 in a year.

Railways.—The new railroad construction during the calendar year 1898 was 3.77 miles, and during 1899, 11 miles, giving the State a total mileage of 8807.97.

Education.—At the close of the school year 1897-98 the school population was 495,949; enrolment in the public schools, 370,240, and average daily attendance, 256,934. There were 12,513 teachers, 9188 buildings used as school-houses, and public school property valued at \$9,504,961. The revenue was \$4,003,584; expenditure, \$3,991,477, of which \$2,935,043 was for teachers' salaries. There were 176 public high schools, with 434 secondary teachers, 11,595 secondary students, and 1905 elementary pupils; 15 private secondary schools, with 63 teachers, 763 secondary students, and 664 elementary pupils; 1 private normal school, with 37 teachers and 1957 students in all departments; and 6 private ones, with 69 teachers, and 1741 students. Normal training was also given in 9 colleges and 11 public high schools. Nineteen colleges for men and for both sexes reported 7 scholarships, 376 professors and instructors, 4950 students, 107,857 volumes in the libraries, valued at \$130,600; \$185,175 invested in scientific apparatus, \$1,811,500 in grounds and buildings, and \$397,155 in productive funds; \$266,633 in total income, and \$123,874 in benefactions. In 1899 there were 724 periodicals, of which 49 were dailies, 610 weeklies, and 54 monthlies.

Finances.—In 1899 the total assessed valuation was \$327,175,107, an increase in a year of \$1,285,360; the bonded debt remained the same in amount as in 1898, but all of it had been acquired by the State school fund.

Population.—As estimated by federal officials the population on June 30, 1899, was about 1,380,000.

Legislation.—Dealing in futures and "bucket shop" transactions were prohibited under heavy penalties. Building and loan associations were placed under the supervision of the bank commissioner and a very comprehensive law was passed regulating them. City courts were established and justices of the peace in cities ousted of

jurisdiction. The board of police commissioners, created originally to enforce the prohibitory liquor law, was abolished. It is expected that this will practically bring about local option or home rule in liquor matters. American insurance companies not of the State of Kansas must pay 2 per cent. State tax and foreign companies 4 per cent., upon gross incomes. This law will probably add \$60,000 annually to the State treasury. A "Charter Board," composed of the attorney-general, secretary of state, and state bank commissioners, was created. It grants all charters and regulates foreign insurance companies doing business in the State, inquiring as to their solvency. A constitutional amendment increasing the Supreme Court judges from five to seven will be voted upon in 1900. The political disabilities of those who bore arms against the United States have been removed. The offices of fish warden and of oil inspector were created. The formation of mutual hail insurance companies to protect growing crops was authorized. The anti-trust law, already enacted, was strengthened.

A Court of Visitation, vested with unusual authority, was created to take the place of the board of railroad commissioners, which has been abolished. The three judges are elective in 1900, but were appointed for the interim. This court is to be in perpetual session, and has been given greater power over railroads and express and telegraph companies than can be exercised by their own board of directors or general officers. It has legislative, executive, and judicial powers within itself. It fixes rates and determines their reasonableness; it apportions charges among common carriers, classifies freight, compels train service, orders the building of stations, regulates crossings, and prescribes rules for the running of trains. In short, all railroads are operated under its direction and guidance. When its orders are disobeyed, it tries the offender, making its own rules of procedure. Any person may complain, and at the cost of the State and with the aid of numerous officials created for the purpose, the so-called trial is obtained. The court may grant injunctions and appoint receivers, being given both common law and equity powers, and may appoint masters, referees, and marshals to carry out its orders. The law provides also that the court investigate strikes, and if it finds the railroad at fault it shall rectify matters by orders, and if the company does not obey the order, the court shall seize and operate the road. If the strikers are at fault it shall order them to cease the strike. In questions of rates or service raised by any complainant, the company is presumptively wrong in the first instance; it is presumed to be guilty until it proves its innocence. The court has apparently unlimited power to punish for contempt. In a word, it is both judge and executor. No suit can be dismissed or compromised without the consent of the court, and failure to comply with any of its orders subjects the corporation to a fine of \$1000 a day. This is regarded as the most surprising piece of railroad legislation ever enacted.

The labor legislation presented features as novel as the railroad legislation. It provides for an annual convention of labor organizations. The delegates are to elect a president, vice-president, secretary, and assistant secretary; these shall constitute the State board of labor and industry. The secretary shall be the commissioner of labor and industry and factory inspector, and the assistant secretary shall be his assistant. Miners are to hold a similar convention, and the secretary elected by such convention shall be the State inspector of mines. This election of salaried State officials by a part of the citizens acting in irresponsible conventions has evoked criticism. It was further enacted that wages must be paid in money.

Elections, etc.—The local elections in 1899 were reported to show an aggregate Republican majority of nearly 10,000 over the combined Democrats and Populists. A legislative investigation into the affairs of the Kansas Agricultural College resulted in the substitution of two Republicans for two Populist members of the board of regents; and with a view to the elimination of an alleged Populist political propaganda in the institution, the following members of the faculty were removed from their places June 12: President Thomas E. Will; Frank Parsons, professor of history and political science; Edward Bemis, professor of economic science; Dr. J. H. Ward, professor of English language and literature; and Secretary M. H. Phipps.

State Officers and National Representatives.—Governor, W. E. Stanley; lieutenant-governor, H. E. Richter; secretary of state, G. A. Clark; treasurer, Frank E. Grimes; auditor, George E. Cole; attorney-general, A. A. Godard; superintendent of education, Frank Nelson; commissioner of agriculture, F. D. Coburn; adjutant-general, S. M. Fox; superintendent of insurance, W. V. Church. Supreme Court: Chief justice, Frank Doster; associate justices, William R. Smith, W. F. Johnston; clerk, D. A. Valentin. The State legislature consists of 103 Republicans, 2 Democrats, 29 Populists, 1 Independent, and 30 Fusionists. Senators: William A. Harris (Pop.), from Linwood, and Lucien Baker (Rep.), from Leavenworth. Representatives: W. J. Bailey (at large), from Baileyville; Charles Curtis, from Topeka; J. D. Bowersock, from Lawrence; E. R. Ridgely (Pop.), from Pittsburg; J. M. Miller,

from Council Grove; W. A. Calderhead, from Marysville; W. A. Reeder, from Logan; and Chester I. Long, from Hutchinson—all Republicans but one.

KAOLIN. The production of kaolin or of china clay in 1898 was:

States.	Quantity. Short Tons.	Value.	States.	Quantity. Short Tons.	Value.
Colorado.....	60	\$135	North Carolina.....	10,000	\$90,000
Connecticut.....	1,500	18,750	Pennsylvania.....	13,502	67,482
Delaware.....	14,968	82,286	Vermont.....	1,060	7,800
Missouri.....	1,850	6,990	Wisconsin.....	5,000	47,500
New York.....	60	60			

KAUTZ, ALBERT, rear-admiral, United States Navy, was born in Georgetown, O., January 29, 1839; he graduated from the United States Naval Academy at Annapolis in 1859 and was promoted midshipman in 1861. In that year he also became master and lieutenant, and was taken prisoner of war. He served as Farragut's flag-lieutenant on the *Hartford* at the capture of New Orleans and also during the Vicksburg attacks. He was promoted lieutenant-commander in 1865, commander in 1872, captain in 1885, commodore in 1897, and rear-admiral in 1898, being assigned to the command of the Pacific station, with the *Philadelphia* as his flagship. On March 6, 1899, the *Philadelphia* arrived at Samoa (*q. v.*), where native troubles had broken out. Admiral Kautz at once issued a proclamation, restoring the authority of the chief justice and placing Malietoa Tanu upon the throne. He joined the British in resisting Mataafa, whose cause was favored by the Germans. A body of men composed of British and Americans was ambushed on April 1, and several British and American officers and men were killed.

KEAN, JOHN, United States senator from New Jersey, was elected, as a Republican, by the legislature to succeed James Smith, Jr., Democrat, January 24, 1899. Born at Ursino, N. J., December 4, 1852, he was educated at private schools, and in 1872 entered Yale, but left the university to study law, and graduated at the Columbia Law School in 1875, two years later being admitted to practice in his native State. In 1882 he was elected to the Forty-eighth Congress and in 1886 to the Fiftieth. He was chairman of the Republican State committee in 1891 and 1892, and in the latter year was defeated for governor by Mr. George T. Werts. In 1894 he was a member of the commission appointed to revise the State judiciary and practice, and in 1896 was elected a delegate at large to the Republican national convention. Mr. Kean is president of the National State Bank of Elizabeth, and holds office in several corporations. His term in the Senate will expire March 3, 1905.

KEBLEY, MRS. ROBERT, an English actress of prominence, died in London, March 12, 1899, in her ninety-third year. She was born at Ipswich, her maiden name being Goward. She made her first appearance in 1825 at the Lyceum Theatre, London, in the title-rôle of *Rosina*. Later in life she achieved great success in dramatizations of several of Dickens's novels. Her husband, a popular comedian, died in 1860. On November 22, 1895, her ninetieth birthday was celebrated at the Lyceum Theatre, London, at which a large number of artists and society people were present.

KELLOGG, SAMUEL H., D.D., Presbyterian missionary to India, was born at Westhampton, L. I., in 1839. His death occurred May 2, 1899, and was caused by a fall over a precipice while he was cycling in the Himalayas, near Landour. After his graduation at Princeton in 1861 he taught mathematics there for a number of years. From 1865 to 1877 he was a missionary in India; returning in the latter year to the United States, he accepted in the Western Theological Seminary the chair of theology, which position he filled till 1886. He subsequently returned to India, and at the time of his death was engaged with two other scholars upon the translation of the Old Testament into Hindustanee; this work was prosecuted under the direction of the Presbyterian Missionary Society of the United States and the British and Foreign Bible Society. Among Dr. Kellogg's writings are an authoritative Hindustanee grammar; *Lectures on Genesis and the Growth of Religion*; *The Jews*; *The Light of Asia* and *The Light of the World*.

KEMP, DIXON, yacht designer, died in England, November 21, 1899, in his sixtieth year. He had been yachting editor of the London *Field* since 1862, and he was the architect and designer of many steam and sailing yachts. He was instrumental in establishing the Yacht Racing Association in 1875, and he founded, two years later, *Lloyd's Yacht Register*. His work *Yacht and Boat Sailing*, 1878, was supplied to the ships of the royal navy by the British admiralty. An eighth edition of the work was published in 1895. In 1899 he published *An Exposition of Yacht*

Racing Rules. Other works written by him were *Yacht Designing* and *Yacht Architecture*.

KENDALL, EZRA OTIS, sometime professor of mathematics and astronomy at the University of Pennsylvania, died in Philadelphia, January 5, 1899. He was born at Wilmington, Mass., in 1816. Professor Kendall won a distinguished place among American mathematicians; he was a member of many educational societies and for years was vice-president of the American Philosophical Society. For a time he was vice-president of the university and dean of the faculty.

KENTUCKY, an east central State of the Mississippi Valley, has an area of 40,400 square miles. The capital is Frankfort. Kentucky was admitted to the Union, June 1, 1792.

Mineralogy.—During the calendar year 1898 the State again broke her remarkable record as a coal producer, having an aggregate output from 116 mines of 3,887,908 short tons, valued at \$3,084,551, a net increase in a year of 285,811 short tons. The amount mined by machinery was approximately 1,400,000 short tons, an increase of 100,000 tons over 1897. In both 1897 and 1898 Hopkins County was the largest producer, with Ohio County second and Whitley County third. The first two had a decreased and the last an increased production. In May, 1899, southeastern Kentucky was the scene of a rush of oil-lease hunters, because of the completion of a 40-mile pipe-line from Somerset to Slickford, on Otter Creek, 10 miles southwest of Monticello, the county seat of Wayne County and headquarters for oil operators. Up to that date 51 wells had been drilled in Wayne County, including 3 drilled for salt, and 33 of them had yielded oil, some only a small amount, others thousands of barrels. The new pipe-line furnishes the means of reaching a market, and its completion was the signal for renewed pumping of old wells and the drilling of new ones. Later in the year valuable zinc lands were discovered at a point less than 100 miles from Cincinnati and near a large railroad system, and in October the working of the first mine there was begun with highly promising results. During 1898 the production of iron ore was 12,913 long tons, and the quarries yielded sandstone and limestone valued at \$156,485.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$22,215,234, the fourth largest amount collected in the States. There were 139 manufacturers of tobacco and 335 of cigars, and the total output was 46,287,459 cigars, 32,680,227 pounds of plug tobacco, 348,281 pounds of fine cut, 4,625,913 pounds of smoking, and 149,714 pounds of snuff. Grain and fruit distilleries in operation numbered 368; the production of fruit brandy was 14,852 gallons; amount of spirits rectified, 5,880,202 gallons; distilled spirits gauged, 46,082,575 gallons, and production of fermented liquors, 434,528 barrels. The coking industry was represented by 5 establishments, with 292 ovens, only about one-half of which were in operation, which used 44,484 short tons of coal, and produced 22,242 short tons of coke, valued at \$32,213, a decrease in a year of 9875 tons. The production of pig-iron was 100,724 long tons, and of all kinds of rolled iron and steel, 39,239 long tons. Kentucky and Alabama together had an output of 3588 long tons of iron and steel structural shapes and 28,713 long tons of iron and steel plates and sheets.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the delivery port of Louisville aggregated in value \$267,870, a decrease in a year of \$3205; exports, none.

Railways.—The new railway construction during 1898 was 19 miles, and during 1899, 7.50 miles, giving the State a total mileage of 3093.96. In July, 1899, the Louisville and Atlantic Railroad Company was incorporated by a syndicate, with a capital of \$2,000,000, to acquire and operate the Richmond, Nicholasville, Irvine, and Beattyville Railroad, sold under order of the Federal Court. On June 29 the State Board of Railroad Commissioners rendered a decision, in response to the commercial organizations, coal miners, and operators of the State, suspending the long and short haul clause of the constitution with respect to freight rates within the State.

Banks.—On October 31, 1899, there were 74 national banks in operation and 38 in liquidation. The active capital aggregated \$11,075,900; circulation, \$6,963,602; deposits, \$18,517,131, and reserve, \$6,717,158. The State banks, June 30, 1899, numbered 216, and had capital, \$13,119,533; deposits, \$33,017,134, and resources, \$54,827,722. The exchanges at the United States clearing houses at Lexington and Louisville in the year ending September 30, 1899, aggregated \$410,133,018, a net increase of \$48,479,259 in a year.

Education.—The latest school census reported is that of 1896, which, as revised, showed a school population of 736,105. At the close of the school year 1896-97, the last for which detailed reports were available at the time of writing, the enrolment in the public schools was 501,893, and the average daily attendance, 308,697. There

were 7989 buildings used as school-houses, and public school property valued at \$5,448,814. The revenue was \$2,753,664; expenditure, \$2,650,190, of which \$1,342,870 was for teachers' salaries. There were 61 public high schools, with 214 secondary teachers, 4754 secondary students, and 847 elementary pupils; 87 private secondary schools, with 306 teachers, 3621 secondary students, and 4730 elementary pupils; 4 public normal schools, with 15 teachers and 1358 students in all departments, and 10 private ones, with 58 teachers and 2043 students. Normal training was also given in 4 colleges and 19 public high schools. Thirteen colleges and universities for men and for both sexes reported 2 fellowships, 136 scholarships, 241 professors and instructors, 4072 students, 82,187 volumes in the libraries, valued at \$86,000; \$68,940 invested in scientific apparatus, \$1,265,500 in grounds and buildings, and \$1,372,495 in productive funds; \$254,523 in total income, and \$36,881 in benefactions. Eleven colleges for women reported 132 professors and instructors, 1315 students, 12,300 volumes in the libraries, \$5800 invested in scientific apparatus and \$447,000 in grounds and buildings, and \$87,406 in total income. An interesting educational feature of 1899 was the establishment of a department of practical forestry in Berea College, which is situated in one of the richest timber districts in the State. In 1899 there were 183 periodicals, of which 18 were dailies, 142 weeklies, and 14 monthlies.

Finances.—The total assessed property valuation as equalized was \$552,877,967 in 1898 and \$563,288,686 in 1899; the State tax rate in 1899 was \$5.25 per \$1000; the total bonded debt, excluding special bonds for \$2,312,596, held by State educational funds, on January 1, 1899, was \$1,171,394, and the floating debt, \$764,000, with a sinking fund of \$608,000, leaving net floating debt, \$66,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 2,220,000.

Party Conventions and Platforms.—The Democratic convention met at Louisville, June 24, and after a protracted session nominated State Senator William Goebel (*q. v.*) for governor. The platform drawn up at that time reaffirmed without any qualification the principles and policies of the Chicago platform of 1896; declared for the 16-to-1 ratio; denounced the national administration "for its reckless extravagance in the conduct of public affairs, for its cruel and inhuman neglect in its treatment of our soldiers and sailors during the late Spanish war," and for its alleged protection and encouragement of trusts, which were declared to be the fruit of Republican monopoly and tariff laws, and especially condemned its Philippine policy. Mr. Bryan's principles were endorsed. In State affairs the platform endorsed the election law known as the Goebel law and the "law to prevent extortionate, unfair, and discriminating freight rates by transportation companies," both of which were passed by the last legislature over Governor Bradley's veto. The master of the convention was Mr. Goebel, and his methods were so bitterly denounced by influential members of the party that another convention was held at Lexington, August 16, which nominated an independent or anti-Goebel ticket, headed by ex-Governor John Young Brown. This convention was remarkable for its numbers; it was, moreover, a gathering of farmers, business men, and others who had taken little part in politics hitherto, but who were determined in their purpose to defeat Goebel. Their platform also upheld Mr. Bryan and condemned President McKinley for the alleged advancement of the interests of trusts, but was mostly devoted to a detailed denunciation of Mr. Goebel, his election law, and his political methods.

The Republican convention met at Lexington, July 13, and unanimously nominated Mr. W. S. Taylor, the attorney-general of the State. The platform endorsed the McKinley administration; denounced all combinations formed "to depreciate below its real value or to enhance the cost of any article, or to reduce the proper emolument of labor;" declared confidence in the policies adopted by the President with regard to Cuba, Puerto Rico, and the Philippines, and pledged him support until the objects sought should be attained; reaffirmed adherence to the principles enounced by the last Republican national convention, except as to the civil service; commended the present amendment of civil service rules by the President, and advocated further modifications. A large part of the platform was naturally devoted to State affairs, and quite as naturally it approved Governor Bradley's administration and denounced the Goebel Election law, the Penitentiary bill, the McChord Railway bill, and many other measures originating with the Democratic legislature.

Elections.—Local issues and personal antagonisms among the Democrats rendered the gubernatorial contest one of unusual complexity and bitter feeling. The fact that Kentucky is a doubtful State aroused national interest in a campaign immediately preceding a "Presidential year." For weeks after election day, November 7, each of the two great parties claimed the election of its candidate with such fierceness and persistence that fears of disorder and violence were justified. On December 9, however, Mr. Taylor was given a certificate of election, and though he assumed control of the government, the Goebel Democrats determined to bring the matter

before the legislature, and at the close of the year the State was in a condition of great political tension. According to the official returns, the vote was as follows: William S. Taylor (Rep.), 193,714; William Goebel (Dem.), 191,331; John Young Brown (Ind. Dem.), 12,140; John G. Blair (Pop.), 2936; O. T. Wallace (Pro.), 2346, and Albert Schumtz (Soc. Lab.), 510.

State Officers and National Representatives.—Governor, W. S. Taylor; lieutenant-governor, John Marshall; secretary of state, Caleb Powers; treasurer, Walter R. Day; auditor, John S. Sweeney; superintendent of public instruction, John Burke; commissioner of agriculture, J. W. Throckmorton; attorney-general, Clifton J. Pratt; adjutant-general, D. Collier. Court of Appeals: Chief justice, James H. Hazelrig; justices, J. D. White, B. L. D. Guffy, George Du Relle, A. Rollins Burnam, T. H. Paynter, J. P. Hobson; clerk, Samuel J. Shackelford. The State legislature consists of 85 Democrats and 53 Republicans. Senators, William Lindsay (Dem.), from Frankfort; William J. Deboe (Rep.), from Marion. Representatives, Charles K. Wheeler, from Paducah; Henry D. Allen, from Morganfield; John P. Rhea, from Russellville; David H. Smith, from Hodgenville; Oscar Turner, from Louisville; Albert S. Berry, from Newport; Evan E. Settle, of Owenton; G. G. Gilbert, from Shelbyville; Samuel J. Pugh (Rep.), from Vanceburg; T. Y. Fitzpatrick, from Prestonburg, and Vincent Boering (Rep.), from London—all Democrats but two.

KERR, NORMAN SHANKS, M.D., English inebriate specialist, died May 31, 1899. He was said to be the most skilful physician in England in the treatment of inebriety. He was consulting physician to the Dalrymple Home for Inebriates, London, and was president of the Society for the Study of Inebriety. Among Dr. Kerr's works are: *Intemperance and its Remedy*, 1877; *Wines, Scriptural and Ecclesiastical*, 1882; *Inebriety: Its Etiology, Pathology, Treatment, and Jurisprudence*, 1888.

KIAO-CHAU. In the autumn of 1898 it was announced that the port of Kiao-Chau was opened freely to the commerce of all nations, and that a Chinese customs house had been established within the German district. It was further stated that citizens of all nations might settle in Kiao-Chau under the same conditions as the Germans themselves, and that the government would grant no trade monopolies. Plans were set on foot for developing the colony by opening direct communication with the interior, and projects for the railway development through private capital were formed. The chief purpose which the Germans appeared to have in view was to use Kiao-Chau as a distributing point for German commerce with the interior of China.

KIEFERT, HEINRICH, German geographer, died April 21, 1899. He was born in Berlin, July 31, 1818; was educated at Berlin University. He explored Asia Minor in 1841. From 1845 to 1852 he was director of the Geographical Institute at Weimar; he then returned to Berlin, and became a member of the Academy of Sciences, and a lecturer in the university. In 1859 he was given a professorship. For one of his Oriental atlases he received in 1844 a prize from the French Institute. Among his best known works are his map of Asia Minor and the atlas illustrating Robinson's biblical researches in Palestine.

KING, JOHN M., principal of the Manitoba Presbyterian College, died in Winnipeg, March 5, 1899. He was born in Roxburghshire, Scotland, in May, 1829. Having been educated at Edinburgh University, he came to Canada in 1856, and for many years was pastor of a Presbyterian church in Toronto. In 1883 he was moderator of the Presbyterian General Assembly, and the same year became principal of Manitoba College.

KING'S DAUGHTERS AND SONS, INTERNATIONAL ORDER OF THE, an interdenominational religious order of service founded in 1886, was estimated to have in 1899 over 500,000 members. These are bound to serve the needy and the suffering. President, Mrs. F. Bottoime; secretary, Mrs. Isabella Charles Davis, 156 Fifth Avenue, New York City.

KIPLING, RUDYARD. See LITERATURE.

KIRKPATRICK, SIR GEORGE A., K.C.M.G., LL.D., former lieutenant-governor of Ontario, Canada, and an ex-speaker of the House at Ottawa, died December 12, 1899. He was born at Kingston, Ontario, in 1841, and was graduated from Trinity College, Dublin. He became a barrister in 1865; member of the Canadian House of Commons 1870-92, speaker 1882-87, a Queen's counsel 1880, Queen's privy counsel for Canada, 1891, and lieutenant-governor of Ontario 1892-97.

KNIGHTS OF LABOR, organized in 1869, the general assembly being organized in 1878, had in 1899 an estimated membership of 200,000. General master workman, John W. Parsons; general secretary-treasurer, John W. Hayes, 43 B Street, Washington, D. C.

KNIGHTS TEMPLARS, the twelfth degree of Masonry, reported for 1899, 43 grand commanderies in the United States and Territories. There are 1012 commanderies under the jurisdiction of the Grand Encampment, with a membership of 116,992. Subordinate commanderies in Delaware, Idaho, Nevada, New Mexico, Sandwich Islands, South Carolina, and Utah, with a membership of 1412, make a total membership of 118,404. Grand master, Reuben H. Lloyd, San Francisco, Cal.; grand recorder, William H. Mayo, St. Louis, Mo.

KNORR, ANGELO. See **SERUM THERAPY**.

KREMENTZ, PHILIPP, cardinal and archbishop of Cologne, died in Cologne May 6, 1899. He was born at Coblenz December 1, 1819; studied at Bonn and Munich, and was consecrated to the Roman Catholic priesthood at Treves in October, 1842. He then held positions in the church at Coblenz and Bedburg, and in 1849 again at Coblenz. In 1867 he was chosen bishop of Ermeland, and the next year was transferred to Frauenburg. In 1885 he succeeded P. Melcher as archbishop of Cologne, and was raised to the cardinalate in 1893. He wrote: *Das Haus Gottes*, 1854; *Die Stadt auf dem Berge oder Offenbarung und Abfall*, 1861; *Israel, Vorbild der Kirche*, 1865; *Das Evangelium im Buche Genesis*, 1867; *Das Leben Jesu, die Prophetie der Geschichte seiner Kirche*, 1869; *Grundlinien zur Geschichtstypik der Heiligen Schrift*, 1875; *Die Offenbarung des heil. Johannes im Licht des Evangeliums nach Johannes*, 1883.

KRUGER, STEPHEN JOHN PAUL, president of the South African Republic, was prominent in 1899 through his negotiations with the British colonial secretary, Mr. Joseph Chamberlain, previous to the outbreak of the Boer war. He was born in Rastenburg, Cape Colony, October 10, 1825. He went with the Boers into Natal, then into the Orange country, and when about fourteen years of age crossed the Vaal. In his early days he saw much adventure and hard fighting, and was one of the Boer leaders in the development of the country. Through courage and prudence he came to be highly regarded by the people, and in 1872 was made a member of the executive council. He became a general in the army, and in the war with England, memorable for the British defeat at Majuba Hill, February 27, 1881, he was commander-in-chief. He was chosen president of the republic in 1883, and has been retained in the position at every election since—1888, 1893, and 1898. He is considered a clever diplomat, and his negotiations with Mr. Chamberlain in 1899 were very creditable; exception, however, must be made to his "ultimatum," his communication of October 10, which it seems had the effect of precipitating the war. See **TRANSVAAL** (paragraphs on History).

LABOR. The subject of labor interests in this volume is treated in part in the articles *Strikes and Wages* (qq. v.), and in part in the articles on the different countries. The present article aims to summarize briefly the important features of labor legislation in the United States in 1899, and to discuss some of the points of interest in connection with the labor movement in this and foreign countries.

Labor Legislation in 1899.—In the review of State legislation for 1899, published by the New York State Library, the chief legislative enactments in regard to labor are grouped under the heads of labor bureaus, public employment agencies, factory inspection, the eight-hour day, and employers' liability. Many of the States have labor bureaus. No new ones were established in 1899, but several were reorganized or changed by the passage of new laws. In Idaho the Bureau of Immigration, Labor, and Statistics was reorganized, and the commissioner required to publish information concerning the State's resources in order to attract immigrants. Kansas also changed her system by creating a State society of labor whose secretary performs the duties of the former State commissioner of labor and the State factory inspector. The State of Massachusetts established a bureau of labor in 1896, and the federal government and many of the State governments have followed its example, but in the Western States the collection of labor statistics is still only a secondary duty on the part of already existing State organs. Public employment agencies have been established in a few of the States, but in general where the State concerns itself with this matter the practice is to provide for the regulation and licensing of private employment agencies. In 1899 Illinois established free employment agencies in cities of 50,000, and Missouri required the commissioner of labor statistics to establish such bureaus in cities of 100,000. Departments of factory inspection have been established in many of the States. In some cases the factory inspector presides over this department and in others the commissioner of labor. The tendency is to enlarge the duties of the factory inspector. In 1899 a New York law gave over to the factory inspector of the State several important duties which had been formerly left to the commissioner of police. Wisconsin increased the number of inspectors; Indiana and Tennessee created inspection departments, and Kansas, Idaho, Missouri, Colorado, South Dakota, Michigan, Alabama, and Arkansas provided for a more complete in-

PRESIDENT PAUL KRUEGER.

spection of the mines within the State. New York passed an important eight-hour law in 1899, providing that no laborer employed by public authorities or by contractors on public works shall be permitted to work more than eight hours a day, even though payment be offered for working overtime. Laws of California, Idaho, Washington, and West Virginia, passed in 1899, also established the eight-hour day for public works. Massachusetts established the eight-hour day for city and town employees. These laws generally provide for the payment of wages at the prevailing rate. In Indiana a law was passed in 1899 fixing the rate of unskilled labor on public works at not less than 15 cents an hour. Many laws exist limiting the hours of labor in occupations injurious to health. A new law was passed in 1899 in Nebraska prohibiting railway companies from permitting trainmen to work more than eighteen consecutive hours without eight hours' rest; in Wisconsin, prescribing the eight-hour day for persons under eighteen years of age in cigar factories; in Missouri, prescribing the hours of labor in bakeries and confectionery establishments; in Colorado, establishing the eight-hour day (except in emergency) in mines, smelters, and reduction works; and in Missouri, for miners working at a depth of 200 feet or more (except coal miners). The Colorado law was declared unconstitutional. In the United States the common law does not hold the employer responsible for an injury sustained by a workingman through the negligence of a fellow-workman, but recent legislation has extended the liability of employers in many States, especially in the railway business. In 1899 North Dakota established the principle of employers' liability for injuries caused by the carelessness of a fellow-employee, and this liability may not be impaired by contract. Other important features of the year's legislation in regard to labor are noted in the *Bulletin* of the bureau of labor statistics of New York. Among them we may mention the following: Laws restricting the freedom of contract between employer and employee were passed in several of the States in 1899. For example, Connecticut, Idaho, and Wisconsin made it illegal for the employer to make non-membership in a labor organization a condition of employment; Colorado prohibited the use of the "truck system"; Kansas, Tennessee, Wisconsin, and Arkansas, and several other States framed certain regulations in regard to the method of paying employees; in Wisconsin a law required that any employer who demanded that his employees should give notice of intention to quit work under penalty of forfeiting wages should himself be liable to equal forfeiture for discharging employees without notice. The laws on the subject of employing women and minors were added to during the year. In New York the law was changed so as to apply to males under eighteen years of age, and to all females in prohibiting work for more than ten hours a day, and no children under sixteen were permitted to operate dangerous machines. Nebraska limited the hours of employment for females in manufacturing establishments, hotels, etc., to ten a day, and the same State, together with Florida, South Carolina, and Wisconsin, have followed the example of certain other States, which required that seats should be provided for female employees. Stricter regulations in regard to the employment of children to the extent of sacrificing their education were adopted in several of the States. The union label to mark goods as coming from factories where trade unionism prevails has frequently been counterfeited, and several States have passed laws to restrain the abuse. Laws on this subject were passed in 1899 by the legislatures of Arizona, Colorado, Delaware, Idaho, Wyoming, Georgia, and Illinois. The important matter of convict labor has led to much legislation for the purpose of preventing direct competition between it and free labor. Among the methods used to prevent such competition are the confinement of convict labor to industries not carried on within the State; the distribution of convict labor among many different industries, with a view to keeping down the product in each; the requirement that goods produced by convicts shall be taken only by State, county, and municipal institutions; the establishment of State prison plants in the West for the making of cordage and twine which have been the subject of monopolies. North Dakota and Kansas followed this policy in their legislation of 1899. In 1899 Idaho established a State board of arbitration whose decision is binding if both parties petition it to investigate and report, and it may investigate and report without petition. Illinois gave the State board of arbitration power to punish as for contempt of court persons refusing to give testimony or produce records, and Indiana extended the term of the labor commissioners and required them to offer mediation in all strikes. Formerly the mediation was to be offered only in strikes affecting fifty persons or more.

Compulsory Arbitration.—While the principle of compulsory arbitration is not generally favored by economists the example of New Zealand, where alone strictly compulsory arbitration has been established, has been in some respects encouraging. This system was established there by the act of 1894, and was amended in detail in 1895, 1896, and 1897. There are a general court of arbitration and local boards of conciliation. The colony is divided into industrial districts, each of which has a board of conciliation divided equally between representatives of the employers and

representatives of the employees. The general court of arbitration for the whole colony has three members who are appointed by the governor. In each district there is a clerk of awards who supervises elections to the boards of conciliation. In case of a dispute, application may be made to this officer by either party, and he refers it to the local board of conciliation. After trying to bring about an amicable arrangement the board of conciliation files its report with the clerk of awards. Either party may then carry the case up to the court of arbitration, whose award must be rendered within a month from the beginning of the hearing. The decisions of the local boards are not binding upon the parties, but the final awards of the court of arbitration are absolutely binding. In order to take part in the election of members of the local boards, employers' associations and the federation of trades unions must register with the registrar of the friendly societies of the colony. The trades unions generally favored the act, while the employers generally opposed it. In the spring of 1899, 132 associations of employers and workmen had registered. In the year 1897-98 twenty cases were brought up, and of these four were settled by the boards of conciliation and sixteen carried to the court of arbitration. The matters of controversy included all points at issue between capital and labor, and the system virtually amounts to giving to the court of arbitration the power of determining the conditions of labor for employers and employees. In many cases the court has fixed the rates of wages and the hours of labor for a period of two years. The system appears to have met with no obstacle in its practical operation and to have retained the favor of the working people. There have lately been signs that the employers were coming to approve it, especially on account of the greater stability which it introduced into their relations with workmen.

Eight-Hour Movement.—An important decision in the matter of the federal eight-hour law was made in 1899. This law, which was enacted August 1, 1892, provides that all employees on the public works of the United States or the District of Columbia shall be restricted to eight hours of work in any one calendar day, and the governments of the United States and the District of Columbia, or the contractors or sub-contractors who employ workmen, shall not require or permit any workman to work beyond that time, except in case of an emergency. The question that arose in 1899 was whether certain contractors on the government armory and boat-house at Annapolis were guilty of violating the statute. They pleaded that they were paying their workmen by the hour and not by the day. It was decided that payment by the hour did not relieve the defendants from the penalty of the law, and a considerable fine was imposed. The reduction of the hours of labor has been for a long time one of the main objects of labor organizations, as well as a conspicuous plank in the platform of the various socialistic parties. At the annual convention of the American Federation of Labor, in Detroit, in 1899, the declaration in favor of an eight-hour working day was made with great distinctness. The committee appointed to investigate the matter reported that in their opinion the introduction of the eight-hour day would do much to increase employment, lessen pauperism and crime, and enhance the consuming power of the people. They took issue with the assertion often made that workmen will produce as much in eight hours as in nine, and they held that the reduction in the output as a result of the shorter working day would yield beneficial results.

Labor in England.—In 1899 the labor department of the British Board of Trade published its annual report on wages and hours of labor for the year 1898. This clearly revealed the prosperous condition that prevailed in that year. It was reported that 1,003,290 working people had received increases of wages in the course of the year, and these statistics do not include agricultural laborers, seamen, and railway servants, who, however, appeared from many signs to have had their fair share in the general increase of wages. This increase was estimated at more than £95,000 a week as compared with a net increase of £45,000 a week in the previous year. The greatest advance was in the coal miners' wages, but there was also an increase in the metal, engineering, ship-building, and building trades. No very marked change in the hours of labor was reported for 1898. Ninety-five per cent. of the persons whose wages were increased in 1898 obtained the advance without having recourse to strikes. In 1899 the statistics showing the condition of co-operative societies in the United Kingdom for the previous year were published. The membership of these societies in 1898 was 1,500,000, the capital \$100,000,000, and the number of employees 44,000. It was reported that both distributive and productive co-operative societies were flourishing. The success of the English co-operative societies is attributed by some to the limitation of dividends and shares, which prevents the concentration of power in a few hands. The rate of interest is limited to 5 per cent., and the surplus profit divided among purchasers instead of being added to the dividends to shareholders. See TRADES UNIONS; also DENMARK; SOCIALISM; UNITED STATES, etc.

LABUAN. See BORNEO.

LACROSSE. The development of lacrosse in Canada, long the home of that pastime, has of late years been equalled in the United States. The strongest team in this country in 1899, as for several years past, was that of the Crescent Athletic Club, of Brooklyn, New York City. By the defeat of four strong Canadian teams—Toronto University, 11-8, Excelsior, 4-2, Montreal, 5-3, and Osgood Hall, Toronto, 11-3—the Crescent players won a fair title to the championship of Canada, and by the defeat of the nine other teams on their schedule, including the two intercollegiate champions, the Crescent men won the championship of the United States. The Crescent A. C. thus won its entire 13 games.

Intercollegiate lacrosse in this country is growing in favor, its more active representatives during 1899 including Cornell, Harvard, Columbia, Johns Hopkins, Lehigh, Stevens Institute of Technology, Hobart, and one or two others. Unfortunately, the sport lacks unity in its organization, there being two intercollegiate leagues, and in these not all the colleges having teams are represented. The Cornell-Harvard-Columbia league championship was won by Cornell, defeating Harvard 1-0, and Columbia 6-0. Cornell also twice defeated Hobart and tied with Stevens, 2-2. Its losing games with Crescent and Toronto were well played, and showed the development of the college game, the scores being 5-7 and 4-7 respectively. The Johns Hopkins-Lehigh-Stevens league championship was again won by Johns Hopkins, probably the strongest college team in the country. In this series Lehigh lost by 11-3, and Stevens 12-1. Johns Hopkins also defeated Harvard 20-0, and Columbia 9-1, and lost twice to Crescent by 3-5 and 1-12. The records of principal teams follows: Crescent A. C., 13 games, all won; Johns Hopkins, 4 won games out of 6; Stevens, 6 out of 9, and 1 drawn; Cornell, 4 out of 9, 2 drawn; Lehigh, 2 out of 6, 1 drawn; Columbia, 2 out of 7; Hobart, 1 out of 6; Harvard, 7 games lost.

LADRONES, or MARIANNE ISLANDS, a group of islands situated in the Pacific Ocean between 13° and 21° north latitude, and 145° and 146° east longitude, with an area of 417 square miles and a population estimated in 1887 at 10,172. The four principal islands of the group are Rota, Tinian, Saypan and Guam (*q. v.*); the last named with a population of about 9000, is the largest, and contains the principal town, Agaña, a place of about 3000 inhabitants. The group was discovered by Magellan in 1521, and had belonged to Spain, up to 1898, for 230 years. In 1898 Guam was ceded by Spain to the United States through the peace treaty of that year, and in February, 1899, the remainder of the Ladrone Islands, together with the Caroline and Pelew groups, comprising all the remaining Pacific possessions of Spain, were sold to Germany for 25,000,000 pesetas, or \$4,825,000. Formal announcement of the transfer was made in June. The purpose of Spain in ceding these islands was to rid herself of the comparatively unimportant appendages to the Philippines, Sulu and West Indian branches of her colonial empire which had been taken by the United States in 1898; the purpose of Germany in acquiring these small Spanish groups was declared to be the rounding off of the German possessions in the Pacific, and the further safeguarding of German commercial interests in that quarter of the globe. According to the clauses of the treaty transferring this territory, Germany concedes to the Spanish trade and agricultural enterprises in the islands the same treatment and facilities as conceded to German trade, and concedes to the Spanish religious orders in the islands the same rights and liberties as to the German orders; Spain will establish naval, mercantile, and coaling stations in the Caroline, Pelew, and Ladrone groups, and will be allowed to retain them in case of war. There was much criticism in the German press at the time of this purchase, the Radical and Socialistic sentiment being that the price paid was beyond the value of the islands. In the terms submitted to Spain by the United States at the close of the Spanish-American war, this country offered to buy a portion of the Caroline Islands from Spain, and there was some public sentiment in favor of buying the Caroline, Pelew, and Ladrone Islands entire. Spain, however, refused to sell to the United States even the islands which it was proposed by our government to buy in the Caroline group. The Ladrones are divided into two groups, the northern of which is actively volcanic. The southern group has most of the population, and this is chiefly in the island of Guam; although the number of inhabitants in the entire group is probably greater than the estimate of 10,172, there are at the most not more than a few hundred settlers outside of the island belonging to this country. The natives are said to be allied to the Tagalos, in Luzon, and the smallness of their numbers is attributed to the wars waged by Spain. The original natives were Chamorros, and the present stock has resulted from the intermingling of these tribes with the Tagalos. Signs of an earlier civilization appear in the ruins of old temples and palaces, especially on the island of Tinian. The climate is said to be healthful and cooler than that of the Philippines. Agriculture and commerce are unimportant.

LAGOS is a British crown colony and protectorate on the western coast of Africa.

It includes the island of Lagos and a coast line and interior lying between French Dahomey and the British Nigeria protectorate. The area of the whole is about 1500 square miles, and the population is estimated at about 100,000. A recent unofficial British report speaks of Lagos as being a colony of great importance to England, since it contains the only safe harbor along a thousand miles of coast, and commands all the main routes to the populous interior. The town of Lagos, with a population of 35,000, is said to be the largest on the West African coast. The now famous Niger controversy of 1897-98, between France and Great Britain, affected the hinterland of Lagos, where the French were reported to be invading British territory. The discussion of this matter, together with the final settlement of the question, may be found under the articles Dahomey and Niger Territories. Notwithstanding the opinion quoted above as to the importance of Lagos to Great Britain as a key to future African commerce, the trade returns for 1897, as reported by publications of the United States Treasury Department, do not show a healthy condition of affairs. The imports of 1897, according to colonial returns, were valued at \$3,749,638, against \$4,386,863 in 1896. The chief decrease was in cotton and silk goods. There was also a decrease of 5157 gallons of spirits, but there was a large increase in the importation of tobacco, chiefly from Great Britain. The value of the exports, \$4,739,700 in 1896, was about \$3,946,000 in 1897. The production of rubber is decreasing, due to the reckless way in which the trees have been tapped. Some 4,458,000 pounds were shipped in 1897, against 6,484,000 pounds in 1896. A large falling off in palm oil exports is attributed to drouth. Coffee and cocoa are reported as being cultivated with success, and a new export has been found in mahogany, the value of which in 1897 was \$30,659. The activity of Great Britain in Lagos will undoubtedly before long again turn the direction of commerce toward a healthy growth. Under the Colonial Loans Act, 1899, an advance of about \$3,800,000 was made by the imperial government for the construction of a railway from Lagos to Abeokuta and Ibadan, and the survey of an extension to the Niger. The Niger territories, now under the Niger Company, will be taken over by the imperial government in 1900, and at this time the boundaries and coast line of Lagos may be extended.

LAKE REGULATIONS. See HARBOR IMPROVEMENTS.

LAMARCKISM. See ZOOLOGICAL LITERATURE (paragraph General Treatises).

LAMOUREUX, CHARLES, a well-known French musical conductor, died at Paris December 21, 1899. Lamoureux was born at Bordeaux in 1834. In 1848 he went to Paris to study under Girard and Chauvet at the Conservatoire. In 1854 he gained the first prize at the Conservatoire for violin playing, and he was a prominent player in the concerts there up to 1872. In 1875 his Société de l'Harmonie Sacrée performed the *Messiah* for the first time in Paris. From 1878 to 1881 he was director of the Paris Grand Opera, and he was made in 1880 a knight of the Legion of Honor. The Lamoureux Orchestra was founded in 1881. During the following decade Lamoureux introduced and popularized Wagner in Paris. He visited London with his orchestra in 1896 and 1897, meeting with great success.

LAMPMAN, ARCHIBALD, Canadian poet, born at Morpeth, Ontario, November 17, 1861, died at Ottawa February 10, 1899. He was graduated at Trinity College, Toronto, in 1882, and from the following year to the time of his death held a clerkship in the Post-office Department at Ottawa. He contributed occasionally to *Scribner's*, *Harper's*, and *The Century*, and published in 1888 *Among the Millet*, and *Other Poems*, and *Lyrics on Earth* in 1896.

LAMSON, CHARLES MARION, D.D., president of the American Board of Commissioners for Foreign Missions, died at St. Johnsbury, Vt., August 8, 1899. He was born at North Hadley, Mass., May 16, 1843, and was educated at Williston Seminary, Easthampton, and at Amherst College, being graduated at the latter in 1864. During the next two years he taught Latin and English at Amherst and then went abroad and studied theology at Halle. Having returned in 1868, he held pastorates in Congregational churches at Brockton and Worcester, Mass., St. Johnsbury, Vt., and Hartford, Conn. The last-named charge he held for the five years preceding his death. Upon the resignation in 1897 of Dr. Richard S. Storrs as president of the American Board of Commissioners for Foreign Missions, Dr. Lamson was elected to the position. During his term of office he did much by his wise counsel and tolerant and sympathetic bearing to allay the spirit of controversy that a short time before had been so active in the Board. Upon his death it was said: "The Congregational denomination loses one of its ablest ministers in the fullest prime of his strength, the American Board loses its president, and the American Church loses one who was peer with its best and wisest leaders." Dr. Lamson was a member of the American Antiquarian Society, and a trustee of Amherst College.

LANDS, PUBLIC. The policy of the United States in regard to its public domain is one of the most enlightened in the world. It may be said that few civilized

governments have found themselves in possession of such vast tracts of land as have come under the public control of this nation from its very beginning. In addition to the reaches of land, extending to the Mississippi, which were possessed by the original colonies, the government has found itself in control of wide stretches of territory added successively by the Louisiana purchase, the Spanish cession of Florida, the Texan annexation, and the Mexican cessions, and the purchase of Alaska from Russia. Thus the United States government has had altogether under its control the disposal of over two-thirds of the national territory, stretching from Ohio to the Pacific Ocean, aggregating, exclusive of Alaska, over two and a half million square miles, or over 1,220,000,000 acres. The whole of this area has now been erected into States and Territories, but a large amount of public land, scattered through some twenty-five or more States (including four Territories), still remains the property of the general government. The total area of public land vacant and unappropriated on July 1, 1899, was 569,815,308 acres, excluding Alaska, and 144,219,233 acres reserved. The entire amount of public land in Illinois, Indiana, Iowa, and Ohio has been appropriated, thus leaving but eight States not in the Far West in which the public domain is unappropriated. These States are Minnesota, with 5,627,394 acres unreserved; Michigan, 473,013 acres; Wisconsin, 374,243 acres; Missouri, 449,029; Mississippi, 285,730; Alabama, 428,883; Louisiana, 593,080 acres, and the State of Florida, in which 1,690,428 acres are still unappropriated.

The policy of the government is well settled that the public lands are for the benefit of the people. The Homestead act, operative in the West, by which the principle of free grants to individuals was adopted, has not only provided opportunity to those who had intent to settle and found homes, but has induced emigration to uninhabited portions of the country. This and the discovery of gold in California have greatly stimulated the remarkable development of the West in the last half century. But in the encouragement of education and the building of railroads, the management of the public land has also played an important part. In addition, the concession for the right of way for irrigation and like purposes has been found to have been of such national benefit that a premium has been placed on the reclamation of the so-called desert lands of the West, and provisions made within the last five years for the donation to each of the States in which there may be situated desert lands of not more than 1,000,000 acres of such land as the State may cause to be irrigated and reclaimed, without regard to cultivation or settlement. In connection with the management of its public lands the United States has also maintained a system of public survey upon which it annually spends a large amount of money.

Agricultural and Mineral Lands.—During the fiscal year ending June 30, 1899, the disposal of public lands amounted to 9,182,413 acres, an increase of 728,516 acres over the aggregate of disposals in the previous year. Patents of the class denominated agricultural—that is to say, patents issued on final and commuted homestead entries, on desert land, timber culture, pre-emption, private cash, town-site, and other entries of an agricultural, non-mineral character—were issued during the fiscal year to the number of 34,407. These patents embraced approximately 5,500,000 acres. Other patents granted include: Mineral and mill-site, 1712 grants; coal, 3883 acres; under railroad grants, 504,651 acres; under wagon-road grants, 60,392 acres; Indian and miscellaneous patents, 212,849 acres; swamp-lands, 150,541 acres; educational grants, etc., 420,760 acres. The military-bounty land warrants located during the year in the several States and Territories represent an aggregate of 9760 acres. The more important of the above patents discussed by the United States commissioner of the General Land Office in his last report were the homestead and railroad grants, desert irrigation, and mineral land grants. There has been a decrease of over 50 per cent. in the acreage patented this year under the land grants authorized by Congress to aid in the construction of railroads. The number of acres patented in the preceding year were 1,032,535. In the adjustments of railroad grants the most important examinations during the past year have been those concerning the Northern Pacific, the Union Pacific, the St. Paul, Minneapolis and Manitoba, and the Southern Pacific Railroads. In a suit brought against the last-named company about 1,000,000 acres of land were recovered and opened to entry. Supplemental proceedings involving a portion of these lands, which have been sold by the company, are pending in the courts, and also three suits involving lands within its main and branch lines aggregating about 2,300,000 acres. A complete adjustment of the grants of the Northern Pacific Railroad shows that that company is entitled to 36,570,100 acres, of which there is still due from the United States 14,851,832 acres. The whole area of the grant to the Union Pacific Railroad is found to be 12,129,842 acres, of which there is still due to the company 5,153,646 acres. As there are large unsurveyed tracts within the limits of both the said grants, some difficulties are expected to arise upon the final adjustments. The adjustments of the grants to the St. Paul, Minneapolis and Manitoba Company for its main and branch lines shows the area of the grant for the main line to be 1,287,228 acres, or an excess of 10,975 acres. For the branch lines the company

has thus far received an acreage less than that granted, and a net balance of indemnity of 55,587 acres is held against the company. Right of way to five railroads has been given through public lands during the year, and 45 companies or individuals have been given right of way for irrigating or water-transportation canals or reservoirs. Under the State Desert Segregation act, ceding irrigated public lands to the State in cases where the State has performed the work, the State of Montana has filed three lists, aggregating 50,201 acres, which have been approved, and a list involving 160 acres has been approved for the State of Wyoming. For the mineral division, the Land Office reports that the mineral and mill-site patents issued for the year were exceeded in number only in 1883, 1891, and 1892, and the number of mining claims patented, 3853, is greater than in any other year except 1892. There are no reliable data at hand from which to estimate the amount of gold taken from the Yukon country in Alaska; no mining claims have been received from that Territory, but United States land offices have now been opened at Circle City and Peavy, and another year will disclose whether or not the miners in that district are desirous of proving up, paying for, and acquiring title to their claims. The localities in the United States showing the greatest activity in the mining industry are principally the Cripple Creek district, Boulder, Clear Creek, and Gilpin Counties, the Leadville district, and upper San Miguel County, all in Colorado; Jefferson, Silver Bow, and Deer Lodge Counties, Mont.; Lawrence County, S. D.; Colville Indian Reservation, Wash.; Salt Lake and Tooele Counties, Utah; Eldorado and Calaveras Counties, Cal.; and Shoshone and Boise Counties, Idaho.

The following table shows the number of mineral and mill-site patents issued for each fiscal year, commencing with the fiscal year ending June 30, 1869, in which the first patent under the United States mining laws was issued:

Year.	Patents.	Year.	Patents.	Year.	Patents.	Year.	Patents.
1869.....	24	1877	514	1885.....	510	1893.....	1,623
1870.....	111	1878.....	542	1886.....	675	1894.....	1,363
1871.....	104	1879.....	343	1887.....	1,489	1895.....	1,242
1872.....	133	1880.....	666	1888.....	1,084	1896.....	1,476
1873.....	215	1881.....	737	1889.....	913	1897.....	1,085
1874.....	365	1882.....	1,298	1890.....	1,407	1898.....	1,259
1875.....	423	1883.....	1,75	1891.....	1,792	1899.....	1,713
1876.....	443	1884.....	1,661	1892.....	3,242		

The Public Forests.—The principle that the State ownership of public lands is for the public benefit has been applied to the agricultural lands as a benefit to the individual, the national benefit accruing therefrom being incidental. In the management of the forest lands, however, the social welfare of the community chiefly is regarded. The policy of holding the forests covering important watersheds or retaining them for the purpose of preserving the timber supply, which is diminishing at an alarming rate, has not until recent years received the attention which it deserves, and the United States is still far behind most European countries in this respect. The practice of disposing of large portions of forest land is no longer carried on, however, to the extent to which it once prevailed. Within the past nine years 37 forest reservations have been created, embracing an estimated area of 46,021,899 acres. There are under consideration also nearly fifty proposed new reserves. The principal revenue now accruing to the government from its woodlands are from the granting of privileges for timbering operations. The latter privilege, when carried out under competent supervision, can work little danger to the present timber supply. It is by the method of State supervision and the replanting of forests that much of the timber is obtained in the large European countries, where forestry has reached a high point of development and attained the status of a profession. The forest service of the United States, even in its present early stage of development, has already proved largely self-supporting. No less important, however, than the preservation of the timber supply, and of even more importance than a large revenue, is the conservation of water at the head springs of our rivers. It is the opinion of the commissioner of the General Land Office that those reserves created to retain needed water supplies should have the forests which they contain left absolutely untouched. When it is considered that it takes from three to five centuries, according to the official report, to make one foot in depth of the humus soil which constitutes the floor of a virgin forest, it does not seem too much to ask that woodland, where original, shall be preserved. This humus soil is the best water reservoir known, soaking up the rainfall like a sponge and transferring it gradually to the springs and feeders of the rivers. When a forest has been cut over and the sunlight admitted, this soil becomes as dry

as tinder and especially subject to fire. Once ignited it burns fiercely, and is often consumed down to the solid rock, and it never returns. The average annual loss from fire already reaches \$20,000,000.

During 1899 the effect of the widespread interest in forest questions has been shown by the enlargement of two of the existing forest reservations, and the establishment of six additional reserves with a combined area of over 5,200,000 acres. The reservations known as the San Francisco Mountains and the Black Mesa Forest Reserves were created in the Territory of Arizona for the conservation of important water supplies. The Gila River Reserve, established about the headwaters and various tributaries of the Gila, San Francisco, Tularosa, and Mimbres Rivers, in New Mexico, will benefit not only that Territory, but the entire southern portion of Arizona, which is dependent upon the Gila River as the one great stream of that arid region. A petition by the Utah legislature for a public park in the vicinity of Fish Lake resulted in the creation of the Fish Lake Forest Reserve, as better serving the interests of the State while the Gallatin Reserves in Montana originated in a request from the Montana College of Agriculture and Mechanic Arts for lands dedicated to experimental work along irrigation and forestry lines. The Lake Tahoe Reserve in California was the result of petitions from the Leland Stanford and California Universities and the Sierra Club, and a petition from Nevada signed by the governor and a number of other State officials. The territory which it was asked should be set aside as a public park contains scenic features of the finest possible description. An area adjoining Lake Tahoe was set aside as a forest reserve embracing the country recommended.

One of the most important measures taken during 1899 was the action of Congress in withdrawing from the Mount Rainier Forest Reserve a portion of the region immediately surrounding Mount Rainier, and setting it aside as a national park. The peculiar features of this region, according to the land commissioner's report, demand different and more stringent protection than that afforded a forest reservation. The forests that clothe the slope and foothills of Mount Rainier require, as great regulators of floods, to be preserved absolutely untouched, while the protection of arctic animals present in that region calls for extraordinary measures. The necessity of having this unique park and its environs preserved in a state of nature has for years attracted much attention, not only in this country but abroad, and the matter of setting it apart as a national park has long been one of international interest, eminent scientists of England and Germany being among the promoters of the move. The scientific reasons which aided in the adoption of the measure by Congress were set forth in the following memorial to the United States Senate:

"Mount Tacoma (Mount Rainier) is single not merely because it is superbly majestic; it is an arctic island in a temperate zone. In a bygone age an arctic climate prevailed over the Northwest, and glaciers covered the Cascade Range. Arctic animals and arctic plants then lived throughout the region. . . . On the great peak the glaciers linger still. They give to it its greatest beauty. They are themselves magnificent, and with them survives a colony of arctic animals and plants which can not exist in the temperate climate of the less lofty mountains. These arctic forms are as effectually isolated as shipwrecked sailors on an island in midocean. There is no refuge for them beyond their haunts on ice-bound cliffs. But even there the birds and animals are no longer safe from the keen sportsmen, and the few survivors must soon be exterminated unless protected by the government in a national park."

The General Land Office endorses the recommendations of members of the Geological Survey that the limits of this important park be increased to influence districts whose scenic aspects are essential to the unity of the park, and whose features should come under park protection. Additional reserves of heavy timber should in this particular case be protected from those operations of lumbermen which it is part of the general economic policy of the forest reserve commission to a certain extent to promote. The extension of the Yellowstone Park is also recommended by the incorporation of a portion of the Teton forest reserve and the Yellowstone timber-land reserve. It is desired to throw additional safeguards about the big game, which is found to winter largely in these outlying reserves, and to protect more effectually the timber embraced in those reserves. Park game-protection does not extend to the forest reserves proper, which are under the State game laws, and open for hunting in season. For the forest patrol it was recommended that a body of regular troops should be employed. "The superior discipline of regular troops makes a more effective patrol than the civil forest officers, and cavalry can cover a greater extent of territory with more expedition and is better able to cope than are forest rangers."

The fact that all of the thirty-seven public forest reservations, embracing an estimated area of 46,021,899 acres, have been created since 1891, or within nine years, furnishes sufficient comment on the advance which the United States has made in the management of this important department of its public domain. These reservations are shown in the following table:

State or Territory.	Name of Reservation.	Date of Proclamation Creating Reservations.	Present Estimated Area in Acres.
Alaska	Afognak Forest and Fish Culture Reserve. (Reserved under Secs. 24 and 14, Act Mar. 3, 1891.)	Dec. 24, 1892	Not ascer- tained.
Arizona	Grand Canyon Forest Reserve.....	Feb. 20, 1893	1,551,520
	San Francisco Mountains Forest Reserve.....	Aug. 17, 1896	*975,300

* Even sections only.

While the benefits derived from a national forestry system in the way of forest preservation and water conservation are necessarily beyond computation, one of the minor advantages—namely, a revenue to the government—is appreciable; the receipts from this source, according to the report of the general land commissioner, were for the past year, \$223,696.56. As the amount expended in connection with public timber was but \$285,000, it is evident that the service is already nearly self-supporting. With the continuance of education in forestry matters, and with proper legislation, the administration of our forest lands can, in the opinion of the commissioner, be made to yield a large revenue.

A patrol of 9 superintendents, 37 supervisors, and 250 rangers served on the reserves from July 1 to October 15, 1899. During the season of 1900, 100 additional rangers will be employed. There were extinguished 749 small fires, 223 considerable fires, and 9 large and important fires, involving a vast saving to timber regions. The total area burned (mostly State forests) was 131,586 acres, and the extra cost of fire service was \$11,887.75. In consideration of new and proposed reserves the sum of \$300,000 for the expenses of the forest service is asked for the year of 1900-01, as against \$175,000 granted for the year 1899-1900. See FORESTRY.

LATTER DAY SAINTS. See MORMONS.

LAWRENCE, WILLIAM, LL.D., jurist and ex-comptroller of the United States Treasury, died at Bellefontaine, O., May 3, 1899. He was born June 26, 1819, at Mount Pleasant, O.; was graduated at Franklin College, New Athens, in 1838, and at the Cincinnati Law School two years later, when he was admitted to the bar. In 1845-47 he edited at Bellefontaine the *Logan Gazette*, and later became one of the editors of the *Western Law Monthly*. He was a member of the lower house of the

Ohio legislature in 1846-48, and of the Senate in 1849, 1850, and 1854. While in the legislature he brought about the establishment of a reform school, and secured the passage of a free-banking law. From 1857 to 1864 he was judge of the Court of Common Pleas and of the District Court. In 1862 he was in the Union service as colonel of the Eighty-fourth Ohio Volunteers, and was at Cumberland and New Creek. Judge Lawrence was a Republican representative in Congress from 1865 to 1877, serving through the Forty-fourth Congress. In 1880 he was appointed first comptroller of the United States Treasury, and resigned this position five years later. He was a prominent member in the Methodist Episcopal Church. Besides a number of important legal works, he wrote much in favor of a protective tariff. Among his publications are: *Ohio Reports*, Vol. XX.; *Organization of the Treasury Department*; *Law of Claims Against Governments*; *Law of Impeachable Crimes*; *Causes of the Rebellion*; *Life and Services of John Sherman*; *Decisions of the First Comptroller*, 6 vols.; *Law of Religious Societies*; *The American Wool Interest*; *Memorials to Congress for Wool Tariff*, 10 vols.; *The Treaty Question*; *Constitutional Law*.

LAWTON, HENRY W., major-general, U. S. V., was shot and killed in an attack upon intrenched Filipinos at San Mateo, Luzon, December 19, 1899. He was the first general killed since the outbreak of war in April, 1898. His rank in the regular army was colonel and inspector-general of volunteers, but his nomination for brigadier-general, U. S. A., was determined upon and was ready to be sent to the Senate on the day of his death. General Lawton had a long and honorable career as a soldier. He was born March 17, 1843, at Manhattan, now a part of Toledo, O. On April 18, 1861, he enlisted as sergeant of Company E, Ninth Indiana Infantry, and on July 29 of the same year was mustered out; on the 20th of the next month he entered, as a first lieutenant, the Thirtieth Indiana Regiment, with which he served to the end of the war. This regiment was a part of the Army of the Tennessee. Lawton was promoted to the rank of lieutenant-colonel, was brevetted colonel, and at the same time was awarded a medal of honor for distinguished gallantry at Atlanta on August 3, 1864. Among the battles in which he took part were Shiloh, Corinth, Chickamauga, Stone's River, Rocky Face, Resaca, Dallas, Kenesaw Mountain, Lovejoy's Station, Franklin, and Nashville. During the war his regiment lost 137 officers and men killed and 275 died of disease, or 412 deaths out of a total enrolment of 1126. On November 26, 1865, Lawton was mustered out, and was recommended for a commission in the regular army by General Sherman, General Sheridan, and General J. T. Wood. This commission he received on July 28, 1866, when he was assigned to the Forty-first Infantry as a second lieutenant. As a first lieutenant in the Fourth Cavalry he gained his fame as an Indian fighter. He served in the Southwest, especially in Arizona, until 1888, participating in some of the hardest Indian campaigns in the history of that part of the country. On March 20, 1879, he was promoted to a captaincy, and it was while holding this rank that he conducted his famous campaign, under the direction of General Miles, against Geronimo, the half-breed Apache leader. This campaign marked the close of Lawton's Indian fighting, for on the 17th of September, 1886, he was made inspector-general with the rank of major—a very desirable staff position. On February 12, 1889, he became a lieutenant-colonel, which grade he held at the beginning of the war with Spain. Lawton was commissioned a brigadier-general of volunteers on May 4, 1898, and in the following month went to Cuba with the army of invasion (Fifth Corps) under General William R. Shafter. He was placed in command of the second division, which took El Caney in the battle of Santiago, July 1, 1898, and on the 7th of the month was made a colonel in the regular establishment, and on the following day a major-general of volunteers. He subsequently commanded the department of Santiago and the Fourth Army Corps. On December 29, 1898, General Lawton was ordered to the Philippines as second in command to General Otis. Having reached Manila March 10, he took command on the 18th of the first division of the Eighth Army Corps. He captured Santa Cruz on April 10, took San Isidro later, and on June 1 assumed command of the lines in Morong province about Manila. He had made his expedition through Laguna de Bay and Bulacan province, having engaged in 22 fights and captured 28 towns. He was next engaged south of Manila, and met with strong opposition, the principal fight being known as that of Zapoti Bridge, June 13. In October he began operations again against the insurgents in the north, and after achieving much success returned to Manila early in December. His last expedition was to take San Mateo, where a small number of the already disintegrated Filipino forces had gathered. In the official announcement of General Lawton's death Secretary of War Root said: "The swift and resistless movement of his column up the Rio Grande and across the northern boundary of the plain of central Luzon, which had just been completed, was the chief factor in the destruction of the insurgent power, and was the crowning achievement of his ardu-

ous life. He fell in the fulness of his powers, in the joy of conflict, in the consciousness of assured victory."

LEAD. The output in 1898 in the United States was 235,573 short tons. It was obtained chiefly from the argentiferous lead ores of Colorado, Idaho, Utah, and Montana, but large quantities were also yielded by the lead and zinc ores of the Mississippi Valley. The total amount of lead refined in the United States in 1898 is estimated at 335,342 short tons. About 84,666 short tons of this were refined in bond and exported, and about 1200 short tons exported in manufactures. The production for 1899 may be somewhat lower than that of 1898, owing to strikes at the Colorado lead-silver smelters.

Messrs. Iles and Shelby have pointed out that the decomposition of the slag dumps at some lead smelters has yielded an efflorescence rich in potash and sodium sulphates, and they suggest that perhaps these may be made to serve as a source of potash.

LEAD POISONING. Medical examination of the employees in potteries in England and medical agitation of the conditions found have been instrumental in securing recent legislation, the effect of which will be to protect such employees from exposure to lead poisoning. Women and children have heretofore been frequent sufferers from this form of toxication. The British Home Office has announced that all workers in lead hereafter are to be subjected to periodical medical examination. Attempts to discourage the use of lead glazes have been made by relaxing some of the special rules of the Factory acts in favor of manufactories where leadless glazes are used. As it is claimed that lead glazes are in no way superior to other glazes, it is confidently predicted that a great industry, hitherto fraught with constant danger to the hands employed, will become comparatively safe through the abandonment of the use of lead. See **WATER-WORKS**.

LEAGUE OF AMERICAN MUNICIPALITIES, established in 1897, had in 1899 a membership of 7000. The objects are to improve municipal administration by organizing study of practical questions, by holding annual conventions, and by maintaining a bureau of information concerning municipal affairs. The meeting for 1900 is to be in Charleston, S. C. Secretary, B. F. Gilkison, 111 Nassau Street, New York City.

LEAGUE OF AMERICAN WHEELMEN, organized in 1880, in 1899 had 59,728 members. General meeting of members for 1900 at Milwaukee, July 10 to 15. Secretary, Abbot Basset, 530 Atlantic Avenue, Boston, Mass.

LEEWARD ISLANDS, a group of the Lesser Antilles, lying to the southeast of Puerto Rico and north of the Windward Islands, constitute a colony of Great Britain. They have a total area of 701 square miles; the population in 1891 was 127,723, an increase of 5000 in a decade. The group comprises Dominica (area 291 square miles; population 26,841), Antigua (area 108; population, with the small islands Barbuda and Redonda, 36,819), St. Kitts (area 65; population 30,876), Nevis (area 50; population 13,087), Montserrat (area 32; population 11,762), the Virgin Islands, and Anguilla. The chief towns are St. John, Antigua, population about 9800, and Basseterre, St. Kitts, population about 9100. Nearly four-fifths of the population are negroes; the whites number about 5100, and the remainder are mulattoes. For administrative purposes the islands are divided into five presidencies; Antigua is the seat of government; the governor and commander-in-chief since 1895 has been Sir Francis Fleming, K.C.M.G. Education is denominational, and there are private schools and schools receiving government aid. The religious bodies in the order of their numerical strength are Anglicans, Wesleyans, Roman Catholics, and Moravians. The chief products are sugar, coffee, cocoa, and fruits. The public debt in 1898 was £300,121. Other statistics of finance and statistics of commerce have been:

	Revenue.	Expenditure.	Imports.	Exports.
1897.....	£124,767	£140,944	£325,653	£331,534
1898.....	112,577	138,612	299,973	286,403

The sugar export in 1897 was valued at £236,209; the leading imports for that year were flour, £47,000, and cottons, £23,308.

On August 7, 1899, the hurricane which swept over the Lesser Antilles and other parts of the West Indies, especially Puerto Rico, devastated Montserrat, and did damage also in St. Kitts, Nevis, and Antigua. Many persons lost their lives and many more were injured.

LEGION OF HONOR, founded by Napoleon in 1802, as a reward for military and civil services, in 1899 had 52 grand crosses, 210 grand officers, 1027 commanders, 5679 officers, and 36,170 chevaliers. Two American women are said to possess the decoration of the French Legion of Honor. Military members receive from 500 to

3000 francs a year, according to rank. The grand master of the order is the president of the French Republic.

LEITNER, GOTTLIEB WILLIAM, PH.D., oriental linguist, died at Bonn, Germany, March 24, 1899. He was born at Pesth, Hungary, October 14, 1830. His father, a German physician, having become involved in the revolution of 1849, went to Turkey. Here Gottlieb, already a good classical scholar, learned Turkish, Arabic, and modern Greek. Later he learned English, French, and Italian at the British College in Malta. He went to London, where he was naturalized as a British subject, and studied at King's College; in this institution he became in 1859 teacher of Arabic, Turkish, and modern Greek, and two years later was made professor of Arabic. He also taught Mohammedan law. In 1864 he was appointed director of the college at Lahore in the Punjab; he did excellent work in that country in establishing schools, societies, newspapers, and libraries, and in introducing reforms in the existing educational institutions. Under the commission of the government of the Punjab he made explorations in Kashmir, Ladakh, Thibet, and Dardistan; his research was made especially notable by his discovery that the Dardu languages are allied to Sanskrit. He also found in a certain tribe Græco-Buddhist sculptures, from which he surmised that the people were descendants of Macedonians who had settled there in the time of Alexander the Great. Leitner extended his philological study to the languages of other districts, including Kabul and Badakhshan, and sent to the Vienna exposition an extensive collection of Central Asiatic antiquities. Among his works, besides many contributions to the collections of learned societies in England and on the continent, may be mentioned: *Theory and Practice of Education*; *Philosophical Grammar of Arabic*, in the English, Arabic, and Urdu languages; *The Sinin-i-Islam*, a history of the Mohammedan religion in its relation to general history; *The Races of Turkey*; *Græco-Buddhist Discoveries*; *A Comparative Grammar of the Dardu Languages*; *History, Songs, and Legends of Dardistan*; *Kafiristan*; *History of Indigenous Education in the Punjab since Annexation*.

LEO XIII. POPE, addressed to Cardinal Gibbons, under date of January 22, 1899, a letter which was practically an encyclical to Roman Catholics in America. The subject of the letter was the so-called "Americanism" in the church, special reference being made to Father Elliott's biography of Father Hecker, the founder of the Paulist order, who died in New York in December, 1888. The Pope pointed out in what "Americanism" is inconsistent with the Church and in what it is not, and while admitting the importance of modern thought and progress, warned American Catholics against a failure to recognize the authority of the Romish discipline and dogma. The letter was answered by Archbishop Keane, Archbishop Ireland, the Paulist Fathers, and other Catholics, all of whom repudiated "all the opinions the Apostolic letter repudiates and condemns." *Apropos* of The Hague Conference, the Holy See was the subject of some discussion; it was urged in some quarters that an invitation be issued to the Vatican for representation at the conference, but this was opposed by the Italian government, and it was finally decided that the Pope receive no official recognition. In 1899 Pope Leo underwent a serious operation, from which, it is said, he has only partially recovered. For many years his physical and mental strength has been most remarkable. He is the son of Count Ludovico Pecchi, and was born at Carpineto, March 2, 1810.

LEONARD, MOSES GAGE, sometime member of Congress, died at his home in Brooklyn, N. Y., March 20, 1899. He was born in Stafford, Conn., July 10, 1809; came to New York City in 1832, and engaged in business. He became an alderman in 1840, and held office for three years. In 1844 he was elected as a Democrat to the Twenty-seventh Congress; he was renominated for the next Congress, but defeated. From 1846 to 1849 he performed important services as commissioner of charities and alms. In the latter year he went to San Francisco, where he was a member of the first common council, but in 1851 returned to New York. Upon the outbreak of the Civil War he was prominent in raising troops, and was one of the organizers of the One Hundred and Thirty-fifth New York Regiment, afterward the Sixth Artillery Regiment. Up to 1860 Leonard was a Democrat; after that he voted with the Republicans until 1884, when he supported Mr. Cleveland.

LEOPOLD II. See CONGO FREE STATE.

LEPROSY. The report of Surgeon Kinyoun, the delegate from the United States to the International Leprosy Conference in Berlin in 1897, was published in December, 1899. At the conference Besnier estimated the number of lepers in the world at 180,000, and credited the United States with possessing 250. Our true number is probably greater. The conference reached the following conclusions: (1) That the *Bacillus lepræ* is the sole cause of leprosy; (2) that every leper is a menace to those about him; (3) that the disease attacks all classes; (4) that the disease is not hereditary; (5) that all cases of leprosy should be reported in obedience to statute; (6) that isolation in some form is desirable. Dr. R. S. Wood-

son, of the United States Army, reports the great improvement of a case of leprosy during treatment with Calmette's antivenene serum from August to October, 1899. The case occurred in a woman, and was of the tubercular-anæsthetic form. His description of her appearance and condition at the time treatment was begun is as follows: "A large, raw-boned woman of 'scrawny' type, aged 36, but apparently 48; weight, 131; hunted, downcast look; huskiness of face, with marked telangiectasis extending over nose, cheeks, chin, and ears; nasal septum destroyed; nose lobulated and sunken in; infiltration of sides of nose extending into cheeks; supraorbital infiltration a symptom-complex, giving the leonine expression of countenance; right ear leathery, pendulous, and thickened; edema of the feet and legs, several small ulcers on each leg; numerous scars of past lesions; voice harsh and strident; stiffened fingers; anæsthesia absolute along the ulnar tract, but sensation diminished over entire surface of arms, chest, and back; very much mottled from former lesions; several small nodules along the dorsum of each hand and on each forearm; marked muscular atrophy of both arms; abundant nasal secretion; frequent bleeding from venules on surface of nose; mental condition good, except for moments of violent rage on slight provocation.

"The patient stated that she was afflicted with the habit of frequently dropping objects held in her grasp; that her sense of touch was so deficient that she would need ocular demonstration of the fact that she held the object in her grasp; also that of late she could not feel the bite of insects (mosquitoes) on any portion of her body. I enucleated a tubercle from the back of her hand about the size of a pea; she gave no evidence of pain during the operation."

Marked improvement resulted from the treatment, which was discontinued because of the failure of the supply of serum. The patient was receiving large doses of *hoang nan* at the same time. The improvement of the patient is thus described by Dr. Woodson: "The present condition of the patient is one of great improvement. She has lost the leprosy expression. The supraorbital infiltration has disappeared. The infiltration on each side of nose and that over each cheek has diminished perceptibly; in fact, all over her face and ears there is a marked loss of infiltration.

"The bluish color of her face has changed to a healthy red. The telangiectasis has diminished. Her eyes are clear and bright. There are no sores on any portion of her body. There is only one tubercle remaining (the one mentioned above on left side, level of fifth rib); this has proved somewhat obstinate, despite frequent local injections. Her anæsthesia has disappeared, so that the injections have become extremely painful, even along the ulnar tract. Her skin has become softer and fairer. Her chest and back have particularly improved, having filled out with healthy tissue, and all lesions have disappeared. Her nasal discharge has ceased. Her voice is natural, and her fingers have lost their stiffness. She has gained 14 pounds in weight in 145 pounds. Her general health is excellent."

Dr. Woodson was led to make the experiment of treating this case with antivenene by the success of similar treatment of five cases of leprosy by Dr. Isidore Dyer, of New Orleans. The latter physician reported two cured, two markedly improved, and one, occurring in an aged and frail patient, unimproved. Dr. Dyer, in turn, conceived the idea of this treatment after witnessing the remarkable amelioration of symptoms in a tubercular leper who was bitten by a venomous serpent in 1897.

Calmette's antivenene is made from snake venom which has been transmitted through many individuals, and thus modified and attenuated. It is not a true antitoxin. *Hoang nan* is the bark of *Strychnos gaultheriana*. It contains the alkaloids found in *nux vomica*—namely, strychnia and brucia. It is much used in Indo-China in leprosy, rabies, scrofula, and paralysis, and is also used in Paris. See INSECTS and THE PROPAGATION OF DISEASES.

LEYDS, WILLIAM JOHANNES, foreign agent of the South African Republic since 1898, was born at Magelang, Java, in 1859, and was educated at Amsterdam University, where he received the degree of doctor at law. In 1884 he was made attorney-general of the South African Republic, and four years later was made state secretary. To this position he was re-elected in 1893 and 1897. In 1889 he was justice of peace for the entire republic. During 1899 Dr. Leyds endeavored to arouse sympathy and gain assistance in Europe for the Transvaal in its negotiations and war with Great Britain, and he was said to have received large sums from the Transvaal government to aid him in effecting his purposes.

LIBERIA, an independent negro republic of western Africa, lying on coast of North Guinea, between 5° N. and 8° N., and bounded on the southeast by the river Cavally and on the northwest by the river Manua. The distance between these rivers is from 300 to 350 miles, and as Liberian territory extends some 250 miles inland the area of the country, though variously given by different authorities, is probably about 75,000 square miles. The population has been placed at 1,068,000, but according to more recent statements, it is about 1,500,000. Of these, some 24,000 are

civilized Americo-Liberians, while the rest of the inhabitants are aboriginal blacks, most of them still being in a barbarous condition. The capital is Monrovia; population about 6000; the populations of the other leading towns are estimated as follows: Buchanan, 5000; Edina, 5000; Harper, 3000; Robertsport, 1200.

According to the constitution, which is modelled on that of the United States, the chief executive authority rests with a president, elected for two years, and assisted by a cabinet representing the departments of state, finance, interior, justice, war and marine, and ports. The president in 1899 was Mr. William David Coleman, who, as vice-president, succeeded to the office upon the death of President J. Cheeseman, November 13, 1896. The legislative power devolves upon a congress of two houses, the senate and the house of representatives, there being eight members in the former, elected for four years, and thirteen members in the latter, elected for two years. There is no army, but the government possesses two small revenue gunboats.

The revenue is derived chiefly from customs duties; the cost of general administration is the principal expenditure. Revenue and expenditure in 1894 were reported to be \$156,179 and \$154,062, respectively; for 1898 the reported revenue and expenditure balanced at \$194,640 (£40,000). A debt of \$486,600 (£100,000) at 7 per cent. was contracted in England in 1871; the interest on this, unpaid since August, 1874, amounted in 1899 to \$368,581 (£178,500), making the total foreign debt \$868,581. There is also an internal debt, of which the interest arrears exceed the principal. Accounts in Liberia are usually kept in United States currency.

The principal exports are coffee, palm kernels, palm oil, cacao, rubber, sugar, ivory, arrowroot, hides, and piassava. Among the leading imports are cottons, haberdashery, provisions, hardware, earthenware, and rum. Statistics of the foreign commerce of Liberia are greatly at variance. One authority states that the combined annual exports and imports "probably do not exceed £500,000" (\$2,433,000); another, that the exports in 1897 amounted to £212,500 (\$1,034,025), and the imports, £250,000 (\$1,216,500); while the summary of commerce and finance for August, 1899, issued by the United States Bureau of Statistics, Treasury Department, placed the exports for the fiscal year 1896-97 at \$689,031, and the imports, \$505,235. This last authority also states that Germany sends nearly two-thirds of the imports, with Great Britain second in rank, and that the trade with the United States is less than that with France or Holland.

Some speculation was called forth in the latter part of 1899 by the visit to Liberia of the United States cruiser *Montgomery*. In some quarters it was thought that the United States was intending to negotiate for a coaling station on the Liberian coast. Another interpretation was that the United States was about to join Great Britain in requesting France to fix the boundary of her territory touching Liberia. It seems that for a number of years France has been encroaching on the territory of the little republic.

LIBRARY ASSOCIATION, AMERICAN, a national body organized in 1876 and incorporated in 1879. Its purposes are the promotion of library interests, the interchange of experience and opinion, the obtaining of larger results from library labor and expense, and the advancement of the profession of librarianship. It also seeks to strengthen the public library as a factor of the American educational system, and to that end acts in co-operation with the library department of the National Educational Association. The American library exhibit, to be made at the Paris Exposition of 1900, has been specially prepared by the New York State Library for, and is largely the outcome of work done by, members and committees of the Association. Its membership numbers 600. The annual meeting of 1899 was held at Atlanta, Ga. The next and twenty-second general meeting will be held in Montreal, Canada, in June, 1900. The president and secretary respectively for 1899-1900 are Reuben G. Thwaites, secretary and superintendent of the State Historical Society, Madison, Wis., and Henry J. Carr, librarian of the Scranton (Penn.) public library.

LIFE SAVING SERVICE. The number of shipwrecked persons succored at United States life-saving stations during the year ending June 30, 1899, was 751, bringing the total for 28 years up to 14,627. Only one station, located on the Atlantic coast, was added during the year, making 265 stations in all. Most of the stations are on the Atlantic coast, there being 193 there, against 15 on the Pacific, 56 on the lakes, and one at the Falls of the Ohio, at Louisville, Ky. Further figures for the last fiscal year of the service are as follows: Disasters, 428; persons involved, 3903, of whom 56 were lost; property involved, \$8,104,640, of which \$1,842,740 was lost. In addition, 294 small craft were involved, containing 671 persons, of whom 7 were lost. The total cost of maintaining the service for the year was \$1,509,831. The Volunteer Life Saving Corps of the State of New York, inland waters, has 672 stations and saved 433 lives last year. Its head office is at 63 Park Row, New York City. The United States service is attached to the Treasury Department, Washington, D. C.

LI HUNG CHANG, Chinese statesman, was born February 16, 1823, in the province of Ngau-hwuy. He became provincial judge of Chêkiang, and in 1860, while governor of Thiang-sin province took part with Colonel (later General) Gordon in suppressing the Taeping rebellion. He received many honors, and was elevated to various official positions. Of some of these during his career he has been divested, but they have subsequently been restored to him. At the outbreak of the war with Japan in 1895 he had charge of the naval, military, and financial affairs of the empire, but early in the war was deprived of some of his honors and removed from the chief command, although he remained prime minister. In March, 1896, he left China to represent the Emperor at the Czar's coronation, and then made his memorable journey around the world. He reached Peking in October, and was soon made minister of foreign affairs, but soon after, for an alleged breach of court etiquette, was fined a year's salary. He declared his intention to retire to private life, but was retained, probably in the interest of the Empress Dowager and her party. In June, 1898, the Emperor conferred on him the Order of the Double Dragon (third degree, first class), an honor never before accorded to a Chinese subject. In September, 1898, he was dismissed from the Tsung-li-Yamen, on account of the Lu-han railway contract, but was shortly afterward reinstated by the Empress Dowager, who appointed him imperial commissioner to report on the Yellow River. His report occasioned an imperial decree, issued April 24, 1899, directing the provision of 400,000 taels for material required for works on the Yellow River; 600,000 taels for dykes, and 2,000,000 taels for deepening the mouth of the river. Li Hung Chang is friendly to foreigners, and especially favors Russians. He is a man of large intellect, a shrewd diplomat, and has attained a power never equalled by a Chinese subject.

LINDSEY, Eleventh Earl of, **MONTAGU PEREGRINE BERTIE**, a captain in the Grenadier Guards, retired, died January 29, 1899. He was born December 25, 1815, and succeeded his brother to the title in 1877. His heir is his son, Lord Bertie, who was born in 1861.

LIPTON, Sir **THOMAS JOHNSTONE**, an English provision merchant, was prominent in 1899 through the part he had in the international yacht race, which took place off Sandy Hook in October. He owns the *Shamrock*, which was defeated by the American cup-defender *Columbia*. (See **YACHTING**.) Lipton was born in Glasgow, Scotland, of Irish parentage. He is president of the Thomas J. Lipton Company, pork packers, Chicago, is proprietor of the Lipton Refrigerator Car Lines in the same city, and owns tea estates in Ceylon. He was knighted in 1898. His sportsmanlike bearing before and during the races of 1899 made him very popular in America. His home is at Southgate, Middlesex, England.

LIQUID AIR IN MEDICINE. Tardy reports of the use of liquid air in medicine come to our notice. As a local anæsthetic it has been very successful, the only danger being that the part anæsthetized may become actually frozen. It has been found useful in the local treatment of ulcers of the leg, for example, abscesses, boils, carbuncles, and buboes. It relieves as by magic the pain of sciatica, herpes zoster, and intercostal neuralgia. It has apparently no effect upon the virulence of anthrax, diphtheria, or typhoid bacilli, for each of these varieties of bacteria resisted its action, although exposed to it for ninety minutes. Vaccine virus also resisted it successfully. As a therapeutic agent liquid air is applied as a spray or by means of a swab. Some experimenters hope for good results in the treatment of cancer with liquid air; but no trustworthy results have yet been reached in regard to this disease.

LISBOURNE, Sixth Earl of, **ERNEST GEORGE HENRY ARTHUR VAUGHAN**, died September 4, 1899. He was born July 30, 1862, and succeeded to the title on the death of his father, the fifth earl, in 1888. His heir is his son, Lord Vaughan, who was born in 1892.

LITERATURE, AMERICAN AND ENGLISH. I. **AMERICAN**.—The production of books in this country during 1899 has never been equalled by that of any other year in the world's history, and the limited space at our disposal precludes the possibility of giving even the titles of all that really merit inclusion. While the masterpieces, those that will stand the test of time, might perchance be counted on the fingers of one hand, the name of those well fitted to give pleasure or instruction is literally legion. We begin with that class of literature which appeals to by far the largest class of readers. It is to be noted that a number of the most widely read novels of this year were published last year. As far as possible this article will confine itself to the publications of the current year, although allusions to former publications are inevitable.

Fiction.—In this department the year is remarkable as having witnessed the publi-

cation of several novels that have broken all previous records in the way of extraordinary sales. Those which attained such extraordinary popularity were: *David Harum*, by Edward Noyes Westcott, and *When Knighthood was in Flower*, by Charles Major (both published in 1898); *Richard Carvel*, by Winston Churchill, a historical romance of the eighteenth century, admirable and even distinguished in its style; and *Janice Meredith*, by Paul Leicester Ford, a vigorous historical novel dealing with the time of the American Revolution. The very great popularity of these books shows a healthy tone in the public mind. *The Greater Inclination*, by Mrs. Edith Wharton, a collection of short stories exhibiting in the highest degree that rare creative power called literary genius, met with much appreciation from the critical portion of the public, and was declared by one eminent critic to be "the one work of fiction belonging to the present year which is equal to the very best in its own class." *McTeague*, by Frank Norris, was the only important representation of the realistic novel that the year produced. The story is a strange and impressive one, and depicts with power and vigor the sordidness and brutality of life. *The Market Place*, Harold Frederic's posthumous novel, though not of sustained excellence throughout, is a vivid study of the modern financial world, and took high rank among the fiction of the year. *No. 5 John Street*, by Richard Whiteing, an artist in irony, was the best socialistic novel of the season, as well as one of the best selling ones; it is a strong and stirring story, and proves that its author is not only a skilful writer but a man of wide reading in many literatures. *The Open Question*, by C. E. Raimond, is a problem novel which attained a large measure of favor. The problem is the morality of suicide in a case where the curse of inherited disease, in every representative of a given race, vitiates the mental or the bodily energies, or both. The story has little incident, its events being those of the immaterial world, crises in the development of character, climaxes of emotional experience. Notwithstanding its occasional defectiveness it was considered a very clever novel, revealing a thoughtful, cultivated, and imaginative mind. *The Maternity of Harriott Wicken*, by Mrs. Henry Dudeney, is a study in degeneracy, of remarkable power, written with a strong grip on her subject, and with a gleam here and there of real humor. *The Two Standards*, by Dr. William Barry, one of our ablest critics of literature and social life, is the popular exposition of some of its author's beliefs, depicting the sordid influence of an undue accumulation of wealth, and reaching the conclusion that the love of money pervades the life of to-day. Whether or not he proves his case, there is in his book the presence of a mighty purpose. The position which he holds is one in which much study and searching have confirmed him. *A Tent of Grace*, by Mrs. Adelina C. Lust, is a story of unusual power and interest, manifested not only in the handling of its tremendous problem—the deep gulf between Jew and Christian—but in its literary style, which has a certain distinction of its own. *Children of the Mist*, by Eden Phillpotts, is a wholesome tale, true to life and place, full of deep interest, rare humor, and vivid descriptions. *The Stolen Story*, by Jesse Lynch Williams, includes seven first-rate newspaper stories, one of which, *The Old Reporter*, is a serious study of some psychological details of journalistic work. *The Awkward Age*, by Henry James, discreetly skirts the edges of forbidden subjects, and represents the apotheosis of the author's peculiar style. *Siren City*, by Benjamin Swift, has for its motive the conflict between puritanism and paganism, and many of its incidents take place in Naples, the "Siren City." *The Black Douglas*, by S. R. Crockett, is a romance of the fifteenth century in Scotland, and deals with the fall of the house of Douglas. *Swallow*, by H. Rider Haggard, was regarded as a veritable work of art, immensely superior to anything else that he had ever done. *A Confident To-Morrow* is a story of New York life by Professor Brander Matthews, in which the fortunes of a young writer form the subject of the narrative. It was received as "a thoroughly good and well-wrought piece of fiction, full of meaning and instinct with a profound appreciation of many things which it is well for all of us to know." *The Chronicles of Aunt Minerva Ann*, by Joel Chandler Harris, is a narration of the experiences of a counterpart to "Uncle Remus," a type of the negro "mammy" before the war. *Ragged Lady*, by W. D. Howells, was published early in the year, and *Their Silver Wedding Journey*, by the same author, in the fall. The first was the most important contribution to fiction of the month in which it was published, and the second is a restful story of travel in Germany, with no hurry about it and not much excitement, but a great deal of entertainment and enough human interests to flavor every change of scene and take the curse of instructiveness off every description. *The Custom of the Country*, by Mrs. Hugh Fraser, is much more than "Tales of New Japan"; it is a collection of idyllic love stories told with the warmth and passion of poetic feeling. The other works of fiction which have appealed to the greatest number of readers during the year (some of which, it will be observed, were first published last year, while others go back to a still earlier date of publications) have been:

- Red Rock. By Thomas Nelson Page.
 The Battle of the Strong. By Gilbert Parker.
 Mr. Dooley: In Peace and in War. By F. P. Dunne.
 The Little Minister. By J. M. Barrie.
 The Christian. By Hall Caine.
 Aylwin. By Theodore Watts-Dunton.
 Second Thoughts of an Idle Fellow. By Jerome K. Jerome.
 The Day's Work. By Rudyard Kipling.
 The Adventures of François. By S. Weir Mitchell.
 The Hon. Peter Stirling. By Paul L. Ford.
 Penelope's Progress. By Kate Douglas Wiggin.
 Hugh Wynne. By S. Weir Mitchell.
 The Prisoner of Zenda. By Anthony Hope.
 Prisoners of Hope. By Mary Johnston.
 The Gadfly. By E. Voynich.
 Rupert of Hentzau. By Anthony Hope.
 The Widow O'Callaghan's Boys. By Guielma Zollinger.
 A West Point Wooing. By Clara Louise Burnham.
 A Hungarian Nabob. By Maurus Jokai.
 Dross. By H. S. Merriman.
 A Triple Entanglement. By Mrs. Burton Harrison.
 The Ladder of Fortune. By Frances C. Baylor.
 Strong Hearts. By G. W. Cable.
 I, Thou, and the Other One. By Amelia E. Barr.
 Manders. By Elwyn Barron.
 That Fortune. By Charles Dudley Warner.
 The Dreamers—A Club. By John Kendrick Bangs.
 The Strong Arm. By Robert Barr.
 Doc' Horne. By George Ade.
 Concerning Isabel Carnaby. By Ellen T. Fowler.
 The Ship of Stars. By A. T. Quiller-Couch.
 When the Sleeper Wakes. By H. G. Wells.
 The Span o' Life. By William McLennan and J. N. McIlwraith.
 The Garden of Swords. By Max Pemberton.
 The Jamesons. By Mary E. Wilkins.
 The Short Linc War. By Merwin Webster.
 Tiverton Tales. By Alice Brown.
 Young Lives. By Richard Le Gallienne.
 A Double Thread. By E. T. Fowler.
 The Fowler. By Beatrice Harraden.
 Agatha Webb. By Anna Katherine Green.
 The Lion and the Unicorn. By Richard Harding Davis.
 Stalky & Co. By Rudyard Kipling.
 The Orange Girl. By Walter Besant.
 Ione March. By S. R. Crockett.
 The King's Mirror. By Anthony Hope.
 Via Crucis. By F. Marion Crawford.
 Young April. By Egerton Castle.
 The Other Fellow. By F. Hopkinson Smith.
 Santa Claus's Partner. By Thomas Nelson Page.
 The House of the Wizard. By M. Imlay Taylor.
 Kit Kennedy. By S. R. Crockett.
 Little Novels of Italy. By Maurice Hewlett.
 The Vizier of the Two-Horned Alexander. By Frank R. Stockton.
 Mr. Dooley in the Hearts of his Countrymen. By F. P. Dunne.
 The Enchanted Typewriter. By John Kendrick Bangs.
 A Duet, with an Occasional Chorus. By A. Conan Doyle.
 The Gentleman from Indiana. By Booth Tarkington.
 In Connection with the De Willoughby Claim. By Frances Hodgson Burnett.
 Trinity Bells. By Amelia E. Barr.
 The Unknown Patriot. By Frank S. Child.
 The Queen's Twins, and Other Stories. By Sarah Orne Jewett.
 Those Dale Girls. By Frances Weston Carruth.
 Snow on the Headlight. By Cy Warman.
 Through the Surf Smoke. By Seumas MacManus.

Biography.—The biography of the year was especially rich in notable and valuable books. *The Life of William Morris*, by J. W. Mackail, presents a truthful and sympathetic record of a remarkable life, the life of a man exceptional in the versatility of his powers. *Reminiscences*, by Justin McCarthy, will be of great and permanent interest to all students of the nineteenth century, and especially attractive to bookmen of every class. The book, though not in name an autobiography, is in reality a self-revelation, and attracted deserved attention. *The Autobiography and Letters of Mrs. M. O. W. Oliphant*, arranged and edited by Mrs. Harry Coghill, was begun by Mrs. Oliphant as a record for her children, but when the last one died she could write no more. With her permission her relative, Mrs. Coghill, told the world all that it has a right to know of a singularly noble and heroic life, and the result is a human document of great value. *George Müller of Bristol*, by Rev. A. T. Pierson, appeals particularly to the readers of religious literature. In *The Life and Letters of Lewis Carroll* (Rev. C. L. Dodgson) Mr. Stuart Dodgson Collingwood shows that he rightly divined the secret of the beautiful side of Lewis Carroll's character and the charm which his personality and his work had for children in his strong and tender love for them. He saw in their unspoiled minds the best material for him to work on, and they appealed keenly to his æsthetic faculties, but

more than all else the reality of childhood appealed strongly to the simplicity and genuineness of his own nature. *James Russell Lowell and His Friends*, by Edward Everett Hale, D.D., is not a formal biography, but an admirable companion or supplement to the biographies of the persons included in the title, for it tells what would not properly come within the scope of those works. It covers, however, the editorial, political, literary, and diplomatic career of Lowell, and the incidental topics treated are numerous and enjoyable. *The Life, Writings, and Correspondence of George Borrow*, by William I. Knapp, Ph.D., LL.D., represents an astonishing amount of work, which has been so well and thoroughly done as to deserve the gratitude of all professed admirers of Borrow, who see in the subject of this book a pure, honorable, diligent, and high-minded man, entitled to rank among the foremost of the century as a master of English. *The Martyrdom of an Empress*, being the story of the murdered Empress of Austria, told by a woman (unnamed) who claimed to have been her intimate friend and confidante, is a very readable book, full of the tragedy that in one form or other marked the "hapless Hapsburgs." *Danton: A Study*, by Hilaire Belloc, does abundant though tardy justice to the character and achievements of this great figure in the second period of the French Revolution, and also gives a complete narrative of the most dramatic phases of the Revolution and a brilliant picture of France herself. *The Life and Public Services of Edwin M. Stanton*, by Hon. George C. Gorham, for some years secretary of the United States Senate, deals chiefly with the lawyer and the official, and disregards for the most part the characteristics of the man, much to be regretted on account of Mr. Stanton's striking personality, but is fully in keeping with Mr. Gorham's professed aim in writing the volumes, which was to mark the place in history to which Mr. Stanton's services to his country entitle him. *The Life and Letters of Sir John Everett Millais*, edited by his son, John Guille Millais, gives the history of most of the artist's pictures and brings the reader into most pleasant personal contact with the man and his friends. *The Letters of Robert Louis Stevenson*, edited by Sidney Colvin, were long expected and much talked of, and their final appearance was well calculated to fill with joy the heart of the lover of Stevenson. The number of the letters is high and the range is wide, for they were written from many parts of the world to correspondents of varied classes, old and young, grave and gay. *The Life of Danton*, by A. H. Beesly, is largely made up of Danton's speeches as recorded in the *Moniteur*. It is written from the standpoint of admiration in a style that is clear and judicious and masterful of detail. *Reminiscences*, by Julia Ward Howe, is essentially an informal review of a life which has come in touch with the spirit of its time at many vital points, and leaves a final impression of variety, fulness, and achievement. It throws light not only on such causes as those of antislavery, the war for the Union, and the change in the position of woman, but also upon many striking tendencies in thought, religion, and social affairs. *The Reminiscences of a Very Old Man*, by John Sartain, who was born in London in 1808, and died at the age of eighty-nine, is remarkable for the unfading freshness and pictorial precision of the author's recollections and his gift of simple, manly, sympathetic writing. When a mere boy he was apprenticed to an engraver, and for sixty-seven years his name was associated with the history of art in America, creating a name for some of our artists and carrying the names of others where they had never gone before and where they still remain in national estimation.

Other notable additions to this department of literature during the year have been:

- | | |
|--|--|
| The Life of Henry Drummond. By the Rev. George Adam Smith. | Nelson and His Times. By Rear-Admiral Lord Charles Beresford, C.B., M.P., and H. W. Wilson. |
| A Life of William Shakespeare. By Sidney Lee. | Thaddeus Stevens. By Samuel McCall. |
| Life of General Nathan Bedford Forrest. By John Allan Wyeth. | The Life of William Makepeace Thackeray. By Lewis Melville. |
| The Life of William Ewart Gladstone. Edited by Sir Wemyss Reid. | The Life of Charles Stewart Parnell, 1864-1861. By R. Barry O'Brien. |
| Ulysses S. Grant. By Hamlin Garland. | Bismarck, the Man and the Statesman, being the Reflections and Reminiscences of Otto, Prince von Bismarck. Written and Dictated by Himself after his Retirement from Office. |
| Horace Bushnell. By T. T. Munger. | The Life of R. W. Dale of Birmingham. By his son, A. W. W. Dale. |
| Memoirs of the Life and Correspondence of Henry Reeve. By John Knox Laughton, M.A. | Life and Letters of Phillips Brooks. By Professor A. V. G. Allen. |
| The Many-Sided Franklin. By Paul Leicester Ford. | Robert Raikes: The Man and His Work. With introduction by Dean Farrar. |
| The Life of Abraham Lincoln. By Ida M. Tarbell. | The Romance of Ludwig II. of Bavaria. By Francis Gerard. |
| Kate Field: A Record. By Lilian Whiting. | |
| Life of Pope Leo XIII. By F. Marion Crawford. | |

John Hancock: His Book. By Abram English Brown. Newman Hall. An autobiography. Letters and Recollections of John Murray Forbes. Edited by his daughter, Sarah Forbes Hughes.

History, Travel, and Adventure.—*The American Revolution* (Part I. 1766-76), by the Right Hon. Sir George Otto Trevelyan, Bart., the biographer and nephew of Lord Macaulay, and a public man well versed in affairs, is specially important as coming from an Englishman, who treats both sides of the great struggle with perfect fairness. In addition to this, it is accurate, it is written with sympathetic intelligence, it represents broad culture as well as special knowledge, and it is interesting. *The Establishment of Spanish Rule in America*, by Bernard Moses, is a book of more than momentary value, although the power of Spain has passed from this hemisphere. Especially interesting and instructive is the contrast Dr. Moses draws between the methods of English and of Spanish colonization. *The Historical Development of Modern Europe*, Vol. II., by Charles M. Andrews, covers the period from 1850 to 1897, is marked by sound judgment combined with a complete mastery of facts and by lucidity of expression, and was regarded as, if anything, more praiseworthy than the preceding volume. *Holland and the Hollanders*, by David S. Mel-drum, received high praise. In it are combined the incidents of travel and the results of observation with historic facts, explanation of governmental and educational systems, and agricultural and commercial statistics in a way to make pleasant reading and give one a complete idea of the sturdy little kingdom. *Present-Day Egypt*, by Frederic Courtland Penfield, United States consul-general in Egypt in 1893-97, is a series of faithful pictures of Egypt as it is to-day. The collection is arranged with skill in a pleasing narrative and includes history, commerce, engineering, antiquities, agriculture, royalty, and social customs. *The English Radicals: An Historical Sketch*, by C. B. Roylance Kent, is a book that involved an immense amount of research and covers a wide field with most satisfactory completeness. It is said that hitherto the Radical party has had no historian, and that Mr. Kent's work has been so well done as to make his book an acceptable encyclopædia of advanced political thought in England. *The United Kingdom: A Political History*, by Goldwin Smith, D.C.L., is especially valuable as a complete and self-contained history of the political development of England, based on recent research. It describes how England, in the last fourteen centuries, has solved the problem of constitutional government and how she has become an imperial power, beginning with the migration of the Angles, Jutes, and Saxons to England in the fifth century, and coming down to points so comparatively recent in the history of England as the accession of Peel to power in 1841, and the confederation of Canada in 1867.

Early in the year there was a decided falling off in the demand for war literature, even the recent publications by well-known authorities, and a similar lack of interest was noticeable in the case of the dramatised works which during the preceding months was so prominent. But as the months went by there was a noticeable increase in the call for Spanish text books and dictionaries, both for the study of Spanish in America and in our new possessions, and in the latter for the study of English. We note a few of the most popular of the books called forth by the war with Spain. *The Maine*, by Captain Charles D. Sigsbee, is a dignified, sober account of the destruction of the *Maine* in Havana harbor, February 15, 1898, and a clear, terse exposition of his reasons for believing that the explosion was due to external causes. *With Sampson Through the War*, by W. A. M. Goode, the correspondent of the Associated Press on board the flagship *New York*, describes the operations of the North Atlantic squadron in Cuban waters up to and through the memorable 3d of July, and is supplemented with chapters by Admiral Sampson, Captain Robley D. Evans, and Commander C. C. Todd. *The Sinking of the Merrimac*, by Lieutenant Holborn, had a peculiar interest at the time of its publication. *The Cuban and Porto Rican Campaigns*, by Richard Harding Davis, took rank as one of the most entertaining and at the same time most instructive contributions to the literature of the war. *Our Navy in the War with Spain*, by John R. Spears, was a decided acquisition to the history of the United States Navy. *In Cuba with Shafter*, by Lieutenant-Colonel John D. Miley, is a plain, straightforward story, founded on abundant knowledge of facts, since the writer was General Shafter's principal aide-de-camp. *In The Fight for Santiago* Mr. Stephen Bonsal aims to tell the story of the private soldier and his misfortunes. *Campaigning in Cuba*, by George Kennan, is not the work of an eye-witness or a participant; the writer saw the campaign from a Red Cross steamer and looked at everything from the hospital standpoint. *Fighting in Cuban Waters*, by Edward Stratemeyer, is especially designed for the delectation of youthful patriots. *History up to Date*, by William A. Johnston, furnishes a résumé of the whole war, from the causes that led up to it to the treaty of Paris. *The War with Spain*, by Henry Cabot Lodge, will probably become a permanent authority on the war. *The Story of the Rough Riders: The Regiment in Camp and in the Battlefield*, by Ed-

ward Marshall, is a complete record of the military manœuvres of the war in Cuba by a typical American newspaper man, who for his valor and devotion to duty received from Governor Roosevelt the medal of the Rough Riders. It is the personal element of the narrative that gives it its value, dealing as it does with incidents that the historian will not consider worth chronicling, but that will in the years to come form the romance of those short but arduous days. *The Rough Riders*, by Theodore Roosevelt, said near the end of the year to be the only one of the recent numerous publications on war subjects that was selling to any extent, is a straightforward, animated, picturesque narrative brimming over with human nature, humor, and all the lights and shades of the primitive passion of war. It has been characterized as such a "powerful commentary upon the Santiago campaign that it stands pre-eminent among its contemporaries in serious military value."

Quaint Corners of Ancient Empires: Southern India, Burma, and Manila, by Michael Meyers Shoemaker, was of special interest, owing to the conflict in the Philippines, with its descriptions of interesting edifices and oriental customs. Many works about the Philippines that were widely read throughout the year were published in 1898, and so need not be mentioned here. *Picturesque India*, by the Right Hon. Sir Richard Temple, written from actual experience, describes England's greatest possession and contains thirty-two illustrations by the author. *The Land of the Pigmies*, by Captain Guy Burrows, with an introduction by H. M. Stanley, describes instructively and entertainingly the characteristics and customs of some of the more important of the Central African tribes. *Under the African Sun*, by W. J. Ansorge, takes the reader from the east to Uganda, a region practically contiguous to that at which Captain Burrows arrives from the west—the two books forming together a good account of a trip across Central Africa from the Atlantic to the Indian Ocean. In *On the South African Frontier*, William H. Brown tells the story of what happened in Mashonaland and Matabeleland during the critical years of the colony, including his own personal adventures as hunter, miner, farmer, curio-collector, etc. In *A Prisoner of the Khaleefa*, Mr. Charles Neufeld narrates with great particularity and many incidents the story of his compulsory sojourn for nearly twelve years among the Mahdists, part of the time loaded with chains, till Omdurman was taken by the British forces. Of special interest are the descriptions of the death of General Gordon and the capture of Omdurman. *The Land of the Long Night*, by Paul Du Chaillu, although addressed chiefly to young people, contains scores of pages that will interest the veteran reader, inasmuch as the far North is to-day still a land of mystery, notwithstanding all the big books that have been written about it. The trip so well described began in October and lasted till spring, and took the writer from the southern coast of Sweden to Nordkyn, within sight of North Cape. *A Thousand Days in the Arctic*, by Frederick G. Jackson, records the life and work of nine scientific observers in one of the most desolate parts of the world for a longer period than any other explorers have voluntarily remained in the Arctic regions, and is valuable not only for its entertaining narrative but also for the valuable information which it contains. The situation in South Africa, especially toward the end of the year, naturally created a great demand for works dealing with that region. Prominent among those which met with considerable popularity were three, each written from an entirely different point of view: *Oom Paul's People*, by Howard C. Hillegas, is written with the old-fashioned American spirit of dislike for Great Britain and suspicion of all her doings, and extols the innocence and virtues of the Boers, *South Africa*, by W. J. Knox Little, is written from the opposite point of view, and, as one critic said, the two books do not agree on any one point except the dustiness of Johannesburg. *The South African Question*, by Olive Schreiner, is written from the Afriander point of view, and while criticised as having rather too much of the sentimentality of all her later writings is admitted to be at times genuinely stirring and in great measure to ennoble a discussion that has not been noticeable for its dignity. *The Transvaal from Within*, by J. P. Fitzpatrick, was a timely work to meet the demand for information regarding South Africa. *White Man's Africa*, by Poulteney Bigelow, and *Europe in Africa in the Nineteenth Century*, by Mrs. Latimer, were also in demand.

Tramping with Tramps, by Josiah Flynt, had an unusual sale for a book that did not belong to fiction. It is a study of the life and characteristics of vagabonds and criminals by one who joined the great army of tramps, which he estimates at sixty thousand in the United States, frequented their haunts, and saw even prison life from the inside. The author is a young university man, who has tramped in both Europe and America. *A Texas Ranger*, by N. A. Jennings, narrates the life and surprising adventures of a young man on the Rio Grande frontier in a company of Texas rangers during the early eighties, and brings before the reader many historic figures of the plains. Mr. Frederick Palmer's *In the Klondyke* gave its readers a more graphic and satisfactory idea of life in that region than had previously appeared, and contained many facts of real significance. *Two Women in the Klondyke*, by Mary

E. Hitchcock, is the story of a journey undertaken in the summer of 1898 by Mrs. Roswell D. Hitchcock, the widow of the late Commander Hitchcock, U.S.N., and Miss Van Buren, a grandniece of President Van Buren. *Alaska and the Klondike*, by Angelo Heilprin, professor of geology at the Academy of Natural Sciences of Philadelphia, describes a journey to the new Eldorado, with observations on the physical history and geology of the gold regions. Mr. Hamlin Garland's *The Trail of the Gold Seekers* is the literary result of his trip over the trail in 1898, when he led a pack-train from Ashcroft, British Columbia, to the Stickeen River, and afterward joined the miners' stampede for the Atlin Lake country. But the work of which Mr. Garland is said to be most fond is contained in his latest book, *Boy Life on the Prairie*, which shows the life of the boy of the western plains in prose, as Mr. Riley has written it in verse.

Mr. Rudyard Kipling's severe and protracted illness in the midst of which occurred the death of his little daughter Josephine, while visiting in New York early in the year, "not only evoked from all classes of people in all parts of the civilized world spontaneous tributes to the distinguished writer's genius, but brought to English-speaking peoples the first full realization of the extent to which Kipling embodies that tremendous vitalizing power and moral force which is the lifespring and the best hope of literature." Whether or not the sympathy and love thus awakened was responsible for the fact, it has been a great Kipling year. His *Day's Work*, although rated far below much of his other work, has had an enormous sale. *Stalky and Co.* has been severely criticised. One of his books published this year, however, has received the highest praise. *From Sea to Sea* contains the collected letters of travel which Mr. Kipling had written at different times between 1890 and 1898, some hitherto unpublished matter, and an accurate text (for the first time) of the *American Notes*. In the opinion of some critics, these letters are so well written and describe in such fresh, crisp language the scenes and customs of India, China, and Japan that they rank among the author's best writing.

Miscellaneous.—The development of a general respect for intelligent criticism and an appreciation of its authority, in a literary epoch characterized as "noisy and multitudinously productive," is indicated by the increasing number of books either dealing with criticism abstractly or exemplifying its principles in the measurement of work by definite standards. In *Some Principles of Literary Criticism*, Professor C. T. Winchester attempts a general examination of a very wide field, which is sufficiently sound and sufficiently comprehensive to serve as a practical working basis for the student of literature. *The Authority of Criticism*, by William P. Trent, is admirable in spirit, broad and scholarly in view, and charming in style. *What Is Good English? and Other Essays*, by Harry Thurston Peck, is the expression of the writer's personal opinion on the various subjects treated, in such a vivid and straightforward manner as to afford intense satisfaction to those who agree with him, and to arouse violent opposition in the minds of those who look at life from a different point of view. *Fisherman's Luck*, by Henry van Dyke, D.D., is a series of essays that make pleasant reading. *University Problems*, by President Daniel C. Gilman, of Johns Hopkins University, is a collection of addresses giving both the ideal with which his work began, and the ripened convictions which its progress has produced, and forms, as a whole, a noteworthy utterance on the aims of the higher education. *Modern Political Institutions*, by Simeon E. Baldwin, LL.D., is a collection of essays and addresses dealing with living political institutions, and abounding in apt illustrations, thus affording both pleasure and instruction. *The Development of the English Novel*, by Wilbur L. Cross, undertakes a minute survey of the growth of prose fiction from the Arthurian romance to Stevenson, and easily takes precedence of any book covering the same ground. *American Lands and Letters*, by Donald G. Mitchell, covers the period "from Leather Stocking to Poe's 'Raven,'" a period which includes many of the greatest names in our literary history, and contains many rare portraits, fac-similes, and views of literary interest. *The Cathedral Builders: The Story of a Great Masonic Guild*, by Leader Scott, is a handsome and elaborate monograph in which is concentrated the light of extensive research on a problem of real importance in the history of architecture, and of deep interest to all students of the past. *The Solitary Summer*, by the author of *Elizabeth and Her German Garden*, is a charming little book abounding in descriptive passages that are full of poetry, quaint remarks that are suggestive and interesting, and a wise philosophy that is wholly commendable. *Imperial Democracy*, by David Starr Jordan, president of Leland Stanford Junior University, was a timely book, presenting the various phases of a democracy's entrance upon imperialism in the light of history as well as recent facts and developments. *Through Nature to God*, by John Fiske, took its place with his other books of a similar nature, which are always in good demand. *Ruskin, Rossetti and Pre-Raphaelitism* is an interesting collection of the Rossetti family papers, edited by W. M. Rossetti, and containing sixty letters and other papers by Mr. Ruskin, dating from 1854 to 1862. There are also twelve

plates from pictures by Dante Rossetti. *Matthew Arnold*, by Professor George Saintsbury, was a notable volume, treating of the work of the great English critic.

The publication of the *Letters of Robert Browning and Elizabeth Barrett Barrett*, 1845-46, was considered the most important literary event of February. These letters fill two large volumes, and are the most important addition to the history of human character and of poetry for many a year. Though among the most closely intellectual letters ever exchanged, their matter was one thing—love. His letters are almost entirely filled with the setting forth of the “thinking-out of love, which was the life-work of his intellect during the whole year and a half covered by the correspondence,” and the passionate praises of his friend, poet, and love; hers sound the most harmonious antiphon: the intelligence of love, the humility, the gratitude. *The Cruise of the Cachalot*, *Idylls of the Sea*, and *The Log of a Sea Waif*, by Frank T. Bullen, were real additions to the literature of the sea, characterized by breeziness of style and unequalled in their delineations of deep-sea wonder and mystery. *Trooper 3809*, by Lionel Deele, treating of life in the French army, scored a great success. *Letters from Japan*, by Mrs. Hugh Fraser, is a vivid picture of life in the capital which is the centre of Japan’s vitality to-day; and where Mrs. Fraser, as wife of the British minister to Japan, had exceptional opportunities to observe the people as well as exceptional sources of information. *The Dreyfus Case*, by Fred C. Conybeare, rendered a real service at the time of its publication by recounting clearly the widely discussed case from its inception to its status at the time of publication. The book was published before the final disposition of the case. Probably the most popular of the numerous publications relating to that famous case was the *Letters of Dreyfus*, written to his wife, although *The Tragedy of Dreyfus*, by G. W. Steevens, who was a reporter at the trial in Rennes, and *The Dreyfus Story*, by Richard W. Hale, a compact and orderly account of the whole proceeding, should not go unmentioned. *The Break-Up of China*, by Lord Charles Beresford, is full of reliable first-hand information concerning existing conditions in China, and shows how the Eastern question is regarded in the East. *The New Far East*, by Arthur Didosy, the founder of the London Japan Society, explains the game of diplomacy now being played in the Orient, although the author is mainly concerned with the prospects of Great Britain in China. *The Dutch and Quaker Colonies in America*, by John Fiske, was undoubtedly one of the leading books outside of fiction. *Truth and Error, or the Science of Intellection*, by Major J. W. Powell, is a curious and interesting work written by a man of wide range of thought and action. *Earth Sculpture, or the Origin of Land-Forms*, by James Geikie, LL.D., F.R.S., is the latest contribution to geology by one of the ablest of interpreters in all that relates to the later changes in the history of the earth’s surface; in this book he has brought together in a popular form the results of his own studies and those of other inquirers concerning the ways in which the land has been given its varied shape.

A Literary History of Ireland from Earliest Times to the Present Day, by Douglas Hyde, LL.D., is a comprehensive volume that was warmly welcomed by all who felt that the Gaelic element in art and literature had been too long minimised and overlooked, in which the author labors in a spirit both wise and plausible to set forth the merits of the early race, carrying through his literary work an interesting history of race origin, influence, and characteristics. *The History of Japanese Literature*, by William George Aston, covering the whole of the long period from the sixth century to the present day, was on the whole disappointing, being regarded rather as a book of reference than the brilliant and informing work which his long residence in Japan would lead his readers to expect. *A History of English Dramatic Literature*, by A. W. Ward, Litt.D., LL.D., in three volumes, is a new and much-needed edition of a work that became the standard authority on its subject when first published about a quarter of a century ago, since which time no work has been produced at all competing with his in scope and aim. *A History of English Romanticism*, by Henry A. Beers, is full of that love of letters which is the soul of criticism. In *Ghostly Japan*, by Lafcadio Hearn, was regarded by many as the most fascinating of Mr. Hearn’s works, taking one into the very heart of Japanese life. *The Map of Life*, by W. E. H. Lecky, lacks originality and unity of system, but shows the large learning and wisdom of the man who has for the past fifty years exercised considerable authority both in history and in ethics. *A Dividend to Labor*, by Nicholas Paine Gilman, is credited with containing practically everything that has been done in an effort to bridge over the chasm which separates in our time the employer from the employee, and shows that we are moving toward a more just and more humane industrial order.

The Book of Golf and Golfers, by Horace G. Hutchinson and Others, is a definitive volume on this subject; it is admirable in structure and entertainingly illustrated. *A Guide to the Wild Flowers*, by Alice Lounsberry, with numerous colored illustrations was an attractive addition to the already large list of books on this subject. Other books on outdoor subjects which were well received were: *The First*

Book of Birds, by Olive Thorne Miller; *Field Key to the Birds*, by Edward Knobel; *Field, Forest, and Wayside Flowers*, by Maud Going; *How to Know the Ferns*, by Mrs. Dana, and *The Bee People*, by Margaret Morley.

The list of illustrated books was large and attractive, in the preparation of which photography occupies a prominent place. *The Education of Mr. Pipp* was Charles Dana Gibson's new volume of illustrations; an illustrated edition of *Janice Meredith*, in two volumes, contained 58 illustrations, 14 fac-similes and reproductions from old prints, and 2 miniatures in color. There were also, among others, new and attractive editions of *Hugh Wynne*, *The Marble Faun*, and *The Grandissimes*. *Sketches in Egypt*, by Charles Dana Gibson, wherein he is both author and artist, was intended more for amusement than instruction, and the intention is faithfully carried out. *Modern Daughters: Conversations with Various American Girls and One Man*, by Alexander Black, is profusely illustrated by pictures evidently taken from life, showing the American girl in every costume, from the heroine of Greek tragedy to the short-skirted bicyclist. *Bob: The Story of our Mocking-bird*, by Sidney Lanier, is an accurate contribution to amateur observation in natural history, the illustrations of which are particularly noteworthy.

The steadily increasing number of good books upon music published within the last few years is worthy of note. In this department of literature there has been a remarkable accession to the number of publications designed to explain to the uninitiated some of the more complex things that go to make up the structure of modern music as well as some of the higher æsthetic problems connected with it. This indicates a growing fondness for music in this country. *The Orchestra and Orchestral Music* and *How Music Developed*, by William J. Henderson, seemed particularly responsive to the public demand for enlightenment. The author is regarded as a clear and sound thinker on musical subjects, and an able expositor of the complications that enmesh many aspects of them. His *The Pianoforte and Its Music* is the initial volume in the *Music Lover's Library*. *Mezzotints in Modern Music*, by James Huncker, attracted the attention of the reading public as well as that of opera and concert devotees. *Masques and Mummings*, by Charles Frederic Nirdlinger, took rank as one of the most important books that have been published in years on the subject of the drama. The author occupies a unique position, being rated as probably the most hated and the most admired dramatic critic in America. Although the collection of essays is marred by blemishes and impertinences, it was conceded that "nothing so strong, so vivacious, so true to the 'eternal verities'" had appeared in this country for years. *A Study of Wagner*, by Ernest Newman, has been styled the first sympathetic exposition of the philosophy, the art theories, and the general intellectual position of the late Richard Wagner, and commends itself equally to the Wagnerian and to the anti-Wagnerian, so admirably in balance is its judgment. *Fragments of an Autobiography*, by Felix Moscheles, and *Recollections of an Old Musician*, by Thomas Ryan, also deserve mention. *A Guide to the Operas*, by Esther Singleton, met with great success. It is a comprehensive discussion of the principal operas, giving the story, stage setting, analysis of the music, etc.

Poetry.—The lack of new poetry worthy of note was especially marked, but there were many reprints and new editions of the standard poets, for which there was a great demand, noticeably Longfellow, Tennyson and Browning, James Whitcomb Riley, Eugene Field, and Paul L. Dunbar. The most notable volume of lyrics printed during the year was *The Man with the Hoe, and Other Poems*, by Edwin Markham, which shadows forth the labor and the care in which the world abounds and shows that at the heart of life there is promise and hope and power. The writer believes that unselfish labor furnishes the only basis for regenerating the world, while fraternity is to him the holiest of all words, being at once "the essence of all Gospels and the fulfilment of all Revelations." *The Wind Among the Reeds*, by W. B. Yeats, was called "a little book of distinctly accentuated genius," and has been described as a prose sequence of Celtic fairy tales and a poetic chain of comment thereon. *The Collected Poems of William Watson* was received as a distinguished contribution to the sum of genuine poetry. *Lyrics of the Hearth-Side*, by Paul Laurence Dunbar, fully maintained the reputation and warm interest which the author had won from a wide circle of readers. *Within the Hedge*, by Martha Gilbert Dickinson, discloses a keen apprehension of the various suggestions and analogies that nature may offer in the contemplative study of human life. *The Island Race*, by Henry Newbolt, celebrates in the most glowing terms and with unfailing rhythm and "swing" the deeds and daring of the English. *Hermione*, by Edward Rowland Sill, is a collection of lyrics characterized by clarity of thought and delicate craftsmanship. *Antigone*, by George Herbert Palmer, is a translation from the Greek in which not only the spirit but the letter of the original is wonderfully preserved, while the introductory note by Professor Palmer, with its sketch of the ancient story and its pertinent observations on the character and province of the Greek chorus, is of exceeding interest. *Sicilian Idyls*, by Jane Minot Sedgwick,

have in some instances a perfection of lyric grace that has caused the writer to be compared favorably with Mrs. Browning. *Bandanna Ballads*, by Howard Weeden, with Introduction by Joel Chandler Harris, include, with new material, the poems and pictures issued by the author as *Shadows on the Wall*, which was very successful. Miss Weeden is said by competent judges to depict the old-time negro "mammies," house servants, and farm-hands with wonderful reality and feeling. *Wild Eden*, by George Edward Woodberry, is a collection of lyrics having to some extent the spirit of true poetry, and *Sea-Drift*, by Grace Ellery Channing, was a noteworthy little volume.

Books for Children.—Juvenile publications were especially numerous, the work of many well-known writers and some new ones. *The Boys' Book of Inventions*, by Ray S. Baker, tells for the younger generation stories of some of the most noteworthy marvels of modern science, and proved very fascinating to the class for which it was written. *The Court of Boyville*, by William Allen White, showed that Mr. White was an adept in delineating the joys and woes of that strange genus, the Boy. *From Cattle Ranch to College: The True Tale of a Boy's Adventures in the Far West*, by Russell Doubleday, is a narrative enticing enough for the old, simple enough for the young, and refreshing throughout, while the spirit is good and wholesome. *The Half-Back*, by Ralph H. Barbour, could not fail to appeal to all boys who are fond of outdoor sports. *Peril and Prowess* is a collection of stories by well-known writers, resulting in a volume of great variety. *Little Jim Crow*, by Clara Morris, the well-known actress, is a collection of more or less pathetic stories. *Rupert's Ambition*, by Horatio Alger, Jr., is a thrilling tale of adventure. *The White Beaver*, by Harry Castlemon, is a story of woodcraft and forest life. *The Hero of Manila*, by Rossiter Johnson, puts the famous admiral intimately before young minds. *Iron Heart, War Chief of the Iroquois*, by Edward S. Ellis, is an exciting romance of pioneer life. *Dorsey, the Young Inventor*, by the same author, is an interesting story by means of which the author manages to convey considerable valuable information. *The Boys of Crooby*, by Ruth Hall, is a romance of early American life. *Henry in the War*, by General O. O. Howard, is a story from real life, "the war" being that of 1861-65. *Under Otis in the Philippines*, by Edward Stratemeyer, is a story of even more timely interest, the title of which explains itself. *The Voyage of the Avenger: in the Days of Dashing Drake*, by Henry St. John, is particularly interesting at this time which marks the downfall of Spanish naval power. *The Young Rajah*, by Arthur Lee Knight, was one of the most artistically attractive gift books of the season for young readers, the scene of which is laid in the island of Ceylon. The other juvenile books published during the year included stories by Byron A. Dunn, Kirk Munroe, Hezekiah Butterworth, Elizabeth Stuart Phelps, Sarah Orne Jewett, Carolyn Wells, Amanda Douglas, Albert B. Payne, and Lily F. Wesselhoef.

II. ENGLISH. At the beginning of the year the leading book in England was *With Kitchener to Khartum*. It had an enormous success; fifty thousand copies were sold at six shillings, and the sixpenny edition was subscribed for in one day. Several other works of the same class were also in great demand. Among the six-shilling novels, for which the demand was very great, those taking the lead were *Aylwin*, *Concerning Isabel Carnaby*, and *Roden's Corner*. The children's books that distanced all others in popularity were *Forgotten Children's Books* and Blackie's stories.

Thomas Hardy's *Wessex Poems* was regarded as a serious and important attempt in verse. The agitation against ritualism and Roman practices awakened an interest in ecclesiastical and Reformation literature; *The Secret History of the Oxford Movement* and Father Chiniqy's *Fifty Years in the Church of Rome* were widely read. There was a wonderful demand for the works of Rev. C. M. Sheldon, whose *In His Steps* was said to be the most widely selling book of the year in England; two million copies were sold in three months. In it the author attempts to fix the precise effect of a struggle after ideals of Christian perfection in the commercial life of to-day, and while the result is not to be classed as literature, its immense circulation shows how it appeals to the masses. Mr. Sheldon, who is an American, neglected to have his book copyrighted in England, and consequently thirteen different publishers issued it in editions ranging in price from half a crown to one penny. The publication of the Browning letters was an important item, and they were widely read. The interest felt in the Dreyfus case resulted in a great demand for F. C. Conybeare's book on the subject. Ian Maclaren's *Afterwards* had an excellent sale, as well as S. R. Crockett's *Red Axe*, showing that the Scottish school still flourishes.

Mr. Swinburne's new tragedy, *Rosamund, Queen of the Lombards*, was considered one of the most important books of the year. It is said to be written in a very old, but for him a very new, manner, and without any of his mannerisms, being severe, even to baldness, while the blank verse never sings; but it is a proof of the vitality of a poet who had won his distinction years before. A volume of poetry by Mr. John Davidson and a series of collected poems by Mr. William Watson were favorably received. The statement is made that Mr. Kipling is the only English poet who has a very large public. Among religious books, three were especially remarkable, the demand for them being so great that the publishers could hardly keep pace with it: Drummond's *New Evangelism*; Stalker's *Christology of Jesus*, and Mathe-son's *Life of Christ*.

There was a great call for books of travel, so that even very expensive works, like Nansen's in its earlier editions, found a ready market. The deep interest shown in the fate of China caused a large demand for Lord Charles Beresford's *Break-Up of China*. Works dealing with the Transvaal were naturally in great demand, and a little work by Olive Schreiner, dealing with south African affairs, attracted a considerable amount of attention. There was a noticeable diminution in the number of books for children published during the year, in marked contrast to the past few years, during which they have been very much overdone. Technical education manuals received increased attention, and they now cover many subjects upon which for many years only American treatises were obtainable. The popularity of Dr. Meiklejohn's series was notable, especially his *Geography*, *English History*, and *English Language*, which have outstripped all competitors. The growing interest in geography was so great as to lead to the publication by the Messrs. Newnes of an *International Geography*, containing some 500 maps, upon which at least seventy authors collaborated, forming a very interesting review of the world as we know it at the end of the century. There were a great many reprints of classics, the reason for which is difficult to understand, since it is perfectly well known that many of them do not pay their way.

Among biographical books the one that excited the greatest interest was the *Letters of Robert Louis Stevenson*. They were thought to give a true side of Stevenson, even if as a portrait they are incomplete, but the unanimous verdict was that they had been too severely and discreetly edited. An important biographical work was the *Life of Sir John Millais*, by J. G. Millais, the baronet's youngest son. It also contains chapters by Sir William Harcourt and Mr. Val Prinsel, and is elaborately illustrated. Mr. Clement Scott's *Autobiography* practically covers the period of theatrical history from the point where the standard Genest left off. Mr. Scott divides with Sir Henry Irving the honor of having practically given the stage its present prominence in English life. *The Life of Dr. Dale of Birmingham*, by his son, is full of valuable material and was well taken up. The *Autobiography* of Mrs. Oliphant was regarded as a notable book. *The Life of Sir Arthur Sullivan*, by Arthur Lawrence, and Mr. Charles Neufeld's account of his imprisonment under the Khalifa were two biographies of very different interest. *The Story of the People of England in the Nineteenth Century*, by Justin McCarthy, is a compendious narrative of the more

important events in the national progress, written for the class of people who have neither the time nor the preparation requisite for more minute researches.

It was noted as an unheard-of occurrence that not only was there no sensible diminution of new publications in what had formerly been known as the "dead season," but the output equalled that of any month during the past year, fiction being very much to the front. *Stalky & Co.*, by Rudyard Kipling, was received with universal disappointment as being totally unworthy of its author's genius. A very notable novel was *No. 5 John Street*, by Richard Whiteing, but the two novels which divided the honors of the spring season were *A Double Thread*, by Ellen Thornycroft Fowler, and *The Fowler*, by Beatrice Harraden. *The Fowler* is the story of at attempt at a mental seduction; in the end, however, the bird escapes the fowler and is received into better hands. It is by far the author's most ambitious effort. *A Double Thread*, which has been styled "a perfectly impossible and immensely entertaining book," is a story of London and country life. The plot has nothing original about it, but the style sparkles with all manner of clever and epigrammatic paradoxes. In the summer it was stated that the demand for cheap fiction increased with the ability of the publishers to turn out well-printed editions at a low figure; consequently there was a tremendous output of sixpenny editions of well-known novels, prominent among which was Mr. George Moore's *Esther Waters*. It also led to the starting of a new venture, called *The Novelist*, by the Messrs. Methuen, which opened with *Dead Men Tell No Tales*, by E. W. Hornung, a brother-in-law of Dr. A. Conan Doyle. This marked dominance of fiction Mr. Edmond Gosse regards as perhaps the most real danger which threatens the world of books to-day. *The Orange Girl*, by Sir Walter Besant, was accorded a warm welcome, and sold better than any other of his publications during the last few years. The second volume of the *Adventures of Captain Kettle*, by Cutcliffe Hyne, was as full of interest and impossibility as the first, and appealed to an equally large circle of admirers. *Unholy Matrimony*, by "John Le Breton" (Mr. Murray Ford and Miss Harte Potts), is a novel that was refused by several publishers in turn, yet when finally accepted and published it made a decided hit. *Prisoners of Hope*, Miss Mary Johnston's successful first novel, published in this country in 1898, was issued in England in 1899 under the title *The Old Dominion*, and made an impression on English critics "by the unusual power and dignity manifested and by the excellence of style." *The Human Interest*, by Violet Hunt, has an unusually pessimistic tone, but is a thoroughly good book, and is regarded as, on the whole, the best thing that Miss Hunt has yet done. *Red Pottage*, by Mary Cholmondeley, was the most popular of the new novels of the year. It contains situations that are undeniably new, and a great success is predicted for it.

The London *Academy*, instead of selecting the best three books published in 1899 to "crown," as heretofore, this year divided the 150 guineas at its disposal into 6 prizes of 25 guineas each, and awarded them as follows: In poetry, *The Wind Among the Reeds*, by W. B. Yeats; in fiction, *On Trial*, by "Zack" (Miss Gwendoline Keats); in biography, *Danton: A Study*, by M. Hilaire Belloc; in history, *England in the Age of Wycliffe*, by G. M. Trevelyan; in translation, the novels of Turgenev, by Mrs. Garnett, and *The Social Life of Scotland in the Eighteenth Century*, by H. G. Graham, in miscellaneous works.

The following list includes the books that have been the most widely read throughout England during the year. A careful examination of it will not only show clearly the trend of the popular taste so far as the English reading public is concerned, but will demonstrate the difficulty of making a distinction between English and American literature.

The Letters of R. L. Stevenson.
Red Pottage. By M. Cholmondeley.
The Slave. By R. Hichens.
The Colossus. By Morley Roberts.
The Transvaal from Within. By J. P. Fitzpatrick.
A Corner of the West. By E. T. Fowler.
Stalky and Co. By Rudyard Kipling.
Gilian the Dreamer. By N. Munro.
Story of Australian Bushrangers. By G. E. Boxall.

The new books published in Great Britain in 1899 numbered 5971. The new editions, 1596—total, 7567.

LLOYD, DANIEL LEWIS, D.D., sometime bishop of Bangor, Wales, died August 4, 1899. He was born November 23, 1843. He became a scholar of Jesus College, Oxford, where he took his master's degree in 1871. From 1867 to 1872 he was headmaster of Dolgelly School and curate of Dolgelly, and from 1873 to 1878 was headmaster of the Friar's School at Bangor. He was headmaster of Christ College, Brecon, from the latter year to 1890, when he was consecrated bishop of Bangor. This position he resigned a short time before his death. Dr. Lloyd published the Welsh hymn book, *Emyniadur yr Eglwys*.

LOCOMOTIVES. See RAILWAYS (paragraph Locomotives).

LOESS. Shimek points out that most of the fossils found in the loess of the central States are land forms of shells, and that this favors the theory of an æolian origin for the loess; another point bearing this way, he says, is that when shells are found in the streams they are always with sandy material and never with the fine silt.

LOGAN, Major JOHN A., only son of the late Major-General John A. Logan, was killed on November 12, 1899, "while gallantly leading his battalion" of the Thirty-third Infantry of General Wheaton's command, in an engagement against the insurgents at San Jacinto, Philippine islands. He fell while leading his men

through an almost impassable barrier against entrenchments of the enemy. Major Logan was born in Illinois July 24, 1865. He was at West Point for two years, but did not graduate owing to poor eyesight. During the Harrison administration he held a consular position abroad. When the Spanish war broke out he at once offered his services, and as a staff officer won commendation in Cuba. On May 12, 1898, he was appointed assistant adjutant-general of volunteers, with the rank of first lieutenant, and in the Santiago campaign served on General Bates's staff. For gallantry in the battle of El Caney he was promoted to the rank of major. After his return from Cuba he was appointed major in the Thirty-third Infantry, U. S. A., and sailed for Manila with his regiment, arriving there on October 27. Major Logan was well known as a breeder of fine horses, but in 1894 he sold his entire stable, comprising nearly two hundred and fifty horses.

LOMMEL, EUGEN VON, German physicist, died in August, 1899, at Munich. He was born March 19, 1837, at Edenkoben in the Palatinate; he studied physics and chemistry at Munich, and in 1860 began teaching in Switzerland. Five years later he became teacher of mathematics in the gymnasium at Zürich; at the same time he lectured in the university and at the Polytechnic School. In 1867 he accepted a call to the professorship of physics in the Academy at Hohenheim, but in the following year he became professor of the same subject in the University of Erlangen. Here he remained until 1886, when he accepted a professorship at Munich, and also took charge of the state physics collection; in Munich also he was a fellow of the Academy of Sciences. His works treated especially of optics. He wrote: *Studien über die Besselschen Funktionen*, 1868; *Wind und Wetter*; *Das Wesen des Lichts*, 1875; *Lexicon der Physik und Meteorologic*, 1882; *Die Beugungserscheinungen einer kreisförmigen Öffnung*, 1884; *Geradlinig begränzter Schirme*, 1886; *Lehrbuch der Experimentalphysik*, 1893. The vacancy caused in the faculty of the University of Munich by the death of Professor Lommel was filled by Professor Röntgen, of Würzburg, the discoverer of the "Röntgen rays."

LORD, WILLIAM PAINE, United States minister to the Argentine Republic, was appointed to his present position by President McKinley on October 23, 1899, to succeed Mr. William T. Buchanan, resigned. Mr. Lord was born at Dover, Del., in 1838. He was graduated at Fairfield College in 1860, and began the study of the law, but the Civil War having broken out he raised a battalion of Delaware cavalry and entered the Union service. From the rank of captain he was promoted major, and finally became judge advocate on the staff of General Lew Wallace. After the war he resumed his legal studies, and in 1866 was graduated from the Albany Law School and admitted to the bar. He accepted, however, the appointment to a lieutenantcy in the Second United States Cavalry, and served at Forts Steilacoom and Alcatraz, and in Alaska. In 1868 he resigned and began the practice of law in Salem, Ore. Having here acted as city attorney, he served as State senator from Marion County in 1878. For fourteen years he was a Supreme Court justice in Oregon, and, as a Republican, was elected governor in 1894, serving from January, 1895, to January, 1899. On April 18, 1899, Mr. Lord was appointed minister to Persia, to succeed Mr. Arthur S. Hardy, but declined.

LOUBET, ÉMILE, seventh president of the French republic, was elected to succeed President Faure on February 18, 1899, two days after the latter's death. President Loubet was born December 31, 1838, in southern France in the commune of Marsanne, *arrondissement* of Montélimar. His father, a peasant farmer, was a man of good repute, and for many years was mayor of the commune. Young Loubet attended schools near his home, and then studied law at Berguin and Paris. He soon became a successful lawyer, was made counsel for the Paris, Lyons, and Mediterranean Railway, then councillor of the *arrondissement*, and in 1871 councillor-general. Not long afterward he was chosen mayor of Montélimar, and retained that position until his election to the presidency.

During that time, however, he held other offices. He was elected to the chamber of deputies as a Republican of the Left in 1876, 1877, and 1881; in 1885 he was sent to the senate, and two years later was called by M. Tirard to the portfolio of public works in the first ministry under President Carnot. On account of his opposition to the policy of M. Charles Floquet, who succeeded M. Tirard as premier, M. Loubet did not retain his cabinet position the following year. In 1892 President Carnot chose him to succeed M. de Freycinet as premier, and he formed a ministry in which he held the portfolio of the interior. In 1896 and 1898 he was elected to the presidency of the senate. He held this office when, on February 16, 1899, President Faure suddenly died; on the 18th the national assembly (consisting of the senate and the chamber of deputies) convened at Versailles, and on the first ballot elected M. Loubet by a vote of 483 against 279 for M. Méline (who, however, had withdrawn his candidacy), 45 for M. Cavaignac, and 5 scattering. M. Loubet was

supported by the Liberals, or Republicans of the Left, while the Progressive Republicans favored M. Méline. M. Loubet was succeeded as president of the senate by M. Eugène Fallières. The new president of the republic is said to be a man of patriotism, integrity, and firmness, and his choice was looked upon as a wise one. About the time of his election he was reproached with the epithet "Panamist"—a reference to his official refusal immediately to make public the details of the Panama scandal when that affair was discovered. In no way was M. Loubet personally involved in the scandal, and his decision to suppress for a time the details was doubtless a wise measure for preventing popular outbursts, not to say an insurrection in favor of one of the pretenders. On June 4, 1899, a violent demonstration was made against President Loubet by anti-Semites at the Auteuil race-course. For a further account of the president in relation to the history of France during the year, see the article FRANCE. The president's mother, who has reached the age of eighty-six, still lives on the farm at Marsanne.

LOUISIANA, a Gulf State of the United States, has an area of 48,720 square miles. The capital is Baton Rouge. Louisiana was admitted to the Union April 30, 1812.

Agriculture.—During 1899 the rice industry was favored with exceptionally encouraging conditions. The blizzard in February, which was exceedingly disastrous to the sugar-cane, orange, and fig interests, was beneficial to rice, and planters put a larger area in that cereal than ever before. As the season wore on it became evident that the crop would equal, if not exceed, that of 1892, the record-breaking year. It is interesting to note that within fifteen years the rice industry has developed a section of the State previously considered worthless. The population was quadrupled, and the wealth increased twenty-fold. This condition is largely due to the development and improvement of an irrigating system, which now comprises 84 canals extending hundreds of miles through the rice district, and assures an ample supply of water, as each canal is capable of irrigating from 1000 to 20,000 acres of land. (See IRRIGATION.) The crop of 1898 was 800,000 bags, and that of 1899 promised 2,000,000 bags. During 1899 orange-growers generally took advantage of the blizzard to restock their groves with species that had resisted the frost. It was proven that the mandarin, tangerine, salsuma, ooushin, and gumquat, all Japanese varieties, escaped injury when properly cared for; and the blizzard that killed fully half of the bearing trees was regarded as a real benefit in that it showed what varieties should be grown. The cotton acreage of 1899 was 1,281,691, and the production was 717,747 bales. See COTTON and THE COTTON INDUSTRY.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$2,163,331. There were 68 manufacturers of tobacco and 155 of cigars, and the total output was 48,078,541 cigars, 97,109,710 cigarettes, 1,477,865 pounds of smoking tobacco, and 35,788 pounds of snuff. Distilleries in operation numbered 11; the amount of spirits rectified was 950,979 gallons; distilled spirits gauged, 3,290,582 gallons; and production of fermented liquors, 193,761 barrels. Discoveries in 1899 lead to the belief that a large part of the coast, especially the area from Belle Isle to Abbeville, a distance of 55 miles, and extending inward from the gulf, a distance of 20 miles, lies over a solid bed of rock salt from 40 to 80 feet deep. Prior to 1898 the salt industry was confined to Avery Island, near New Iberia. In 1899 operations were begun on Weeks, Jefferson, and Belle islands, where salt was found in extensive quantities, and valuable discoveries were made in Vermilion, Iberia, and St. Mary parishes. Salt was found in so many places where its existence had not been suspected that the State geologist was directed to ascertain the extent of the new territory so underlaid, and to map the entire area. The Frasch process of liquefying the sulphur near Lake Charles by superheated water not having proved the commercial success its promoters anticipated, operations were suspended in 1897. In 1899 it was understood that an attempt would be made to recover the large known amount of sulphur by a chemical process.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the port of New Orleans aggregated in value \$11,907,659, an increase in a year of \$1,243,202; and the exports, \$88,182,878, a decrease of \$24,643,803. The movement of gold and silver coin and bullion was, imports, \$624,497; exports, \$6196—making the total foreign trade in the year \$100,721,230.

Railways.—The new railway construction during 1898 was 160.38 miles, and during 1899, 158.30, giving the State a total mileage of 2677.74.

Banks.—On October 31, 1899, there were 20 national banks in operation and 8 in liquidation. The active capital aggregated \$3,260,000; circulation, \$1,423,848; deposits, \$19,040,541, and reserve, \$5,229,130. The State banks, June 30, 1899, numbered 50, and had capital, \$3,415,550; deposits, \$10,827,205, and resources, \$15,852,550; and stock savings banks, 3, with capital, \$300,000; depositors, 10,094; deposits, \$3,105,461, and resources, \$3,839,734. The exchanges at the United States clearing-

house at New Orleans in the year ending September 30, 1899, aggregated \$442,659,100, a decrease of \$2,423,380 in a year.

Education.—The school census of 1897 gave a total enumeration of 434,180, and at the close of the school year 1897-98 the enrolment in the public schools was 182,341, and the average daily attendance, 132,046. There were 3834 teachers, 3055 buildings used as school-houses, and public school property valued at \$1,066,000. The revenue was \$987,046; expenditure, \$956,888, of which \$746,690 was for teachers' salaries. There were 20 public high schools, with 88 secondary teachers, 1755 secondary students, and 512 elementary pupils; 25 private secondary ones, with 87 secondary teachers, 987 secondary students, and 1913 elementary pupils; 2 public normal schools, with 26 teachers and 797 students; and 1 private one, with 16 teachers and 272 students. Normal training was also given in 2 colleges and 2 public high schools. Nine colleges and universities for men and for both sexes reported 194 scholarships, 166 professors and instructors, 1917 students, 71,700 volumes in the libraries, valued at \$69,500; \$126,250 invested in scientific apparatus, \$1,845,000 in grounds and buildings, and \$1,947,313 in productive funds, \$214,974 in total income, and \$7800 in benefactions. Two colleges for women reported 21 professors and instructors, 186 students, \$75,000 in grounds and buildings, \$31,000 in productive funds, \$14,950 in total income, and \$2000 in benefactions. In 1899 there were 183 periodicals, of which 18 were dailies, 142 weeklies, and 14 monthlies.

Finances.—The aggregate assessed valuation in 1898 was \$261,545,868, at the rate of 37 per cent. of actual value, an increase in a year of \$1,747,655. On April 1, 1899, the total interest-bearing bonded debt was \$10,877,800; floating debt, \$914,397; unrecognized bonds not fundable, \$3,953,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 1,310,000.

Legislation.—The most prominent enactment of the special session of the legislature, held from August 8 to August 18 was a law authorizing New Orleans to purchase or construct water and sewerage works, and to issue bonds against the same by aid of a constitutional amendment to be voted on in April, 1900. At a special election held for the purpose on June 6 the citizens of New Orleans had voted in favor of the measure.

State Officers and National Representatives.—Governor, Murphy J. Foster; lieutenant-governor, R. H. Snyder; secretary of state, John T. Michel; treasurer, A. V. Fournette; auditor, W. W. Heard; attorney-general, M. J. Cunningham; superintendent of education, J. V. Calhoun; adjutant-general, Allen Jumel; commissioner of agriculture, Leon Jastremski; commissioner of insurance, John T. Michel. Supreme Court: Chief justice, F. T. Nicholls; associate justices, Newton C. Blanchard, Lynn B. Watkins, Joseph A. Breaux, Frank A. Monroe; clerk, T. McC. Hyman. The State legislature consists of 88 Democrats, 31 Republicans, and 15 Populists; a new legislature will be elected in April, 1900. Senators: Donelson Caffery, from Franklin; Samuel D. McEnery, from New Orleans, both Democrats. Representatives: Adolph Meyer, from New Orleans; Robert C. Davey, from New Orleans; Robert F. Broussard, from New Iberia; Phanor Brezeals, from Natchitoches; Joseph E. Ransdell, from L. Providence (*vice* Samuel T. Baird, who died April 22, 1899); S. M. Robertson, from Baton Rouge—all Democrats.

LOW, SETH, LL.D., president of Columbia University, was appointed by President McKinley a member of the American delegation to the peace conference which met at The Hague in May, 1899. The appointment of the delegation was announced by Secretary of State Hay on April 6, 1899. Mr. Low was born in Brooklyn, N. Y., January 18, 1850; after his graduation at Columbia, in 1870, he began the study of law, but soon left it to enter his father's business, tea-importing, and later became a member of the firm. From 1881 to 1885 he was mayor of Brooklyn, being elected as an independent, and his administration was conducted with ability and integrity. He became president of Columbia College in 1890, and was largely instrumental in reorganizing the institution on a university basis. In 1895 he presented to the university the magnificent library building, estimated to cost \$1,000,000. Mr. Low was a member of the New York Rapid Transit Commission and the Greater New York Commission. In the fall of 1897 he was the Citizens' Union candidate for first mayor of the greater city, and was defeated by Mr. Robert A. Van Wyck, the Tammany Democratic nominee. The vote for the three principal candidates was: Van Wyck, 228,531; Low, 148,215; General Benjamin F. Tracy, Republican, 101,994. Mr. Low is president of the Archaeological Institution of America, and vice-president of the New York Academy of Sciences.

LOWRY, Rev. Dr. ROBERT, who died November 25, 1899, was a Baptist clergyman, well known as the author of many hymns and other church music. He had written numerous Easter and Christmas services and single songs, and edited a large number of hymn and Sunday-school song collections. The sales of copies of his com-

positions have been large. He was born in Philadelphia in 1826, and graduated in 1854 from Lewisburg (now Bucknell) University, Lewisburg, Penn., of which institution he was professor of belles lettres, 1869-75, and chancellor, 1876-82. He delivered numerous lectures throughout Europe and America. His last pastorate was at Plainfield, N. J.

LOYAL LEGION, MILITARY ORDER OF THE, founded in 1865 by officers and ex-officers of the army, navy, and marine corps who served in the Civil War, had in 1899 a membership of 9099. Commander-in-chief, Lieutenant-General John M. Schofield; registrar-in-chief, Brevet-Major William P. Huxford, Atlantic Building, Washington, D. C.

LUDLAM, REUBEN, an eminent homœopathic physician, died April 29, 1899. He was born at Camden, N. J., October 7, 1831; after his graduation from the medical department of the University of Pennsylvania in 1852 he studied in Europe. Returning to America, he built up a practice in Chicago as a homœopath. He was connected with the Hahnemann Medical College and Hospital from the time of its organization in 1860; in this institution he became dean and clinical professor of the surgical diseases of women. In 1870 he was made president of the American Institute of Homœopathy, and president of the Chicago Academy of Medicine in 1873. From 1877 to 1887 he was a member of the Illinois Board of Health. Among Dr. Ludlam's publications are: *Clinical Lectures on Diphtheria* and *Clinical and Didactic Lectures on the Diseases of Women*.

LUDLOW, BARON, Rt. Hon. HENRY CHARLES LOPES, K.B., died December 25, 1899, at the age of 72 years. He was formerly recorder of Exeter, and judge of the Court of Appeals. He graduated from Balliol College, Oxford, with honors, and in 1852 was called to the bar in the Inner Temple. He became a Queen's counsel, served in the House of Commons from 1868 to 1876, and then was made a judge of the High Court of Justice. He sat in the Court of Appeal from 1885 to 1897, when he was raised to the peerage at the Queen's diamond jubilee. In 1890 he was appointed treasurer of the Queen's Temple, and in 1895 chairman of the Wiltshire Quarter Session. The heir to the title was his son, Henry Ludlow Lopes.

LUPUS. See ROENTGEN RAYS.

LUQUIENS, JULES, head of the department of French in Yale University, died at Salem, O., August 25, 1899, at the age of 53 years. He was born in Switzerland, and his early life was passed there. Before being called to Yale he was a teacher in a university on the Franco-Swiss border line. When Professor William Knapp went to the University of Chicago in 1891 Professor Luquiens became head of the French department.

LUTHERAN CHURCH IN THE UNITED STATES is composed of four general bodies, fifteen independent synods, 200 independent congregations, and the sect called Waldenstromians. The general bodies are (I.) the General Synod, with 1207 ministers, 1545 churches, and 195,860 communicants; (II.) the United Synod in the South, with 214 ministers, 412 churches, and 39,107 communicants; (III.) the General Council, with 1228 ministers, 2011 churches, and 352,484 members; and (IV.) the Synodical Conference, with 1957 ministers, 2525 churches, and 520,785 members. The fifteen independent synods are the Missouri Synod, the United Norwegian, the Joint Synod of Ohio, the Buffalo Synod, Hauge's Synod (Norwegian), the Texas Synod, the German of Iowa, the Norwegian Lutheran, the Michigan, the Danish in America, the Icelandic, the Immanuel Synod, the Soumai (Finnish), the Norwegian Free, and the Danish United. The total number of Lutheran ministers in the United States is 6685, of churches 10,991, and of communicants 1,575,778. The Waldenstromians number 140 ministers, 150 churches, and 20,000 communicants. The Lutherans report much progress in the organization of missions in New York City, Buffalo, Rochester, Utica, Baltimore, and other cities. Several missionaries have been sent to Puerto Rico. The United Synod in the South has founded a theological seminary at Mount Pleasant, S. C. A notable publication during 1899 was the *Lutheran Cyclopædia*, edited by Dr. Jacobs and the Rev. J. A. W. Haas. The latest report of the United States commissioner of education shows the Lutherans to have 24 institutions of learning, with 189 professors, 1864 students, and endowment funds aggregating \$917,168.

LUTHER LEAGUE, a society of young people of the Lutheran Church, established for the furtherance of greater Christian activity. The society was founded in 1888, the first convention was held in 1895, and in 1899 there was an estimated membership of 70,000. President, E. F. Eilert; secretary, C. G. Grauer, Buffalo, N. Y.

LUXEMBURG is a grand duchy of Europe, with an area of 998 square miles, bounded by Germany, Belgium, and France. The inhabitants, census of 1895, number 217,583, the majority of whom are Catholics. Luxemburg, a city of 20,000 inhabitants, is the capital. The duchy of Luxemburg formed part of the German confed-

eration from 1815 to 1867; in the latter year it was declared, by the treaty of London, to be neutral territory, and was placed under the sovereignty of the King of the Netherlands. Upon his death in 1890 it passed to the present executor, the Duke of Nassau. There is also a legislature, the chamber of deputies, the 45 members of which are chosen directly by the cantons for six years. For commercial purposes the duchy is a member of the German Zollverein.

LYDDITE, a modern high explosive. It takes its name from Lydd, Wales, where the first experiments were made with it. Lyddite is the special explosive used by the British, and has attracted considerable interest since the beginning of the war with the Boers. Its method of manufacture is preserved as a secret by the British Bureau of Ordnance, but the best authorities believe it to be partly or wholly picric acid. Unlike explosives such as gun-cotton, lyddite is used as a filler—that is to say, it is poured in a liquid state into shells. A recent authority says of it that it is “simply picric acid brought into a dense state by fusion.” The shells are coated inside with a special varnish, and the melted picric acid is cast into them. As this explosive requires a strong detonator, or very powerful primer, the British government is said to have adopted a primer of picric acid, which consists of a mixture of two parts of ammonium picrate to three parts of saltpetre, manufactured in much the same way as ordinary granulated gunpowder. This is then set off by the ordinary service fuse. Among the characteristics of lyddite may be mentioned as most important its stability—that is to say, it is not affected by ordinary changes of temperature, remaining permanent under the influence of both cold and heat. Whenever it is exploded it is said that the effects of its influence are six or seven times as great as those of black powder on compact rock or masonry, and one and one-half to two times as great in earth. A shell filled with lyddite will break the most solid and resisting plates of steel. Not only is the projectile scattered in small fragments, but all objects within the radius of action are likewise shattered. The radius extends only from 20 to 25 yards, but those who are unfortunate enough to be found within it, even if they are not touched by the fragments, will be suffocated by the blast of gas produced by the explosion. It is this latter feature that has caused considerable comment during the war in Africa. The dense fumes of yellowish green gas, resulting from the decomposition of the picric acid compound, suffocating those who come in contact with it, and staining articles with the yellow color, has been referred to in graphic terms by correspondents and others who have written of its effects at Ladysmith and elsewhere in South Africa. The use of lyddite was originally restricted to 5-inch Howitzer guns, but has recently been extended to guns of higher calibre, and the announcement has been made that lyddite shells are to be supplied to the guns mounted in the forts of the English sea fronts. It has also been decided that the 5-inch Howitzers are to be permanently supplied with lyddite shells, and orders have been issued that no more shrapnel shells are to be made for those guns. The now famous naval guns used by the British during the siege at Ladysmith were provided with shells containing lyddite.

McCOMAS, LOUIS EMORY, United States senator from Maryland, was elected, as a Republican, to succeed Senator Arthur P. Gorman, Democrat. Born in Washington County, Md., October 28, 1846, he was educated at St. James's College (Maryland) and Dickinson College, being graduated at the latter in 1866. He studied law, and in 1868 was admitted to the bar. In 1882 he was elected to the Forty-eighth Congress, and was returned to the following three Congresses. In 1893 President Harrison appointed him associate justice of the Supreme Court of the District of Columbia, and in this capacity he served until 1899. Since 1895 Judge McComas has occupied the chair of evidence and contracts in the Georgetown University Law School. His term in the Senate will expire March 3, 1905.

McCONNELL, JAMES, editor and part proprietor of the Philadelphia *Evening Star*, died December 6, 1899, at the age of 55 years. He was at one time Albany correspondent of the New York *Tribune*, under Horace Greeley, and he also, under the latter's régime, acted successively as political editor, night editor, and city editor of the *Tribune*. In his earlier career he succeeded the late John Russell Young as copy-holder on the Philadelphia *Press*, and later, under Mr. Young's editorship, was made a war correspondent of the *Press*.

MacCORMAC, Sir WILLIAM, M.A., D.Sc., president of the Royal College of Surgeons, volunteered for surgical work in 1899 in the Boer war. Born at Belfast, Ireland, January 17, 1836, he was educated in that city and at Dublin and Paris. He was a surgeon to the Anglo-American Ambulance in the Franco-German war, and was present at the battle of Sedan. In 1881 he was knighted, and in 1897 made a baronet. He is a member of a large number of medical societies both in England and on the continent, and has received the decorations of several foreign orders, including that of an officer in the Legion of Honor. Besides various lectures and papers he

has published: *Antiseptic Surgery; Surgical Operations; Notes and Recollections of an Ambulance Surgeon.*

MCCOY, Sir FREDERICK, K.C.M.G., professor of natural science in Melbourne University, died May 15, 1899. Born in 1823 and educated for the medical profession at Dublin and Cambridge, he became, however, professor of geology and mineralogy in Queen's University, Ireland, in 1854. He held the degrees M.A., D.Sc., and F.R.S., and was created a K.C.M.G. in 1891. With Sedgwick he wrote *British Palaeozoic Rocks and Fossils*.

McCUMBER, PORTER J., United States senator from North Dakota, was elected, as a Republican, by the legislature, to succeed Senator William N. Roach, Democrat, January 20, 1899. Born at Crete, Ill., February 3, 1856, he was graduated in law at the University of Michigan in 1880, and the following year went to North Dakota, where he began the practice of law. In 1885 and 1887 he was a member of the territorial legislature. His term in the Senate will expire March 3, 1905.

MACDONALD, HECTOR ARCHIBALD, aide-de-camp to Queen Victoria, who succeeded General Wauchope in command of the Highland Brigade in South Africa in December, 1899, was born in Ross-shire, Scotland, April 13, 1852. He joined the Gordon Highlanders in 1870 as a private, and served over nine years, attaining some distinction in the Afghan war (1879-80), and was mentioned in despatches for his behavior at Karatiga. He served in the Maiden expedition of 1880; accompanied Lord Roberts in his famous march to Kabul; and was promoted lieutenant for his distinguished conduct at the battle of Kandahar, receiving also a medal and clasps. As lieutenant he took part in the Boer war of 1881, and was present at Majuba Hill. Here he was also mentioned in despatches. In 1885 he was in the Nile expedition, and, promoted captain in the Gordon Highlanders in 1888, took part in the engagement of Suakim, where he was again mentioned in despatches and received a medal, clasp, and the Khedive's star. In July, 1891, he became major in the Royal Fusiliers. He commanded the third infantry brigade of Lord Kitchener's Dongola expeditionary force, and was promoted to lieutenant-colonel, mentioned in despatches, and given the Khedive's medal with clasps. In 1898, as brigadier-general in the Egyptian army, he was appointed to command the Soudanese brigade, and distinguished himself as a leader at the battles of Atbara and Omdurman. On the death of General Wauchope he was transferred from India to South Africa to command the Highland brigade as major-general.

MACDOWELL, EDWARD ALEXANDER, American composer, born in New York, December 18, 1861, studied the piano at an early age under Teresa Carreño and others, and in 1876 went to Paris, where he studied the piano under Marmontel and composition under Savard. He also studied composition under Joachim Raff. In 1881-84 he was a teacher of the piano in the Darmstadt Conservatory. In 1884-88 he lived in Wiesbaden, where he had previously resided in 1879-81. In 1888 he went to Boston, remaining there until he was called to fill the chair of music in Columbia College, created in 1895. In 1899 he became president of the Manuscript Society of New York. He is also director of the Mendelssohn Glee Club. Mr. Macdowell is an excellent concert pianist and has composed concertos, sonatas, and many pieces for his instrument. His *Woodland Sketches* and *Sea-Pictures* are especially admired. His orchestral compositions, which take high rank among modern works, include an *Indian Suite*, constructed on themes from the Sioux tribes. Princeton gave him the degree of Mus. Doc. in 1896.

MACEDONIA. See BULGARIA.

McENROE, WILLIAM HALE, M.D., for many years professor of materia medica in the medical school of the University of the City of New York (now New York University), was born in Charlottesville, Va., August 15, 1854, and died in New York City, May 17, 1899. He had been elected to a chair in the recently established Cornell Medical College. He wrote *Materia Medica and Therapeutics*.

MACFARLAN, Lieutenant-General DAVID, C.B., died June 23, 1899. Born in Calcutta, August 30, 1833, and educated at the Edinburgh Academy and College and at Addiscombe College, he entered the Bengal Artillery in 1853. He served through the Indian mutiny on the northwest frontier in the campaign of 1864, and in the Afghan war of 1878-79. He was decorated for meritorious services in India.

McGIFFERT, ARTHUR CUSHMAN, D.D., since 1893 professor of church history in the Union Theological Seminary, New York City. In May, 1898, the general assembly of the Presbyterian Church considered charges of heresy against Dr. McGiffert. The charges were based on his book, *A History of Christianity in the Apostolic Age*, in which, it was alleged, were embodied heretical teachings on the inspiration of the Bible, the divinity of Christ, and the Lord's Supper. The assembly requested Dr. McGiffert to reconsider his views, and if he then felt unable to with-

draw them to leave the church voluntarily. This Dr. McGiffert declined to do, on the ground that his teachings were in no way inconsistent with the essential doctrines of the Presbyterian Church. The question was brought before the New York Presbytery in December, 1899, when that body voted that the best interests of the church required the Presbytery to disavow Dr. McGiffert's teachings, but to pursue no further action. One of the members gave notice, however, that he would prefer formal charges of heresy, and the defendant was cited to appear before the Presbytery on February 12, 1900. The indications were, however, that the Presbytery would on that day decide that he should not be brought to trial.

MACKENZIE, Rev. JOHN, missionary, died at Kimberly, South Africa, March 23, 1899. He worked in the same sphere as Dr. David Livingstone and Dr. Robert Moffat. Mackenzie fought for the Bechuana natives against the Boers, and preceded Mr. Cecil Rhodes as deputy commissioner of Bechuanaland.

MCELLEAN, ISAAC, who was known as the "sportsman's poet," died August 20, 1899, at his home in Greenport, L. I. He was born in Portland, Me., May 21, 1806; he studied at Phillips Academy, Andover, where N. P. Willis was his roommate and Oliver Wendell Holmes a fellow-student. When their preparatory work was ended Willis went to Yale and McLellan to Bowdoin; here the latter was graduated in 1826, his class being one year behind that of Hawthorne, Longfellow, and Franklin Pierce. His acquaintance here with Longfellow ripened into a lifelong friendship. After graduation he studied law, was admitted to the bar, and practised for a number of years in Boston. Continuing his association with literary men, he wrote for the magazines and became associate editor of the *Daily Patriot*, and subsequently began the publication of the *Pearl*, a monthly. In 1851 he removed to New York, and thereafter was interested chiefly in literary work and in field sports. Sportsmen will remember him especially for his *Poems of the Rod and Gun*; before the publication of this book he wrote *The Year, and Other Poems*; *The Fall of the Indian*, and *Mount Auburn*. He also wrote *Haunts of Wild Game*; his last work was entitled *War Poems*. Among his best known compositions are *The Trout Brook*; *Napoleon*; *New England's Dead*, and *The Notes of the Birds*.

McMANES, JAMES, a prominent Republican leader of Philadelphia, died November 24, 1899, at the age of 77 years. He came from Ireland at the age of 8 years. After the Civil War he became an influential member of the Philadelphia Republican political machine. He was president of the People's Bank, which failed in 1898 by reason of a defaulting cashier, and which involved prominent Pennsylvania officials in scandal for the alleged use of State money in speculation. McManes came to the rescue of the bank's depositors with a promise to personally assume its liabilities, and on June 14, 1898, he turned over to the receiver \$400,000 with which to pay the bank's obligations. His actual obligation on his holdings of stock were said to be not more than \$125,000.

MADAGASCAR, lying in the Indian Ocean, off the southeastern coast of Africa, from which it is separated by the Mozambique Channel, is one of the largest islands in the world. It is possessed by France, who laid claim to it as early as 1642, though little was done until recent years either to make good the claim or to develop the country. In 1882-85 France compelled the recognition of her authority by the natives in a part of the island, and having secured Diégo-Suarez, established a resident-general and assumed the right of control. This right was recognized by foreign governments, but not by the native government until ten years later, when a French expedition to the interior of the island compelled the submission of the Queen. This was followed in 1896 by the formation of the colony of Madagascar, and in 1897 by the deposing of the Queen, who was exiled to Réunion Island (*q. v.*). The colony is administered by a governor-general, General Gallieni in 1899, aided by an administrative council at the capital city, Antananarivo.

The total area of Madagascar is about 228,500 square miles, the island being 975 miles long and 355 miles in extreme breadth. The population is variously estimated at from 2,500,000 to 5,000,000, the most important element of which is the Hovas, a race allied to the Malays, and having considerable intelligence. The Hovas, together with the Saklavas, who are also very numerous, number about 2,000,000. Other races include the Betsiléos, the Baras, the Betsimisarakas, etc. The foreign population is mostly Asiatic, with a few Europeans, for whom the climate is unhealthful. Antananarivo has a population of 100,000, and Tamatave, on the east coast, which is the chief port of the island, has a population of about 10,000. As to religion and education, missionary enterprise has afforded better facilities than might be expected. Through the efforts of representatives of the Christian church there are said to be among the natives some 450,000 Protestants and 50,000 Roman Catholics, and 170,000 children are reported as being educated at the various schools the products of the former including rice, caoutchouc, sugar, coffee, cotton, and connected with missions. Agriculture and cattle-raising are the chief occupations,

sweet potatoes; mineral resources include copper, gold, iron, lead, sulphur, graphite, and lignite. Valuable woods abound in the forests. The commerce includes an export trade in coffee, sugar, rice, seeds, caoutchouc, vanilla, gum copal, wax, lard, cattle, hides, horns, gold dust, and ebony. The principal items of import are cotton cloth, tinware, iron ware, tobacco, wines, and beer. The increase of tariff on goods coming from countries other than France is said to have caused depression in trade, especially in cotton goods, the duty on which is between 50 and 60 per cent. of their value. (See FRANCE, paragraphs on History.) England has the largest import trade into Madagascar, followed in the order of importance by France, the United States, and Germany. There is a popular demand for United States cottons, especially soft-finished textiles, which are said to be highly appreciated by the natives. Most of the imports enter through Tamatave, which has an excellent harbor, although the port of Majunga (population, 14,000), on the northwest coast, has a good trade with Mauritius and Réunion. Good roads from Tamatave to the interior have never existed, but the French government in 1898 granted concessions to a company to build a canal from that port to Andevorante, and a railway to the capital is projected as well as to Ivondro. Tamatave is connected by telegraph with the capital, Antananarivo. In 1899 Great Britain entered a protest against the discriminations claimed to have been made against British trade in Madagascar by reason of the French tariff regulations. From 10 per cent. *ad valorem* the duty was raised to 45 per cent., and later to 55 per cent. on the principal imports, and some of the articles sent into the island by Great Britain pay nearly 80 per cent. On the other hand, French imports are taxed only 3 per cent., and some articles from France are said to be admitted free. Of course, a country has the power to levy what duties it may on its colonial trade, but Great Britain's claim is based on an understanding made with France at the time Great Britain recognized the latter's suzerainty over Madagascar, whereby British trade with that island, which is considerable, especially in its Indian branch, was not to be interfered with.

On November 28 a bill was introduced into the French parliament authorizing the colony of Madagascar to issue a loan of 60,000,000 francs for the construction of a railway from Antananarivo to the eastern coast and for the carrying out of public works.

MAGNESITE. The production in the United States in 1898 was 1263 short tons, valued at \$19,075, and came chiefly from California. Magnesite bricks are manufactured at several localities in the Eastern States, but the product comes mainly from Europe.

MAHAN, ALFRED THAYER, Captain, U.S.N., retired, an authority in naval strategy, was appointed by President McKinley a member of the American delegation to the peace conference which met at The Hague in May, 1899. The appointment of the delegation was announced by Secretary of State Hay on April 6, 1899. Captain Mahan was born September 27, 1840, at West Point, N. Y., where his father, D. H. Mahan, was professor of military engineering in the Military Academy. Appointed to the navy in 1856, he was graduated from the Naval Academy at Annapolis in 1859. He was assigned to duty in Brazilian waters, from which he returned at the outbreak of the Civil War, and served on the *Congress* and *Pocahontas*. He was promoted to a lieutenancy in 1861, was instructor for a year in the Naval Academy, and then resumed sea duty, continuing until the end of the war on the *Seminole* and *James Adger*. In 1865 he was made lieutenant-commander, subsequently was advanced to the rank of commander, 1872, and captain, 1885, and on November 17, 1896, was retired at his own request. During this time he saw a large amount of service both on sea and shore. He was attached at various times to the Gulf, South Atlantic, Pacific, Asiatic, and European squadrons, the New York Navy Yard, the Boston Navy Yard, and the Naval Academy at Annapolis. Captain Mahan was president of the Naval War College at Newport, R. I., in 1886-89 and 1892-93, and in the last-named year was given command of the *Chicago* in the European squadron, which position he held until his retirement in 1896. The Spanish-American war occasioned his recall to active duty in May, 1898, as a member of the Naval Advisory Board. Captain Mahan is recognized as one of the greatest authorities on naval strategy, and his fame rests largely upon the philosophy of naval history which he has set forth in several volumes. His publications include: *The Influence of Sea Power upon History*, 1890; *The Life of Admiral Farragut*, 1892; *The Influence of Sea Power upon the French Revolution and Empire*, 1892; *The Life of Nelson, the Embodiment of the Sea Power of Great Britain*, 1897; *The Interest of America in Sea Power, Present and Future*, 1897; *Lessons of the Spanish-American War*, December, 1899. His works have had an extraordinary sale for books of their character, and several of them have been translated into French, German, and Japanese. He has received the degree of LL.D. from Cambridge, Harvard, and Yale, and that of D.C.L. from Oxford.

MAINE, a New England State, has an area of 33,040 square miles. The capital is Augusta. Maine was formerly a part of Massachusetts, and was admitted to the Union as a State, March 15, 1820.

Manufactures, etc.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$346,866. There were 94 tobacco factories in operation, which had a combined output of 5,210,606 cigars. The year 1899 was a remarkable one in the lumber industry. The surveyor-general of the port of Bangor reported that from January 1 till December 1 there was surveyed at the port 174,012,809 feet of lumber of all kinds, and that the survey for December would increase this total by 4,000,000, making the year's survey 178,012,809 feet, an excess of nearly 34,000,000 feet over 1898, and with one exception the largest since 1872. For the first time in twenty-five years the Penobscot River was swept bare of logs and lumber. From the army of men in the woods it was estimated that the winter cut of 1899-1900 would be from 190,000,000 to 200,000,000 feet on the Penobscot and about 150,000,000 feet on the Kennebec. The annual report of the State commissioner of labor, treating of the wood pulp industry, shows that, counting ground wood pulp mills, sulphite mills, and paper mills separately, there were 58 pulp and paper mills in the State, 30 pulp and 28 paper. These were comprised in 37 different plants, employing 5902 operatives, paying over \$5,000,000 per annum in wages, using wood valued at \$2,500,000, and having an output of 1835 tons of pulp and paper daily, or an aggregate of 550,500 tons per annum. The capital invested in the joint industry was over \$30,000,000, and the annual product was worth nearly \$18,000,000. The ship-building industry also showed a remarkable development. At the close of 1899 the number of vessels on the stocks or under contract to be built during 1900 was much greater than for many years, and the new shipping launched during the year was about 50,000 tons. Steel ship-building at Bath has now become a firmly established industry. There are now on the stocks there the United States torpedo-boats *Dahlgren* and *Craven*, and the training ship *Chesapeake*, and the Bath Iron Works has the contract to build two of the new monitors. Quarrying during the calendar year 1898 yielded granite to the value of \$1,032,621; slate, \$199,237; and limestone, \$1,283,468—total, \$2,515,326.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the various ports aggregated in value \$2,074,332, an increase in a year of \$232,077; and the exports, \$13,778,305, an increase of \$5,008,752. The movement of gold and silver, all at the port of Bangor, was, imports, \$267,986; exports, \$1346, making the total foreign trade of the year \$16,121,969.

Railroads.—The new construction during 1898 was 124 miles, and during 1899 40.40 miles, giving the State a total mileage of 1,920.38.

Banks.—On October 31, 1899, there were 82 national banks in operation, and 17 in liquidation. The active capital aggregated \$10,971,000; circulation, \$5,742,678; deposits, \$21,206,244; and reserve, \$7,476,584. The loan and trust companies, April 29, 1899, numbered 17, and had capital, \$1,597,619; deposits, \$7,162,665; and resources, \$10,023,364; and the mutual savings banks, 51, with depositors, 173,509; deposits, \$62,583,435; and resources, \$65,932,907. The exchanges at the United States clearing-house at Portland in the year ending September 30, 1899, aggregated \$78,024,719, an increase of \$5,229,496 in a year.

Education.—At the close of the school year 1897-98, the school population was 209,713; enrolment in the public schools, 134,405; and average daily attendance, 97,616. There were 6727 teachers, 4113 buildings used as school-houses, and public school property valued at \$4,225,401. The revenue was \$1,619,922; expenditure, \$1,614,330, of which \$1,104,796 was for teachers' salaries. There were 154 public high schools, with 332 secondary teachers, 8568 secondary students, and 1857 elementary pupils; 35 private secondary schools, with 146 teachers, 2885 secondary students, and 306 elementary pupils; 4 public normal schools, with 32 teachers and 1011 students in all departments; and 2 private ones, with 7 teachers and 200 students. Normal training was also given in one college and 8 public high schools. Four colleges and universities for men and for both sexes reported 8 fellowships, 218 scholarships, 108 professors and instructors, 1227 students, 129,682 volumes in the libraries, valued at \$162,550; \$143,625 invested in scientific apparatus, \$1,091,566 in grounds and buildings, and \$1,661,512 in productive funds; \$213,196 in total income, and \$114,500 in benefactions. Two colleges for women reported 16 professors and instructors, 326 students, 10,892 volumes in the libraries, \$230,000 invested in grounds and buildings and \$142,000 in productive funds; \$18,325 in total income; and \$5600 in benefactions. In 1899 there were 179 periodicals, of which 17 were dailies, 113 weeklies, and 38 monthlies.

Finances.—The assessed valuations in 1898 were: Real estate, \$260,841,021; personal property, \$68,675,223—total, \$329,516,244, an increase over the total of 1896 of \$1,015,250; tax rate, \$2.75 per \$1000. On January 1, 1899, the bonded debt was

\$2,203,000, a decrease in a year of \$50,000, and there was a temporary loan of \$150,000, against a similar one in 1898 of \$200,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 694,000.

Legislation.—The following additions were made to the list of misdemeanors: To advertise for sale debts, dues, accounts, or demands owing by any person, unless the party advertising is an executor, trustee, sheriff, or other official; to desecrate the national or the State flag by using it for advertising purposes, by trampling upon it, or by mutilating it; and ticket "scalping," none but agents of railroads being allowed to sell personal or limited tickets, and when these are unused they must be redeemed by the company. Any person who entices or assists any member of the crew of any vessel to desert may be punished by fine and imprisonment. Interest on personal loans with pledge of personal property was limited to the rate of 3 per cent. monthly for three months and 15 per cent. per annum thereafter on sums of \$200 or less. Library commissioners will be appointed by the governor to encourage free public libraries, and to select books to be bought for travelling libraries; and books may be loaned from the State Library to citizens and to free libraries. A State Board of Commissioners of Pharmacy was created to examine and license all apothecaries. Soldiers and sailors serving as volunteers will be given extra pay by the State; they will be reimbursed for any outlays for doctors and nurses, and a limited amount will be paid for funeral expenses. Pensions will be paid by the State to those who served either in the Civil War or the war with Spain, and are disabled and unable to make a living.

State Officers and National Representatives.—Governor, Llewellyn Powers; secretary of state, Byron Boyd; treasurer, F. M. Simpson; adjutant-general, John T. Richards; attorney-general, William T. Haines; superintendent of education, W. W. Stetson; insurance commissioner, S. W. Carr. Supreme Judicial Court: Chief justice, John A. Peters; associate justices, Andrew P. Wiswill, Lucilius A. Emery, William H. Fogler, W. P. Whitehouse, Thomas H. Haskell, Sewall C. Strout, Albert R. Savage; clerk, W. S. Choate. State legislature consists of 157 Republicans and 25 Democrats. Senators: Eugene Hale, from Ellsworth; William P. Frye, from Lewiston—both Republicans. Representatives: Amos L. Allen, from Portland (*vice* Thomas B. Reed, who resigned August 22, 1899; Charles F. Littlefield (*vice* Nelson Dingley, who died January 13, 1899); E. C. Burleigh, from Augusta; and Charles A. Boutelle, from Bangor—all Republicans.

MALARIAL FEVER AND MOSQUITOES. The most momentous medical discovery of the year 1899 is that of the cause of human malaria. There were several scientists to whom credit is due in the matter, but the lion's share of it belongs to Major Ross, a surgeon in the English army, stationed at Calcutta. During several years of laborious research he forged the links that completed the discovery. As long ago as 1807, Crawford, an American, suggested the possibility of the transmission of malaria to man by the mosquito. Again, in 1848, Nott, of New Orleans, referred to the part played by insects in propagating malarial fever. In 1883 Dr. A. F. A. King, also an American, reiterated the theory at some length, and explained the immunity of the negro by the character of his perspiration. Laveran, who in 1880 discovered the *plasmodium malariae*, the parasite of the disease, declared in 1891 his adherence to the mosquito theory, as did also Flüge in the same year. In 1892 Pfeiffer showed that a variety of protozoa, called coccidia, which are found as parasites in the rabbit, is capable of two cycles of development, one being exogenous. He mentioned that Koch had suggested that a similar condition might hold good for the parasite of malaria, and that exogenous malarial spores might be conveyed to man by the agency of blood-sucking insects. In 1894 Manson, of Great Britain, appeared as a vigorous supporter of the mosquito theory, as best calculated to explain the various conditions of the problem. He drew a parallel between the malarial parasite and the *filaria Bancrofti*, which he had investigated so thoroughly. He suggested that the female mosquito fills herself with infected blood, deposits her eggs and dies beside them. The water in which she lies becomes contaminated with the spores developing in her body, and is then drunk by men, or the spores are inhaled with dust from dried puddles, or the larvæ after being hatched feed on the dead body of the mother, and thus become carriers of infection, or the ground might become infected by the bodies of mosquitoes that contain the parasite dying and falling on it. Ross's really monumental work in his studies of malarial organisms in birds' blood solved the problem. He discovered that, after a special variety of gray mosquito had fed on the blood of birds containing certain mature organisms, called protozoa, the stomach wall of the insect always contained pigmented coccidia two days later. After other changes had occurred, on the eighth or ninth day, the coccidia rupture, and set free innumerable thread-like bodies, which are distributed, by the blood current of the mosquito, through its tissues. Eventually these bodies are found in certain glands in the thorax

of the mosquito, whose ducts open at such a point as to furnish secretion that lubricates the lancets of the mosquito. When he punctures the skin of his victim, this secretion, containing the thread-like bodies, is injected into the bottom of the wound. Manson and his pupil Daniels proved that these thread-like bodies or germinal spores develop into mature proteosoma in a bird bitten by the infected mosquito, thus completing the cycle.

While Manson was repeating his experiments, Grassi, the distinguished Italian, was completing a series of studies on the mosquitoes of Italy. He found and described three varieties of mosquito, common in malarious regions but unknown in regions free from malaria. In 1898 he determined that *anopheles claviger* was the insect which carried malarial infection. A man who had never before been subjected to malarial infection failed to be infected with certain mosquitoes of the *culex* variety. After a long period he was exposed to the bites of *anopheles claviger*, and in a short time began to suffer from malarial fever. Quinine cured him of the attack. The Italian scientists Bignami, Bastianelli, and Grassi, working together, arrived at the conclusion that the malarial hemisporidia (small reproductive cells produced within a cyst) run through a cycle in man characterized by a long amœboid stage and an absence of the encapsulated phase, reproducing themselves a great number of times during the completion of this cycle, and also giving rise to forms which remain sterile in man—Grassi's "gameti." These latter forms, taken into the stomach of the *anopheles* with the blood he draws from an infected man develop into sporozoa, and these in turn form sporozoites, delicate filaments which find their way to the salivary glands of the *anopheles*. The saliva, anointing the lancet of the *anopheles*, carries the infection to the next victim bitten.

The family of *Culicida* is composed of the three genera, *culex*, *edes*, and *anopheles*. Several species of *culex* do not carry malarial infection, and it has not been charged against *edes* that this genus does. Three species of *anopheles* in Italy have been proved to be malaria carriers: *a claviger*, *a bifurcatus*, and *a pictus*. Five species of *anopheles* are found in Europe. The division of entomology of the United States Department of Agriculture describes seven species of *anopheles* in this country, including *a claviger*, *a nigripes* (which is supposed to be identical with *a bifurcatus*), and *a punctipennis*.

Having ascertained the cause of human malaria, the next problem is to remove it, to destroy the mosquito. During the summer of 1899 Celli and Cassagrandi made several interesting experiments with substances supposedly poisonous to mosquitoes. Several specimens of *culex*, as well as *anopheles claviger*, and *a bifurcatus*, were subjected to the tests, in all stages of development: egg, larva, nymphæ, and mosquito. In their report they omit consideration of any lethal agent that did not kill larvæ in at least seventy-two hours. They mention as larvicides: 1. Mineral substances: five per cent. solution of permanganate of potassium (which acts slowly), lime, copper sulphate, iron sulphate, and ammonia (all of which act rather slowly), sulphurous water even when not saturated with sulphurous oxide (one of the most active larvicides), corrosive sublimate, even as strong a solution as one per cent. (kills the larvæ slowly and fails to kill the nymphæ). 2. Vegetable substances: strong tobacco, some commercial insect powders obtained from chrysanthemum buds (very potent poisons), other insect powders (weaker), infusion of quassia, of *solanum nigrum*, and of *daphne quidum* (weak). 3. Aniline dyes: gallol of Weiler-ter-Meer, of Verdingen, and green malachite of the Actiengesellschaft für Anilin Fabrikation of Berlin (most energetic action). The gallol is efficacious in a solution of 0.0062 per cent., the malachite in a solution of 0.0125 per cent. Both larvæ and nymphæ are killed by: 1. Oily substances. 2. Sulphurous oxide water, potassium permanganate mixed with hydrochloric acid. 3. Formalin and lysol are not very efficacious, and corrosive sublimate even less so. A rise of temperature in the water shortens the time of destruction of the insects, except in the case of the use of petroleum, which acts mechanically by forming an air-tight pellicle over the water. Petroleum is the first to lose its larvicidal action by evaporation. In the proportion of 0.20 ccm. per 100 cm. of surface it lasted only two days at 18°C. Practically petroleum was found most serviceable, as it is easily used, does not kill fish or the inferior animals and is cheap. The vegetable powders and staining substances are also cheap, and the latter are of great duration. The perfect mosquito is killed by: 1. Odors of turpentine, iodoform, menthol, camphor, and garlic. 2. Fumes of tobacco, chrysanthemum flowers, fresh eucalyptus leaves, quassi wood, pyrethrum, and simple wood smoke. 3. Gases, the most practicable being sulphurous oxide. Winter affords the best chances for destroying mosquitoes, as they take refuge in houses, barns, and cattle sheds during this season. Even at best but little can be accomplished in the way of killing mosquitoes. The best results are to be secured by systematically pouring petroleum upon the surface of ponds, marshes, and puddles where the insect might breed and propagate its species.

MALMESBURY, Fourth Earl of, EDWARD JAMES HARRIS, died May 19, 1899.

Born April 12, 1842, and educated at the Royal Military College at Sandhurst, he entered the army in 1860, becoming in 1865 aide-de-camp to General Lord Strathnairn, commander in Ireland, in 1866 to General Sir John Mitchell, commander in Canada, and in 1868 to Sir Henry Barkly, governor of Mauritius. From 1875 to 1880 he was an adjutant in the Royal Irish Rifles, and later became lieutenant-colonel of this regiment, retiring in 1882. He succeeded to the title upon the death of his uncle, the third earl, in 1889. His heir is his son, the Viscount Fitz-Harris, born in 1872.

MALONE, Rev. SYLVESTER, pastor of the Church of Sts. Peter and Paul, Brooklyn, N. Y., died December 29, 1899, at the age of 78 years. Father Malone was a conspicuous member of the liberal wing of the Roman Catholic Church. While never in the least compromising in his convictions regarding his own church, he recognized freely the good influence and work of other denominations. He was an ardent American, and strenuously endorsed the public school system. It was his constant endeavor to modify the high sectarian feeling between the Protestants and Catholics. While devoted to the institutions and methods of Catholicism, he was on terms of intimate friendship, at the same time, with many prominent Protestant ministers. Besides being an intense American, Father Malone had been an ardent abolitionist, and the Church of Sts. Peter and Paul was the first Catholic church to display the Stars and Stripes upon the outbreak of the Civil War. Father Malone prominently endorsed Father McGlynn during the ecclesiastical fight which resulted in that priest's suspension, and he even addressed a memorial to the Pope, in which he said: "The charges against Dr. McGlynn raise the question of the right of the citizen to express his views freely and openly on all subjects that are non-essential. Nothing can alter this view of the case, and I ask, is it wise to give our fellow-citizens cause, even for suspicion, that Catholics are the enemies of the principle of civil liberty, held so sacred by all Americans?" Father Malone came to the United States from Ireland in 1838. He was educated at the seminary at La Fargeville, N. Y., and at St. John's College, Fordham, and on August 15, 1844, was ordained to the priesthood. Three years later he became rector of the church of Sts. Peter and Paul, which position he retained to the time of his death. He was nominated in 1894, at the suggestion of Hamilton Fish, to a vacancy in the Board of Regents of the University of the State of New York, and, although opposed by the archbishop of New York, was elected.

MALTA, an island colony of Great Britain, situated in the Mediterranean, 58 miles south of Sicily, and about 180 from the African coast, comprises besides the island of Malta, several islets, and Gozo and Comino. The total area is 117 square miles, of which Malta has 95 and Gozo about 20. The total population at the beginning of 1899 was 180,328, besides British troops, numbering 11,317. The capital is Valetta, which has an excellent harbor, and the population of which is about 50,000. Valetta is also one of the great naval stations of Great Britain. The government is administered by a governor, who is assisted by an executive council of 7 official and 3 unofficial members, and a legislative council of 6 official and 14 elected members. The governor and commander of the troops is Lieutenant-General Sir Francis Wallace Grenfell, G.C.B., G.C.M.G.

The lower classes of the inhabitants are chiefly Punic and speak a dialect of Semitic origin; the upper classes are of Italian and other European origin, and usually speak Italian. Roman Catholicism is the prevailing religion, and the schools, including those that receive government aid, are Roman Catholic. The public schools in 1897 numbered 119, with 14,836 pupils; there were 116 private schools with 3679 pupils. In addition there are a university, a lyceum, and 2 secondary schools. The government grant for public schools in 1897 amounted to £21,232. The chief industry is agriculture, and the leading products potatoes, cotton, oranges, honey, figs, and corn; the manufactures include cotton goods, filigree, and matches. The vegetable production is not sufficient to supply the military and naval forces stationed in Malta; in 1898 the potato crop was a failure. Over 4000 women and children, chiefly in Gozo, are employed in making lace. The commerce is chiefly transit. Imports and exports in 1897 amounted to £10,895,639 and £10,088,760 respectively; of the imports only £905,006 were actually disembarked, the rest being in transit. Imports and exports, actual, in 1898, were £880,164 and £51,597 respectively; in transit, £9,144,967 and £9,327,543 respectively. Vessels entered in 1897 numbered 4111, aggregating 3,637,426 tons; cleared, 4079, with a tonnage of 3,607,042. In 1898 the entrances numbered 3890, with a tonnage of 3,563,728.

The chief sources of revenue are custom duties. Revenue and expenditure in 1897 were £323,787 and £324,673 respectively; in 1898, revenue, £332,488; expenditure, £339,082. The public debt in 1897 was £79,168.

There are reported 8 miles of railway, 65 miles of telegraph lines, and 350 miles

of telephone lines. Early in 1899 direct steamship communication was established between New York and Malta.

Up to March, 1899, Italian was the only language of the courts, but in that month English was made allowable. It was announced at that time that after fifteen years all legal proceedings would be conducted in English instead of Italian. The change was made by an order in council, the legislative body being opposed to it. The latter body considered the change degrading to the inhabitants of Malta, but it has been shown that the majority learn English rather than Italian at school, where a choice is offered.

MAMMALOGY. See ZOOLOGICAL LITERATURE.

MANGANESE. The production of manganese in 1898 came from six States, which was one less than the previous year, and amounted to 15,987 long tons, valued at \$129,185, or an increase of nearly 44 per cent. over the output for 1897. This increase was due to the great stimulation that existed in the steel industry for the same year, as the chief market for the manganese ore is in the production of ferro-manganese at steel works. The amount of ore used by chemical works is comparatively small. Virginia, Georgia, and Arkansas continued to be the important producing States, while small quantities came from Alabama, California, and Tennessee. Manganese was also produced from other ores and in the following amounts:

Kind of Ore.	Quantity. Long Tons.	Value.
Manganiferous iron ore.....	287,810	\$424,302
" silver ore.....	99,651	295,412
" zinc ore.....	48,502	26,670
Imported manganese ore.....	114,885	831,967

Much manganese ore is being shipped from Leadville, Col., at the present day, so that the camp is not entirely dependent on its lead silver ores

MANITOBA, a province of the Dominion of Canada, with an area of 73,956 square miles; capital, Winnipeg.

Agriculture.—In the calendar year 1898 the yield of wheat was 25,313,745 bushels; oats, 17,308,252; barley, 4,277,927; flax, 350,000; potatoes, 3,253,038; rye, 63,860; pease, 31,880; and roots, 2,471,715. The area devoted to these crops aggregated over 2,225,000 acres. Wheat had an increased acreage and a yield exceeding that of the previous year by more than 7,000,000 bushels. In September, 1899, Premier Greenway estimated that the growing crop would double that of 1898. Live stock comprised principally 227,097 cattle, 101,836 horses, 69,648 swine, and 32,053 sheep.

Fisheries.—The value of the yield of the fisheries of Manitoba and the Northwest Territories combined in 1897 was \$638,416; principal catch, whitefish, \$413,893, and herring, \$117,667; value of all apparatus employed in the fisheries, \$237,646; value of exports of fishery products (1898), \$211,748; fry distributed in 1898, 9,000,000.

Mining.—The principal mineral production is coal, which in 1898 yielded 340,088 tons in Manitoba and the Northwest Territories together. In addition to its share in the total output, Manitoba imported 30,964 tons for home consumption, and the Northwest Territories exported 40,434 tons.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise aggregated in value \$4,432,184, practically all of which was entered for home consumption; exports, domestic and foreign, \$3,472,801, an increase in a year of \$1,507,046; duty collected, \$907,050. The registered merchant marine, January 1, 1899, comprised 80 steamers of 6692 gross tonnage, and 41 sailing vessels of 747 tonnage.

Banks.—On January 1, 1899, there were 46 chartered bank branches in the province, and during the previous year the exchanges at the clearing house in Winnipeg amounted to \$90,754,276, an increase in a year of \$6,318,444. There were 29 post-office savings banks, with 1730 depositors and \$304,133 deposits, and 1 government savings bank, with 3880 depositors and \$888,777 deposits.

Railways and Post-Offices.—In 1898 the total length of railways was 1621 miles. Manitoba and the Northwest Territories together had 796 post-offices, in which were posted in a year 10,350,000 letters and 1,250,000 postal-cards, and Manitoba alone had 90 money-order offices, which issued 70,015 orders.

Education.—The school population in 1897 was 51,178, and the enrolment in the 1068 public schools was 39,841, and the average attendance 21,500. Collegiate institutes for advanced education are attached to the public schools in Winnipeg, Portage la Prairie, and Brandon, and have an aggregate enrolment of 818 students. There is also a normal school in Winnipeg for the training of teachers. At the end of 1899 there were 52 periodicals, of which 6 were dailies and 37 weeklies.

Finances.—The revenue of the province in the year ending December 31, 1898, was \$936,604; expenditure, \$837,888; gross debt, \$5,701,951; Dominion government debt allowance, \$3,707,196; other assets, excluding public buildings and grounds, \$4,962,276; total assets, \$8,669,472; excess of assets over gross debt, \$2,967,521.

Population.—Local estimates in 1898 gave Winnipeg 39,384, and Brandon 5928. The Indian population of the province and the reservation in the Northwest Territories was 21,316. In the province alone were 54 schools for Indian youth, with enrolment 1932, and average attendance 984. The Indians cultivated 1215 acres of land, had 2961 head of live stock, and received \$54,971 from their fish, furs, and other industries.

MANUFACTURES. The reviews of special industries given elsewhere in this volume (see CALCIUM CARBIDE; CARBORUNDUM; CARS; CEMENT; COKE; COTTON, IRON AND STEEL; LOCOMOTIVES; SHIP-BUILDING; SILK AND WOOL) all show a notable increase in production in 1899 as compared with previous years. They are, however, only notable examples of the progress which has been witnessed during the year in all branches of manufactures in the United States. While similarly complete figures are not available for foreign countries, it can be stated that nearly all the industrial European nations have experienced a year of exceptional activity in the production, consumption, and trade in manufactured articles. As a single example of this progress, but, nevertheless, a very important one, the exports of iron and metals and manufactures thereof from Great Britain during 1898 and 1899 may be given. The figures are as follows:

	Quantities. Gross tons.		Values. Pounds sterling	
	1898.	1899.	1898.	1899.
Brass, manufactures of	5,294	5,706	471,234	563,167
Copper, ingots, etc.	26,662	31,938	1,480,153	2,398,880
Copper, manufactures of	13,879	11,054	861,562	912,518
Yellow metal.....	10,322	6,927	505,024	437,388
Hardware			1,430,358	1,586,910
Cutlery			556,326	603,326
Implements and tools.....			1,314,076	1,429,700
Pig-iron.....	1,042,853	1,379,296	2,739,093	4,794,357
Bar, angle and rod....	150,119	159,133	993,973	1,227,336
Rails.....	476,047	472,672	2,173,665	2,313,981
Chairs and sleepers	73,048	61,060	311,307	312,459
Unenumerated railroad material.....	60,808	58,065	526,773	504,132
Wire, and manufactures.....	44,123	49,253	772,604	898,201
Hoops, sheets and plates.....	101,292	110,013	779,181	932,380
Galvanized sheets.....	226,496	239,353	2,539,876	3,121,410
Tin plates.....	250,953	256,639	2,744,077	3,167,683
Cast, wrought and all others not enumerated	355,562	358,125	4,732,459	5,232,098
Old iron and steel for remanufacture.....	84,802	116,400	298,561	380,524
Steel, unwrought.....	283,249	323,530	2,640,186	3,368,462
Black plates for tinning.....	58,327	85,567	541,886	827,958
Manufactures of steel or steel and iron combined.....	85,071	44,470	904,231	1,021,859
Lead and manufactures.....	38,076	40,261	545,354	635,630
Plate and plated ware.....			427,443	423,228
Telegraph wire and apparatus.....			985,283	1,407,783
Tin, unwrought.....	5,467	4,709	391,898	587,531
Spelter, and manufactures.....	8,665	6,707	157,512	154,392
Other metal articles.....			1,036,867	1,129,220
Locomotive engines.....			1,483,600	1,168,467
Agricultural engines.....			687,934	764,471
Other steam engines.....			1,454,928	1,642,675
Agricultural machinery.....			850,236	944,480
Sewing machines.....			1,083,481	1,292,033
Mining machinery.....			716,377	735,092
Textile machinery.....			6,038,012	6,819,598
Other machinery.....			5,485,405	5,964,064

The records of foreign commerce of the United States for 1898 and 1899 furnish some very interesting figures respecting the growth of manufactures in the United States. During 1899 the total foreign trade of the United States amounted to \$799,834,620 in imports and \$1,275,486,641 in exports. Of the exports, more than 30 per cent. were manufactures, and of the imports, 33 per cent. were raw materials for the use of manufacturers. In both instances these figures are larger than ever before. The following figures show the values of the principal manufactures and manufacturers' materials imported into the United States in 1896, 1898, and 1899, as they are given by the Bureau of Statistics of the United States Treasury Department.

Montfort-l'Amaury, and became an enthusiastic Boulangist politician, and presented himself as a candidate for the elections of 1893 in the *arrondissement* of Rambouillet, which he succeeded in obtaining. See FRANCE (paragraphs on History).

MARCHANT, Major JEAN, the French officer who in 1898 led an expedition to Fashoda, returned to France in the spring of 1899, was made a commander of the Legion of Honor, and was awarded by the Academy of Moral and Political Sciences the Audiffret prize of 15,000 francs, given annually for the greatest act of devotion. He was born November 22, 1863, at Thoissey, in the department of Aisne. After a short experience as clerk to a notary he entered the army in 1883, and until 1887 attended the military school of St. Maixent. In 1889 he went to West Africa and took part in the expedition of Marine-Lieutenant Hourst in the exploration of the Niger, and the next year he participated in the expedition that led to the capture of Segou, and in 1891 was French resident to King Tiba at Sikaso. In 1892, after being promoted to the rank of captain, he returned to France, but in March, 1893, went again to Africa and proceeded from the Ivory Coast to Tengrela in the Niger Territory; after his return to the coast he took part under Monteil in the battle against King Samory. Going back to France at the end of 1895, he conceived the plan of sending an expedition across the continent from the coast of French Congo to the Upper Nile. Receiving the command himself, he returned to Africa, and with 169 followers left Brazzaville on the 21st of March, 1897, taking two gunboats up the Congo and the Ubangi. After reaching Ratai he experienced great difficulty in transporting his boats over the Nile-Congo watershed. Near the confluence of the Sueh and the Uau, Marchand established Fort Desaix, at More he set up an arsenal, and by the end of 1897 he had in the valley of Bahr-el-Ghazal 7 steel boats, a steamer, and 15 lighters. After successful fights with the Dervishes he reached Fashoda on July 10, 1898, with 8 officers and 120 men. Bonchamp's relief expedition from Abyssinia was forced to return on account of the swampy region about the Sobat. The occupation of Fashoda precipitated an international dispute, when on September 21, 1898, General Kitchener, commander of the Anglo-Egyptian army, arrived there and demanded the evacuation of the place. While the settlement of the question of possession was pending, Marchand decided to return to France, and reached Cairo on the 3d of November. Two days later it was announced that France had withdrawn her claims. Marchand, who had now been promoted to major, returned to Fashoda. On the 11th of December he left there with his men, going up the Nile in a gunboat to the mouth of the Sobat, and then up that river; when navigation was no longer possible the company proceeded on foot, and came to Adis Adaba, Abyssinia, on March 11, 1899. About the middle of May, after traversing a most hazardous route, he reached Djibouti, and by the end of the month arrived in Paris. Though politically a failure, Marchand's expedition, bringing to light a hitherto unknown region of Africa, was a success from the geographical point of view.

MARCONI, WILLIAM, electrical engineer and inventor of what is thus far the most successful system of wireless telegraphy, was born in 1875 at Marzabotto, near Bologna, Italy. His mother was an English woman. Signor Marconi was educated at Leghorn under Professor Rosa and at the University of Bologna under Professor A. Righi. During this time he developed to some extent his system of wireless telegraphy, beginning his experiments without wires in 1895 on his father's estate at Bologna; here he succeeded in transmitting messages over distances exceeding a mile. After reading the works of Professor William Henry Preece, F.R.S., he went to him for advice. Marconi's apparatus was tested, and he and Mr. Preece in 1896 conducted experiments between Penarth and Weston, England, with favorable results. Further experiments were then made in Rome and Spezia, and messages were sent from the shore to a steamer about nine and one-third miles distant. In the latter part of 1897 Signor Marconi began experiments at the Needles on the Isle of Wight, and about the 1st of the following January succeeded in signalling to the mainland. He then established a station at Bournemouth, fourteen miles from the Needles, but later moved it to Poole, four miles farther. Since that time the sending of messages without wires from the Needles to Poole has been a common occurrence. For a further discussion of this subject see the article WIRELESS TELEGRAPHY.

MARCY, OLIVER, A.M., LL.D., professor of geology and dean at Northwestern University, died March 19, 1899. He was born at Colerain, Mass., February 13, 1820; was graduated in 1846 at Wesleyan University, Middletown, Conn. From this year until 1862 he taught in Wilbraham Academy, when he was called to the chair of geology in Northwestern University at Evanston, Ill., which position he retained to the time of his death. From 1876 to 1881 he was acting president of the university. Professor Marcy was a member of the Chicago Academy of Sciences, an associate member of the National Geographical Society and of the American

Ornithological Union, and a fellow of the American Association for the Advancement of Science and of the Geological Society of America.

MARINE BIOLOGICAL ASSOCIATION. See ZOOLOGICAL STATIONS; FISH AND FISHERIES.

MARINE ENGINEERING during the past sixty years was ably discussed at the last (Dover) meeting of the British Association for the Advancement of Science by Sir William Henry White, director of naval construction of the British navy. In fifty to sixty years the speed of transatlantic vessels has increased from $8\frac{1}{2}$ to $22\frac{1}{2}$ knots; ships have trebled in length, about doubled in width, and increased tenfold in displacement. The engine power is now about forty times as great, and the coal consumption per horse-power hour only one-third what it was in 1840. Modern twin-screw engines at high pressure now produce 6 to 7 horse-power per ton weight of propelling machinery, including boilers, against 2 horse-power in 1840, in both cases at sea. Looking ahead another sixty years, Sir William said it would be idle to predict the characteristics of ocean navigation at that time, but some of the probable lines of advance mentioned were: Reductions in the weight of propelling apparatus, of fuel, and of hulls. The use of water-tube boilers in war-ships has saved one-third of the weight of the old cylindrical boilers, with the same power and natural draft, but no great saving in coal consumption is expected from the water-tube boiler. Liquid fuel, he thought, would have advantages over coal, especially in transportation to the ship, and in feeding the fires. Even if liquid fuel saved only one-third the weight of coal required to do the same work, it would reduce the fuel load of an Atlantic liner by 1000 tons (of 2240 pounds), which could be utilized in increased cargo or speed. Adequate supplies of liquid fuel, however, do not appear to be available. In the matter of weight of the vessel itself, he estimated that in an Atlantic liner of 20 knots about 1000 tons' weight could be saved by substituting nickel steel for the mild steel that has so recently replaced wrought iron. Although this would increase first cost, the reduction in weight would enable the speed to be increased by 1 knot, or from 20 to 21 knots, without changing dimensions. In conclusion, Sir William thought that vessels still larger than any yet built might be expected.

Water-tube boilers have been adopted by the United States Navy for our future war-ships. The reasons for this course were given at length by Rear-Admiral George W. Melville, engineer-in-chief, U. S. N., in a paper read before the New York meeting of the Society of Architects and Marine Engineers, November 16-17, 1899. Admiral Melville stated that he had opposed their adoption until "convinced that they must be used if we are not going to content ourselves with inferior ships to those built for other nations." The advantages and disadvantages of water-tube boilers, as compared with cylindrical boilers, were concisely summarized by Admiral Melville as follows:

"Advantages: Less weight of water, quicker steamers, quicker response to change in amount of steam required, greater freedom of expansion, higher cruising speed, more perfect circulation, adaptability to high pressures, smaller steam pipes and fittings, greater ease of repair, greater ease of installation, greater elasticity of design, less danger of explosion.

"Disadvantages: Greater danger from failure of tubes, better feed arrangements necessary, greater skill required in management, units too small, greater grate surface and heating surface required, less reserve in form of water in boiler, large number of parts, tubes difficult of access, large number of joints, more danger of priming."

The two new United States battle-ships, the *Kearsarge* and *Kentucky*, are being equipped with electric power for hoisting coal, boats, and ammunition, training guns, and driving ventilating apparatus.

A number of important phases of ship-building, including various engineering points, were covered in a series of papers read before the ship-building section of the biennial conference of the Institution of Civil Engineers, held in London, June 7-9, 1899. These papers, like the others at the conference, were concise reviews of the progress and prospects of the subjects treated, designed largely to draw out discussion.

MARKHAM, EDWIN, poet and educator, was born in Oregon City, Ore., in 1852; his boyhood was passed on a cattle range in central California; he was educated at the State Normal School, and afterward pursued a college course and studied law, but never became a practitioner. He engaged in blacksmithing for a time, and then entered upon educational work; as superintendent and head-master of schools, he has left his impress on California. In 1899 Mr. Markham was principal of the Observation School of the University of California, at Oakland. He is a man of wide reading, possessing one of the largest and best-selected libraries in the State, and was made famous by his short poem, *The Man with the Hoe*, written after see-

ing Millet's well-known painting, and first published in the San Francisco *Examiner* for January 8, 1899.

MARRIAGE, MEDICAL CONTROL OF. In February, 1899, the Senate of the State of North Dakota passed a bill providing for the creation of a commission of three physicians in each county, whose duty it shall be to examine all persons applying for marriage licenses, and to decide if they shall be allowed to marry. Of the soundness of such a measure from a sanitary point of view there can be no doubt; but it remains to be ascertained whether or not sentiment will render it impracticable. Properly used, the power of such a commission would prevent a large number of intended marriages, controlling the propagation of disease and the procreation of defective or degenerate offspring. A certain check could be put in this way to the spread of tuberculosis, hereditary insanity, chronic alcoholism, and those widespread scourges, gonorrhœa and syphilis. Dr. Schulz, the health commissioner of the State of Wisconsin, advocates in his report, issued in October, 1899, making the issuance of marriage licenses subject to medical control. The storm of unfavorable comment raised by Dr. Schulz's suggestion is likely to defeat his purpose for the present.

Fraenkel, of Munich, proposed in an article, published in August, 1899, that the matter of the marriage of sufferers from lung trouble should be regulated. He states that marriage of a formerly tuberculous person may be permitted if the disease has been arrested for several months. If the predisposition to lung disease was hereditary, marriage is not warranted, even after an apparent cure of tuberculosis. Tuberculous men, he finds, bear marriage well; and if their wives be healthy, their children are likely to be healthy also. Tuberculous women, on the other hand, are endangered by pregnancy, labor, and the puerperal state. They give birth, usually, to weak children, whatever the health of the fathers. If marriage of former tuberculous people is permitted, Fraenkel urges that special attention be given to the offspring in the way of a sound wet-nurse, an abundance of milk during childhood, no alcohol, a large quantity of fat and butter, exercise, and sea-bathing.

MARRYAT, FLORENCE (Mrs. Francis Lean), English author, died in London, October 27, 1899. She was a daughter of the late Captain Frederick Marryat, and was born at Brighton, July 9, 1837. She was educated at home, and at a very early age gave evidence of literary taste and ability. It is said that in her twelfth year she wrote a novel which she illustrated with her own pen drawings. As a writer she first gained the attention of the public in 1865, in which year appeared her *Love's Conflict*, *Woman against Woman*, and *Too Good for Him*. There followed a long succession of works, chiefly fiction, many of which were first published serially. In 1872 she became editor of *London Society*. Miss Marryat was also known as a lecturer, an operatic singer, and a comédienne. In collaboration with Sir C. L. Young she wrote *Miss Chester*, a three-act drama, and in 1881 she acted the principal comedy rôle in her own play, *Her World*. Augustin Daly's famous play, *Pique*, was founded upon Miss Marryat's novel, *Her Lord and Master*. Among her works, which number over seventy, are: *My Own Child*; *My Sister the Actress*; "*Gup*," *Sketches of Anglo-Indian Life and Character*; *Veronique*; *The Confessions of Gerald Estcourt*; *The Prey of the Gods*; *Petronel*; *The Girls of Feversham*; *Nelly Brooke*; *No Intentions*; *Sybil's Friend and How She Found Him*; *Mad Dumarscq*; *Open, Sesame!*; *Her Word Against a Lie*; *Facing the Footlights*; *The Life and Letters of Captain Marryat*. In her later years she had an interest in spiritualism, and among her writings dealing with this subject are *The Risen Dead* and *There Is No Death*. Many of her stories have been translated into German, French, Flemish, Russian, and Swedish. Miss Marryat was twice married, first to Colonel Ross Church, of the Madras Staff Corps, and second to Colonel Francis Lean, of the Royal Marine Light Infantry.

MARSH, OTHNIEL CHARLES, PH.D., LL.D., professor of paleontology in Yale University, and one of the most prominent of modern scientists, died in New Haven, March 18, 1899. He was born in Lockport, N. Y., October 29, 1831, and it was not until 1852 that he entered Phillips Academy at Andover; four years later he entered Yale, and was graduated in 1860. He then continued his studies at the Sheffield School in New Haven, and at the universities of Heidelberg, Breslau, and Berlin. Having returned to America, he was appointed in 1866 to the chair of paleontology at Yale, which position he retained to the time of his death. Professor Marsh was the nephew and heir of George Peabody, and thus was enabled financially to prosecute his scientific researches. It was largely through his suggestion and influence that his uncle founded the Peabody Museum at Yale. In the early part of 1898 Professor Marsh gave to the museum all his scientific collections, which in the course of his many years of study and investigation had become very large and valuable. In many respects the collection of this museum is one of the largest and richest in the world.

From 1868 almost to the time of his death he was actively engaged in paleontological research, especially in the Rocky Mountain region of the United States, though during the last decade he turned his attention to the geology of the region between the Appalachian system and the Atlantic. He crossed the Rocky Mountains twenty-seven times. His work, which was chiefly directed to the discovery of extinct vertebrate animals, was conducted with unusual vigor, and its results showed in him both a keen originality and an "exceptionally clear recognition of the principles of biology." Many of his discoveries are of the first magnitude, while the total "researches conducted by him in person or carried out under his direction have enriched the world's knowledge of paleontology, geology, and kindred sciences more than those of any man living." Charles Darwin wrote in 1882 "that Professor Marsh's printed descriptions of his discoveries afforded the best support to the theory of evolution that had appeared in twenty years." In his various expeditions Professor Marsh discovered hundreds of species of extinct vertebrates, many of which had previously been entirely unknown, while many others had not been found before in America. Among the extinct vertebrates discovered by him are the *odontornithes*, cretaceous birds having teeth; the *dinocerata*, six-horned animals of the eocene period and elephantine in bulk; the earliest ancestors of the horses, *eohippus*, *orohippus* and *epihippus*; the first known American *pterodactyls*, or flying lizards; the *frontotherida*, a new family of ungulates from the miocene period; the first mammals of the jurassic period found in America, together with new families of dinosaurs and some enormous reptiles; and a large variety of American monkeys, bats, and marsupials. The investigation of Professor Marsh that has probably gained the widest popular attention was his tracing of the phylogeny of the horse; in the more restricted circle of scientists his principle of cephalization is regarded as very important. Besides his unflagging industry in discovery the scientific world owes much to Professor Marsh's method of classification and the clear setting forth of the results of his work. He published many scientific articles. Almost his entire fortune was left to Yale University. He was an honorary member of several European academies of science; he received the Bigsby medal of the Geological Society of London (1877), of which he was a fellow; he received the Cuvier prize of the Institute of France; he was a fellow of the Royal Geographical Society; he was president of the American Association for the Advancement of Science in 1878, and of the National Academy of Sciences from 1883 to 1885. Few men have reached a higher place in the realm of science than he; his "whole life illustrates the possible achievement to be derived from absorbed and single application of natural powers in one chosen direction."

MARSHALL, Mrs. EMMA (born MARTIN), English author, died May 6, 1899. She was born near Cromer, England; was educated at a private school at Norwich; thereafter she lived chiefly at Wells, Exeter, Gloucester, and Bristol. She wrote a large number of historical novels, each usually having some well-known personage as its central character. Among such of her characters are Sir Philip Sidney, George Herbert, Sir Thomas Brown. The time of her *In the Choir of Westminster Abbey* (1897) is that of Henry Purcell; *Under the Dome of St. Paul's* (1898) treats of the time of Sir Christopher Wren. Among her most popular works are *Penshurst Castle*; *Winchester Meads*; *Under Salisbury Spire*. Besides *Under the Dome of St. Paul's* she published in 1898 *Better Late than Never*. Many of her books have been translated into German, appearing especially in the Tauchnitz edition.

MARSHALL, GEORGE A., ex-congressman from Ohio, died April 22, 1899. He was born in Shelby County, O., September 14, 1851; was educated at the public schools, and at the Ohio Wesleyan University. He studied law, was admitted to the bar, and, being elected prosecuting attorney of Shelby County, served in that capacity for eight years. He was elected as a Democrat to the Fifty-fifth Congress by 9000 plurality, to represent the fourth district of Ohio. His term expired March 4, 1899.

MARTINIQUE, one of the Lesser Antilles lying between the Windward and Leeward groups, is a French dependency having an area of 381 square miles, and a population (1895) of 187,692. The colony is represented at Paris by a senator and two deputies; it is administered by a governor with a general council and municipal councils. The seat of government is at Fort de France, or Fort Royal; St. Pierre, with a population of about 25,400, is the largest and chief commercial town. There are 13 denominational and private schools, one normal school, a law school at Fort Royal, 3 secondary schools with about 490 students, and 38 primary schools with about 10,300 pupils. Local revenue and expenditure for 1898 balanced at 2,581,848 francs; the expenditure of France in the budget of 1899 was 2,581,848 francs; there is an annuity debt of 95,000 francs. The principal products are sugar, coffee, cacao, cotton, and tobacco. The export of sugar in 1896 was 34,429 tons, and of rum and arrack 3,765,000 gallons. In 1897 the exports to France amounted to 18,997,565 francs and the imports from France 12,965,952.

MARTUCCI, GIUSEPPE, Italian composer, born in Capua in 1856, was educated at the Naples Conservatory, and has acquired a reputation as a pianist on the Continent and in England. He is now director of the Bologna Conservatory, and is regarded as one of the best Italian composers of the day. His symphony in D minor (*op. 75*), first performed by the Società del Quartetto, Milan, 1895, was played by the London Philharmonic, May 4, 1899.

MARYLAND, a Middle Atlantic State, has an area of 12,210 square miles. The capital is Annapolis.

Mineralogy.—Coal-mining is carried on in two counties only, Allegany and Garrett, and is the most productive in the first. The system continues to be pick-mining. During the calendar year 1898 the output of 31 mines was 4,674,884 short tons, valued at the mines at \$3,532,257, an increase in a year of 232,756 tons, and the largest on record in the State. Of the total output, 4,618,990 tons was shipped at the mines for commercial sales. There was an increase in a year of \$353,798 in the aggregate value of quarry products, the several outputs being: Granite, \$317,258; sandstone, \$13,646; slate, \$82,240; marble, \$120,525; and limestone, \$433,653—total value, \$967,322. The production of iron ore was 5941 long tons, valued at \$11,882.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 18,562,432 bushels, value, \$6,682,476; wheat, 10,710,966, \$7,283,457; oats, 1,675,596, \$502,679; rye, 353,276, \$201,367; buckwheat, 97,630, \$54,673; potatoes, 1,420,352, \$724,380; and hay, 319,781 tons, \$3,885,339. Live stock, January 1, 1900, comprised horses, 130,959, \$6,950,014; mules, 12,891, \$937,005; milch cows, 154,712, \$4,610,418; other cattle, 102,723, \$2,604,643; and sheep, 138,177, \$485,553.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$6,926,472. There were 43 manufacturers of tobacco and 783 of cigars, and the total output was 284,361,775 cigars, 487,665 cigarettes, 206,373 pounds of fine-cut tobacco, 12,115,724 pounds of smoking, and 909,869 pounds of snuff. Grain and fruit distilleries in operation numbered 29; the production of fruit brandy was 12,409 gallons; amount of distilled spirits gauged, 14,569,232 gallons; and production of fermented liquors, 976,293 barrels. The production of pig-iron was 190,974 long tons, and of all kinds of rolled iron and steel, 149,820 long tons. More than half of the limestone output was burned into lime, and the bulk of the remainder was used for paving, road-making, and building purposes. Almost all the granite and marble was cut for building uses, and the bulk of the slate for roofing.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the port of Baltimore aggregated in value \$9,151,155, an increase in a year of \$244,037, and the exports, \$107,156,240, a decrease of \$11,689,340. The only trade in gold and silver was exports of \$6810, making the total foreign trade of the year \$116,314,205, a net decline of \$11,486,949.

Banks.—On October 31, 1899, there were 69 national banks in operation and 4 in liquidation. The active capital aggregated \$15,694,960; circulation, \$5,792,577; deposits, \$56,305,173; and reserve, \$14,996,571. The State banks, June 30, 1899, numbered 22, and had capital, \$1,704,250; deposits, \$6,431,230; and resources, \$9,143,960; loan and trust companies, 3, with capital, \$1,850,000; deposits, \$3,761,530; and resources, \$7,595,544; private banks, 5, with capital, \$138,300; deposits, \$362,129; and resources, \$530,151; and mutual savings banks, 18, with depositors, 166,337; deposits, \$55,564,940; and resources, \$58,166,330. The exchanges at the United States clearing house at Baltimore in the year ending September 30, 1899, aggregated \$1,276,120,171, an increase of \$387,953,740 in a year.

Railways.—The new railway construction during 1898 was 15.80 miles, and during 1899, 32.50 miles, giving the State a total mileage of 1,357.54.

Education.—At the close of the school year 1897-98, the school population was 351,400; enrolment in the public schools, 236,003; and average daily attendance, 134,539. There were 4987 teachers, 2465 buildings used as school-houses, and public school property valued at \$4,500,000. The revenue was \$2,991,271; expenditure, \$2,709,104, of which \$2,027,615 was for teachers' salaries. There were 46 public high schools, with 143 secondary teachers, 3922 secondary students, and 1294 elementary pupils; 39 private secondary schools, with 197 secondary teachers, 1896 elementary students, and 1697 elementary pupils; 2 public normal schools, with 16 teachers and 481 students in all departments; and 2 private ones, with 11 teachers and 98 students. Normal training was also given in 2 colleges and 1 public high school. Eleven colleges for men and for both sexes reported 24 fellowships, 259 scholarships, 270 professors and instructors, 1990 students, 185,310 volumes in the libraries, valued at \$239,840; \$182,377 invested in scientific apparatus, \$2,017,626 in grounds and buildings, and \$3,407,500 in productive funds; \$393,299 in total income, and \$72,958 in benefactions. Five colleges for women reported 1 fellowship, 21 scholarships, 87 professors and instructors, 744 students, 19,500 volumes in the libraries, \$54,550 invested

in scientific apparatus, \$1,270,000 in grounds and buildings, and \$363,500 in productive funds, \$102,046 in total income, and \$13,000 in benefactions. In 1899 there were 204 periodicals, of which 17 were dailies, 142 weeklies, 33 monthlies, and 6 quarterlies.

Finances.—The treasury receipts in the year ending September 30, 1898, were \$3,095,314; expenditures, \$3,236,101; cash balance, \$566,351; total funded debt, \$9,284,986; sinking funds, \$6,251,958; net debt, \$3,033,028, offset by unproductive stocks, \$8,649,627, and amount due from accounting officers and incorporated institutions, \$615,375. The tax rate was \$1.77½ per \$1000, and the total assessed valuation, \$603,326,096. On January 1, 1899, the net debt was \$3,564,513.

Population.—As estimated by federal officials the population on June 30, 1899, was about 1,275,000.

Party Platforms.—The Democratic State convention was held in Baltimore, August 2, 1899. The platform insisted that in time of war as well as of peace the freedom of the press should be preserved, and that the right of the people to criticise freely the policy and conduct of the administration should be defended at all hazards; declared unalterable opposition to the creation and maintenance of a large standing army in time of peace; declared Republican legislation responsible for the "gigantic industrial and commercial trusts," and demanded a non-partisan administration of the police department and the public schools. It will be seen that no reference was made to the Chicago platform, nor to the free silver issue, but it was said that all the nominees favored the gold standard. The Republican party was declared responsible for the numerous violations of the law on the part of the negroes, the latter believing that they will receive protection and immunity from punishment on account of their votes, which, it is asserted, are cast almost solidly for the Republican ticket.

The Republican State convention was held September 6, 1899, and its platform declared belief in the gold standard and that all our currency should be made at law redeemable in gold coin at the option of the holder; favored import duties for protection and revenue; expressed confidence in the national administration's ability to solve the Philippine problem; favored laws to suppress trusts and all combinations which create monopoly, but opposed legislation merely for popular effect, in reckless disregard of business revival after prolonged depression; declared that the finances of the State were in a better condition than ever before; favored a non-partisan administration of the schools; pledged a non-partisan reorganization of the Baltimore Police Department, and legislation further to guard the fairness and purity of elections.

Elections.—Governor Lloyd Lowndes, the Republican candidate, received 116,286 votes; Mr. John Walter Smith, the Democratic candidate, 128,409 votes, and was therefore elected by a plurality of 12,123; the total vote cast was 244,695. In the campaign several questions of a local and personal character had so great prominence that national issues were completely overshadowed. The result was regarded by the friends of ex-Senator Gorman as restoring the latter's political prestige.

State Officers and National Representatives.—Governor, John Walter Smith; secretary of state, Richard Dallam; comptroller, J. W. Hering; treasurer, T. J. Shryock; adjutant-general, L. A. Urhner; attorney-general, Isidor Rayner; superintendent of education, E. B. Prettyman; commissioner of insurance, T. Albert Kurtz. Court of Appeals: Chief judge, James McSherry; associate judges, David Fowler, A. Hunter Boyd, Henry Page, I. Thomas Jones, John P. Briscoe, S. D. Schmucker, James A. Pearce; clerk, Allen Rutherford. The State legislature consists of 37 Republicans and 80 Democrats. Senators: Louis E. McComas, from Baltimore; George L. Wellington, from Cumberland—both Republicans. Representatives: William B. Baker (Rep.), from Aberdeen; Frank C. Wachter (Rep.), from Baltimore; James W. Denny (Dem.), from Baltimore; Sydney E. Mudd (Rep.), from La Plata; and George A. Pearce (Rep.), from Cumberland. One seat in the House of Representatives is vacant owing to the election of John Walter Smith for governor, November 7, 1899.

MASON, THEODORUS B. M., lieutenant-commander, U. S. N., retired, who died October 15, 1899, at the age of 51 years, was instrumental in developing the Bureau of Naval Intelligence during the war with Spain. He was a native of New York State, but was appointed to the Naval Academy from Florida. He became a midshipman in 1864, an ensign in 1869, a master in 1870, a lieutenant in 1872, and a lieutenant-commander on January 23, 1894. On December 8, 1894, he was retired, but was called into service again during the Spanish war.

MASSACHUSETTS, a New England State of the United States, has an area of 8315 square miles. The capital is Boston.

Mineralogy.—The production of granite in the calendar year 1898 fell slightly below that of the previous year, and was in greater demand for building purposes than for monumental work. The quarry outputs were: Granite, \$1,650,508; sandstone, \$91,287; slate, \$958; marble, \$38,210; and limestone, \$174,822—total, \$1,955,785.

Massachusetts and Connecticut together had a yield of 20,251 long tons of brown hematite ore, valued at \$53,628.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 1,449,504 bushels, value, \$739,247; oats, 489,027, \$185,830; barley, 50,850, \$34,578; rye, 133,296, \$105,304; buckwheat, 44,180, \$30,923; potatoes, 3,760,710, \$2,143,605; and hay, 667,499 tons, \$10,346,234. Live stock, January 1, 1900, comprised horses 66,017, \$5,154,136; milch cows, 181,589, \$6,755,111; other cattle, 73,378, \$1,990,270; and sheep, 40,194, \$182,883.

Manufactures.—During 1898 the production of pig-iron was 3661 long tons, and of all kinds of rolled iron and steel, 104,221 long tons, an increase in the latter in a year of nearly 10,000 tons. A noteworthy industrial feature of 1899 was the completion of the Otto-Hoffman by-product coke plant at Everett. It has 400 ovens, and the largest gas holder and purifying house in the world, receives its coal from Nova Scotia, and produces gas for illuminating and fuel purposes, coal tar for street paving, and coke for its usual uses. During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$8,153,620. There were 31 manufacturers of tobacco and 722 of cigars, and the combined output was 103,811,603 cigars, 3,244,480 cigarettes, 233 pounds of fine-cut tobacco, 15,114 pounds of smoking, and 78,860 pounds of snuff. Distilleries in operation numbered 11; amount of spirits rectified, 3,816,587 gallons; distilled spirits gauged, 10,139,489 gallons; fermented liquors produced, 1,763,939 barrels. The annual report of the Bureau of Statistics of Labor for 1898 shows: Establishments considered, 4701; value of goods made and work done in the nine leading industries, \$865,619,185; capital invested in manufacture of boots and shoes, \$22,414,665, cotton goods, \$112,702,330, woollen goods, \$26,930,024, and machines and machinery, \$32,686,813; annual wages paid for boots and shoes, \$23,904,714, cotton goods, \$26,294,240, woollen goods, \$7,205,613, and machinery, \$10,068,181; and persons employed on boots and shoes, 51,897, cotton goods, 81,385, woollen goods, 19,438, and machinery, 18,658. Textile goods show a largely decreased production, but the general manufacturing output was substantially increased.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at ten ports of entry and delivery aggregated in value \$52,228,433; exports, \$128,047,814, an increase in a year in imports of \$608,359, and in exports, \$10,512,452. The trade in gold and silver was, imports, \$114,135; exports, \$22,409, making the total foreign trade of the year \$180,612,791, a net increase of \$10,795,515.

Banks.—On October 31, 1899, there were 250 national banks in operation and 41 in liquidation. The active capital aggregated \$80,827,500; circulation, \$29,754,578; deposits, \$305,283,019; and reserve, \$82,744,345. The loan and trust companies, June 30, 1899, numbered 34, and had capital, \$11,375,000; deposits, \$117,945,813; and resources, \$138,423,252; and the mutual savings banks, 186, with depositors, 1,465,960; deposits, \$509,215,854; and resources, \$542,985,597. The exchanges at the United States clearing houses at Boston, Springfield, Worcester, Lowell, New Bedford, and Fall River in the year ending September 30, 1899, aggregated \$7,058,260,809, a net increase of \$1,548,543,941 in a year.

Railways.—There was no new railway construction during 1898, and only 4.20 miles in 1899, giving the State a total mileage of 2111.79. A great sensation in railway circles was occasioned in the summer of 1899 by the leasing of the Boston and Albany system to the New York Central and Hudson River Railroad for a term of 999 years, on the basis of a guarantee of 8 per cent. on the Boston and Albany stock.

Education.—At the end of the school year 1897-98 the school population was 616,100; enrolment in the public schools, 456,141; and average daily attendance, 349,147. There were 13,203 teachers, 3395 buildings used for school-houses, and public school property valued at \$39,077,405. The revenue was \$13,653,649; expenditure, \$13,653,649, of which \$7,733,138 was for teachers' salaries. There were 227 public high schools, with 1356 secondary teachers, 33,322 secondary students, and 842 elementary pupils; 96 private secondary schools, with 648 secondary teachers, 5574 secondary students, and 1889 elementary pupils; 10 public normal schools, with 168 teachers and 4051 students in all departments; and 3 private ones, with 17 teachers and 168 students. Normal training was also given in 3 colleges and 11 public high schools. Nine colleges for men and for both sexes reported 51 fellowships, 862 scholarships, 753 professors and instructors, 7527 students, 719,959 volumes in the libraries, valued at \$686,000; \$1,313,450 invested in scientific apparatus, \$8,142,425 in grounds and buildings, and \$15,421,277 in productive funds, \$1,712,316 in total income, and \$1,559,355 in benefactions. Five colleges for women reported 135 scholarships, 308 professors and instructors, 2621 students, 38,183 volumes in the libraries, valued at \$125,800; \$136,500 invested in scientific apparatus, \$2,547,533 in grounds and buildings, and \$1,320,389 in productive funds, \$655,144 in total income, and \$248,582 in benefactions. In September, 1899, a unique exhibition was opened to the public in Copley and Allston Halls, comprising drawings by the pupils of more than fifty pub-

lic schools of the State, supplemented by contributions from the State Normal Art School, the normal and training schools, and the evening drawing schools. In 1899 there were 632 periodicals, of which 86 were dailies, 323 weeklies, 173 monthlies, and 23 quarterlies.

Finances.—In 1898 the assessed valuations of the State were: Real estate, \$2,182,596,651; personal property, \$1,371,419,131—total, \$3,554,015,782, an increase in a year of \$6,033,628; and of the cities, counties, and towns, \$2,764,242,784, an increase of \$61,914,730. The total funded debt of the State, January 1, 1899, was \$59,786,229; sinking funds aggregated \$15,189,152, leaving the net debt \$44,597,077, an increase in a year of \$6,923,241. The net debt of the cities, counties, and towns in 1898 was \$121,385,139; increase in a year, \$5,586,250.

Vital Statistics.—A feature of more than ordinary interest in the report of the State Board of Health for 1898 was the part relating to the mortality from the most fatal diseases, particularly consumption and diphtheria. For twenty-five years the general death rate of the State varied but little from 19.5; but in 1898 it fell to 17.5. This decrease, it is shown, was largely due to a better treatment of infectious and preventable diseases. The death rate from consumption in 1853 was 4272 per 1,000,000 persons; in 1895 it was 2194; and at present is considerably less. The establishment of a special State hospital for the isolation of persons under treatment for tuberculosis, the more vigorous enforcement of measures essential in combating infectious diseases, a better knowledge on the part of the people of the art of prolonging life, a growing appreciation of sanitary science, and the organization and equipment of local health authorities, are cited as causes of the improvement.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 2,745,000.

Legislation.—By the statutes of 1899 bicycle paths are protected; a board of cattle commissioners was created with power to suppress contagious diseases, establish hospitals and quarantine and kill cattle incurably diseased, without compensation to the owner; the Bertillon method of identifying criminals was adopted; process butter must be stamped "Renovated butter"; collectors dressed in a way to attract attention are prohibited; desecration of the flag is prohibited; each town must elect a tree warden to care for public shade trees; weekly payment of wages is required, and eight hours is a day's work when employment is by municipalities; street railways are authorized to act as common carriers for packages and small parcels, and no bank shall do business as a trust company. An elaborate law was also enacted relative to the descent and distribution of personal property.

Party Platforms.—The Republican State convention met in Boston, October 6, 1899, and drew up a platform that congratulated the nation upon the auspicious results that had followed the restoration of the Republican party to power in all branches of the federal government; declared that the tariff law had proved adequate to meet the expenses of the government on a peace footing, and that the National Treasury Department had been administered in such a way as to restore stability to value and faith in the national credit; it demanded legislation for the development of the merchant marine, and favored making the principal harbors accessible to the largest vessels afloat; it expressed unqualified opposition to trusts and monopoly, and warmly commended the administration of President McKinley and of Governor Wolcott.

The Democratic State convention met in Boston, September 21, and its platform reaffirmed and endorsed the principles of the platform adopted by the Democratic national convention of 1896; renewed the demand for the free and unlimited coinage of both gold and silver at the ratio of 16 to 1; denounced unqualifiedly the purpose of the Republican party to surrender to the banks the governmental function of issuing paper money and controlling its volume; approved the war with Spain, but declared the "aggression in the Philippines" to be "wanton and needless"; denounced a large standing army as a "terrifying form of militarism"; pledged the Democratic party "to give due trial to such remedies as may hasten the disintegration of trusts"; demanded government ownership and operation of all railroads; endorsed Mr. Bryan; favored the election of United States senators by direct vote of the people, and the enforcement of an eight-hour workday; the abolition of the law granting a life tenure to members of the judiciary; and the public ownership and operation of street railways, water-works, and other municipal business enterprises.

The Prohibition platform declared that the entire production, transportation and sale of liquors for beverage purposes should be prohibited by law; that the laborer's deadliest enemy is the legalized saloon; that the citizens can, if they choose, entirely banish the liquor traffic; that prohibition will prohibit whenever citizens empower a party that wishes to enforce the law; that its candidates can be relied upon for a prudent and vigorous administration of all State affairs; that intelligence and not sex should qualify a voter; and that the Christian Sabbath should be better protected by law from secular encroachment. It denounced license, high

or low, or any system or regulation that gives protection to the drink traffic; the introduction of the liquor traffic in our newly acquired possessions; the retention of the army "canteen" by the government; the lawlessness known as "lynch law," and what it alleged to be moral weakness of the federal administration.

Elections.—The State offices to be filled by the election on November 7, 1899, were those of governor, lieutenant-governor, secretary, treasurer and receiver-general, auditor, and attorney-general. The Republican candidate for governor, W. Murray Crane, received 168,902 votes; the Democratic candidate, Robert Treat Paine, Jr., 103,802 votes; the Socialist-Labor candidate, George R. Peare, 10,778 votes; the Democratic-Socialist candidate, Winfield P. Porter, 8262 votes; the Prohibition candidate, Rev. Albert B. Coats, 7402 votes, and all others, 20 votes. The total vote cast was 298,246, and Mr. Crane was elected by a plurality of 65,100.

State Officers and National Representatives.—Governor, W. Murray Crane; lieutenant-governor, John L. Bates; secretary of State, W. M. Olin; treasurer, E. S. Bradford; auditor, John W. Kimball; adjutant-general, Samuel Dalton; attorney-general, H. M. Knowlton; secretary of the Board of Education, Frank A. Hill; secretary of the Board of Agriculture, James W. Stockwell; insurance commissioner, F. L. Cutting. Supreme Judicial Court for the Commonwealth: Chief Justice, Oliver W. Holmes; justices, Marcus P. Knowlton, James M. Morton, John Lathrop, James M. Barker, John W. Hammond, William C. Loring; clerk, Henry A. Clapp. The State legislature consists of 197 Republicans, 77 Democrats, 4 Independents, and 2 Socialist-Democrats. Senators: Henry Cabot Lodge, from Nahant, and George F. Hoar, from Worcester—both Republicans. Representatives: George P. Lawrence (Rep.), from North Adams; Frederick H. Gillett (Rep.), from Springfield; John R. Thayer (Dem.), from Worcester; G. W. Weymouth (Rep.), from Fitchburg; William S. Knox (Rep.), from Lawrence; William H. Moody (Rep.), from Haverhill; Ernest W. Roberts (Rep.), from Chelsea; Samuel W. McCall (Rep.), from Winchester; John F. Fitzgerald (Dem.), from Boston; Henry N. Napen (Dem.), from Boston; Charles F. Sprague (Rep.), from Brookline; W. C. Lovering (Rep.), from Taunton; William S. Greene (Rep.), from Fall River.

MATHEMATICAL SOCIETY, AMERICAN, formed in 1888, reorganized 1894, to encourage and maintain an active interest in mathematical science. Publishes *Transactions* (quarterly) and *Bulletin* (10 months in each year). In 1899 had a membership of 337. President, R. S. Woodward; secretary, F. N. Cole, Columbia University, New York City.

MAURITIUS, a crown colony of Great Britain, is an island lying in the Indian Ocean, 500 miles east of Madagascar, having an area of 705 square miles, and a population, reported at the beginning of 1899, of 378,872, of whom 261,222 were East Indians. The remainder of the inhabitants are chiefly of French or of mingled French descent. The language spoken in large part is French. Dependencies of Mauritius are Rodriguez Island and the Seychelles, Almirante, Oil, and St. Brandon islands, the total area of which is 350 square miles, and the population about 17,000. The capital of Mauritius is Port Louis, with a population in 1898 of 54,223. Government is administered by a governor, who is assisted by an executive council of five officials and two elected members, and by a legislative council of twenty-seven members, of whom eight are ex-officio, nine nominated by the governor, and ten elected. The governor since 1897 has been Sir Charles Bruce, K.C.M.G. Instruction is largely supported by the government; the total expenditure for this in 1898 was 486,836 rupees. Of the public school population about 70 per cent. are Roman Catholics, 3 per cent. Anglicans, something over 1 per cent. belonging to other Christian churches, and about 25 per cent. Hindoos and Mohammedans; to the last two classes government assistance is not granted.

The chief sources of revenue are custom duties, licenses, and railways. The revenue and expenditure in 1897 amounted to 7,996,705 rupees and 8,626,798 rupees respectively; in 1898, revenue, 7,620,318 rupees; expenditure, 8,131,465 rupees. In the latter year the public debt was £1,195,691, and the paper money in circulation 3,404,250 rupees. The Indian rupee (value in United States currency about \$0.52) is used in accounts.

By far the most important industry is sugar culture, and most of the provisions needed, including rice, grain, flour, etc., are imported. The trade is chiefly with India. The total imports and exports, valued in rupees, in 1897 were 18,948,233 and 28,192,675 respectively; in 1898 the exports amounted to 31,866,437 rupees. Of the export for 1897, 22,327,650 rupees were accredited to unrefined sugar; aloe fibre, 242,507 rupees; vanilla, 136,620 rupees. The foreign tonnage entered in 1897 was 328,708 tons; cleared, 338,638 tons.

MAYFLOWER DESCENDANTS, SOCIETY OF, organized in 1894, a society of descendants of persons who sailed on the *Mayflower* to Plymouth Rock, Mass.,

in December, 1620. In 1899 the membership was about 2000. The officers of the New York Society are John Taylor Terry, governor, and Jeremiah Richards, secretary, 83 Grand Street, New York City.

MAZET, ROBERT, chairman of a conspicuous legislative committee authorized in 1899 to investigate charges of corruption in the government of New York City, is a native of Pittsburg, Penn. He was graduated at Columbia in 1881, and immediately began to practise law in New York. All his life he has been a Republican, and a staunch supporter of the workingmen. He was instrumental in securing the passage of a bill for the improvement of the West Side and Riverside Drive, New York; supported the Mechanics' Lien law for the protection of workingmen, and a bill for improvements in school advantages for the children of New York. Mr. Mazet is identified with charitable institutions, and is a member of the State Charities Aid Association. He was elected to the New York legislature in 1896, and was re-elected by a majority of over 3800 votes. The Mazet committee began its work on April 8. Mr. Richard Croker (*q. v.*) was one of the first witnesses examined. See NEW YORK.

MECHANICAL ENGINEERS, AMERICAN SOCIETY OF, incorporated in 1881, had in 1899 a membership of 1951. General meetings for 1900 at Cincinnati, May 14-18, and in New York, December 4-7. The society published in 1899 Vol. XX. of its *Transactions*. President, Charles H. Morgan; secretary, F. R. Hutton, 12 West Thirty-first Street, New York City.

MEDAL OF HONOR LEGION, an association of officers and enlisted men who were awarded medals of honor in the American Civil War, was organized in 1890, and has an estimated membership of about 500. Commander, Theodore S. Peck, Burlington, Vt.; adjutant, Llewellyn G. Estes, Washington, D. C.

MEDICAL ASSOCIATION, AMERICAN, held its fiftieth annual session at Columbus, O., June 6-10, 1899, at which the governor of the State and the mayor of the city delivered addresses of welcome. The president's address was upon *Our National Body; Its Purposes and Destiny*. Tuberculosis and kindred topics were discussed. The report of the treasurer showed the association to be financially in a prosperous condition. It was decided that there be no permanent secretary, but that the editor of the *Journal* perform a secretary's duties; provision was made for an assistant secretary. Officers elected: President, W. W. Kern, M.D., Philadelphia, Pa.; secretary, George H. Simmons, M.D., Chicago, Ill.

MEDICAL ASSOCIATION, BRITISH, held its sixty-seventh annual meeting at Portsmouth, England, August 1-4, 1899. Important papers were read by Professor Ogston on the *Medical Services of the Army and Navy*, in which he proposed certain reforms in the naval and military medical departments; and by Dr. G. Nuttall on the *Part Played by Insects, etc., in the Propagation of Infectious Diseases*. John Ward Cousins, M.D., F.R.S.C., was elected president.

MEDICAL PROGRESS IN 1899. Great activity was noticeable during the year in the department of bacteriology and materia medica. The investigation of the cause of contagious diseases, due in all probability to germs yet unidentified, was pushed by eager and able bacteriologists in many laboratories. (See BACTERIOLOGY; PLAGUE; SCARLET FEVER; SMALLPOX; SERUM AND SERUM THERAPY; YELLOW FEVER.) The materia medica of the clinician was enriched by several new or newly approved drugs. (See the articles ACOIN; ARECOLIN; ASTEROL; CHLORETON; OXYCAMPHOR; SUPRARENAL EXTRACT; THERMOL, and Kalagua, in article TUBERCULOSIS, paragraph Treatment.) The sufferings of many ill or wounded human beings were limited in one direction by an improved method of rendering the body insensible to pain. (See ANÆSTHESIA.) Widespread interest in tuberculosis and in the means of preventing its spread was aroused, and in many countries a veritable crusade against the disease was started. The need of special hospitals and of State care for the unfortunate victims of this scourge was realized in many localities, and societies for the study of its propagation and of means to limit its spread sprung into existence. (See TUBERCULOSIS.) The plague pursued its fatal course in its chosen home, India, and also spread dismay and disaster in China, Arabia, Japan, and Madagascar, and in a few other countries. Its appearance in New York harbor and in Honolulu awakened the liveliest concern among students of sanitary science and health officers. (See PLAGUE.) A very interesting and valuable series of experiments in the cure of disease with light is being carried on by Professor Finsen and his associates. This is the first time popular attention has been drawn to solar therapeutics since the absurd blue-glass craze in 1877. (See PHOTOTHERAPY.) By far the most important achievement of the year in medicine was the establishment of the fact that malarial fever is transmitted to man, and from man to man, by mosquitoes. (See MALARIAL FEVER and MOSQUITOES.) The rôle of insects in the propagation of disease is being thoroughly studied, and many hitherto inexplicable cases of appar-

ently sporadic disease are traced to their source. (See INSECTS AND THE PROPAGATION OF DISEASE.) Other medical facts and news are found under their proper captions.

MEDICO-PSYCHOLOGICAL ASSOCIATION, AMERICAN, founded in 1844 as the Association of Medical Superintendents of American Institutions for the Insane. The object of the society is the study of all subjects pertaining to mental disease. It had in 1899 a membership of 354. Meetings are held and proceedings are published annually. Secretary, C. B. Burr, Flint, Mich.

MEDILL, JOSEPH, editor and proprietor of the *Chicago Tribune*, died at San Antonio, Tex., March 16, 1899. He was born near St. John, New Brunswick, April 6, 1823. When eight years old he removed with his parents to Massillon, O.; studied law at Canton, and was admitted to practice in 1846. In 1849, however, he entered journalism, taking charge of the *Coshocton Republican*, a Free-Soil paper. About two years later he established the *Cleveland Forest City*, a Whig organ. He was a supporter of General Winfield Scott, but rejected the Baltimore platform, which endorsed the Fugitive Slave law of 1850. He effected in 1852 a union of his paper with the *Free Democrat*, the new paper being the *Cleveland Leader*. In this he urged the disbanding of the Whig party and the formation of a party distinctly opposed to the extension of slavery; and in 1854 he was one of the twelve men who met in Cleveland to organize the new Republican party in Ohio. The following year, with two partners, he bought the *Chicago Tribune*, which immediately became a radical antislavery paper, and soon won a position of influence. Mr. Medill supported John C. Fremont in 1856 and Abraham Lincoln for the senatorship in 1858 and for the Presidency in 1860. He supported the war administration, but opposed President Johnson's plan of reconstruction. He favored the election of Grant in 1868. Mr. Medill was a prominent member of the Illinois constitutional convention in 1870. The following year President Grant appointed him on the first board of civil service commissioners; in 1872 he was elected mayor of Chicago. He bought a controlling interest in the *Tribune* in 1874, and became its editor-in-chief.

MÉLINE, FÉLIX JULES, French statesman, was defeated for the presidency of the republic, after the death of M. Faure, by M. Émile Loubet on February 18, 1899, by a vote of 483 to 279. M. Méline was born at Remiremont, in the Vosges, May 20, 1838. He became a lawyer in Paris, entered the chamber of deputies in 1872, and four years later was appointed under-secretary of state for justice. In 1883 he entered the cabinet of M. Jules Ferry as minister of agriculture, and in 1888 became president of the chamber. Subsequently he was chairman of the tariff commission, and expressed himself greatly in favor of the protective policy. After the fall of the ministry of M. Bourgeois he formed on April 28, 1896, a conciliation cabinet, which stood until June 15, 1898. During the Dreyfus affair M. Méline favored the anti-revisionists. He belongs to the Moderate Republican party.

MENELEK II, Emperor of Abyssinia and King of Shoa, was born in 1843, and in 1889 succeeded Johannes II. In the first year of his reign he concluded a treaty with Humbert, King of Italy, which placed Abyssinia under Italian protection. This "Ucciali Treaty" has occasioned much trouble, the advances of the Italians from Erythrea resulting in a war in 1895, in which Menelek was victorious. The Italian government, however, would not accept Menelek's demands for modifications of the Ucciali treaty and the retirement of the Italians, and in 1896 the latter were again defeated by Menelek at Adowa. Elated at having won a signal victory over a European nation, Menelek established diplomatic relations with France, Russia, and Great Britain. In the early part of 1899 Menelek was occupied in subduing the revolt of Ras Mangascia, governor of Tigré, who made formal submission to the Negus on February 18. Menelek claims to be a direct descendant of Solomon and the Queen of Sheba. He is an able and energetic ruler, and personally administers the government of his kingdom, in which he has promoted the advance of civilization.

MENINGITIS, CEREBRO-SPINAL. See VITAL STATISTICS.

MERCIER, AUGUSTE, a French general and former minister of war, and one of Dreyfus's chief accusers, was born in Arras, December 8, 1833. He was educated at the École Polytechnique, entered the artillery, and passed various grades, reaching that of general of division in 1889. His bravery at the siege of Puebla, Mexico, won him the decoration of the Legion of Honor. He served in the Franco-Prussian war, and was taken prisoner after the surrender of Metz, and after the war he took part in the battles of the Communards. For a while he commanded the artillery at Angoulême. Called by M. de Freycinet to the war office in 1889, he was conspicuous at Beauvais. In 1893 he commanded the eighteenth army corps at Bordeaux, and in that year was offered the post of minister of war, which office he held during the time of the Dupuy ministry. In 1895 he was given command of the fourth army corps stationed at Le Mans. He insisted on Dreyfus's guilt and summoned him before the

Council of War, which condemned him to life-long penal servitude (December 22, 1894). At the trial at Rennes in 1899 he still maintained his opinion. See FRANCE (paragraphs on History).

MERCURY. See QUICKSILVER.

MEREDITH, EDMUND ALLEN, LL.D., a Canadian leader of the prison reform movement and a brother to Sir W. Meredith, the late chief justice of Quebec, died in Toronto, Ontario, January 12, 1899. He was born at Ardrea, County Tyrone, Ireland, October 7, 1817; was graduated at Trinity College, Toronto, 1837, and a few years later was admitted to the bar. He was made principal of McGill College, Montreal, in 1846, but he resigned the following year to become assistant provincial secretary of Upper Canada. He was under-secretary of state for the provinces after the confederation of 1867, and in 1873 was made first deputy minister of the interior; he retired in 1878. Dr. Meredith accomplished his most important work during his connection with the Canadian Prison Board, for which he served as inspector and later as chairman. He advocated the complete separation of prisoners in common jails, introduced the "crofter system" in penitentiaries, opposed the sending of children under fourteen years of age to county prisons, and effected various reforms in Canadian prisons and asylums. He published several pamphlets on social and literary subjects.

MERGENTHALER, OTTMAR, inventor of the linotype typesetting machine, died in Baltimore, Md., October 28, 1899. He was born in Würtemberg, Germany, May 10, 1854. In early life he came to the United States, found employment in the clock-making trade and afterward entered the electrical business. He then studied general machinery, and, though never a printer, began experiments to the end of making a machine to set type. These experiments continued for ten years, and finally were successful in 1886. Since then the linotype machine has been improved, but it is not greatly different from the one built by the inventor. This machine has revolutionized the printing trade, and is used in almost all large book-publishing and newspaper offices. From the invention large profits accrued to Mergenthaler.

MERRIAM, WILLIAM RUSH, ex-governor of Minnesota, was appointed by President McKinley on March 4, 1899, director of the Twelfth Census. Mr. Merriam was born at Wadham's Mills, Essex County, N. Y., in 1849; his family moved in 1861 to St. Paul, Minn., where he has since resided. After his graduation from Racine (Wis.) College in 1871, he began a clerkship in the First National Bank of St. Paul; two years later, when the Merchants' National Bank was organized, he was made its first cashier, and in 1880 was elected vice-president and in 1882 was advanced to the presidency, which position he still holds. In 1882 and 1886 Mr. Merriam was elected as a Republican to the State legislature, and during his second term was speaker. He was elected in 1888 governor of Minnesota, and was re-elected for the ensuing term. He has been active in educational and charitable work, and is regarded as a man of much business ability. The assistant director of the Twelfth Census is Mr. Frederick H. Wines, of Illinois.

MERRILL, SAMUEL, former governor of Iowa, died August 31, 1899. He was born at Turner, Me., August 7, 1822; was educated in the common schools, and in 1847 began business in New Hampshire. He entered politics and was twice elected to the legislature. In 1856 he removed to Iowa, and four years later was elected to the legislature in that State. In 1862 he entered the Union volunteer service, and received a colonel's commission. He was compelled to retire from the army on account of a severe wound received at Black River Bridge. Merrill was governor of Iowa from 1868 to 1872.

MERTEL, Cardinal TEODOLFO, died in Rome, Italy, July 11, 1899, at the age of 92 years. In 1858 he was raised to the Cardinalate, and at the time of his death was Vice-Chancellor of the Holy Roman Church.

METAMORPHIC ROCKS. Sederholm shows that a series of metamorphic, schistose, and crystalline rocks were originally true normal sediments laid down either in water or deposited by wind, and interbedded with lava flows. The region is in southwestern Finland, and the paper is a most important contribution to metamorphism, for it is often difficult to prove the sedimentary origin of such altered rocks.

METEORITES. Among the new discoveries of the past year may be mentioned six masses aggregating 100 hundred pounds from Choctaw and Sumter Counties, Ala., and another from Cherokee County, N. C. One specimen which fell at Allegan, Mich., on July 12, 1899, is found to consist mostly of olivine and enstatite, with particles of metallic iron scattered through it. A mass of meteoric iron of about three pounds weight has come from a place near Ireddell, Bosque County, Tex. H. L. Ward describes a meteorite from Ness County, Kan., which

weighs 417 pounds. Cohen describes a number of meteoric irons, and gives analyses of them.

METEOROLOGY. The survey of the clouds undertaken at the suggestion of the international cloud commission has obtained many data which are of aid in the construction of a sound theory of the history of cyclones and anticyclones.

The report of the meteorological department of India for 1898-99 shows 174 stations. It is noted that the reports of the mountain stations cannot be used to any great extent for making up the prophecies for the lower lying regions, as local conditions affect the weather at these points. The report of the Cape of Good Hope commission shows that it was established in 1861, and that there are now in operation 2 first order stations, 54 second order, 17 thermometric, and 370 rainfall stations. Some of these are located in Orange Free State, the Transvaal, and other outside points.

M. Mamson has made an attempt to formulate the laws of climatic evolution, and comes to the conclusion that the present zonal distribution of climate is gradually increasing in temperature and extent; that there had been a gradual rise in temperature since the culmination of the ice age, in tropical latitudes; that preceding climates were independent of latitude, and were controlled by the internal or planetary heat of the earth; and that while the ice age was unique in the climatic history of the earth, still, local glaciations could have occurred during any period and in any latitude provided there were land areas sufficiently elevated.

Bilwiler believes that five varieties of winds should be classed as foehn winds—namely, those on the northern slopes of the northern valleys of the Alps; those on the southern side of the Alps, and known as the north foehn; a third class is one that takes place on both the northern and southern side of the Alps at the same time; a wind caused by the local hastening of a slowly down-setting current in the centre of an anticyclone may form the fourth class, and the fifth is the dry foehn-like wind which has been noticed blowing out of winter anticyclones.

In *Bulletin 26* of the Weather Bureau is discussed the electrification of the atmosphere, the loss of life and property by lightning, and the character of soil and vegetation as influencing lightning strokes.

Clayton, in studying weather periodicities, shows that there is a small range in the frequency of thunderstorms in the United States, the maximum being a few days before the greatest northern declination of the moon. He also notes that when the mean daily departures from the normal temperatures at the Blue Hill observatory from October, 1898, to February, 1899, are plotted, the minimum temperatures of October, December, January, and February occurred very near the times of the new moon.

It has been found that by careful observation of the amount of precipitation in the different watersheds of the Great Lakes and the manner in which the snows melt, it is possible to indicate approximately the level of the lakes. These inferences are, however, contingent on the maintenance of a constant cross-section and slope of the connecting channels.

Kite-balloon observations were carried on in France during the year 1899. At the observatory at Trappes altitudes of 3940, 3590, and 3300 metres were reached on the 14th and 15th of June, and the 3d of July. The kite meteorographs showed that in anticyclones the rate of decrease of the upper temperature becomes slower at a distance of a few hundred metres above the ground, and even inversions of temperature are at times noted. In cyclonic areas the decrease in temperature is more rapid. The wind velocity in fair weather and with high temperature often decreases with the altitude up to between 1500 and 3000 metres. On cloudy days, on the other hand, and with low pressure, the velocity tends to increase with the altitude. Of over 100 ascents made with *ballon-sondes*, 7 reached a height of over 14,000 metres, 24 higher than 13,000 metres, and 53 attained 9000 metres. The results obtained show that there was a much greater variation in temperature at high altitudes than was formerly supposed, and that annual variation occurred up to 10,000 metres, a maximum being reached toward the end of summer and a minimum toward the end of winter.

Professor Woodward, from his investigations of the physics of the atmosphere, states that the atmosphere extends at the equator 26,000 miles beyond the earth, and 17,000 at the poles. He also shows that the prevalent notion as to the weight of the atmosphere—namely, that it has the same weight as a shell of mercury 30 inches thick surrounding the earth, is erroneous, and he allows the mass of the atmosphere to range between 1-1200 and 1-10,000,000 of the mass of the earth.

Among the new text-books are *Grundlinien der maritimen Meteorologie*, by W. Koppen.

METEOROLOGY, ANCIENT DOCUMENTS ON. See ASTRONOMICAL PROGRESS.

METEORS, THE NOVEMBER. See ASTRONOMICAL PROGRESS.

METHODIST CHURCH, FREE, organized in 1860, has headquarters at Chicago; reports progress for 1899. A decision in a will contest in favor of the college at Greenville, Ind., which is under the denomination, will give that institution real estate in Shelby County, Ill., but leaves the college in debt as a result of the lawsuit. The latest report gives this sect 36 conferences, 500 ministers, and about 30,000 communicants.

METHODIST EPISCOPAL CHURCH. This church stands first in point of numbers of communicants among the Protestant churches of the United States. The year 1899 was one of prosperity in all things except the number of church members. The missionary society received more than ever before, a sum amounting to \$1,376,000, and large subscriptions have been received for the Twentieth Century Thank Offering, which is expected to reach \$20,000,000. Missionary work in all parts of the globe was pushed with gratifying results. In 1899, in the 17 Methodist denominations, there were 36,424 ministers, 53,023 churches, and 5,809,516 communicants. The latest report (1899) of the United States Commissioner of Education shows the Methodists to have 85 institutions of learning, with 873 professors; 8816 students, and endowment funds aggregating \$10,743,139. The next quadrennial conference of the Methodist Episcopal Church will be held May 2, 1900. There are reported 17 bishops of the church in the United States, a missionary bishop for India, and two missionary bishops for Africa.

METHODIST EPISCOPAL CHURCH, SOUTH. This division of the Methodist Episcopal Church reports for 1899 a prosperous year, without, however, any increase in church members, there being 5923 ministers, 14,160 churches, and 1,456,272 communicants, the last figure representing a loss of about 2000 church members. A large portion of the Twentieth Century Thank Offering of \$1,500,000 has already been subscribed. The next general conference will be held in 1902. The denomination has 11 bishops.

METHODIST PROTESTANT CHURCH, founded 1828, reports no great growth during the last four years. The number of ministers in 1899 was 1494, with 2352 churches and 179,507 communicants. The next general conference will meet at Atlantic City in May, 1900. Missions are carried on in Japan and China. The latest report of the United States Commissioner of Education shows the Methodist Protestant Church to have 3 institutions of learning, with 38 professors, 257 students, and endowment funds of \$50,000.

METHUEN, Third Baron, PAUL SANFORD METHUEN, major-general in the British army, was prominent after the outbreak of the Boer war in the fall of 1899 as the commander of the Kimberley relief column. Advancing from the south toward Kimberley, he defeated the Boers at Belmont, northern Cape Colony, on November 23, and two days later, at Gras Pan, he carried the Boer position at the point of the bayonet. On the 28th of the month he again attacked the enemy, who were strongly entrenched at the Modder River, and though the result was a victory for the English, General Methuen described the battle as "one of the hardest and most trying fights in the annals of the British army." The total British losses were reported as 471 officers and men. It was reported that Methuen himself was wounded. Reinforcements arrived on December 2, and on the 11th the Boers were again attacked at Magersfontein, north of the Modder. The British were repulsed after fierce fighting, sustaining a reported loss of 832 officers and men, including among the killed Major-General A. W. Wauchope and the Marquis of Worcester. After this crushing defeat General Methuen did little during the remaining weeks of the year. On December 28 his position was shelled by the Boers. See TRANSVAAL (paragraphs on History).

Lord Methuen was born September 1, 1845, and in 1864 became a lieutenant in the Scots Guards; in 1873 he served in the Gold Coast, and the next year was a brigademajor for the home army district. From 1877 to 1881 he was military attaché at Berlin, and from the latter year to 1884 served as assistant adjutant-general and assistant quartermaster-general for the home district, while in 1882 he was commandant at the headquarters in Egypt. In 1884-85 he commanded the field force in Bechuanaland, served in 1888 as deputy adjutant-general in South Africa, and became a major-general in 1890. He was in command of the home district from 1892 to 1897, when he was succeeded by Major-General H. Trotter. General Methuen has the following titles: Companion of the Bath, Companion of St. Michael and St. George, and Knight Commander of the Royal Victorian Order.

METROPOLITAN MUSEUM OF ART, organized in 1870, occupies a large building in Central Park, New York City, near Fifth Avenue and Eighty-second Street. The report of the trustees for the year 1899 shows that the museum incurred no debt, and that the expenses were \$128,155. The number of visitors exceeded that of the previous year by 28,662, the total number recorded being 540,060. The number

of members was 1973, against 1865 in 1898. Work on the new wing of the building was pushed forward during the summer, but was later delayed by a strike of the workmen employed. The number of permits issued to copyists in the departments of painting and sculpture and in the cast department was 1117. The year 1899 was a notable one for gifts received, among the more important being the sum of \$20,000, the income of which is to be used for the purchase of works of art; a silver vase presented by Mr. R. M. Grinnell; another, known as the "Magnolia vase," a bequest of \$25,000 from Charles E. Tilford; Turner's "Grand Canal at Venice," bequeathed by the late Cornelius Vanderbilt, and numerous other paintings, pieces of statuary, numismatic collections, and other objects of art. The Jacob H. Lazarus scholarship, amounting to \$1000, was awarded to Mr. Andrew T. Schwartz. A course of lectures on art was given in connection with Columbia University. The museum has a library of 5669 bound volumes, 156 portfolios, and 553 unbound and miscellaneous volumes. President, Henry G. Marquand; secretary, L. P. di Cesnola.

MEXBOROUGH, Fourth Earl of, JOHN CHARLES GEORGE SAVILE, M.A., died August 17, 1899. Born June 4, 1810, and educated at Trinity College, Cambridge, he sat in Parliament as a Conservative in 1831 for Gatton, and from 1835 to 1847 for Pontefract. He succeeded his father to the title in 1860. His heir is the Viscount Pollington, born in 1843.

MEXICO, a Spanish-American republic, touching the United States on the north and Guatemala and British Honduras on the south. The capital is Mexico.

Area and Population.—The 27 states, 2 territories and federal district comprising the country are classified as Atlantic states, Inland states, and Pacific states. The area of the first-named class is 124,692 square miles, and the population, according to the census of 1895, 1,594,848, making the average number of inhabitants a square mile 12.7. The inland states have an area of 316,125 square miles; population (1895), 6,704,073; inhabitants to the square mile, 21.2. The area of the Pacific states is 324,768; the population (1895), 4,321,038; inhabitants to the square mile, 13.3. The total area accordingly, with a few small islands, is 767,005 square miles, the total population (1895) 12,619,959, and the average population a square mile 16.4. Of the total population about one-fifth are whites, something more than two-fifths mestizos, and the remainder Indians; of the last two classes only a small proportion are civilized. Returns of the census of 1895 give the following populations for the principal cities: Mexico, 344,377; Puebla, 91,917; Leon, 90,978; Vera Cruz, 88,993; Guadalajara, 83,870; San Luis Potosi, 69,676; Monterey, 56,855; Pachuca, 52,189; Durango, 42,165; Zacatecas, 40,026; Merida, 36,720; Queretaro, 32,790; Oaxaca, 32,641; Morelia, 32,287; Aguascalientes, 31,619; San Juan Bautista, 27,036; Toluca, 23,648; Colima, 19,305; Jalapa, 18,173. Mexico is traversed by lofty mountains, many of which are snow capped. See GLACIERS.

Government.—The chief executive authority is vested by the constitution in a president, chosen by an electoral college for a term of four years, and assisted in his official duties by a cabinet, the members of which direct the following departments: The interior, foreign affairs, finance, war and marine, justice and public instruction, industry, colonization, and fomento, communications and public works. In case of disability on the part of the president, the congress elects an acting president. The president is General Porfirio Diaz, who was first elected in 1876, and whose fifth term will end November 30, 1900. The legislative power devolves upon a congress of two houses, a senate and a house of representatives, the former consisting of 56 members, two for each state and the federal district, the latter consisting of about 227 members, each nominally representing about 40,000 inhabitants. Both senators and representatives are elected by the direct suffrage of "all respectable male adults." The several states have their own constitutions and statutes, and elect their own governors and legislatures. Interstate customs duties are not allowed. Besides lower courts, civil and criminal, there are district courts with 32 judges, circuit courts with three judges, and a supreme court with 15 judges.

Army and Navy.—The army in 1897 consisted of 2068 officers and 30,075 men, about two-thirds being infantry. With reserves the war footing is reported at 151,500, while all able-bodied men between the twentieth and fiftieth years are liable for military service. The Mexican navy is small, antiquated, and of little value; it consists of two unarmored gunboats, two despatch boats, and the *Zaragosa*, a steel training cruiser of 1200 tons. For these vessels there is a complement of about 90 officers and 500 men. It is stated that five first-class torpedo boats and four gunboats are projected or building.

Finance.—Taxes and customs duties constitute the chief items of revenue, representing, respectively, about 45 per cent. and 40 per cent. of the whole. Budget estimates of revenues and expenditures in Mexican dollars have been as follows for fiscal years:

	1897.	1898.	1899.	1900.
Revenue.....	47,220,000	50,325,900	51,659,500	54,913,000
Expenditure.....	47,554,926	50,410,312	52,089,485	54,886,756

In his message of September 16, 1899, President Diaz stated that the actual ordinary revenue for the fiscal year exceeded \$59,000,000, while the budget estimate for the period had been \$51,659,500; the greater part of the increase was due to larger receipts from import customs and stamp taxation. In the budget for 1900 \$24,192,000 were expected from import and export duties and \$22,411,000 from internal taxation; among the expenditures, \$21,021,042 were allotted for the public debt and pensions and \$12,164,355 for war and marine. The aggregate revenues and expenditures of the several states in 1896 amounted, respectively, to \$14,971,057 and \$14,472,906 (Mexican currency), and of the several municipalities, \$11,779,976 and \$11,670,784, respectively. At the beginning of 1898 the external federal debt was \$105,374,689 (United States gold), mostly at 6 per cent. The internal debt, mostly at 3 per cent. and 5 per cent., including the floating debt of about \$1,473,000, amounted in 1897 to about \$88,400,000 (Mexican currency).

The nominal value of the Mexican coinage of silver and gold has been for fiscal years:

	1895-96.	1896-97.	1897-98.
Silver.....	\$22,634,788	\$19,296,009	\$21,427,057
Gold.....	565,786	453,474	459,219

The standard of value is silver, the silver dollar, or peso, being worth in United States currency on October 1, 1899, \$0.474. Except bank-notes there is no paper currency.

Conversion of the Foreign Debt.—In the summer of 1899 measures were taken for the conversion of the external debt. An article in the *Bulletin* of the Bureau of American Republics for July, 1899, stated that a formal contract had been signed "whereby Messrs. J. P. Morgan and Company, in New York; Mr. S. Bleichrener, the Deutsche Bank, the Dresdner Bank, in Berlin, and Messrs. J. S. Morgan and Company, in London, undertake the conversion of the entire foreign debt of the republic of Mexico—namely, 6 per cent. loans of 1888, 1890, and 1893, and the 5 per cent. Tehuantepec loan heretofore issued in London and Berlin, into a 5 per cent. consolidated external gold loan due within 45 years at par by semiannual drawings, which may be increased after the year 1909, the first one to take place in June, 1900, or by purchase in the market if same can be made under par. Principal and interest of the bonds payable in gold in Germany, London, Amsterdam, Berlin, or New York, in the last city at the rate of \$4.85 per pound sterling. Bonds to be issued in denominations of from £20 to £1000 at the option of the subscriber. The bonds are secured by a special hypothecation of 62 per cent. of the import and export duties of the republic of Mexico, such duties having amounted, as officially stated by the financial agent of the Mexican government in the years 1897-98, to \$22,582,437 silver, of which 62 per cent. would amount to over \$14,000,000 silver, and in 1898-99 (eleven months only) \$24,709,076, of which 62 per cent. would amount to over \$15,000,000. The annual interest and sinking fund requirement for the entire external debt of Mexico, as consolidated by the new issue of bonds, is about \$6,200,000 gold, or at present exchange about \$13,000,000 of silver, the total amount of the issue being £22,700,000, of which £5,000,000 are reserved for allotment in the United States and in Holland. The issue in England and Germany at the present time will be limited in favor of holders of the existing bonds, who will be given the right of conversion."

Industries.—Agriculture and mining constitute the principal industries. Although the climate and soil are suited to a large number of products, and the government encourages agricultural pursuits, still farming methods in general are in a backward condition. Business, however, in 1899, as well as the general financial condition of the country, was said to be good. The mineral wealth of Mexico is great, there being large deposits of gold, silver, iron, lead, copper, mercury, cobalt, tin, zinc, sulphur, antimony, coal, and petroleum; some of these, particularly silver and gold, have for many years been in process of exploitation, while others, as, for example, coal, it has not yet been profitable to mine in any considerable quantities. This is due largely to difficulties of transportation. Of the mining enterprises, about one-third belong to foreigners and the remainder to Mexicans. In 1898 Mexico took the first place among the silver-producing countries of the world. In 1899 there were in Mexico 8299 mining properties, divided among 20 classes, as follows: Silver, 4024; gold and silver, 1675; silver and lead, 1035; gold, 828; copper, 173; silver and copper, 156; iron, 99; mercury, 95; gold and copper, 54; silver and iron, 42; copper and iron, 22; sulphur, 20; lead, 19; antimony, 19; opal, 13; tin, 8; lead and iron, 7; copper and lead, 6; silver and magnesia, 2; rock salt, 2.

The values in Mexican currency of some of the more important products for 1897 were: Corn, \$87,233,671; wheat, \$18,680,475; various woods, \$17,860,128; sugar-cane, \$15,690,029; beans, \$12,692,336; cotton, \$12,026,010; coffee, \$8,282,038; henequin, \$7,394,519; barley, \$5,503,243; chick-peas, \$3,816,734; tobacco, \$2,985,924; ixtle, \$2,793,775; dye plants, \$2,378,063; rice, \$2,254,462; peas, \$1,685,779; gums and resins, \$690,922; white beans, \$668,475; cacao, \$565,808. The value in round numbers of all agricultural products raised in 1897 was reported to be \$261,500,000. One of the products of first importance is the henequin crop of Yucatan.

For the size of the country and the suitability of its soil and climate, Mexico's sugar output is very small, amounting annually to 70,000 to 90,000 tons, all of which is used in local consumption. One reason advanced for the meagre output is the fact that for the most part the methods of Mexican sugar planters are crude and antiquated. Manufacturing industries are few, and are concerned chiefly with sugar, cotton, and brandy. There are metallurgical works of importance at Durango, San Luis Potosi, and Monterey.

Commerce and Shipping.—The leading exports include silver, coffee, henequin, gold, woods, cattle, hides and skins, and tobacco; among the principal imports are cotton and woollen textiles, iron and machinery, provisions, spirits, and other alcoholic beverages. The following figures, representing Mexican currency, except for the imports, the values of which are given in gold, are for the foreign trade during fiscal years:

	Total Imports.	Exports.		Total Exports.
		Merchandise.	Precious Metals.	
1897.....	\$42,204,095	\$45,164,417	\$66,182,077	\$111,346,494
1898.....	43,603,492	53,930,417	75,042,332	128,972,749
1899.....	50,869,194	138,478,137

For the same years the values of the chief exports were as follows:

	Silver.	Coffee.	Henequin.	Gold.
1897.....	\$57,396,947	\$9,876,532	\$7,431,852	\$5,858,366
1898.....	65,074,260	10,649,119	11,564,519	6,364,308
1899.....	66,431,541	7,936,908	18,711,325	8,843,081
	Woods.	Cattle.	Hides and Skins.	Tobacco.
1897.....	\$3,518,950	\$3,575,476	\$2,903,229	\$2,720,091
1898.....	3,597,069	4,507,327	3,590,477	4,489,768
1899.....	4,918,572	3,646,915

The figures given above for silver include, besides the ordinary export, coin and ore. For 1899 also the lead and copper exports were valued in Mexican currency at \$3,786,144 and \$4,135,613, respectively. The foreign commerce with the United States far exceeds that with all other countries combined. The gold value of merchandise exported to the United States in 1898 was \$21,670,775, a gain over the four previous years, though less than the amounts for 1892 and 1893, which were, respectively, \$29,413,875 and \$32,372,998. The value in Mexican currency of the entire export to the United States in the fiscal year 1897 was \$86,742,951 (gold value, about \$41,116,158); in 1898, \$94,974,616 (gold value, about \$45,017,968); in 1899, \$103,553,486 (gold value, about \$49,084,352). Exports to other countries of trade importance for the last two fiscal years were valued in Mexican currency as follows:

	Great Britain.	France.	Germany.	Belgium.	Spain.
1898.....	\$14,775,638	\$5,320,016	\$6,995,733	\$1,556,090	\$1,231,342
1899.....	14,095,178	6,252,293	4,020,307	2,577,688	1,172,948

The gold value of imports from the United States to Mexico in the fiscal year 1898 was \$21,490,604; in 1899, \$24,164,687. The gold value of imports from the other important commercial countries was:

	Great Britain.	France.	Germany.	Belgium.	Spain.
1898.....	\$8,104,697	\$5,435,698	\$4,781,821	\$590,196	\$2,039,132
1899.....	9,211,221	5,917,167	5,677,925	707,408	2,969,936

There entered in the foreign and coasting trade in 1898 at the ports of the republic 10,527 vessels, aggregating 4,085,200 tons, and cleared, 10,452 vessels, aggregating 3,880,940 tons. In the same year the merchant marine consisted of 68 vessels, 17 steam and 51 sail, of 4081 tons and 9317 tons respectively.

Communications.—The length of railway lines in 1898 was reported to be 7750 miles; in 1899, according to a statement in the *Bulletin* of the Bureau of American Republics for December, the railways aggregated 13,369 kilometres (8307 miles).

In 1898 there were 1688 post-offices, 127 miles of tramway, 7459 miles of telephone lines, and 42,150 miles of telegraph lines, of which 28,220 miles belonged to the federal government. In the fall of 1899 there were reported 68,250 kilometres (42,408 miles), and 2457 post-offices.

Religion and Education.—The principle of religious toleration prevails in Mexico, and there is no state church, but Roman Catholicism is the preponderant faith. The proportion of Catholics to Protestants in the municipality of Mexico is more than 100 to 1. Primary instruction in most of the states is gratuitous and nominally compulsory. Education, however, as in most Latin-American countries, is in a very backward condition; in the capital in 1890 there were over 175,000 persons who could neither read nor write. There are schools for higher education and professional instruction. Primary instruction is directed by the states, the municipalities, the federal government, and various private organizations. The total number of schools in 1896 was reported to be 11,512, with an enrolment of 767,942, and an average attendance of 490,746, of which over three-fifths were boys. In the same year there were 102 public libraries, besides the national library of 159,000 volumes, and 531 newspapers, of which all but 15 were in Spanish.

The Yaqui Rebellion.—In July, 1899, the Yaqui Indians of the state of Sonora, in northwestern Mexico, began a formidable uprising against the governmental authority. Accounts both of the causes of the rebellion and of its progress during 1899 were meagre, and seemingly not of great reliability. The chief cause, however, appeared to be the encroachments of Mexicans on the Indian lands. Several severe engagements took place between government troops and the Indians in August and September, and intermittent fighting occurred up to the end of the year, at which time the Indians were still unsubdued. The casualties among the latter, however, were said to be many. Their fighting force was estimated to number about 5000, and at the outbreak of the trouble it was thought that their courage, combined with the very wild and mountainous nature of the country, would enable them to wage for some time a successful guerrilla warfare against the government. The Mexican forces were commanded by General Torres. The Yaquis, who probably number some 15,000 or more, were once a large and powerful tribe, and extended far within the present territory of the United States. They are a half-civilized people, being considerably further advanced than the neighboring tribes, and engage chiefly in hunting, mining, and agriculture. A spirit of independence is strong among them, and they have repeatedly made determined revolts against both Spanish and Mexican authority. As late as 1897 peace was concluded between them and the Mexican government, terminating an insurrection.

MIASKOWSKI, AUGUST VON, professor of political economy in Leipsic University, Germany, and an authority on political economy and international law, died November 23, 1899. He was born at Pernau, in Livonia, January 26, 1838. He studied law and political science at Dorpat, Heidelberg, and Berlin, and in 1873 was appointed as a lecturer at the University of Jena. He subsequently held professorships in the universities of Basel, Hohenheim, Breslau, and Vienna, and in 1891 was called to Leipsic, where his lectures attracted many students. Among his writings are: *Die Gebundenheit des Grundbesitzes und des Familienhauhalts*, 1873; *Isaak Iselin*, 1875; *Die Verfassung der Land-, Alpen-, und Forstwirtschaft der deutschen Schweiz*, 1878; *Die schweizerische Allmend*, 1879; *Das Erbrecht und die Grundigenschaftsverhältnisse im deutschen Reich*, 1882-84; *Agrarpolitische Zeit- und Streitfragen*, 1889.

MICA. The United States supply of mica in 1898 amounted to 124,520 pounds of sheet mica, valued at \$103,534. The States of North Carolina, New Hampshire, and South Dakota continue to be the sources of supply. The imports of mica, both crude and trimmed, amounted to 956,497 pounds, valued at \$150,082. The twentieth annual report of the United States Geological Survey contains an important description of the mica deposits of the United States by J. A. Holmes.

MICHAEL ALEXANDROVITCH, Czarevitch of Russia, who on the death of the Grand Duke George (July 10, 1899) became heir to the throne, was born in St. Petersburg, December 4, 1878. He was educated for the army, and is colonel of the One Hundred and Twenty-ninth Regiment of infantry. He is the Czar's only surviving brother.

MICHIE, Sir ARCHIBALD, K.C.M.G., was born in 1810 and died June 22, 1899. He studied law, became a barrister, Middle Temple, in 1838, and later was made a Queen's counsel in the bar of Victoria. He served as agent-general in England for Victoria, and in that colony as attorney-general and minister of justice.

MICHIGAN, a lake State of the United States, has an area of 58,915 square miles. The capital is Lansing. Michigan was admitted to the Union January 26, 1837.

Mineralogy.—During 1898 the State maintained the first rank as a producer of iron ore, and not only increased its output of 1897 by 1,259,383 long tons, but yielded 37.8 per cent. of the total production of the country. The output was 7,192,376 long tons of red hematite (ranking first in this species) and 154,470 long tons of magnetite (ranking fourth), a total of 7,346,846 tons, valued at \$10,368,807. In coal, the State had the largest output in its history—315,722 short tons, valued at \$462,711, an increase of 92,130 tons over the product of 1897, which was the largest of all previous years. There were 17 mines in operation during the year, and 8 more were opened near its close. In copper, the Lake Superior region had an output of 158,491,703 pounds, an increase in a year of 13,209,644 pounds, and its largest on record. The State was exceeded by Montana only in production. During 1899 all the mining camps felt the effects of the great copper boom. A number of abandoned and closed mines were reopened, and many of the largest interests sank new shafts and increased their stamp-mill facilities. In August the famous Calumet and Hecla plant was treating an average of upward of 4000 tons of rock daily, using 22 stamps, and was building a new mill of 6 stamps to treat the rock from the amygdaloid mine then being opened on the property. Shaft No. 12 of this plant was yielding rock running as high as 80 per cent. refined copper; so rich, in fact, that the rock was shipped direct to the smelter without being run through the stamps. The payment of the 113th dividend of the Calumet and Hecla corporation in December, 1899, brought the total dividends up to \$65,850,000 in a period of thirty-three years, an annual average of nearly \$2,000,000. Despite the flurry in copper stocks, the output of the mines in the first half of 1899 was only 1.3 per cent. above that of the previous corresponding period, and the second half made but little change in the relative proportions. In quarrying, the State had an output of sandstone valued at \$222,376, and of limestone valued at \$271,523.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$4,643,795. There were 149 manufacturers of tobacco and 1233 of cigars, and the combined output was 134,799,726 cigars, 12,056,730 cigarettes, 5,995,616 pounds of plug tobacco, 2,814,071 pounds of fine cut, 6,858,945 pounds of smoking, and 84,990 pounds of snuff. The production of fermented liquors was 804,430 barrels. In 1898 the salt product from 53 works was 5,263,564 barrels, valued at \$1,628,081, an increase in a year of 1,270,339 barrels, but not sufficient to enable the State to regain the primacy in rank lost to New York in 1893. The output of pig-iron was 147,640 long tons, and of the total product of limestone about two-thirds was burned into lime.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the ports of entry and delivery of Detroit, Huron, Michigan, Superior, and Grand Rapids aggregated in value \$5,092,068; exports, \$28,736,925, a decrease in a year of \$256,433 in imports and increase of \$3,434,074 in exports. The trade in gold and silver was: Imports at Detroit and Huron, \$17,795; exports at Detroit, \$2462, making the total foreign trade of the year \$33,849,250, a net increase of \$3,191,467.

Transportation.—The new railway construction during 1898 was 147.77 miles, and during 1899, 149.20 miles, giving the State a total mileage of 8098.17. During the season of 1898 (April-October) the total registered tonnage that passed through the St. Mary's Falls Canal was 16,426,472, the smallest since 1894. Freight aggregated 18,509,048 net tons, and included coal, 3,288,410 net tons; flour, 6,113,966 barrels; wheat, 36,505,272 bushels; other grain, 21,253,440 bushels; copper, 105,180 net tons; iron ore, 10,834,454 net tons, and lumber, 799,501,000 board measure feet.

Banks.—On October 31, 1899, there were 80 national banks in operation and 89 in liquidation. The active capital aggregated \$11,490,000; circulation, \$4,859,356; deposits, \$58,092,434, and reserve, \$17,068,949. The State banks, June 30, 1899, numbered 188, and had capital, \$12,215,040; deposits, \$93,825,170, and resources, \$114,943,348; and private banks, 43, with capital, \$615,800; deposits, \$3,239,942, and resources, \$4,049,326. The exchanges at the clearing houses at Detroit, Grand Rapids, and Kalamazoo in the year ending September 30, 1899, aggregated \$458,321,274, a net increase of \$53,333,753 in a year.

Education.—At the close of the school year 1897-98, the school population was 703,730; enrolment in the public schools, 496,025, and average daily attendance, 347,714. There were 15,673 teachers, 7885 buildings used as school-houses, and public school property valued at \$18,138,589. The revenue (1896-97) was \$6,452,571; expenditure, \$6,281,003, of which \$4,152,879 was for teachers' salaries. There were 282 public high schools, with 999 secondary teachers, 27,458 secondary students, and 4667 elementary pupils; 21 private secondary schools, with 103 secondary teachers, 1207 secondary students, and 3092 elementary pupils; 3 public normal schools, with 94 teachers and 2996 students in all departments; and 3 private ones, with 15 teachers and 861 students. Normal training was also given in 7 colleges and 62 public high schools. Eleven colleges for men and for both sexes reported 3 fellowships, 51 scholarships, 367 professors and instructors, 5394 students, 226,661

volumes in the libraries, valued at \$200,662; \$612,212 invested in scientific apparatus, \$2,333,704 in grounds and buildings, and \$1,609,983 in productive funds; \$649,061 in total income, and \$252,851 in benefactions. Under an act of the legislature the annual income of the University of Michigan is to be enlarged by upward of \$92,000 by increasing the tax for its support from one-sixth to one-fourth of a mill on each dollar of assessed valuation. The total registration of the university in October, 1899, was 3187, and the total number of persons in the faculty, 222. The city of Ann Arbor in 1899 gave the university ground for which it paid \$17,000 for a site for the new homœopathic hospital, and contracts were signed for the building, to cost \$48,670. In 1899 there were 808 periodicals, of which 67 were dailies, 628 weeklies, and 84 monthlies.

Finances.—The last fifth-year assessed valuations, in 1896, were: Real estate, \$805,553,976; personal property, \$140,455,965—total as assessed, \$946,009,941; total as equalized, \$1,105,100,000, a decrease from the equalized valuation in 1891 of \$24,900,000. On July 1, 1899, the bonded debt was \$500,000 in 1898 war-loan bonds, and \$10,992 in non-interest-bearing bonds that have never been presented for payment. What is known as the trust-fund debt was \$6,120,003 on the same date.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 2,385,000.

Elections, etc.—There were no State elections in Michigan, but the municipal elections on April 3 showed heavy Democratic gains in some of the larger cities—Detroit, Grand Rapids, Saginaw, Jackson, and Kalamazoo—but not in the smaller cities and rural districts. Toward the end of June some political excitement was aroused by the announcement of an alliance between Governor Pingree and Secretary of War Russell A. Alger, with the avowed purpose of compassing the defeat of James McMillan (Rep.) for re-election to the United States Senate. The basis of the combination included a declaration against trusts and in favor of the election of United States senators by direct vote of the people. On September 8, however, General Alger, in a letter addressed to one of his active adherents, announced his definite retirement from the senatorial contest for reasons "personal and of a business nature."

Detroit Street Railways.—The experiment in municipal ownership of railroads attempted in Detroit ended in failure. An act of the legislature authorized the Board of Aldermen of Detroit to appoint a commission to purchase the street railways of that city. The commission appointed, consisting of Governor Pingree, chairman, Eliot G. Stevenson (Dem.), and Charles E. Schmidt (Rep.), petitioned the city council for a franchise, but the petition was laid on the table. The constitutionality of the law was now questioned, primarily on the ground that it conferred on the city the right to engage in a work of internal improvement contrary to the provisions of the constitution. A test case was submitted to the Supreme Court of the State, which sustained the above objection, and early in July declared the law unconstitutional. It held that the meaning of the term internal improvements, as employed in the constitution, plainly included the street roads existing in Detroit. This decision, while pleasing to the opponents of the principle of municipal ownership, was held by some to establish a dangerous precedent in extending the term internal improvements to cover such cases. It was said, for example, that "if the inhibition which rests upon the State in regard to internal improvements also applies to the cities and villages of the State, all the well-known local conveniences and improvements now existing in the State are without warrant in law and have no legal standing." In spite of the finding of the court, Governor Pingree and two others undertook to purchase the lines, and to have the city guarantee the bonds on the understanding that if the roads did not pay they were to revert to the owners. They also promised a 3-cent fare. This scheme, which would have amounted virtually to municipal ownership, aroused popular opposition, and was not carried out. The 3-cent fare, which had been tried as an experiment, was given up and the regular 5-cent rate restored.

Legislation.—The Anti-Trust law enacted by the legislature of 1899 was regarded as a striking feature of the session. The law first defines minutely what constitutes a trust, and then imposes a heavy penalty for each violation. According to this law, no one can engage with another to sell his goods at any definable price, and if a man is undersold by any combination of capital, skill, and art, he can recover twice the profit he might have made, because the underselling is an effort to prevent competition. Other legislation imposed a tax of 3 per cent. on the gross earnings of express companies within the State, and 2½ per cent. on those of telephone companies, and levied a 5-per-cent. tax upon all bequests of over \$500 to other than heirs, certain relatives, and regularly adopted children; it also created a State board of assessors to assess the property of railroad, express, telegraph, and telephone companies; taxes were authorized to pay for the care of needy soldiers and for funeral expenses. An inspector of coal mines is to be appointed to see to

their safety, a State forestry commission was established, and a State free library board was created. Physicians, surgeons, barbers, horseshoers, and veterinarians are to be examined, and the first four licensed. Interest was reduced to 5 per cent., but by contract may be 7. Laws in the interests of the laboring classes were passed, and another law, defining a mob and lynching, declared that the person injured and the legal representatives of one killed by lynching may recover from the county to the extent of \$5000, the county having recovery over against the parties guilty of lynching. The State board of medical examiners are to issue diplomas.

State Officers and National Representatives.—Governor, Hazen S. Pingree; lieutenant-governor, O. W. Robinson; secretary of state, Justus S. Stearns; treasurer, George A. Steel; auditor, Roscoe D. Dix; attorney-general, Horace M. Oren; superintendent of public instruction, Jason E. Hammond; insurance commissioner, Harry H. Stevens. Supreme Court: Chief justice, Robert B. Montgomery; associate justices, Frank A. Hooker, Joseph B. Moore, Charles D. Long, Claudius B. Grant; clerk, Charles C. Hopkins. The State legislature consists of 119 Republicans and 13 Democrats. Senators: Julius C. Burrows, from Kalamazoo, and James McMillan, from Detroit—both Republicans. Representatives: John B. Corliss, from Detroit; Henry C. Smith, from Adrian; Washington Gardner, from Albion; E. L. Hamilton, from Niles; William A. Smith, from Grand Rapids; Samuel W. Smith, from Pontiac; Edgar Weeks, from Mount Clemens; J. W. Fordney, from Saginaw; Roswell P. Bishop, from Ludington; R. O. Crump, Bay City; William S. Mesick, from Mancelona; Carlos D. Sheldon, from Houghton—all Republicans.

MICHIGAN, UNIVERSITY OF, at Ann Arbor, Mich., was opened in 1841. During the academic year ending September 30, 1899, no very important changes were made in the methods or range of instruction. The Law Department found its convenience admirably subserved by its new and spacious building, providing well-lighted and well-ventilated library room, and lecture rooms attractive and commodious. The Homœopathic Medical College had a fairly successful year; in its hospital 1218 patients were treated in the public clinics. The Dental Department had as many students as it could accommodate; no less than 8000 persons were treated in the dental clinics of the year. The libraries were increased by the addition of 10,254 volumes. By an act of the legislature of 1899 the appropriation for the aid of the university was raised from the tax of one-sixth of a mill to that of one-fourth of a mill, thus increasing its annual income by about \$92,500. In November, Mr. Henry P. Glover, of Ypsilanti, Mich., gave to the university the De Criscio collection of Latin inscriptions, including more than 250 inscriptions on marble, besides a few on brick, lead pipe, and other materials, and ranging in age from the time of Augustus to the fifth century, A.D. For statistics, see **UNIVERSITIES AND COLLEGES**.

MICROSCOPICAL SOCIETY, AMERICAN, for the encouragement of microscopical research, was organized in 1878, and incorporated in 1891. In 1899 the society had 350 members, and published Vol. XX. of its *Transactions*. General meeting for 1900, in New York, June 27-30. President, A. M. Bleile; secretary, Henry B. Ward, Lincoln, Neb.

MILES, WILLIAM PORCHER, was born in South Carolina, July 4, 1822; died at Burnside, La., May 11, 1899. After his graduation from Charleston College, he studied law, but later was called to the chair of mathematics in his alma mater. He represented his State in the United States Congress, and, after secession had become a fact, in the Confederate Congress. Later, in the progress of the war, he was a colonel on the staff of General P. G. T. Beauregard. After the war Miles became president of the University of North Carolina. This position he subsequently resigned to take charge of sugar fields in Louisiana. His wife had inherited thirteen sugar plantations in this State, and Miles became the second largest sugar producer in the United States. At the time of his death he was president of the W. P. Miles Planting and Manufacturing Company.

MILITARY ORDER OF FOREIGN WARS was organized in New York in 1894, the National Commandery in 1896, the membership being composed of veterans or descendants of veterans who served in the Revolutionary War, the War of 1812, the war with Tripoli, the Mexican War, or the war with Spain. Commanderies have been established in New York, Pennsylvania, Connecticut, Illinois, California, Massachusetts, Florida, Maryland, District of Columbia, Ohio, Missouri, and Vermont. The officers of the general commandery are: Commander-general, General A. S. Webb; secretary-general, James H. Morgan, St. Paul Building, New York City.

MILK. The new milk law, adopted by the city of Boston, became operative June 1, 1899. Producers as well as sellers of milk, when applying for the necessary licenses, must state whence the milk comes, and give certificates to the effect that

the cows have been examined within the year, and that the milk is not stored or handled in a place where either horses or cows are kept. Storekeepers are not allowed to put a can of milk on floor or counter, out of which to serve to customers, but are required to keep it in a covered ice-box. Milk found to be unclean is destroyed. Cases of contagious diseases in the families of farmers, milk-peddlers, or storekeepers necessitate the immediate cessation of their selling milk in Boston.

Dr. Rowland G. Freeman, of New York, asserts that about 99 per cent. of the bacteria found in milk rise to the top with the cream, possibly because they are carried up by the fat globules as they rise, or because there are richer food and more oxygen at the surface. He therefore suggests, to avoid raising the milk as a whole to 155°, that the cream be sterilized and then returned to the raw milk.

Dr. G. Leslie Eastes, of London, reports in the *British Medical Journal* in November, 1899, his results from bacteriological and microscopical examination of 186 samples of milk. He found tubercle bacilli in eleven samples, possibly in two others. In 47 he found pus; in 77 others he found muco-pus. In 11 cases the presence of pus was doubtful. Blood was found in 24 samples, was probably absent in 85, and was absent in 77 samples. Streptococci were found in 106 cases. In short, about 80 per cent. of the samples examined were unfit for human food.

H. E. Annett, published in the London *Lancet*, in November, 1899, the results of his experimental studies of boric acid and formalin as preservatives of milk. He concludes that they are very injurious to the health of the consumer, and especially so to infants. He believes that a large proportion of the fatal cases of summer diarrhoea owe their origin to the pernicious practice among dairymen of systematically treating the milk during hot weather with preservatives. See **SERUM THERAPY**.

MILLER, LEWIS, inventor of agricultural implements, died in New York City, February 17, 1899. He was born in Greentown, O., in 1829; his home at the time of his death was in Akron, O. Miller's inventive ability was turned chiefly to reaping and binding, mowing, and threshing machines. In 1874, with Mr. John H. Vincent, he founded the Chautauqua Assembly, and was its president until he died. To this organization he gave large sums, and also to various charitable enterprises, and churches and Sunday-schools, irrespective of denomination.

MILLÖCKER, KARL, musician and composer, died in Vienna, Austria, December 31, 1899. He was born there May 29, 1842. He composed many operettas that attained wide popularity. Among these are *The Beggar Student*, 1882; *The Black Hussar*, 1884; *Poor Jonathan*, 1890.

MILNER, SIR ALFRED, M.A., G.C.M.G., governor of Cape Colony and high commissioner of South Africa since 1897, was educated in Germany, at King's College (London), and at Balliol College (Oxford). In 1881 he was admitted to the bar in the Inner Temple, and from 1882 to 1885 was chiefly engaged in journalism, writing for the *Pall Mall Gazette* and other London papers. In the latter year he stood unsuccessfully for Parliament in the Harrow Division. From 1887 to 1889 he was private secretary to the chancellor of the exchequer, and during the next three years was under-secretary for finance in Egypt. The latter experience enabled him to write *England in Egypt*, which is said to be the best book that has been published on the Anglo-Egyptian situation. From 1892 to the year of his appointment to South Africa he was chairman of the board of inland revenue. The negotiations preceding the outbreak of the Boer war brought Milner into prominence in 1899. See **TRANSVAAL** (paragraphs on History).

MIND CURE. See **SUGGESTION**.

MINERALOGY. The number of new species which have been noted during the past year is large and comprises the following: *Arzrunite*, a basic lead sulphate and copper chloride; *Batauvite*, a hydrated magnesium aluminium silicate from Bavaria; *Carnotite*, a vanadate of potassium and uranium from Colorado; *Cedarite*, a fossil resin from the Saskatchewan River, Canada; *Cuprogoslarite*, a new variety of zinc sulphate; *Fedrovite*, a new variety of pyroxene; *Glauchroite*, a lime, manganese silicate; *Goldschmidtite*, a telluride of gold and silver; *Grünlingite*, a sulphotelluride of bismuth from England; *Hancockite*; *Hardystonite*, a silicate of lime and zinc; *Ktypeite*, a name given by Lacroix to certain pisolitic forms of calcium carbonate; *Lagerlöfite*, a lime soda aluminium silicate, produced artificially; *Loranskite*, a new tantalate from Finland; *Mossite*, a nisho-tantalate of iron from Norway; *Nasonite*, a silico-chloride of lead and lime; *Philipstadite*, a new variety of amphibole; *Planoferrite*, a hydrated ferric sulphate from Atacama, Chile; *Rafaelite*, a lead oxychloride from Chile; *Scanaite*, an oxide of iron, lead, titanium, and manganese from Brazil; *Stelznerite*, a mixed hydrate and sulphate of copper from Chile; *Stokesite*, a hydrated silicate of sodium and lime; *Thalenite*, a new yttrium silicate from Sweden; *Van Dieksteite*, a telluride of bismuth and silver from Colorado; *Vallite*, from Edwards, New York.

K. von Kraatz-Kaschlau has found that the coloring matter of many minerals is

not due to the presence of metallic impurities, as formerly supposed, but to the inclusion of varying percentages of carbonaceous matter. This includes minerals like smoky quartz, fluorite, apatite, barite, zircon, amethyst, etc. In the case of fluorspar he found that on heating the mineral to drive off the carbon a dark violet crystal changed through green to light violet or pink as the heating continued. The gas, which was driven off, he collected and identified.

Professor Morozewicz has published the results of five years experimenting on the formation of minerals in magmas. He has succeeded in not only producing artificially a number of minerals and rocks, but also in discovering the conditions governing their formation.

L. J. Spencer states that the number of mineral species discovered in England up to the present date is 293.

The first appendix to the sixth edition of Dana's *System of Mineralogy*, which appeared in the early part of 1892, has been issued. Other books of the year are: *Manual of Determinative Mineralogy and Blowpipe Analysis*, by G. J. Brush, revised by S. L. Penfield; *The Characters of Crystals: An Introduction to Physical Crystallography*, by A. J. Moses; *The Progress of Mineralogy in 1892*, by Herbert and Withrow; *Minerals of Mexico*, Bulletin of the Mexican Geological Institute.

Much work is being done in determining more correctly the chemical formulæ of many mineral species. The following papers bear mostly on this: *On the Chemical Composition of Parisite and a New Occurrence of it in Ravalli County, Mont.*, by Penfield and Warren; *The Constitution of Tourmaline*, by F. W. Clarke; *On the Separation of Alumina from Molten Magmas and the Formation of Corundum*, by J. H. Pratt; *Experiments Relative to the Constitution of Pectolite, Pyrophyllite, Calamine, and Analcite*, by Clarke and Steiger; *The Mineralogical Structure and the Chemical Composition of the Trap of Rocky Hill, N. J.*, by A. H. Phillips; *Melenite, Coloradite, Pectite, and Hessite*, by W. F. Hillebrand; *Roscoelite*, by Hillebrand and Turner; *A Comparative Study of Etch Figures; The Amphiboles and Pyroxene*, by R. A. Daly, proceedings American Academy of Arts and Science, XXIV., and on a *New Variety of Hornblende*, *ibid.*; *On a Hydromica from New Jersey*, by Clark and Darton.

MINERAL PAINTS. The statistics for 1898 include the same substance as last year, and in addition graphitic shale, which was mined near Cartersville, Ga., and used for coloring fertilizer:

Variety.	Quantity Short Tons.	Value.	Variety.	Quantity Short Tons.	Value.
Ochre	11,963	\$123,832	Venetian red.....	10,271	\$160,711
Umber.....	1,177	8,285	Zinc white	33,000	2,310,000
Sienna.....	689	11,140	Soapstone.....	100	800
Metallic paint.....	20,972	263,979	Slate.....	4,571	46,215
Mortar color.....	7,107	74,894	Others.....	2,000	6,000
			Total	91,850	\$3,004,856

MINERAL WATERS. For the year 1898 the United States Geological Survey reports 28,853,464 gallons of mineral water valued at \$8,051,833, with an average price of 27.9 cents a gallon. The total number of springs which have been reported was 484. In 1899 appeared the work *Recherche, Captage et Amonagement des Sources Thermé minérales*, by L. De Launay.

MINING. The United States Geological Survey has issued during the past year the two following tables, one giving the detailed mineral production for 1898, the other the total metallic and non-metallic minerals from 1880 to 1898 inclusive.*

PRODUCTS.		1898.	
		Quantity.	Value.
<i>Metallic.</i>			
Pig-iron, spot value (a).....	long tons (b).....	(c) 11,778,984	\$116,557,000
Silver, coining value (d).....	troy ounces.....	54,438,000	(d) 70,394,485
Gold, coining value (e).....	do.....	3,118,308	64,463,000
Copper (f), value at New York City.....	pounds.....	526,512,987	61,865,276
Lead, value at New York City.....	short tons (g).....	222,000	18,650,000
Zinc, value at New York City.....	do.....	115,369	10,385,910

Total value of nonmetallic mineral products	\$353,419,765
Total value of metallic products	343,400,955
Estimated value of mineral products unspecified (r).....	1,000,000
Grand total.....	\$697,820,720

(a) By "spot" value is meant value at the point of production.

(b) Long tons are tons of 2,240 avoirdupois pounds; short tons are tons of 2,000 avoirdupois pounds.

(c) Iron ore 1892: 16,290,686 long tons; value at mines: \$33,204,896. 1893: 11,597,029 long tons; value at mines: \$19,265,973. 1894: 11,579,679 long tons; value at mines: \$13,577,325. 1895: 15,957,614 long tons; value at mines: \$18,219,084. 1896: 16,005,449 long tons; value at mines: \$22,798,069. 1897: 17,518,046 long tons; value at mines: \$18,953,321. 1898: 19,433,716 long tons; value at mines: \$23,060,897.

(d) Figures of production furnished by the Bureau of the Mint, Treasury Department. Coining value \$1 3929 per troy ounce. Commercial value, 1895: \$35,445,000. 1896: \$39,655,000. 1897: \$33,316,000. 1898: \$32,118,430.

(e) Figures of production furnished by the Bureau of the Mint, Treasury Department. Coining value, \$20.6718 per troy ounce.

(f) Including copper made from imported pyrites.

(g) The product from domestic ores only.

(h) Of 76½ avoirdupois pounds net.

(i) Including aluminium alloys.

(j) Includes antimony smelted from imported ores, in 1898, 80 per cent.

(k) Including nickel in copper-nickel alloy, and in exported ore and matte.

(l) Including brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.

(m) Not including limestone for iron flux or grindstones.

(n) Of 42 gallons.

(o) Of 300 pounds for natural cement, and 400 pounds for artificial Portland.

(p) Of 260 pounds net. The reduced price in 1893 is due to omitting cost of packages.

(q) Including metallic paints, ochre,umber, venetian red, sienna, ground soapstone, ground slate, and mineral black.

(r) Including building sand, glass sand, iron ore used as flux in lead smelting, tin ore, nitrate of soda carbonate of soda, sulphate of soda, and alum clays used by paper manufacturers.

MINING ENGINEERING. The problems arising in the mining of ores and their reduction to metal for the most part fall under one or another of the following heads: (1) Mining geology, (2) mining engineering, (3) metallurgy, and (4) mechanical engineering. The second and fourth subjects are more particularly the province of the engineer, the first subject comes within the field of the geologist, and the third within that of the metallurgist. From the engineering point of view the limit of the possibilities in drainage, hoisting, power transmission, ventilation, etc., extends to a point far beyond the limits established by commercial conditions.

Drainage.—Drainage is one of the least determinable factors in mining. The influx of water may be confined to the upper levels of the mine, in which case it is comparatively easy to remove, or it may increase progressively with the depth, in which case the cost of drainage rapidly increases, and may become prohibitive to commercial operation. For deep level-pumping, particularly where the shaft deflects from the vertical, the tendency of modern mining practice is to employ electrical operative pumps.

Hoisting.—The depths from which ore is hoisted in mining operations to-day greatly exceed those of only a few years ago, and modern hoisting machinery has to be designed in many cases to work from depths of from 3000 feet to 6000 feet. As yet the steam engine has full possession of the field as the motor for hoisting machinery, but the claims for electricity are becoming increasingly great, and engineers are beginning to give it consideration as a promising substitute for the older form of motor. Modern improvements in the manufacture of a high quality of wire rope have made it possible to reach the great depths referred to as far as the rope is concerned, and the chief problem for the engineer is to design the hauling machine and subsidiary appliances for handling these long ropes with their loads. To wind these very long ropes on a drum without over-laying requires a drum very large and inconvenient to operate. Several plans have been adopted to solve the difficulty. One of these is the use of flat ropes wound on themselves, but there are objections to flat ropes because of their larger size and weight and greater wear, and because they are inadmissible on inclines. Another solution is to divide the shaft into two compartments virtually, and, instead of winding the rope on the drum, simply pass it around the drum so that one end with the bucket attached is unwound down one compartment, while the other end similarly loaded is wound up from the other compartment. By this method the two buckets see-saw up and down alternately. Various sheave, drum, and counterbalance arrangements are employed with this system. The hoisting speed in modern deep-mine working runs as high as 3600 to 5000 feet per minute.

Power Transmission.—The transmission of power in modern mining is accomplished by compressed air and electricity. Compressed air is used for operating drilling machinery and for running emergency and shaft-sinking pumps. For operating fixed interior drainage pumps (see paragraph Drainage) and for lighting, ventilating, and signalling, electricity is employed. The electric drill has not succeeded in supplanting compressed air drills to any great extent.

Ventilation.—One great need for ventilation in mine working, and at the same time one of the greatest obstacles for securing it, is the increase of heat as depth is obtained. This heat is usually due to one or a combination of the following causes: (1) The increasing secular heat as further approach is made toward the interior of the earth; (2) proximity of the workings to heated volcanic rocks, salftaras, hot springs, etc.; (3) chemical decomposition of certain constituents of the ores, or of the enclosing wall-rocks, confined to deposits of comparatively rare occurrence; (4) animal heat and heat due to the use of illuminants and explosives, all of subordinate importance. It is generally estimated that the average increment of temperature due to internal heat of the earth is 1° F. for about 60 feet vertical depth. This rate of increase is by no means uniform in different localities, and is not invariably uniform in the same mine. Ventilation or the removal of this heated and sometimes noxious air is usually accomplished at the present time by exhaust-fans in the up-cast shaft supplemented by electrically driven fans underground, and by the exhaust of air-drills.

Treatment of the Ore.—The manipulation of the ore above ground, in so far as it is an engineering problem, consists of its crushing and its handling in the mills, and of its conveying and disposal before reaching and after leaving the mills. Modern advance in this department of mining engineering is along the line of employing heavier, stronger, more durable, more economical, and more efficient machinery, and more scientific methods. See IRON AND STEEL.

MINING ENGINEERS, AMERICAN INSTITUTE OF, organized in 1870, had in 1899 a membership of 2660. President, Dr. James Douglas; secretary, Dr. R. W. Raymond, 99 John Street, New York City.

MINNESOTA, a northwestern State of the United States, has an area of 83,365 square miles. The capital is St. Paul. Minnesota was admitted to the Union May 11, 1858.

Mineralogy.—With a total production during the calendar year 1898 of 5,963,509 long tons of iron ore, all of the red hematite variety, the State continued to hold second rank in both the general production and in that of its specialty. The ores came from the noted Vermilion and Mesabi ranges, both of which are wholly within the State, and of these the Mesabi range yielded 4,837,971 long tons, its greatest record, and the Vermilion range 1,125,538 tons, a decrease from its maximum of the previous year. The total of both ranges exceeded that of 1897 by 362,080 long tons, and was valued at \$4,659,649, and the shipments aggregated 5,878,908 tons. A Duluth report of December 15, 1899, placed the total shipments from Minnesota mines for that year at 8,364,294 long tons, or somewhat over 2,500,000 tons in excess of the 1898 shipments. Before the close of 1899 practically all the Lake Superior bessemer ore, the old-range ore, and the old-range non-bessemer ore, aggregating nearly 18,000,000 long tons, had been sold for delivery in 1900, a transaction the greatest by far in the history of the American iron trade. In order to handle the great shipments already under charter, all the railways concerned in the ore traffic have been obliged to increase their rolling-stock and dock facilities, and several have extended their lines. This condition also affected the lake-carrying interests similarly. Quarrying during 1898 yielded granite valued at \$79,309; sandstone, \$175,810; slate, \$400, and limestone, \$345,685—total, \$601,204.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 31,171,272 bushels, value, \$7,481,105; wheat, 68,223,581, \$37,522,969; oats, 52,688,416, \$11,591,452; barley, 8,144,125, \$2,524,679; rye, 1,112,472, \$467,238; buckwheat, 193,562, \$100,652; potatoes, 10,888,608, \$2,722,152; and hay, 2,575,230 tons, \$11,202,250. Live stock comprised horses, 459,673, \$25,236,763; mules, 8248, \$489,858; milch cows, 672,540, \$21,285,891; other cattle, 504,463, \$13,700,354; and sheep, 419,218, \$1,333,113.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$2,567,688. There were 105 manufacturers of tobacco and 567 of cigars, and the combined output was 49,817,119 cigars, 90,680 cigarettes, 200 pounds of fine-cut tobacco, 91,478 pounds of smoking, and 20,634 pounds of snuff. The amount of spirits rectified was 681,847 gallons; distilled spirits gauged, 1,303,573 gallons, and fermented liquors produced, 581,212 barrels. In December, 1899, it was estimated in Minneapolis that local mills would cut nearly 120,000,000 feet more lumber in the coming season than in any previous one, and Duluth records showed an output of that lumber district for the season of about 750,000,000 feet. At the beginning of the winter's logging there were 15,000 men and 5000 horses at work in the country around the head of Lake Superior and the Upper Mississippi River, and it was expected that 1,200,000,000 feet of standing lumber would be cut during the winter, for working up in Duluth, Superior, and Minneapolis. With all possible activity in lumbering and milling, the supply was far below the season's demands, and the industry was seriously hampered by inadequate shipping facilities. Heretofore, lumbering has been confined chiefly to pine, although the forests contain excellent pulp-wood, cedar, birch, and many valuable hardwoods for furniture-making. In 1899 a beginning was made in the use of spruce for pulp, and a number of paper-mills were under contract for erection. For the first time, also, there was a demand for cedar, especially for railway ties, and for birch timber for thread spools for export to England.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the Duluth and Minnesota districts aggregated in value \$2,569,524; exports, \$4,774,037, an increase in a year of \$13,407 in the former, and of \$780,812 in the latter.

Banks.—On October 31, 1899, there were 69 national banks in operation and 41 in liquidation. The active capital aggregated \$12,290,000; circulation, \$2,459,476; deposits, \$52,962,030, and reserve, \$19,154,616. The State banks, June 30, 1899, numbered 171, and had capital, \$6,716,800; deposits, \$25,531,604, and resources, \$36,893,830; loan and trust companies, 8, with capital, \$3,362,326; deposits, \$1,233,189, and resources, \$5,529,203; private banks, 47, with capital, \$639,275; deposits, \$2,940,070, and resources, \$3,900,631; and stock savings-banks, 10, with depositors, 46,000; deposits, \$10,864,228, and resources, \$11,960,785. The exchanges at the United States clearing house at Minneapolis in the year ending September 30, 1899, aggregated \$517,797,428, an increase of \$54,786,938 in a year.

Railways.—The new railway construction during 1898 was 262.35 miles, and during 1899, 368.84 miles, giving the State a total mileage of 6771.71. A considerable part of the construction in 1899 was on new link lines and on old line extensions, to keep up with the extraordinary development of iron-mining.

Education.—At the close of the school year 1897-98, the school population was 510,800; enrolment in the public schools, 384,063, and average daily attendance, 243,200. There were 11,243 teachers, 7000 buildings used as school-houses, and public school property valued at \$14,559,564. The revenue was \$5,084,765; expenditure, \$4,893,678, of which \$3,235,879 was for teachers' salaries. There were 112 public high schools, with 504 secondary teachers, 11,710 secondary students, and 1036 elementary pupils; 30 private secondary schools, with 177 secondary teachers, 1565 secondary students, and 2573 elementary pupils; 5 public normal schools, with 93 teachers and 3351 students in all departments, and 2 private ones, with 11 teachers and 194 students. Normal training was also given in 3 colleges and 9 public high schools. Nine colleges for men and for both sexes reported 2 fellowships, 12 scholarships, 381 professors and instructors, 4557 students, 92,000 volumes in the libraries, valued at \$119,241; \$132,900 invested in scientific apparatus, \$2,747,560 in grounds and buildings, and \$1,662,091 in productive funds; \$400,514 in total income, and \$36,421 in benefactions. Albert Lea College for women reported 7 professors and instructors, 47 students, 2000 volumes in the library, \$25,000 invested in grounds and buildings, and the same amount in productive funds; \$5970 in total income, and \$6000 in benefactions. In 1899 there were 648 periodicals, of which 36 were dailies, 521 weeklies, and 68 monthlies.

Finances.—The assessed valuations in 1898 were: Real estate, \$489,565,789; personal property, \$109,792,757—total, \$599,358,246, an increase in a year of \$28,759,433; total tax levied, \$13,847,896; State tax rate, \$1.80 per \$1000; special tax for public school and university purposes in addition, \$1.23. The total bonded debt, February 1, 1899, was \$1,349,000, of which \$418,000 was held in State funds; and certificates of indebtedness due between July 1, 1900, and July 1, 1908, amounted to \$500,000. The funding bonds, due July 1, 1921, are subject to call at any time, with a limit of \$150,000 yearly.

New Townships.—During the summer of 1899 surveys were made of fifty townships, comprising more than 1,110,000 acres, in the northwest corner of the State, that will be added to the public domain as soon as the surveys are examined and registered. About one-fifth of the land is valueless till drained; the remainder is well adapted to agriculture. Most of the tract formerly belonged to the Red Lake Chippewa Indians. The new Manitoba and Southeastern Railroad, which will reach Lake Superior at Crookston and Fort Williams, will render this tract accessible for immediate improvement.

Population.—As estimated by federal authorities, the population on June 30, 1899, was about 1,850,000.

Legislation.—Legislation in Minnesota during 1899 disclosed no enactments that seemed specially novel or important. An amendment to the constitution, providing for loaning the permanent school and university funds in the bonds of municipalities and school districts, will be voted upon by the people at the next general election. The raising of sugar beets is encouraged, and sugar-beet seed is to be distributed. The governor is to set apart a day for tree-planting, and measures have been taken for the protection of birds. Bicycle paths are protected, and those who throw on any highway that which will injure bicycles or puncture tires are guilty of a misdemeanor. Civil rights are protected by making it a misdemeanor to deprive any person of the full and equal enjoyment of the accommodation and privilege of all places of public resort, of amusement, or conveyances, because of race, creed, color, or previous condition of servitude. Husband and wife are not liable for each other's debts. A State dairy and food commissioner is to be appointed, with important duties devolving upon him. Milkmen in cities and towns must be licensed, and regulations were made for the management of dairies. It is a misdemeanor to sell "renovated or boiled butter" without stamping it. The use of chemicals to preserve butter, milk, or cheese is prohibited.

A law governing, with much detail, primary elections for the nomination of candidates, and another permitting the use of automatic voting machines were enacted. The preservation and growth of forests is encouraged, and a State board of forestry was created. A State board of nine citizens was created to constitute a tribunal of appeal from complaints of grain inspection; their decision as to grade of grain is final. The docking of horses was made a misdemeanor. Interest was reduced from 7 to 6 per cent. "Travelling libraries" were provided for, and a State library commission was created. A naval reserve, composed of eight companies, was established. Railroad commissioners, heretofore appointed by the governor, will hereafter be elected. All narrow-gauge railroads must be changed to standard-gauge. Rates on grain, flax, lumber, live stock, and coal in force for sixty days shall not be raised, except by authority of the railroad commission. Free transportation shall be given to shippers of live stock. A caboose with a toilet-room must be attached to all live stock and emigrant trains. Attendance at school was made compulsory, and a truant officer is to be appointed; uniform State cer-

tificates for teachers were provided for, and a State high school board was created to provide for higher education.

State Officers and National Representatives.—Governor, John Lind; lieutenant-governor, L. A. Smith; secretary of State, Albert Berg; treasurer, A. T. Koerner; auditor, R. C. Dunn; adjutant-general, G. C. Lambert; commissioner of insurance, J. A. O'Shaughnessy; attorney-general, W. B. Douglas. Supreme Court: Chief Justice, Charles M. Start; associate justices, Calvin L. Brown, John A. Lovely, Charles L. Lewis, L. W. Collins; clerk, Darius F. Reese. The State Legislature consists of 135 Republicans, 26 Democrats, 8 Fusionists, 9 Populists, and 2 Independents. Senators: Cushman K. Davis, from St. Paul, and Knute Nelson, from Alexandria, both Republicans. Representatives: James A. Tawney, from Winona; James T. McCleary, from Mankato; Joel P. Heatwole, from Northfield; F. C. Stevens, from St. Paul; Loren Fletcher, from Minneapolis; Page Morris, from Duluth; and Frank M. Eddy, from Glenwood—all Republicans.

MINNESOTA, UNIVERSITY OF, at Minneapolis, organized by the State in 1868, is co-educational and non-sectarian. In 1899 there were the following schools (the number of students in attendance being appended): The Graduate Department (147 men, 48 women—total, 195); the College of Science, Literature, and the Arts (418 men, 480 women—total, 898); the College of Engineering and the Mechanic Arts (136 men, 15 women—total, 151); the School of Mines (62 men); the School of Chemistry (9 men); the Department of Agriculture (349 men, 60 women); the College of Law (440 men, 7 women); the Department of Medicine (448 men, 27 women); and the Summer School (141 men, 239 women); total (excluding duplicates), 2099 men and 826 women; grand total, 2925. The university library contains about 50,000 volumes, and there are libraries accessible in St. Paul and Minneapolis, aggregating 252,000 volumes. President, Cyrus Northrop, LL.D.

MISSIONARY ASSOCIATION, AMERICAN, founded in 1846, a society of the Congregational denomination, has done work among the American Indians and the Chinese in America, and in 1899 sent eight teachers to Puerto Rico. The association publishes the *American Missionary*. The fifty-third annual meeting was held at Binghamton, N. Y., October 17-19, 1899. President, Rev. F. A. Noble, D.D.; corresponding secretaries, Rev. A. F. Beard, D.D., Rev. F. P. Woodbury, D.D., Rev. C. J. Ryder, D.D., Fourth Avenue and Twenty-second Street, New York City.

MISSIONS, CHRISTIAN FOREIGN. See FOREIGN MISSIONS.

MISSISSIPPI, a Gulf State of the United States, has an area of 46,810 square miles. The capital is Jackson. Mississippi was admitted to the Union, December 10, 1817.

Agriculture.—In the season of 1898-99 the cotton area was 2,900,298 acres; the yield, 1,247,128 gross bales, giving the State third rank in production; and the average price was 5.27 cents per pound for upland and 14 cents for sea island. For the season of 1899-1900 the official estimate was: Area, 2,784,000 acres; yield, 209 pounds of lint cotton per acre. Other productions and values in the calendar year 1899 were: Corn, 39,043,712 bushels, value, \$17,960,108; wheat, 25,010, \$19,508; oats, 1,365,740, \$682,870; potatoes, 324,032, \$330,513; and hay, 79,059 tons, \$731,296. Live stock, January 1, 1900, comprised horses, 203,492, \$8,903,707; mules, 164,713, \$9,743,925; milch cows, 244,103, \$5,052,932; other cattle, 273,706, \$3,719,121; and sheep, 215,748, \$335,490. See COTTON AND THE COTTON INDUSTRY.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$90,842. Eight factories had a combined output of 227,322 cigars. Other taxable productions are included in the totals of Louisiana, with which Mississippi constitutes one district. In 1899 there were 10 cotton mills in operation, and at the close of the year 22 more were in course of organization. The increase in the number of spindles during the year was 5184. The new mills will represent an average capital of \$100,000 each; several exceeding that amount.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the port of Pearl River aggregated in value \$439; exports, \$1,704,939, a slight decrease in a year in imports and an increase of \$333,401 in exports.

Railways.—The new railway construction during the calendar year 1898 amounted to 41 miles, and during 1899 to 135.44 miles, giving the State a total mileage of 2826.82.

Banks.—On October 31, 1899, there were 12 national banks in operation and 5 in liquidation. The active capital aggregated \$955,000; circulation, \$305,710; deposits, \$2,722,820; and reserve, \$694,359. The State banks, June 30, 1899, numbered 92, and had capital, \$3,782,530; deposits, \$9,847,771; and resources, \$15,807,578.

Education.—At the close of the school year 1896-97, the last for which reports are available, the school population was 531,300; enrolment in the public schools, 367,579; and average daily attendance, 223,900. There were 7903 teachers, 6510 buildings used as

school-houses, and public school property valued at \$1,636,055. The revenue was \$1,214,630; expenditure, \$1,165,840, of which \$1,057,735 was for teachers' salaries. There were 85 public high schools, with 186 secondary teachers, 3472 secondary students, and 4667 elementary pupils; 50 private secondary schools, with 144 secondary teachers, 2415 secondary students, and 4398 elementary pupils; 7 public normal schools, with 31 teachers and 1110 students in all departments; and 10 private ones, with 70 teachers and 2052 students. Normal training was also given in 7 colleges and 29 public high schools. Four universities and colleges for men and for both sexes reported 4 fellowships, 10 scholarships, 52 professors and instructors, 769 students, 30,000 volumes in the libraries, valued at \$34,000; \$38,800 invested in scientific apparatus, \$440,000 in grounds and buildings, and \$692,500 in productive funds; \$67,243 in total income and \$7000 in benefactions. Thirteen colleges for women reported 149 professors and instructors, 1069 students, 11,300 volumes in the libraries, \$410,000 invested in grounds and buildings, and \$117,427 in total income. Two schools of technology had 35 professors and instructors, 544 students, 10,000 volumes in the libraries, \$97,250 invested in scientific apparatus, \$244,010 in grounds and buildings, and \$197,150 in productive funds, and \$120,760 in total income. In 1899 there were 226 periodicals, of which 14 were dailies, 172 weeklies, and 22 monthlies.

Finances.—The amount and disposition of the bonded debt in 1899 were the same as reported in the YEAR BOOK for 1898—namely, \$2,682,876, which included \$1,612,512 in school funds, the only debt on which interest has to be paid. The last reported assessed property valuations—those for 1897—were: Real estate, \$113,210,931; personal property, \$44,994,791; railroad, telegraph, and telephone property, \$24,682,876—total, \$182,888,598. The last reported tax rate (1897) was \$6.50 per \$1000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 1,540,000.

Party Platforms.—The Republicans held no convention in 1899, but united with the Populists, at whose convention, held August 16, a platform was drawn up favoring direct legislation through the initiative and referendum; declaring that the only solution of the trust problem may be reached through the public ownership of public utilities; advocating the issuance and control of all the money of the country—gold, silver, and paper—by the government and the restoration of the silver coinage at the ratio of 16 to 1; denouncing the electoral system of Mississippi, and favoring an amendment to the State constitution providing that tax receipts shall be the test of electoral privileges; demanding the better collection of taxes and favoring their reduction by the abolition of useless offices and the curtailment of extravagant salaries, and favoring an amendment to the Constitution rendering all public officials and their deputies ineligible to succeed themselves or each other in office.

The Democrats in their State convention of August 16, 1899, enunciated a declaration of principles, which endorsed the Chicago platform of 1896 and the policies of Mr. W. J. Bryan; protested against trusts and combines, and endorsed the Democratic administration of public affairs in Mississippi and the system of primary elections, under proper restrictions, for all Democratic nominations. The platform itself was very short, but amendments of about double its length were offered, in which various acts of the State administration were noted and disapproved of; these, however, were rejected by majority votes.

Elections.—The Republican-Populist-Fusion candidate, Mr. Prewett, received 6097 votes; the Democratic candidate, Mr. A. H. Longino, received 42,273 votes, and hence was elected by a plurality of 36,176, the whole vote cast being 48,370.

State Officers and National Representatives.—Governor, A. H. Longino; lieutenant-governor, James T. Harrison; secretary of state, J. L. Power; treasurer, R. J. Stowers; auditor, W. Q. Cole; superintendent of education, H. L. Whitfield; attorney-general, Monroe McClurg; adjutant-general, William Henry. Supreme Court: Chief justice, Thomas H. Woods; associate justices, S. H. Terral, Albert H. Whitfield; clerk, Edward W. Brown. The State legislature consists wholly of Democrats (178), with the exception of two Populists in the lower House. Senators, H. de S. Money (Dem.), of Carrollton, and Will Van Amberg Sullivan (Dem.), appointed temporarily by the governor, *vice* E. C. Walthall, deceased. Representatives, John M. Allen, from Tupelo; Thomas Spight, from Ripley; T. C. Catchings, from Vicksburg; A. F. Fox, from West Point; John S. Williams, from Yazoo; Frank A. McLain, from Gloster; Patrick Henry, from Brandon—all Democrats.

MISSOURI, a central State of the Mississippi Valley, has an area of 69,415 square miles. Capital, Jefferson City. Missouri was admitted to the Union in 1821.

Mineralogy.—In 1899 State Geologist Gallagher predicted that within the next five years Missouri would startle the world with the great amount of lead, zinc, copper, nickel, cobalt, and coal mined in the State, and declared that in these minerals Missouri was the richest of any State in the country. The principal source of the supply

of zinc ore in the United States is the Joplin-Galena district in southwestern Missouri and southeastern Kansas. Formerly all the ore mined there was converted into metal on the spot, and the output could be ascertained readily, but now considerable quantities of concentrates are shipped to distant smelters, hence the local production can be approximated only. During 1898 the sales of zinc ore in the district amounted to 235,122 short tons, and of lead ore to 26,473 short tons, of a combined value of \$7,145,262. In zinc there was an increase in a year of 53,587 short tons, and in lead a decrease of about 3650 tons. State Mine Inspector Quimby, reporting for the fiscal year ending June 30, 1899, says that at least \$10,000,000 of Eastern and other out-of-State capital was invested in the lead and zinc mines of the State in the year, and that, as results, new mills were springing up on every hand, pumping systems were being brought to the highest state of efficiency, and valuable and abandoned properties were being reclaimed and successfully operated. The total value of lead and zinc mined in the State during the year was \$9,009,953, an increase of \$3,071,218 over the total of the previous year. At the close of 1899 it was estimated that the total for the entire district would exceed \$11,000,000 for the calendar year. The output of coal in the calendar year 1898 was the largest since 1893—namely, 2,688,321 short tons, from 124 mines, valued at \$2,871,296. In that year the demand for iron gave a value to the "lean ore" not previously reported, because considered unmarketable without further treatment. This ore with the year's mining gave a total output of 205,347 long tons, almost all of the red hematite species, valued at \$123,345. Quarrying yielded granite valued at \$78,423; sandstone, \$48,795; and limestone, \$735,275—total, \$862,493. See ASPHALTUM.

Agriculture.—An important enterprise was undertaken in 1899, under a recent act of the legislature, which will give the State many thousand acres of the richest possible farming land. The scheme is the draining of the swamps in Scott, Pemiscot, and New Madrid Counties, in the southwestern part of the State, by means of channels dredged through the swamps and forests so that the water can run off. It is expected that the land when drained and cleared of timber will be worth \$40 an acre. The following shows the production and value of the principal crops in the calendar year 1899: Corn, 162,915,064 bushels, value, \$48,874,519; wheat, 11,398,702, \$7,067,195; oats, 20,299,350, \$4,871,844; barley, 12,960, \$5443; rye, 127,439, \$63,720; buckwheat, 34,986, \$21,341; potatoes, 8,757,496, \$3,502,998; and hay, 3,094,394 tons, \$19,339,962. Live stock, January 1, 1900, comprised horses, 724,597, \$24,891,718; mules, 165,026, \$7,210,321; milch cows, 659,731, \$18,868,307; other cattle, 1,387,615, \$36,981,329; and sheep, 597,619, \$1,854,711. See AGRICULTURE (paragraph Agricultural Teaching).

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$16,369,075, the seventh largest among the States. There were 2 manufacturers of tobacco, and 980 of cigars, and the combined output in the calendar year 1898 was 67,295,824 cigars, 350,735,000 cigarettes, 59,933,571 pounds of plug tobacco, 53,637 pounds of fine cut, 5,021,108 pounds of smoking, and 2,016 pounds of snuff. Grain and fruit distilleries in operation numbered 67; the amount of spirits rectified was 2,912,834 gallons; distilled spirits gauged, 7,631,683 gallons; fermented liquors produced, 2,254,039 barrels; and oleomargarine produced, 1,867,211 pounds.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the delivery ports of Kansas City, St. Joseph, and St. Louis aggregated in value \$3,417,640, an increase in a year of \$454,351; exports, \$5486, making the total foreign trade of the year \$3,423,126.

Railways.—The new railway construction during the calendar year 1898 amounted to 132.40 miles, and during 1899 to 98.80 miles, giving the State a total mileage of 6909.45.

Banks.—On October 31, 1899, there were 63 national banks in operation and 66 in liquidation. The active capital aggregated \$17,615,000; circulation, \$20,157,709; deposits, \$107,023,249; and reserve, \$28,895,885. The State banks, April 5, 1899, numbered 495, and had capital, \$18,991,435; deposits, \$77,939,376; and resources, \$110,492,047; and the private banks, 88, with capital, \$933,370; deposits, \$6,106,178; and resources, \$8,165,038. The exchanges at the United States clearing houses at St. Louis, Kansas City, and St. Joseph, in the year ending September 30, 1899, aggregated \$2,381,129,030, an increase in a year of \$278,857,029.

Education.—At the close of the school year 1897-98, the school population was 981,422; enrolment in the public schools, 688,583; and average daily attendance, 440,692. There were 15,266 teachers, 10,116 buildings used as school-houses, and public school property valued at \$16,718,410. The revenue was \$6,489,476; expenditure, \$6,248,961, of which \$4,230,504 was for teachers' salaries. There were 201 public high schools, with 654 secondary teachers, 17,143 secondary students, and 2089 elementary pupils; 80 private secondary schools, with 344 secondary teachers, 4466 secondary students, and 3461 elementary pupils; 5 public normal schools, with 51 teachers and 2667 students in all departments, and 5 private ones, with 39 teachers and 1463 stu-

dents. Normal training was also given in 11 colleges and 15 public high schools. Twenty-six universities and colleges for men and for both sexes reported 7 fellowships, 174 scholarships, 516 professors and instructors, 6513 students, 195,495 volumes in the libraries, valued at \$378,425; \$319,105 invested in scientific apparatus, \$4,884,000 in grounds and buildings, and \$3,771,839 in productive funds, \$580,970 in total income, and \$360,207 in benefactions. Twelve colleges for women reported 179 professors and instructors, 1368 students, 13,800 volumes in the libraries, \$715,000 invested in grounds and buildings, and \$84,600 in productive funds, and \$157,579 in total income. In 1899 there were 1096 periodicals, of which 84 were dailies, 821 weeklies, and 146 monthlies.

Finances.—In 1898 the total assessed valuation was \$971,935.839, a decrease in a year of \$4,818,313, and the tax rate was \$2.50 per \$1000, the same as since 1892. The total bonded debt, January 1, 1899, was \$3,642,000; school and seminary certificates, \$4,393,839—total, \$8,035,839. In November, 1899, the State Fund Commissioners resolved to call in \$1,000,000 of State bonds and to extinguish the entire debt in 1901, and in December the State treasurer redeemed \$795,000 in 3 per cent. option bonds held in New York. The commissioners expected to redeem \$500,000 more in bonds in January, 1900, which would make a total reduction of the bonded debt in a year of nearly \$1,500,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 3,320,000.

Legislation.—Two constitutional amendments are to be submitted to the people in 1900: (1) to provide for authorizing a jury to return a verdict upon two-thirds of their number concurring therein; and (2) to authorize counties to levy a special tax of 15 cents on each \$100 of valuation for road and bridge purposes. A State poultry association was created, with the governor a member of the executive board; also the office of beer inspector and a State board to examine and license barbers. A manager, inspector, and board of trustees of a fruit experiment station are to be appointed by the governor. In view of the increasing number and influence of department stores, a law was enacted dividing articles of trade into a large number of classes and allowing the sale of goods of more than one class by the same business management only upon the payment of license fees. These fees were designed to be practically prohibitive of the business of the department store. The law applied only in cities of 50,000 or more inhabitants. It was regarded by many jurists to be unconstitutional. A free labor bureau must be established in every city having more than 100,000 inhabitants. When goods are made under unclean or unhealthful conditions, they must be labelled by the labor commissioner "Tenement-made," or "Made under unhealthful conditions," in letters two inches long, and it is unlawful to remove such tag. No one shall work in a bakery more than six days in one week, or if afflicted with consumption, scrofula, or skin disease, and no one shall sleep in the bake-room. Eight hours were made a day's work in all mines except coal mines. Miners shall be paid at least once in every fifteen days, and shall be given one hour above ground for each meal. All inheritances, except to direct heirs or persons dependent upon the testator, shall be taxed 5 per cent. In the matter of trust legislation Missouri has distanced all the other States. More laws concerning trusts and trade combinations have been passed and more cases have reached its higher courts than in any other State, and the efforts to enforce these laws have created widespread interest. The last legislature did its part toward strengthening the anti-trust statutes already in force. Among the multitude of cases that might be cited is the following: In July, 1897, the attorney-general brought suit against seventy-three foreign insurance companies doing business in St. Joseph, charging them with violating the provisions of the anti-trust law by combining to maintain rates for fire, tornado, and lightning insurance in said city. The case was finally settled by inflicting a penalty of \$1000 upon each company, and allowing them to do business without combination as to rates. It is said that the attorney-general has commenced suit of a similar character against about eighty other foreign insurance companies.

State Officers and National Representatives.—Governor, Lon V. Stephens; lieutenant-governor, A. H. Bolte; secretary of state, A. A. Lesueur; treasurer, F. L. Pitts; auditor, J. M. Seibert; adjutant-general, M. Fred Bell; attorney-general, E. C. Crow; superintendent of education, W. T. Carrington; railroad and warehouse commissioners, J. Flory, T. J. Hennessey, and W. E. McCully; secretary State Board of Agriculture, J. R. Rippey; superintendent of insurance, E. T. Orear. Supreme Court: Chief justice, James B. Gantt; associate justices, Thomas A. Sherwood, Gavon D. Burgess, Theodore Brace, L. B. Valliant, W. C. Marshall, Waltour M. Robinson; clerk, J. R. Green. The State legislature consists of 105 Democrats, 67 Republicans, and 2 Populists. Senators: Francis M. Cockrell, from Warrensburg, and George G. Vest, from Kansas City—both Democrats. Representatives: James T. Lloyd (Dem.), from Shelbyville; W. W. Rucker (Dem.), from Keytesville; John T. Dougherty (Dem.), from Liberty; Charles F. Cochran (Dem.), from

St. Joseph; William S. Cowherd (Dem.), from Kansas City; David A. DeArmond (Dem.), from Butler; James Cooney (Dem.), from Marshall; D. W. Shackleford (Dem.), from Jefferson City (*vice* Richard P. Bland, who died June 15, 1899); Champ Clark (Dem.), from Bowling Green; Richard Bartholdt (Rep.), from St. Louis; Charles F. Joy (Rep.), from St. Louis; Charles E. Pearce (Rep.), from St. Louis; Edward Robb (Dem.), from Perryville; W. D. Vandiver (Dem.), from Cape Girardeau; M. E. Benton (Dem.), from Neosho.

MITCHELL, PETER, one of the promoters of Canadian federation, the first cabinet of which entered into office in 1867, died at Montreal, November 26, 1899. He was born in 1824 at Newcastle, New Brunswick. In 1856 he was elected to the legislature for the county of Northumberland. He became legislative councillor, and in 1858 entered the government of Sir Leonard Tilley. At the time of his death he was inspector of fisheries, a post he had held since Sir Wilfrid Laurier had assumed power. He was president of the Mitchell Steamship Company, and largely interested in the Canadian Pacific Railway. He was proprietor of the Montreal *Herald*, and later president of the Herald Publishing Company.

MONAZITE. The production in 1898 was 250,776 pounds, valued at \$13,542. That for 1899 will probably be about the same. North Carolina continues to be the native source of supply.

MONEY. The table on the following page, compiled by the United States director of the mint, shows the stock of gold, silver, and uncovered paper in the countries of the world on January 1, 1899, together with estimates of population. When compared with the statement for the year ending June 30, 1898, there is an apparent increase in the world's stock of gold about \$19,700,000, a decrease in silver of \$141,700,000, and an increase of uncovered paper of about \$524,000,000.

MONIER-WILLIAMS, Sir MONIER, D.C.L., LL.D., PH.D., professor of Sanskrit in the University of Oxford, died April 11, 1899. His high place in Oriental scholarship was widely recognized. He was born in Bombay, November 12, 1819; he studied at King's College, London, and entered Balliol College, Oxford, in 1838. Before taking his degree he left Oxford and studied at the East India College, Haileybury; he re-entered Oxford and received his degree (M.A.) from University College, 1844. From this time to 1858 he occupied the chair of Sanskrit at Haileybury, and for the next two years at Cheltenham. In 1860 he was appointed to the chair of Sanskrit at Oxford, in which position he remained to the time of his death. He was the founder of the Indian Institute at Oxford; in 1875 he proposed the founding of this institution, and subsequently made three Indian journeys in support of it—the first in 1875-76, the second in 1876-77, and the third in 1883-84. He superintended the completion of the institute in 1896. In 1880 he was made a C.I.E., and a K.C.I.E. in 1886. Among his many publications are: *Sanskrit Grammar*, 1846; *English-Sanskrit Dictionary*, 1851; *Introduction to Hindustani*, 1858; *Application of the Roman Alphabet to the Languages of India*, 1859; *Study of Sanskrit in Relation to Missionary Work*, 1861; *Indian Epic Poetry*, 1863; *Practical Hindustani Grammar*, 1864; *Sanskrit English Dictionary*, 1872; *Practical Sanskrit Grammar*, 1876; *Hinduism*, 1877; *Modern India and Indians*, 1878; *Religious Thought and Life in India*, 1883; *Holy Bible and Sacred Books of the East*, 1886; *Buddhism*, 1890; *Brahmanism*, 1891; *Indian Wisdom*, 1893; *Reminiscences of Old Haileybury College*, 1894; *New Sanskrit-English Dictionary*, 1899.

MONROE, Rt. Hon. JOHN, LL.D., judge in the chancery division of the High Court of Justice in Ireland, died September 29, 1899. He was born in 1839; was admitted to the Irish bar in 1863, becoming a Queen's counsel in 1877. In 1885 he was made a judge of the Irish High Court, which position he held until he died. He was solicitor-general for Ireland in 1888.

MONTANA, a northwestern State of the United States, has an area of 146,080 square miles. The capital is Helena. Montana was admitted to the Union November 8, 1889.

Mineralogy.—The most noticeable feature of the report of Eugene B. Braden, of the United States assay office, at Helena, on the mineral productions in the calendar year 1898, is the evidence that the great copper mining promise of 1897 was not maintained, the output in 1898 being the smallest since 1895. The report shows the following productions: Gold, 253,867 fine ounces, valued at \$5,247,912; silver, 14,818,661 fine ounces, of a coining value of \$19,159,482; copper, 216,979,354 fine pounds, valued at \$26,102,616, and lead, 21,403,592 fine pounds, valued at \$809,055. The output of gold showed an increase in a year of \$751,481, silver a decrease of \$2,571,227, copper a decrease of \$696,298, and lead a decrease of \$119,563. The decrease in copper was attributable to the closing down of the great Anaconda mine during a part of the year in consequence of a fire. After ten years of uninterrupted increase in the annual output of coal, the production in 1898, 1,479,803 short tons,

valued at \$2,324,207, showed a decline in a year of 168,079 tons, the bulk of which was in Cascade County, although two-thirds of the entire product was from mines there. Quarrying yielded sandstone and limestone of a total value of \$66,879. General mining operations in 1899 showed a considerable betterment, especially in coal. A copper discovery of considerable magnitude was made on the East Boulder River in Jefferson County. Coal was found on the south fork of Sixteen-Mile Creek, which promised to surpass any existing coal field in the State; an important strike was made on the Mountain Side coal property in Gallatin County, disclosing a finer vein than any in the Bozeman district; a large plant was opened up at Bridger, in Carbon County, to work a newly discovered bituminous vein; and a fine vein, six feet wide, was discovered on Strickland Creek, near Livingston. Arrangements were concluded for an active working of the sapphire fields in Yogo now belonging to a syndicate, a market for these stones having been established in London, Paris, Berlin, and New York. The estimates of the United States director of the mint on the gold and silver production of the year credited Montana with gold, \$4,919,897, and silver, \$20,040,403.

Agriculture.—An important addition to the farming and grazing areas of the State was made possible in August, 1899, when the Crow Indians and government commissioners effected an agreement for the sale by the former to the government of 1,000,000 acres of land on the northern side of the Crow Reservation, from Fort Custer to the Yellowstone River, and from Prior Creek to the eastern boundary of the reserve, embracing the lower Big Horn and other smaller streams. A considerable part of this tract is arable, most of it is excellent for grazing, and parts are well timbered. The Northern Pacific Railway runs along the northern border, and the Burlington system passes diagonally through it. The price is about \$1 per acre. On the ratification of the agreement by Congress, the tract will be thrown open to settlement.

Railways.—The new railway construction during the calendar year 1898 amounted to 49.15 miles, and during 1899 to 24 miles, giving the State a total mileage of 2995.06.

Banks.—On October 31, 1899, there were 21 national banks in operation, and 23 in liquidation. The active capital aggregated \$2,305,000; circulation, \$727,711; deposits, \$12,645,199, and reserve, \$5,162,436. The State banks, June 30, 1899, numbered 14, and had capital, \$771,000; deposits, \$3,460,173, and resources, \$6,605,863.

Education.—At the close of the school year 1897-98, the school population was 49,498; enrolment in the public schools, 35,070, and average daily attendance, 23,400. There were 1086 teachers, 656 buildings used as school-houses, and public school property valued at \$1,857,964. The revenue was \$815,341; expenditure, \$776,150, of which \$483,221 was for teachers' salaries. There were 15 public high schools, with 39 secondary teachers, 896 secondary students, and 22 elementary pupils; 4 private secondary schools, with 14 teachers, 124 secondary students, and 526 elementary pupils; and a public normal school, with 5 teachers and 45 students in all departments. Normal training was also given in 1 college and 1 public high school. Three universities and colleges for men and for both sexes reported 1 fellowship, 1 scholarship, 31 professors and instructors, 253 students, 6700 volumes in the libraries, \$8800 invested in scientific apparatus, and \$225,000 in grounds and buildings, \$41,500 in total income, and \$2000 in benefactions. The State College of Agriculture and Mechanic Arts had 19 professors and instructors, 201 students, \$10,000 invested in scientific apparatus, and \$120,000 in grounds and buildings, and \$52,010 in total income. In 1899 there were 92 periodicals, of which 12 were dailies, 69 weeklies, and 7 monthlies.

Finances.—The assessed valuations in 1899 (full cash value) were: Real estate, \$72,482,529; personal property, \$54,288,096; railroad property, \$14,992,689—total, \$141,763,314; State tax rate, \$2.50 per \$1000. Loans issued on land-grants for the benefit of the State capitol, agricultural college, normal school, university, and deaf and dumb asylum, aggregated \$640,000. The State is not liable for these loans, and has no bonded indebtedness.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 240,000.

Proceedings of the Legislature.—The election of a United States senator required seventeen days of the legislative session, but on the eighteenth ballot William A. Clark (*q. v.*), Democrat, was elected to succeed Lee Mantle, Silver Republican. Charges of bribery were made, an investigation was demanded, and personal and political feeling ran high, so much so that ex-Speaker Kennedy was knocked down because of some remarks concerning bribery charges. Little important legislation seems to have been enacted during the remainder of the session. The office of court reporter was abolished in the Supreme Court, the judges thereof being required to report their own decisions, for which extra compensation is to be paid. Insurance companies are to be taxed to raise a fund for the aid of disabled firemen in cities, who are to hold their positions during good behavior. Free county high schools

and kindergartens were established. Stealing a ride upon a railroad was made a misdemeanor. A State board of horticulture was created with extraordinary powers for the inspection of trees and nursery stock, and with power to condemn and destroy that which is infected or diseased beyond cure. Every foreign insurance company issuing a policy in the State must have it countersigned by a resident agent in order that the State may collect the tax imposed on premiums.

State Officers and National Representatives.—Governor, Robert B. Smith; lieutenant-governor, A. E. Spriggs; secretary of state, T. S. Hogan; treasurer, T. E. Collins; auditor and insurance commissioner, T. W. Poindexter; attorney-general, C. B. Nolan; adjutant-general, F. C. English; superintendent of education, E. A. Carleton; commissioner of agriculture, J. H. Calderhead. Supreme Court: Chief justice, Theodore Brantley; associate justices, W. H. Hunt, W. T. Piggott; clerk, Henry G. Rickerts. The State legislature consists of 16 Republicans, 51 Democrats, and 24 Populists. Senators: Thomas H. Carter (Rep.), from Helena, and William A. Clark (Dem.), from Butte. Representative, A. J. Campbell (Dem.), from Butte.

MONTENEGRO, a small principality of southern Europe which for 400 years maintained its independence against Turkey, and whose independence was formally recognized by European powers in 1878, through the treaty of Berlin. The country is situated between Bosnia and Albania, and was till 1878 separated from the Adriatic by a strip of foreign territory. By the Berlin conference it was assigned the port and district of Antivari, and in 1880, through the influence of the powers, it obtained from Turkey the port and district of Dulcigno. The area is about 3630 square miles, and the population has been estimated at about 228,000, which may have decreased in recent years on account of emigration. Its capital is Cetigne, or Cetinje, with a population variously estimated at from 1500 to 3000. Other towns are Podgoritz, with 6000 inhabitants; Dulcigno, with 5000, and Niksik, with 3000. The majority of the inhabitants belong to the Greek Orthodox Church, and are allied to the Servian branch of the Slav race. Agriculture, the chief occupation, is carried on under somewhat primitive conditions. A species of common ownership prevails in most parts of the country. The crops include maize, oats, tobacco, potatoes, barley, buckwheat, the grape, and olives. The forests are abundant throughout the mountains, which traverse the country, the more valuable trees being the beech and the oak. Owing to the rocky and mountainous character of the land as a whole, farming is pastoral rather than agricultural, and large herds of cattle are reared. The trade is small. The executive authority is vested in the reigning prince, Nicholas I. The constitution, though nominally that of a limited monarchy, rests on a patriarchal basis. There is a legislative council of 8 members, one-half of whom are nominated by the Prince and one-half chosen by that part of the population capable of bearing arms. There is no standing army, though there are a few small military divisions, but all Montenegrins are trained soldiers, and an efficient army can be gathered if necessary. Montenegro also has no navy, but her ports, by international agreement of the powers, are closed to all foreign war-ships, and the protection of her coast-line is assumed by the national parties to the treaty of Berlin. In 1898 there were serious disturbances on the Montenegrin-Albanian border, growing out of the long-existing racial antagonisms of the Mohammedans and the Christians in the Berane district. Attention was also drawn to Montenegro in 1898 by the agitation in that country for the creation of a new state, to consist of Montenegro, Servia, Bosnia, and Herzegovina, and to be ruled by Prince Nicholas of Montenegro. In 1899 the Crown Prince Danilo was married to the Duchess Jutta, daughter of the Hereditary Grand Duke of Mecklenburg-Strelitz. In 1898 the revenue was said to be about \$340,640 (£70,000), and the public debt about \$827,240 (£170,000).

MONTSERRAT, a West Indian island, forming a presidency of the British crown colony of the Leeward Islands (*q. v.*), has an area of 32 square miles, and a population (1891) of 11,762. The chief town is Plymouth (population about 1500). The leading products are sugar, limes, coffee, and cacao. The sugar export in 1897 amounted to £5087; the annual export of lime-juice is about 100,000 gallons, valued at over £7400. The aggregate entrances and clearances in foreign shipping in 1897 were 228,715 tons. The following figures are for 1898: Imports, £15,161; exports, £13,849; revenue, £6199; expenditure, £11,935; public debt, £17,300. In the early part of the year, on account of certain excise collections, riotous outbreaks occurred, which were terminated by the arrival of the British cruiser *Talbot*. On May 17, 1899, Montserrat suffered within a period of five hours forty-five earthquake shocks, which did much damage. In the great hurricane of August 7 and 8, 1899, the island was devastated and three-fourths of the inhabitants were forced to depend on the government for food.

MOODY, DWIGHT LYMAN, evangelist, born February 5, 1837, at East Northfield, Mass., died at East Northfield on December 22, 1899. It is generally recognized that Mr. Moody was one of the great Christian teachers of recent years. His life-work was taken up soon after his conversion to the church, which occurred in Boston when he was at the age of eighteen. He was at that time a salesman in the shoe trade, and in 1856 he went to Chicago, where he followed the same business. He joined the Plymouth Congregational Church of Chicago and began his Christian work there by organizing a class of boys taken from the tenement district of Chicago. He next started a mission school, which was very successful, and finally comprised 650 pupils and 60 teachers. In 1860 Moody gave up business and engaged entirely in Christian work. In 1862 he married Emma C. Revell, a sister of Fleming H. Revell, the publisher. In 1865 he was elected president of the Chicago Y. M. C. A. For the next six years he travelled in the interest of Sunday-school and Y. M. C. A. work. Mr. Moody was instrumental in causing the erection of some of Chicago's best-known religious structures. After the great fire in 1871 he erected on the site of his burned mission chapel a building costing \$70,000. He built, also, Farwell Hall, the first Y. M. C. A. building in this country. He caused it to be rebuilt after a fire which destroyed the first structure, and again after the great fire of 1871, and finally he built the present well-known Farwell Hall. He also built the Chicago Avenue Church and the Bible and Institute Buildings, Chicago. Y. M. C. A. buildings at New York, Boston, Philadelphia, Baltimore, Scranton, and other cities were erected largely through his influence, while in England and Scotland, where he first became really famous, a number of well-known Y. M. C. A. and other buildings had been erected through his personal efforts. The establishment of the school for Christian workers, the Northfield Seminary for Girls, and the Mount Hermon School for Boys, comprising many buildings, attracted hundreds of students annually, besides making the name of Northfield a familiar one in all parts of the United States and Great Britain. During the Civil War Mr. Moody was in the service of the Christian commission, and in 1898, during the Spanish war, he was actively engaged in Christian work among the troops in the South. His evangelistic work became widely famous when he visited Great Britain with his co-worker, Ira D. Sankey, in 1873. The meetings which have been held by him throughout this country have been extraordinary for their number and great attendance, and especially for their wide influence. The character and life-work of Moody were equally unique. Personally he was a man of strong physical constitution and even temperament, with no academic culture, but with the power of inspiring nearly all with whom he came in contact. His theology was that of the orthodox church of the early middle century. At the same time he showed both toleration and breadth. There was no denominationalism in his expressed views, his meetings were always on a union basis, and he accepted the co-operation even of men whose broader views he could not accept, such as Drummond, George Adam Smith, and Beecher. He was a theologian in no sense. His theme was the love of God, and his story was told in the plainest of English; his work as he saw it was to inspire men with faith and love. It has been pointed out by Dr. Lyman Abbott that "though his view of the Bible belonged to the past cycles of thought, his use of the Bible was essentially modern," and that no man of recent times did more to promote a careful study of the Bible, a study which if not always scholarly, was always intelligent and spiritual.

MORAVIAN CHURCH. During 1899 the most important event in this church was the assembling of the General Synod in the mother church at Herrnhut, Saxony. The congregations of the Moravian missions in Greenland were in 1899 placed under the charge of the Danish Lutheran Church of Greenland. The number of Moravians in the United States was 14,521, with 117 ministers and 109 churches. The total number of Moravians in 1899 in America, England, and Germany was about 200,000.

MORMONS, OR LATTER-DAY SAINTS. The Church of Jesus Christ of Latter-Day Saints founded by Joseph Smith in 1830, finally settling on the Great Salt Lake in 1847. In 1899 this body had 1700 elders and 300,000 church members. The sect is carrying on active missionary work in many parts of the world.

The Reorganized Church of Jesus Christ of Latter-Day Saints was formed in 1851 by the secession of some of the original founders of Mormonism under the leadership of Joseph Smith, son of the prophet. Its headquarters are at Lamoni, Ia. In 1898 it had 2200 ministers and 40,639 members.

MORMONISM. Interest in the subject of Mormonism was augmented in 1899 by the case of the polygamist, Mr. Brigham H. Roberts, the representative-elect from Utah to the Fifty-sixth Congress. Shortly after Mr. Roberts's election in 1898 a movement to insure his exclusion from the House of Representatives was begun, and before the meeting of the Fifty-sixth Congress it had assumed considerable importance. Especial activity was shown in it by the Woman's Board of Home Mis-

sions of the Presbyterian Church. The objection against the seating of Mr. Roberts was part of a wider movement against the spread of Mormonism. Alarm was felt in certain quarters on account of the growing strength of the Mormons, who were said already to have gained a great influence in the States adjoining Utah. When Utah was admitted as a State in 1896 a clause forbidding polygamy was expressly set forth in its constitution. But in 1898 and 1899 it was charged that in spite of the promises that had been made before 1896, and in spite of the prohibitory clause of the constitution, the Mormons of Utah were still contracting polygamous marriages, and were only waiting until they should be strong enough before practising polygamy upon the large scale of former years. The Mormons retorted that no polygamous marriages had been contracted since 1890, and near the beginning of 1899 Lorenzo Snow, president of the Mormon Church, uttered a pronouncement in which he asserted "unequivocally and without any mental reservation" that after the manifesto abolishing polygamy in the Mormon Church had taken effect in 1890, which manifesto was issued by Wilford Woodruff, the late president, on April 6 of that year, no polygamous marriages had occurred in Utah. He also declared that no such marriages could take place without ecclesiastical sanction, that there was no movement in the church for the revival of polygamy, and that he and the other leaders in the church were opposed to any such revival. President Snow, however, maintained the right of those who had taken plural wives before 1890 to continue their marital relations, and implied that these relations on the part of Mr. Roberts should be no obstacle to the latter's admission to Congress. Mormonism, declared President Snow, "does not mean polygamy." On the other hand the opponents of Mormonism declared that the doctrine of polygamy is an essential part of Mormonism, and they asserted that the manifesto of 1890 was merely a suspension of the practice of polygamy for the time being. They further alleged that polygamous marriages were taking place secretly, and in formidable numbers. In December, 1899, a delegation to Congress, representing the Gentile element in Utah, issued a statement that there were two thousand polygamous households in Utah, that plural wives are supported by prominent Mormon politicians and ecclesiastics, and that one thousand illegitimate children had been born to polygamous wives since the admission of Utah to the Union. It will be remembered that President Harrison issued a proclamation of amnesty in January, 1893, to all persons liable to the penalties imposed for plural marriages who had abstained from unlawful cohabitation since November 1, 1890, and that President Cleveland had issued a similar proclamation in 1894 on the ground that he had evidence that the members of the church were actually practising such abstinence. In regard to Mr. Roberts it was said that he had been convicted of living with plural wives before the amnesty proclamations of Presidents Harrison and Cleveland, and that he had not complied with the conditions of either of these proclamations. His conduct was moreover violative of the promise of the leaders of the Mormon Church in 1890, that all polygamous relations should cease, and that no new polygamous marriages should be consummated. He had urged the State to repudiate the promise which it had made as a Territory in order to secure statehood, and in this he was supported by the Mormon Church. The reason offered for such a course was that Utah was entitled of right to admission to the Union, without making such a covenant, and that the United States had no right to insist upon this covenant as a condition precedent to admission. It was thus obtained under duress, and was not morally obligatory. It was urged that by the election of Mr. B. H. Roberts Utah was virtually notifying the nation that she repudiated the solemn covenant which she made in order to secure statehood. In the petition which was sent to Congress urging the members to refuse Mr. Roberts his seat, it was advocated that an amendment to the constitution should be framed and submitted, making the election of polygamists henceforth impossible. Interest in the specific case of Mr. Roberts increased as the time for the convening of the Fifty-sixth Congress drew near, and widespread public opinion, as reflected in the press, was fairly well agreed against Mr. Roberts having a place in the House. Opinions differed, however, as to whether the House should refuse to admit him, or should first seat and then expel him. The majority of the people took the former view, and numerous protests against Mr. Roberts were made by churches, ecclesiastical bodies, and other organizations, representatives in Congress were appealed to by their constituents, and an immense popular petition was submitted to the House.

The pertinent arguments concerning the Roberts case involved two questions: (1) Had the House of Representatives constitutional authority to exclude Mr. Roberts? and (2) if it had, were the reasons for his exclusion sufficient? 1. Bearing directly upon the case the Constitution makes two declarations: First, that "each House shall be the judge of the elections, returns, and qualifications of its own members;" and secondly, that "no person shall be a representative who shall not have attained to the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in

which he shall be chosen." There was no doubt that Mr. Roberts possessed all the qualifications made in the second clause, with the exception of that of citizenship. This was a matter that elicited much discussion and is considered below. On the assumption, then, that he did possess all the qualifications named in the Constitution, had the House the power to refuse him his seat? On the one hand it was argued that not only no person without these could be admitted to the House, but that no person, even though possessing them, could be seated if the House, for reasons which it alone should decide to be sufficient, should vote to exclude him. The supporters of this constitutional interpretation based their judgment not only on what they held to be the plain meaning of the Constitution, but on the theory that the Constitution, being largely derived from the unwritten constitution of England, carries with it, in this matter of the rights of a parliamentary body to be the judge of its own members, the principles that have long obtained in Great Britain. On the other hand it was held that the Constitution permits the House of Representatives to decide only upon the questions of fact involved in the three qualifications explicitly set forth.

2. Those who believed that the House had constitutional authority to exclude Mr. Roberts held that the following was sufficient cause for exclusion; while those who believed that the House should first seat and then expel him held that the same reasons were adequate cause for expulsion. A federal law of 1862 prohibiting bigamy was amended in 1882, so that both the contracting of a polygamous marriage and the maintaining of marital relations with more than one woman was a felony and disqualified the offender from voting and holding office. This law, of course, applies only to Territories, and in the case of Utah became inoperative when that Territory was admitted to the Union in 1896. While the law was in force, however, Mr. Roberts contracted plural marriages, and for this felony was convicted in 1889 and served a term in prison. But thereafter and up to the present time he has not only supported his three wives, but continued his marital relations with them, and hence the proclamations of amnesty issued in 1893 and 1894 by President Harrison and President Cleveland were not applicable to him. On the ground of his being a convicted felon, who though having suffered the legal penalty had continued his criminal relations and had not received executive pardon, it was argued that he had lost his citizenship, and hence, according to the Constitution, was ineligible to office; while on the ground of the immorality of his continued polygamous relations it was argued that he was not a fit person to sit in the House of Representatives, and should therefore either not be admitted or be admitted and then expelled.

Those who maintained Mr. Roberts's citizenship said that by his conviction for crime he had not forfeited this, since the conviction had taken place prior to the admission of Utah as a State. In regard to his exclusion, rather than an admission to be followed by expulsion, aside from the constitutional objection held by some and mentioned above, it was argued that such exclusion would establish a mischievous precedent. By such a procedure "a formidable minority in the House," said Mr. Roberts, "may be reduced either to a very insignificant minority, or even blotted out of existence; the representation to which a State is entitled on the floor of the House may be denied to it." See ROBERTS, BRIGHAM HENRY.

MOROCCO, an African sultanate, lies between the Atlantic Ocean and the Mediterranean Sea on the north and the Desert of Sahara on the south, and Algeria on the east and the Atlantic on the west. The capitals are Fez, Morocco City, and Mequinez.

Area and Population.—As the southern frontiers are undetermined, the area cannot be stated with any degree of certainty; the most recent estimate places it at 219,000 square miles. Knowledge of the population is also very vague, but 5,000,000 is an estimate accepted by some authorities; other estimates range from 2,500,000 to 9,400,000. On the basis of the latter figure races are represented as follows: Berbers and Tuaregs, 3,000,000; Mued Arabs, 3,000,000; Shellah Berbers, 2,200,000; nomadic Bedouin Arabs, 700,000; negroes, 200,000; Jews, 150,000. Of the 5000 Christians in the country about 4000 are thought to be in Tangier. The inhabitants of Morocco are Sunnite Mohammedans of the Malekite sect. The population of Fez is about 140,000; Mequinez, 56,000; Morocco, 50,000; Tangier, 30,000.

Government, etc.—The government is an absolute despotism, the Sultan being the head of both civil and religious law. The Sultan is Mulai-Abd-el-Aziz, who has reigned since June 7, 1894. The ministers who assist him, but who have no executive authority beyond what he chooses to give them, are the grand vizier, chief chamberlain, chief administrator of customs, chief treasurer, and the ministers of foreign affairs, home affairs, and war. The army comprises about 10,000 infantry and 400 cavalry, besides 2000 irregular cavalry. The navy amounts to very little, consisting of only three or four small vessels. These include two gunboats, one having a displacement of 1200 tons, and an old iron screw vessel, while recently another gunboat was

building at Sampierdarena. The annual imperial revenue is about £500,000 (\$2,433,000).

Industries and Commerce.—Among the chief products are wheat, barley, maize, peas, beans, oil, esparto, and hemp; the fruits produced include figs, almonds, oranges, dates, lemons, pomegranates, and olives. Agriculture is in a backward condition, and the development of the general resources of the country is retarded by the barbarous government. The mineral wealth is said to be considerable, including copper, lead, tin, iron, antimony, coal, gold, and silver. Among the exports are wool, almonds, pease, beans, dates, gums, esparto, slippers, carpets, and leather. The imports include cotton, linen, and other textiles, provisions, iron goods, and other hardware. The imports and exports in 1896 amounted to £1,315,536 and £1,286,847 respectively; in 1897, imports £1,396,970, exports £1,114,136. Great Britain leads in both the import and export trade, with France and Germany ranking next. The chief ports are Tetuan, Tangier, L'araiche, Rabat, Mazagan, Mogador, Saffi, and Dar-al-Baida. The total tonnage entered at these ports in 1897 amounted to 949,376 tons, carried in 2038 vessels.

History.—A critic of England's policy toward Morocco declares that in recent years English interests in that country have not advanced. The French, on the other hand, according to this writer, have done much to promote their influence in Morocco. Recent events which have prejudiced the Sultan against the English were the attempt of a trading company to establish itself on Cape Jubly, and of an English adventurer named Spilsbury to form a sort of protectorate in the Sous country in southern Morocco. The trading company tried to evade the excise duties in its dealings with the natives, and one of the traders was shot by the Moors. The British government obtained an indemnity, but the trading company was removed. The filibustering expedition of Spilsbury and his men resulted in a conflict with the natives. Spilsbury was charged with an assault on the Sultan's police, but acquitted at his trial, which occurred at Gibraltar. France has tried to keep on friendly terms with the Sultan in the interest of trade and internal developments. In 1897 and 1898 certain tribes in the Algerian province of Oran, which were under the protection of France, were injured by rival tribes in Morocco. An indemnity was demanded, but the Sultan postponed payment. In 1899 the French consul-general of Tangier went in person to Fez to present to the Sultan the claim for indemnity. In general, however, the Sultan showed a readiness to make concessions to France. He agreed to open two ports on the coast of Sous to foreign commerce, and to introduce certain measures of reform.

MOUAT, Sir JAMES, K.C.B., died January 4, 1899. He was born in 1815, and was educated at University College, London, and in Paris. In 1838 he entered the army medical department. He served in the Crimea in 1854-55 and in New Zealand in 1860-65, being made surgeon-general in 1864. He was appointed honorary surgeon to the Queen in 1888, and was created K.C.B. in 1894.

MOWBRAY, Sir JOHN ROBERT, D.C.L., M.P., died April 22, 1899. He was born at Exeter, June 3, 1815; was educated at Westminster and at Christ Church, Oxford. He became a barrister at the Inner Temple in 1841. He was a Conservative member of Parliament for the city of Durham from 1853 to 1868 and for the University of Oxford from the latter year to the time of his death. He was father of the House of Commons. In 1858-59 and in 1866-68 he was judge-advocate-general, and in the latter two years and from 1871 to 1893 was church estate commissioner. He was created a baronet in 1880.

MUNICIPAL BATHS AND WASH-HOUSES. Germany was the first nation in modern times to establish public baths. Great Britain, however, was the first country to inaugurate the modern system of enclosed baths and wash-houses. Liverpool opened the first of these in 1842, and her example was quickly followed by cities and towns throughout the kingdom. Of the 65 county boroughs, with over 50,000 population, only 7 do not have public baths. Of the 250 smaller boroughs, 74 have public baths. During 1899 several English cities erected bathing establishments. Bradford is erecting a central establishment at a cost of about \$146,000, and five smaller district baths. In Poplar the foundation stone for new baths was laid December 7, 1899. Pancras is doubling its bathroom accommodations. Shoreditch opened a fine new bath-house, wash-house, and gymnasium in March. West Haven and Stratford are both constructing bath-houses, the latter to include a Turkish bath.

In the early part of October the engineer and superintendent of the Liverpool Municipal Baths presented some plans to the corporation for bath-houses suitable

for the very poor, and the corporation decided that one such bath should be erected as an experiment. The building is to have a frontage of 45 feet and depth of 75 feet. There will be a separate entrance for men and women, with penny-in-the-slot type of arrangements for receiving admittance tickets. The bath halls are $28 \times 15\frac{1}{2}$ feet, providing for 10 men's rain baths and 4 women's rain baths, each having a dressing-box; also one slipper bath, so that women can bathe their children who are too young for a shower bath. The staff required is one man and his wife and a messenger boy. Free bath tickets are to be distributed on application by the medical health officer. The probable cost of the building is \$7200 to \$9700, and the annual cost of maintenance about \$1500. In Halifax, Manchester, and Rochdale, baths are furnished free to school children, and a movement to this end is under way in London.

Germany has municipal bath-houses in more than 45 of its cities having a population of over 50,000. France has fewer. In Austria, Norway, and Sweden, baths have been erected in the larger cities. Vienna has eleven. In the United States only ten or a dozen cities are reported as possessing any form of municipal bath-house. The small number of bathing establishments in America may be partly due to the greater prevalence of private bathrooms and to the bathing facilities connected with Y. M. C. A. buildings and athletic and other clubs. New York was constructing in 1899 on Rivington Street a building to accommodate 2000 bathers daily, and also wash-houses at the cost of \$95,000. New York already maintains five bathing places on the Hudson and nine on the East River. At these places, in 1899, about 3,870,000 baths were taken, of which one-fourth were by women and girls.

Two forms of bath are provided for in the modern bath-house—the slipper bath, so called because it is taken in a tub, usually covered at one end like a slipper, and the rain or shower bath. The most recent tendency seems to be in favor of the shower bath, as possessing the following advantages: It requires less space, less water (11, instead of 50 or 60 gallons), and less attendance, and is therefore cheaper. It is also more sanitary, because cleanliness is more easily maintained, and there is no danger of infection from the former occupant of the bath. There is also less danger that the bather will take cold.

A. Heessel Tiltman, in a paper read before the Royal Institute of British Architects in February, 1899, points out that while municipal bath-houses are very popular, they are not patronized by the class for which they were chiefly intended—the very poor. The twofold cause he gives is that the bath-houses are not sufficiently accessible, and that sufficient effort is not made to educate the masses in cleanliness. His scheme for reform proposes that the municipal system should embrace three types of bathing establishments: (1) The central establishments, containing swimming pools for both sexes, as well as slipper, shower, and hot-air baths; (2) the district bath and wash-houses to be much smaller, much nearer together, and located in the poorest and most crowded districts, each building containing not more than 50 rain-baths and from 30 to 50 washing compartments; (3) the people's baths, very small buildings, consisting of a series of double cells, $6 \times 3\frac{3}{4}$ feet, serving as dressing and washing compartments, the aim being to provide in the simplest and cheapest manner shower baths for the very crowded districts.

Municipal Wash-Houses.—These are usually constructed in connection with the municipal bathing establishments. In Glasgow the city furnishes power, water, and drying apparatus for about four cents per hour. In England a new and very beneficial addition to the wash-house department is a public crèche, where any washer having young infants with no one to take care of them at home may leave them free of charge during such time as she is engaged in the wash-house.

MUNICIPAL GOVERNMENT. The present article is confined to a discussion of some of the topics brought up at the annual meetings of the League of American Municipalities and the National Municipal League, and to a brief record of the municipal legislation of the year. The absence of official statistics for American municipalities has been the occasion of much complaint, and some of the organizations having to do with the improvement of municipal government—namely, the American Society of Civil Engineers, the National Municipal League, and the American Society of Municipal Improvements—made an effort in 1899 to have the Eleventh Census undertake the collection of complete municipal statistics. But the law providing for the census prohibits such additional subjects from being taken up until after the main schedules are completed in 1902. In the meanwhile, however, under a law passed in 1898 the Department of Labor has undertaken the collection of municipal statistics, and in the *Bulletin* for September, 1899, a large body of such statistics is presented, covering a wide range of information for cities having a population of 30,000 or more. There are more than 140 of such cities, and the statistics are too voluminous to be repeated here.

Meetings of Societies.—The annual convention of the League of American Municipalities was held at Syracuse, N. Y., September 19-22, 1899. Among the topics discussed were garbage collection and disposal (*q. v.*), the special assessment system

for public improvement, the question whether contract or day's work was the better system for municipal public works, the constitutional limitation of municipal indebtedness in relation to public improvements, and the administration of English municipalities. But by far the most important topic both in the matter of the papers read and in regard to the discussion that it occasioned was the general question of municipal ownership of public service industries. A brief résumé of the arguments may be presented here. On behalf of municipal ownership it was urged that where it had been adopted there had been a saving to the people and an improvement in the service rendered. In regard to municipal ownership of water-works, it was argued that the system was coming into general favor, that it prevailed throughout foreign countries, and that 1700 of the 3200 American works in existence in 1897 were under public ownership. A great many instances were cited of the success of municipal ownership in this field, as well as in lighting, street railway, and telephone systems. The argument was advanced that the people should do for themselves in the ownership of their public utilities what capital is doing for itself, and that the trusts furnished an object-lesson to the people in the matter of reducing the cost of production. Municipal ownership was favored also on the ground that it tended toward a higher morality and enhanced interest in municipal affairs. The pessimistic prophecies in regard to certain services when they were undertaken by city governments had not been fulfilled, and, on the contrary, there had generally been a reduction of the cost of service. On the other hand, one of the opponents of municipal ownership went so far as to say that money taken from taxpayers for expenditure on municipally owned industries was virtually confiscated. Mr. Robert P. Porter declared his opinion that the municipal ownership movement in the United States was a menace to sound government; that the movement had not made the progress in Great Britain that had been reported, and that the results where it had been practised there were by no means what had been claimed for them. It was a question whether in the matter of water, gas, and street lighting the United States or the United Kingdom was in the lead. Again, it was argued that public ownership meant a bad administration of the service; that the civil service would be insufficient; that clerks and other officers would receive higher salaries, and that under a democratic form of government it was doomed to failure. One speaker declared that municipal ownership of street railways abroad did not give as good results as private ownership in this country. He attributed this chiefly to the lack of an incentive to economize the operation of the municipal plants, and he stated that there was a population of 15,000 per mile of track abroad to 2600 in the United States. A critic of municipally managed industries reported that the cost of the municipal electric lighting plant in Detroit was far greater than the price for which a private company had offered to do the work, the difference in favor of the latter being \$29 in 1898. Professor E. W. Bemis, in answering Mr. Porter's criticism of municipal ownership in England and Wales, said that 45 out of the 64 county boroughs in those countries owned their water-works, that 21 per cent. of the street railway track was owned by municipalities, and that 42 per cent. of the English electrical lighting plants were owned by the cities and towns. Under a proper system of charges the profits should not be included in the cost. He presented figures to show that in a large number of cases the private lighting plants in this country were charging more than the municipal plants for street lighting.

The National Municipal League held its fifth annual meeting at Columbus, O., November 15-17, 1899. It devoted most of its time to the discussion of the "Municipal Programme" which had been framed in the previous year. This programme included a draft of a model charter, together with suggestions for constitutional amendments, which would be required in certain of the States for its adoption. Among the points brought out during the discussion were the fact that in the course of the year many improvements had been made in municipal government. As an instance of this it was pointed out that out of the 52,000 employees under the municipality of Greater New York, about 50,000 were under civil service or personal registration rules, and that in general there was a tendency toward non-partisanship and toward the conduct of city governments on business principles. One speaker declared that the chief causes of wastefulness in municipal expenditures were ignorance, partisanship, State interference, municipal irresponsibility, and indefiniteness of organization. The municipal programme tries to meet these dangers by introducing the principles of municipal home rule, of separation of the legislative and executive functions, of the merit system, of a uniform system of accounting, of nominations to office by petition, of short-term franchises, etc. There was considerable discussion of the Ohio municipal code, which was to be submitted to the legislature in January, 1900. This code is based largely on the municipal programme. It provides for cities and villages, the dividing line being a population of 3000. Some of the features of the municipal programme had gone into effect in a codification of the township laws of Indiana, and in Wyoming the principle of a uniform

system of accounting was established by the appointment of a State examiner of accounts, both municipal and State. In Minnesota and Indiana a beginning has been made along this line. In New York there was an attempt to secure uniform municipal accounts, but it was not successful.

Municipal Legislation.—The new charter for San Francisco went into effect on January 1, 1900. It has been upheld by the State Supreme Court. The chief conclusions reached by the commission appointed in 1898 to consider the municipal code in Ohio are stated by one of the members as follows: The old classification of cities should be abolished, and municipal corporations should be governed by local councils and not by the State legislature. The functions of city councils should be limited strictly to legislative matters, and administrative functions should be confined to the executive department of the cities, with the mayor as the responsible head. Subordinate offices should be filled by the merit system of appointment. Municipal officers, including members of the board of education, should be nominated and elected upon a non-partisan ballot. In New Jersey a general law relating to the government of cities under 12,000 empowered the city councils to make such ordinances, not contrary to the laws of the State or of the United States, as it may deem necessary for good government, etc., and a commission was established to report on the revision and codification of municipal laws. A similar extension of the powers of city councils was authorized in North Dakota by general law, and in South Carolina the municipalities acquired the right to adopt amendments to their charters on petition of a majority of the freeholders and on a majority vote of the electors. The eight-hour day for city laborers was adopted in many municipalities. Popular votes were given in its favor at municipal elections in Massachusetts. Another feature of municipal policy in 1899 was the tendency to substitute the day labor plan for contract work. See the articles on the separate States.

MUNICIPAL GYMNASIA. The first indoor municipal gymnasium ever constructed in the United States with public funds was formally opened in Boston on November 1, 1899. The structure cost \$28,000. It was erected from plans prepared by F. W. Howard, chief architect, division of the engineering department of the city. It covers an area of approximately 10,000 square feet. The style of the building is English domestic architecture. Provision is made for a gymnasium-hall giving a floor area of about 6800 square feet, with a clear height of 18 feet under the trusses. There is a running track, 18 laps to the mile, around the walls of the building, suspended from the trusses. It is raised at the corners, padded, and covered with rubber matting. The building is heated by steam from a boiler plant located in an adjoining brick building, and from this plant is supplied the hot water for bathing and toilet purposes. On the north side of the building are the office, coat-rooms, and locker-rooms, giving accommodations for 200 men; also dressing-rooms, toilet-rooms, and shower bathrooms. On the second floor are the accommodations for women. It is the intention to use the shower-room as a public bath. The building is lighted by electricity. It is thoroughly equipped with first-class apparatus. The management has been given to Mr. John W. Bowler, formerly superintendent of the Charlesbank gymnasium, Boston. An out-of-door public gymnasium was opened in Boston as early as 1826. Two instructors were employed, and a class of 400 pupils was formed, on whose roll many well-known names appear. But its popularity soon waned.

In the new bath-house at Shoreditch, England, completed in March, 1899, one of the rooms is to be used for baths only in the summer, being transformed into a public gymnasium in the winter. This seems to be a common practice in the English bath-houses. See **MUNICIPAL BATHS**; **PARKS**.

MUNICIPAL IMPROVEMENT, AMERICAN SOCIETY FOR, founded in 1894, had in 1899 a membership of 95, consisting of city engineers, commissioners of public works, street, sewer, and water-works superintendents, and other city officials. At the annual meetings a variety of papers were read on topics relating to municipal engineering and sanitation. The society publishes annual reports. President, A. D. Thompson, Peoria, Ill.; secretary, D. L. Fulton, Allegheny, Penn.

MUNICIPAL LEAGUE, NATIONAL, formed in 1894 to improve municipal government, had 115 affiliated associations in 1899. The League has published the *Municipal Program*, and *The Proceedings of the Columbus Conference for Good City Government*. Secretary, Clinton Rogers Woodruff, 1112 Girard Building Place, Milwaukee, Wis.

MUNICIPAL OWNERSHIP. See **ELECTRIC LIGHT AND POWER**; **ELECTRIC STREET RAILWAYS**; **MUNICIPAL GOVERNMENT**.

MÜNSTER, Prince GEORGE HERBERT, German ambassador to France, was the head of the German delegation at the peace conference which met at The Hague in May, 1899; in the following August Emperor William granted him the title of Prince of Derneburg. Prince Münster was born in London, England, December 23, 1820. From

1857 to 1865 he was Hanoverian ambassador at St. Petersburg, and in 1866, after the annexation of Hanover, was one of the first nobles of his state to give a hearty allegiance to the King of Prussia. He became a hereditary member of the Hanoverian house of lords and marshal of the *Landtag* in 1867, and from that year sat occasionally in the North German and then in the German *Reichstag* as a Free Conservative. From 1873 to 1885 he served as German ambassador at London, and was then transferred to Paris, his present position, to succeed Prince Hohenlohe, now Imperial Chancellor. Prince Münster has done much to promote better relations between France and Germany. He has written: *Politische Skizzen über die Lage Europas vom Wiener Kongress bis zur Gegenwart*, 1867; *Mein Anteil an den Ereignissen des Jahres 1866 in Hannover*, 1867; *Der Norddeutsche Bund und dessen Uebergang zu einem deutschen Reich*, 1868; *Deutschlands Zukunft, das deutsche Reich*, 1870.

MURRAY, JAMES ORMSBY, M.A., D.D., LL.D., dean of Princeton University, died at Princeton, N. J., March 27, 1899. He was born at Camden, S. C., November 27, 1827. He was graduated at Brown in 1850, after which he taught Greek there for one year; he then entered Andover Theological Seminary, being graduated in 1854. From this time until 1861 he was a Congregational clergyman in South Danvers (now Peabody), Mass., from 1861 to 1865 in Cambridgeport, Mass., and from the latter year to 1873 at the Brick Presbyterian Church in New York City. Dr. Murray was called to the chair of the English language and literature and belles lettres at Princeton in 1874, which position he thereafter occupied. His lectures became very popular. In 1886 the trustees of the university created the office of dean of the faculty, and elected Dr. Murray to the position. His degrees were received as follows: LL.D. from Brown in 1865, D.D. from Princeton in 1867, and M.A. from Princeton in 1896. Largely due to his influence was the adoption of the honor system in examinations at Princeton and subsequently the abolition of hazing. In 1893 and 1895 he delivered the L. P. Stone lectures at Princeton Theological Seminary, the first course being on *Scepticism in Literature* and the second *Religion in Literature*. Dr. Murray was compiler and editor of the hymnal, *The Sacrifice of Praise*. Among his best known works are *William Gamwell: A Biographical Sketch with Selections from his Writings*; *George Ide Chace: A Memorial*; *Life of Francis Wayland*; *Introduction, with Bibliography, to Cowper's Poetical Works*; *Lectures on English Literature*. The recently endowed chair of English literature at Princeton, a call to which has been accepted by the Rev. Dr. Van Dyke, of New York, who, like Dr. Murray, also goes from the Brick Church, was named in honor of the popular dean. At the time of his death it was said that "few men in the academic world of this generation have made a deeper impression upon the young men under their care than Dean Murray." He was "a Christian gentleman of the old-time and all-time type; a man of fine natural qualities, full of humor, good sense, and with a gift for fellowship and friendship which made him the most companionable and lovable of men."

MUSEUM OF NATURAL HISTORY, AMERICAN, at Central Park West and Seventy-seventh Street, New York City, organized 1869, had in 1899 a membership of 1076. Has a large building, the corner-stone of which was laid in 1874, and has large collections of specimens, open to the public five days in the week. The museum conducts several series of lectures to public school teachers and others. President, Morris K. Jesup; secretary, John H. Winser.

MUSIC IN 1899. The year as a whole was particularly lacking in the production of any new works of the first importance or the introduction of any new celebrities. In Germany, Weingartner, Strauss, Muck, Mottl, and Nikisch continue to be the influential conductors; the younger Russian composers invade concert programmes in England and France as well as in Germany; the oratorio assumed more importance than usual owing to Perosi; the opera reasserted itself in the new world; and Paris lost a great conductor in Charles Lamoureux, who for many years had striven earnestly for recognition of German music in France. Death removed Johann Strauss, the composer of operas and waltzes; Amalie Joachim, the famous singer and wife of Joachim, the violinist; the Chevalier Antoine de Kontski, a contemporary of Beethoven, and a well-known pianist; Foli, an old opera singer (whose real name was Allan James Foley), and F. J. H. Prume, the violinist.

There were no new operas of any great importance. Much interest was felt in Siegfried Wagner's maiden effort, *Die Bärenhäuter*, presented for the first time in Munich on January 20. It was given in several German cities and even reached Prague, while excerpts found their way into concert halls in various parts of the world. There is little originality in the work. The hero, Hans Kraft, sells his soul to the devil, and can be redeemed only by the love of a faithful woman. The story, therefore, suggests *Tannhäuser* and *The Flying Dutchman*, but there is also a ring which three water-fairies try to steal from the hero. The musical themes of the opera are announced in the overture, and the orchestration is a strong feature of the whole work. Felix Weingartner con-

ducted his opera, *Genesius*, in Leipsic; Zollner's *Die Versunkene Glocke*, founded on Hauptmann's drama, was much liked in Berlin; and Bungert's *Circe* had its first performance in Hamburg. Other successful operas were Dvorák's *The Devil and Katie* (*Cert a Káca*), Prague; Wolf's *Der Corregidor*, Prague; Rudolph von Procházka's fairy opera, *Gluck*, Prague; Jan Blockx's *Heerberg-Princess*, The Hague; Granados's *Maria del Carmen*, Barcelona; Servais's *Ion*, Carlsruhe; Brauer, *Morgiana*, Carlsruhe; Falchi's *Trillo del Diavolo*, with Tartini as the hero, Rome; J. Stenhammer's *The Feast of Solhang*, after Ibsen, Stuttgart; Hallén's *Waldemar's Treasurc*, Sweden; Puget's *Beaucoup de Bruit pour Rien* (on *Much Ado About Nothing*), Paris; and Massenet's *Cendrillon*, Paris. The revival of interest in Mozart occasioned the dramatic scenes, *Mozart and Salieri*, by Rimsky-Korsakoff, played in Moscow. Pushkin's text is used, and themes from Mozart are introduced. Sir Arthur Sullivan wrote a new comic opera; text by Basil Hood, London.

Notwithstanding the popularity of Wagner, many old operas were revived and proved highly successful. The model performances of Mozart's works in Munich, under Possart's careful direction, were imitated in other German cities. *The Magic Flute* received especial favor. It had a long run in Berlin, and thirty performances in Bremen, leading all other works in popularity. This opera was performed in London at the Lyceum Theatre by the students of the Royal College of Music. The interest in Mozart extended to London and New York, but an attempt to revive *Le Nozze di Figaro* in Milan, where it has not been heard since 1825, was not, however, successful. Weber's *Euryanthe* was revived at the Royal Opera, Berlin, under Richard Strauss with great success, and *Oberon* was revived at the Théâtre Lyrique, Paris, with such brilliant results that it is likely to remain in the repertory for a long time. Of course, Wagner's works had their share of popularity. *Der Ring des Niebelungen* was twice given in London, and three times in New York without cuts, and it was represented also at the Royal Theatre, Madrid, where it was a novelty. The text was translated into Spanish by Señor Cardanus. Richter, Mottl, and Muck conducted. A cycle of Wagner's works was given in Prague, with a performance of young Wagner's *Die Bärenhäuter*, the conductors being Mottl and Leo Bluh. The special performances of Wagner's works given annually in Munich began this year with the early and seldom heard opera, *Die Feen*. *Tristan und Isolde* was heard for the first time in Paris. It was given under the direction of Lamoureux; Frau Wagner went to Paris for the occasion. *Parsifal* travelled to Constantinople, where excerpts were given at the Græco-French Institute under Paul Lange. The Bayreuth festival began on July 22, with the *Ring*, conducted by Siegfried Wagner, and Hans Richter conducted *Die Meistersinger* and *Parsifal*.

A cycle of the dramatic operas by Smetana was given at the National Theatre, Prague, and Smetana's *Dalibor* was successfully revived in Leipsic. Berlioz's *Les Troyens* was played in Carlsruhe under Mottl, and *La Prise de Troie* was given at the Paris Opera. Méhul's *Joseph* was revived at the Paris Opera and was much liked. It was also successful in Milan. At the Opera Comique Adam's *Le Châlet* achieved its 1400th representation. This opera was also revived in London and was sung at Windsor at the Queen's request. Donizetti's *Don Pasquale* was revived in Berlin, and Verdi's *Ernani* in Dresden. An old opera by Spohr, *Die Kreuzfahrer*, the score of which was discovered recently in the archives of the Royal Theatre at Cassel, was performed there in May, during a competition of male choirs under the patronage of Emperor William. Lortzing's posthumous opera, *Regina*, had its first performance at the Royal Opera, Berlin, and was well received. *Pinafore* was revived in London. Perosi's oratorios were heard universally. *The Resurrection of Lazarus* failed to produce much impression in Berlin and New York. He conducted his new oratorio, *Il Natale del Redentore* (*The Nativity of Christ*), at Como for five successful days, September 19-22. The first performance of his new mass, *Benedicamus Domine*, which obtained the prize at the exhibition of sacred art in Turin, took place at the Church of the Sacred Heart, Turin, on April 2. August Klughart brought out a new oratorio, *The Destruction of Jerusalem*, Regensburg; Woyrsch, a "Passion oratorio," Frankfort-on-the-Main. Lortzing's oratorio, *Die Himmelfahrt Christi*, the score of which had long been lost sight of, was sung in Liegnitz with great success; Max Bouch brought out *Gustavus Adolphus*, Gotha; and Peter Benoit, a cantata for the Van Dyck festivities at Antwerp. Mendelssohn's *Elijah* was sung in Yokohama; and Sir Frederick Bridge gave an exceptionally fine performance of *The Messiah* at Albert Hall with the Royal Choral Society according to the Handel traditions and without the Mozart accompaniments. The same conductor gave a performance of Wagner's *Holy Supper of the Apostles* in London.

Among the other novelties of 1899 were a new song cycle by Liza Lehmann, *In Memoriam*, consisting of ten vocal numbers for baritone solo. It was first sung at a Saturday popular concert, November 23. Richard Strauss's new symphonic poem, *Heldenleben*, was given by the Museum Society, Frankfort-on-the-Main; Ernst von Dohnányi's new string quintet was played by the Chamber Music Union, London;

Felix Weingartner completed a new symphony and a new string quartet. Under Nikisch the Berlin Philharmonic Society played as novelties a new symphonic poem by Carl Gleiütz, called *Fata Morgana*; a symphony in G minor, by César Franck; an unpublished symphony by Bruckner; a symphonic poem, *Antar*, by Rimsky-Korsakoff; Vincent d'Indy's symphony upon a mountain theme; Gernsheim's G minor and St. Saëns's A minor symphony. The chief novelties heard in New York in 1899 were: Frank Van der Stucken's *William Ratcliff*, a symphonic prologue; Vincent d'Indy's *Istar*, variations; Chabrier's *Bourée Fantastique*; Arthur Foote's A minor piano quintet; Richard Strauss's piano quartet; a psalm by Horatio W. Parker; a sonata for piano and violin by Mrs. H. H. A. Buch; a quintet by César Franck; a sonata for piano and violin by Walter Damrosch; a terzetto by Dvorák, and a piano trio by Henry Holden Huss. An interesting concert of ancient Greek music was given in Bremen. *The Hymn to Apollo*, discovered at Delphi, and a fragment of the *Orcestes*, of Euripides, were heard.

The changes in the musical world were not many. Sir Hubert Parry succeeded Sir John Stainer as professor of music at Oxford; Sir A. C. Mackenzie resigned his post as conductor of the London Philharmonic, and was succeeded by Frederic H. Cowen; and Hans Richter made a fresh agreement with the Opera of Vienna to remain there until 1904, with the privilege of conducting the concerts in Halle and Manchester. Arthur Mees was elected director of the Mendelssohn Glee Club, of New York, and E. A. MacDowell was made president of the Manuscript Society.

A new conductor rose to fame in New York, Franz Kaltenborn, who first appeared at a song recital by Lilli Lehmann. His series of popular concerts in the summer were an unprecedented financial success, and established his reputation. Mascagni took his orchestra on a tour in Europe; Leandro Campanari's orchestra achieved renown in Milan by giving all of Beethoven's symphonies; Paderewski won universal admiration; Petschnikoff became famous with his violin; and Burgstaller played *Parsifal* successfully at Bayreuth. The visitors to the new world were numerous: Camille St. Saëns gave four concerts in Rio Janeiro; Frederic H. Cowen visited Canada; Blanche Marchesi gave song recitals in New York and other cities; Joseffy, Paderewski, Teresa Carreño, De Pachmann, Mark Hambourg, Sauer, Leopold Godowsky, Josef Weiss, Louis Breitner, Lady Hallé, Petschnikoff, Elsa Ruegger (the 'cellist'), Clara Butt, Adele aus der Ohe, and Willie Burmester appeared in concerts and recitals.

New York had a particularly successful opera season. The company included Marcella Sembrich, Lilli Lehmann, Jean and Édouard de Reszké, Van Rooy, Schumann-Heink, Albert Saléza, Carbone, Campanari, Plançon, Salignac, Clementine de Vere, Victor Maurel, Andreas Dippel, Marie Brema, Van Dyck, David Bispham, Emma Eames, Lilian Nordica, and Suzanne Adams. Three cycles of the *Nibelungen Ring* were given. *Lohengrin* had nine performances; *Faust*, eight; *Tannhäuser*, *Roméo et Juliette*, and *Die Walküre*, each seven; *Les Huguenots*, six; *Tristan und Isolde* and *Don Giovanni*, each five; *Das Rheingold*, *Siegfried*, *Die Götterdämmerung*, and *Aida*, four; *Carmen*, *La Traviata* and *Le Nozze di Figaro*, each three; *Lucia di Lammermoor*, *Rigoletto*, *Le Prophète* and *Ero e Leandro*, two; and *L'Africaine*, *Manon*, *La Favorita*, *Il Trovatore*, *Philémon et Baucis*, and *Cavalleria Rusticana*, one each. The Grau company played in Boston, Chicago, and other cities. The Ellis and Damrosch opera company played chiefly in Philadelphia and Boston. Melba, Gadschi, Ternina, and Alvarez, who made his American *début* in Boston, January 25, were the principal singers. Puccini's *La Bohème* was given in Boston, January 9, with Melba. In the autumn the Grau company, with many of the same singers, and including Alvarez, had a season in Chicago and Boston before opening in New York.

In England two composers gained in reputation, Elgar and S. Coleridge Taylor; the musical season was brilliant. Richter gave concerts; Lamoureux conducted his orchestra in London; Sarasate, Dohnányi, Busoni, Chaminade, Moszkowski, Martucci, Rachmaninoff, Richard Strauss, Blanche Marchesi, Carreño, and Paderewski are among the artists who appeared in 1899. The opera opened in Covent Garden on May 8, with *Lohengrin*, conducted by Dr. Muck, of Berlin. The Grau company included: Frau Mottl, Litvinne, Mlle. Strakosch, Susan Strong, Eames, Schumann-Heink, Nordica, the De Reszkés, Scotti, Van Rooy, Dippel, Gadschi, Van Dyck, Zélie de Lussan, Lucienne Bréval, Melba, Lilli Lehmann, and Bispham. The season closed July 24. *Faust* was given seven times; *Lohengrin*, six; *Roméo et Juliette*, five; *Tannhäuser*, five; *Carmen*, five; *Aida*, four; *Pagliacci*, four; *La Bohème*, four; *Tristan und Isolde*, four; *Cavalleria Rusticana*, three; *Die Walküre*, three; *Don Giovanni*, three; *Die Meistersinger*, three; *Der Fliegende Holländer*, two; *Les Huguenots*, two; *Lucia di Lammermoor*, two; *Norma*, two; *Fidelio*, one; *Ero e Leandro*, one; *Rigoletto*, one, and *Le Châlet*, one. Isidore de Lara's *Messaline* was also given with Mlle. Héglon, Leclerc, Alvarez, and Renaud. Schumann's music to

Byron's *Manfred* was given for the first time in London on June 21, and Sir A. C. Mackenzie wrote incidental music for *Manfred*.

Broadwood raised an important question with regard to the lowering of the pitch of pianofortes. There has been a general rise of pitch during the present century, and at the same time an increasing movement to check that rise and follow the "normal" or "continental" pitch, determined by the French commission of 1858, which decided that the middle A should equal 435 vibrations.

The library of the British Museum acquired a collection of 35 unknown madrigals, three being by Palestrina; the Bibliothèque de l'Opéra, Paris, was presented with Alboni's piano by Mme. Marie Marimon. A new manuscript by Schubert was discovered, bearing the date "Wien im November, 1825," and in one corner the word, "Schwammerl," a nickname of Schubert. The manuscript was sold at auction in Ziegelhausen, near Heidelberg.

There were many musical festivals during 1899. The Allgemeiner Deutscher Musikverein met at Dortmund; a musical festival was held in Meiningen from October 7 to 10 in connection with the unveiling of the Brahms memorial. Brahms's *Deutsches Requiem*, *Triumphlied*, *Tragic Overture*, and Second and Fourth symphonies were played, and also works by Haydn, Schubert, Mozart, Schumann, and Beethoven, including the *Ninth Symphony* and *Fidelio*. At Cassel eighteen German male societies had a festival under the patronage of the Emperor. The Cologne Maennergesang-Verein carried off the first prize. The jury included Reinecke, Schuch, Wüllner, and Richard Strauss. At the musical festival on the Lower Rhine, held in Düsseldorf, the following were performed: Beethoven's *Missa Solemnis*; Bach's cantata, *Halt in Gedächtniss Jesum Christum*; the prelude to *Parsifal*; Liszt's symphonic poem, *Orpheus*; Beethoven's triple concerto; R. Strauss's new symphonic poem, *Heldenleben*; Mendelssohn's *Walfurgis Nacht*; Schumann's symphony in B flat; R. Strauss's *Don Quixote*; Brahms's *Rhapsody*, for contralto solo and male choir, and the second act of Cornelius's *Barber von Bagdad*. The conductors were Richard Strauss and Butts.

At the Worcester festival, England, S. Coleridge Taylor, Elgar, and Horatio W. Parker attracted attention with new works. The last named conducted his *Hora Novissima*, a setting of Bernard de Morlaix, for soli, chorus, and orchestra, which was admired. S. Coleridge Taylor's *Solemn Prelude*, for orchestra, was performed, and Elgar's *Lux Christi* and *Orchestral Variations on an Original Theme* were conducted by the composer. At the Norfolk and Norwich festival Randegger conducted Berlioz's *Faust* and Perosi's *Passion of Christ*. Sir Hubert Parry's *Song of Darkness and Light*, Elgar's *Lux Christi*, Cowen's *Ode to the Passions and Endymion*, S. Coleridge Taylor's *Hiawatha's Wedding Feast*, Verdi's new sacred works, and Dvorák's biblical songs were performed. There were also festivals in North Staffordshire and in Sheffield. The London Musical Festival (Mr. Robert Newman's series of concerts), May 8-17, was a colossal enterprise. There were two orchestras; one, led by Mr. Henry J. Wood; the other, by Charles Lamoureux; Paderewski, Ysaye, and Lady Hallé appeared. Perosi's *Transfiguration of Christ*, *The Raising of Lazarus*, and the *Resurrection of Christ* were given. An Irish Musical Festival (Feis Ceoil) was held in Dublin (May 15-20). Plunkett Greene and Miss Florence Daly were among the solo singers. The competitions lasted a week, ending in a band contest. Various prizes were offered. Holyoke, Mass., had a festival, with C. S. Cornell as conductor. Haydn's *Creation*, Rossini's *Stabat Mater*, and S. Coleridge Taylor's *Hiawatha's Wedding Feast* were performed. Musical festivals were also held in Toronto, Albany, Lincoln, Springfield, Louisville, Ann Arbor, and Worcester. During the year there were many honors paid to famous musicians in the way of monuments and special performances.

¹ The anniversary of Richard Wagner's death was celebrated in Venice on February 23. Selections from his works were performed in St. Mark's Square, and a marble bust of Wagner was unveiled in the Teatro Fenice, where a special performance of *Die Walküre* was given under Signor Vitale. Paris celebrated the centenary of the birth of Halévy on May 27 by a performance of *L'Eclair* and excerpts from his other works at the Opéra Comique. The death centenary of Cimarosa was commemorated in Aversa; the birth centenary of Lwoff, composer of the Russian national hymn, was celebrated in St. Petersburg. Mayence honored the twenty-fifth anniversary of the death of Peter Cornelius. Berlin performed *Die Fledermaus* at the Royal Opera House, in memory of Johann Strauss, and the same opera, and also Brahms's *Requiem*, were sung in Vienna to commemorate him. Verdi celebrated his eighty-sixth birthday; Marchesi her fiftieth anniversary as a teacher; and a great festival concert was given in Berlin to celebrate the sixtieth anniversary of Joseph Joachim's first public appearance. At the cycle of Goethe's works, performed in Düsseldorf, in honor of the one hundred and fiftieth anniversary of the poet's birth, *Egmont* was given with Beethoven's music.

A monument to Brahms, by Hildebrand, was unveiled at Meiningen; one to Hans von Bülow, by Hildebrand, in the Ohlsdorf cemetery, near Hamburg; one to Ambroise Thomas, by Falguière, was placed in the Parc Monceau, Paris. The Liszt Denkmal of Weimar offered three prizes for designs for a monument to cost 40,000 marks. Leipsic voted 5000 marks toward a monument to J. S. Bach; Weimar awarded a prize to Hermann Hahn, of Munich, for a design for a statue of Liszt; Prague decided to erect a statue to Mozart, and gave a performance of Humperdinck's *Hänsel und Gretel* to raise funds; and Düsseldorf voted funds to erect monuments to Mendelssohn and his friend Immermann, the poet. A tablet to Glinka was unveiled on the house in which he died in Berlin. A concert of Glinka's works was given in Berlin by his pupil, Balakirew. Lille named a square *Roi d'ys* in honor of Edouard Lalo, a native of that city.

The King of Greece subscribed \$2400 toward the erection of a national theatre in Athens for operatic and dramatic performances; a new Beethoven Saal was inaugurated in Berlin on January 2 and 3, with the Philharmonic Society, under Herr Rebizek, and the Joachim Quartet; and the Norwegian government granted 1000 crowns to the composer Elbing, to enable him to collect old Norwegian folk-songs. A Hochschule für Musik was opened in Mannheim, October 2, with Wilhelm Bopp as director; a northwest London choral society was founded with Frederic H. Cowen as president, for the production of little known choral and instrumental works; and an Oxford and Cambridge Musical Club was founded in London with Dr. Joachim as president. Among its 200 members are Arthur J. Balfour, Sir J. F. Bridge, Sir A. C. Mackenzie, Dr. Hans Richter, and Sir Hubert Parry. Warsaw decided to establish a Philharmonic Society, Jean de Reszké and Paderewski serving on the committee, and a new philharmonic orchestra was organized in Vienna under the direction of Carl Stix.

MUSICAL ART SOCIETY, organized in New York in 1893 to bring before the musical public the works of Palestrina, Bach, and other old masters, had in 1899 a chorus of 55 professional singers. Two concerts are given annually—in December and in March. President, Frederick E. Hyde; musical director, Frank Damrosch; secretary, Miss Laura J. Post, 24 East Thirty-third Street, New York City.

MUSICIANS AND COMPOSERS, SOCIETY OF AMERICAN, organized in 1899 from the Manuscript Society, with the object of promoting the interests of musical composition in America. It has 500 members, and holds six private meetings and two public concerts annually. President, Edward MacDowell; secretary, Lucien G. Chaffin, 26 East Twenty-third Street, New York City.

MYSTIC SHRINE, NOBLES OF THE, is an ancient Arabic order, and while not a regular Masonic body, is composed of Masons who have reached the Thirty-second degree, Ancient Accepted Scottish Rite (eighteenth degree in England), or Knights Templars in good standing. The latest reports give 81 temples in the United States, with a total membership of about 52,000.

NAIRNE, Sir CHARLES EDWARD, K.C.B., general in the British army, died February 19, 1899. Born in London, June 30, 1836, and educated privately and at Addiscombe College, he entered the Bengal Artillery as a second lieutenant in 1855, transferring to the Royal Artillery in 1861. He served against the Indian mutiny in 1857, winning a medal for meritorious services; in 1863 he took part in the Euzofzai expedition, and the following year was promoted captain. He served honorably in the Kabul campaign of 1879 and in Egypt in 1882. He was promoted through the various grades, becoming a major-general in 1890 and a lieutenant-general in 1895. From the latter year to the time of his death he was in command of the forces at Bombay.

NASH, GEORGE KILBON, governor of Ohio, was elected to that office, as a Republican, November 7, 1899. Born in Medina County, O., August 14, 1842, he was educated at the Western Reserve University and Oberlin College, but relinquished his course before graduation, and taught school. He studied law and was admitted to practice; for a time was editor of the *Ohio State Journal*, and subsequently was appointed chief clerk in the office of the Ohio secretary of State. From 1879 to 1882 he was prosecuting attorney of Franklin County, and from 1883 to 1885 was judge of the State Supreme Court, after which he practised law at Columbus. For a number of years he was a member and chairman of the State Republican committee, and has long been active in State politics. At the election of November 7, 1899, the vote for Governor stood: Nash, 417,199; John Roll McLean, Democrat, 368,176; Samuel M. Jones, Independent, 106,721.

NATAL, a British South African colony, lying northeast of Cape Colony, with a frontage on the Indian Ocean of about 375 miles, has an area of about 30,000 square miles and an estimated population in 1899 of from 850,000 to 900,000, comprising mostly Kaffirs, with about 61,000 Indians and 60,000 whites. The bulk of

the white population is British, but the Dutch Boers are the most numerous in the northern districts. The capital is Pietermaritzburg, population about 25,000, which is situated 50 miles inland from Durban (Port Natal), the only port, with a population of about 40,000.

The principal occupation is agriculture, and the crops raised include cereals, vegetables, tea, and sugar. Wool also is produced. Among minerals iron is found, and the mining of coal is an increasing industry. Of the total area of Natal, about 2,250,000 acres have been set apart for native occupation. The trade is steadily increasing and is enlarged by a considerable amount of Transvaal imports and exports, which reach their destination through the port of Durban. The total imports of Natal in 1898 amounted to £5,323,216, mostly from Great Britain. The principal items were apparel, haberdashery, machinery, iron and iron goods, flour and grain, leather goods, spirits, cottons and woollens, etc. The exports in 1898 amounted to £2,184,667, of which wool was the most important item. Other exports are coal, gold, hides and skins, Angora hair, sugar, and bark. Recent Natal trade has been somewhat affected by drought and pests. The colonial revenue is derived mainly from posts and telegraphs, land sales, customs, stamps, excise, licenses, the native hut tax, and railways. The expenditure is devoted mainly to public works, defence, and railways. There are nearly 500 miles of railway, which have been constructed and are operated by the government. Defence is provided for by a body of mounted police, numbering about 550 Europeans, a volunteer force of about 1400, and a small volunteer naval corps. These forces were, of course, greatly increased in 1899. Education has state aid, and has made considerable progress.

Natal was first settled in 1824 by a small force of Englishmen, and in 1843, in spite of the efforts of Boers who had immigrated from Cape Colony and attempted to set up a government, the territory was proclaimed British, and annexed to Cape Colony. Thirteen years later it became a separate colony, the government of which was perfected in 1893. Later Zululand (*q. v.*) and British Amatongaland were annexed as provinces. The government consists of a governor, a legislative council of 12 members, nominated by him, and a legislative assembly of 39 members, elected by popular vote.

Northern Natal was one of the two important fields of the British-Boer war in 1899, the first Boer invasion being across the frontier of Natal in October under the direction of General Joubert. The first important battles were fought in Natal, namely, at Glencoe and Elandslaagte, in which the British were successful, and also at Rietfontein. The Boers, however, proclaimed all Natal north of the Tugela River Orange Free State territory. They were successful in engagements about Ladysmith, and besieged General White and an imperial force of about 9000 men in that town during the remainder of the year, although they were unable to force his surrender. During this time they swept over a large part of the colony. The forces of the Boers at one time threatened Pietermaritzburg, but retired after partially cutting off communications with the capital. In the latter part of November the Boers were driven out of the region south of the Tugela River, but on December 15 General Buller, in attempting to cross the Tugela for the relief of Ladysmith, met with a severe repulse, making with the British reverses at Stormberg and Magersfontein in Cape Colony the third defeat by the Boers within one week. See TRANSVAAL (paragraphs on History).

NATIONAL ACADEMY OF SCIENCES. See ZOOLOGICAL SOCIETIES.

NATIONAL EXPORT EXPOSITION, held in Philadelphia, Penn., September 14 to December 2, 1899, under the auspices of the Philadelphia Commercial Museum and the Franklin Institute, was the first national exposition of American manufactures specially suited for export trade that was ever held in this country. Its purpose was to demonstrate the ability of the American manufacturer to supply the world with every article which may be needed in any foreign market. About \$1,000,000 was spent in the erection of the buildings, covering nine acres of ground, and in the preparation of the grounds. The exhibits, numbering nearly 1000 in all, represented more than half a billion dollars of invested capital, and were said to be the most complete collection of domestic and foreign manufactures ever brought together. The exposition was a success in every way. The attendance was very large, and the manufacturers made important business connections all over the world. The president of the exposition was P. A. B. Widener, and Dr. William P. Wilson was the director-general.

NATIONAL GALLERY, Trafalgar Square, London, is the chief art gallery in Great Britain, and was founded in 1824 by the purchase of the Angerstein collection of 38 pictures. The gallery now contains fine examples of the work of most of the great masters. The latest report shows the annual number of visitors to have been 422,913 on the 209 free days. On Sunday afternoons there were 30,635 visitors, and on students' days, 39,349. The gallery is open to the public on all week days, except

Thursday and Friday. Director, Sir E. J. Poynter, president of the Royal Academy; Hawes Turner is keeper and secretary.

NATIONAL MUSEUM. See ANTHROPOLOGY IN AMERICA.

NATURAL GAS. The value of natural gas in the United States in 1898 amounted to \$15,296,813. This does not include the amount of Canadian gas consumed in Buffalo and Detroit. No new fields of large extent were discovered in 1898, although some large wells were found in old territories, as southwestern Pennsylvania, West Virginia, and central Ohio. The pressure in many of the present fields is becoming lower from year to year, although this reduction in the pressure, due to the slow exhaustion of the fields, is being met by the invention of various types of regulating machinery, which tend to economize the gas used. The tabulation of the uses to which natural gas is being put at the present day shows: Domestic fires, 571,998; iron mills, 34; steel works, 10; glass works, 154; other uses, 3314.

NATURAL SCIENCES, ACADEMY OF (Philadelphia), founded in 1812, had in 1899 a membership of 600. The academy meets weekly, publishes *Journal*, *Proceedings*, etc. President, Samuel G. Dixon, M.D.; secretary, Edward J. Nolan, M.D., Logan Square, Philadelphia, Penn.

NAVAL ARCHITECTS AND MARINE ENGINEERS, SOCIETY OF, organized in 1893 for the promotion of ship-building and marine engineering, had in 1899 a membership of 700. The society publishes *Transactions*. General meeting for 1900 at New York, in November. President, Clement A. Griscom; secretary, Francis T. Bowles, U.S.N., 12 West Thirty-first Street, New York City.

NAVAL ORDER OF THE UNITED STATES was organized in 1890 and the general commandery in 1893. There are State commanderies in Massachusetts, Pennsylvania, New York, California, and Illinois, and in the District of Columbia. The members are (1) veteran officers and their male descendants, and (2) enlisted men who have received the naval medal of honor. The next triennial meeting is to be held in New York in 1902. General commander, Rear-Admiral John G. Walker; general recorder, Lieutenant-Commander Leonard Cheney.

NAVAL VETERANS, NATIONAL ASSOCIATION OF, organized in New York in 1887 to perpetuate the names and deeds of the men of the American Navy, to assist widows and orphans of members, and to encourage the building of an efficient navy, had in 1899, 41 local societies, a paid membership of over 8500, and 3000 contributing members. Commodore commanding, George L. Seavey, Chicago, Ill.; fleet secretary, George E. Haskins, 767 Washington Avenue, Brooklyn, N. Y.

NAYLOR-LEYLAND, Sir HERBERT SCARISBRICK, member of Parliament, was born January 24, 1864; died May 7, 1899. He retired as captain of the Second Life Guards in 1895. From 1892 to 1895 he represented Colchester in Parliament as a Conservative. In the latter year he was created a baronet, and in politics became a Liberal and Home Ruler. He successfully stood for Parliament in 1898 in the Southport division of Southwest Lancashire, succeeding to the seat vacated by George N. Curzon when the latter became viceroy of India as Lord Curzon of Kedleston.

NEBRASKA, a central western State of the United States, has an area of 77,510 square miles. The capital is Lincoln. Nebraska was admitted to the Union, March 1, 1867.

Mineralogy.—Coal-mining has been confined to the southwest corner of the State, but the seams are so thin that the industry has never become profitably established. In 1896 a total of 3560 short tons was mined in Dixon County; in 1897 the output was only 495 tons, and in 1898 mining was entirely suspended. The only industry that showed an increased production during 1898 was quarrying, which yielded an output of limestone valued at \$78,493 against a value of \$42,359 in 1897. The product was used almost entirely for building and road-making. See ABRASIVES.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$2,158,729, and for the three States, constituting the Nebraska collection district—Nebraska, North Dakota, and South Dakota—\$3,428,079, showing that the bulk of these manufactures were in Nebraska. The district contained 40 manufactories of tobacco and 314 of cigars, and the combined output in the calendar year 1898 was 17,904,761 cigars and 41,236 pounds of smoking tobacco. In the fiscal year 1898-99 the quantity of spirits rectified was 389,266 gallons; distilled spirits gauged, 5,300,495 gallons; and fermented liquors produced, 216,665 barrels. The maturing of the corn crop in 1899 caused the opening of many new industries and an exceptional increase in the volume of all lines of business. Cash for grain and corn began pouring into the State about October 1, and within a short time every manufacturer was working his force overtime, in order to supply demands. The unusually heavy traffic practically blockaded

all the large railroads, which were unable to buy or borrow sufficient cars for their unexpected needs. Viewing all the industrial activities of the State, it may be said that there was never a time in the history of Nebraska when the evidences of prosperity were so numerous as in the closing months of 1899, and that never before was the industrial condition so favorable.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at Lincoln and Omaha aggregated in value \$394,825, an increase in a year of \$89,356; and exports at Omaha, \$250,791, increase in a year, \$244,191.

Railways.—The new railway construction during the calendar year 1899 amounted to 59.85 miles, giving the State a total mileage of 5598.42.

Banks.—On October 31, 1899, there were 99 national banks in operation and 70 in liquidation. The active capital aggregated \$9,710,000; circulation, \$2,832,781; deposits, \$18,273,289; and reserve, \$6,851,432. The State and private banks combined, June 19, 1899, numbered 398, and had capital, \$7,232,485; deposits, \$21,025,766; and resources, \$30,053,677. The exchanges at the United States clearing houses at Omaha and Hastings in the year ending September 30, 1899, aggregated \$316,568,530, an increase in a year of \$14,201,943.

Education.—At the close of the school year 1897-98 the school population was 366,069; enrolment in the public schools, 273,914; and average daily attendance, 173,930. There were 9608 teachers, 6676 buildings used as school-houses, and public school property valued at \$8,943,924. The revenue was \$3,829,155; expenditure, \$3,712,017, of which \$2,449,834 was for teachers' salaries. There were 225 public high schools, with 511 secondary teachers, 13,403 secondary students, and 5017 elementary pupils; 14 private secondary schools, with 61 secondary teachers, 513 secondary students, and 856 elementary pupils; a public normal school, with 20 teachers and 699 students in all departments; and 4 private ones, with 55 teachers and 2615 students. Normal training was also given in 6 colleges and 4 public high schools. Twelve universities and colleges for men and for both sexes reported 25 fellowships, 19 scholarships, 338 professors and instructors, 3590 students, 77,520 volumes in the libraries, valued at \$135,800; \$225,650 invested in scientific apparatus, \$1,844,400 in grounds and buildings, and \$453,952 in productive funds; \$245,061 in total income and \$33,007 in benefactions. In 1899 there were 614 periodicals, of which 31 were dailies, 532 weeklies, and 34 monthlies.

Building and Loan Associations.—Reports for the half year ending June 30, 1899, show a decrease in the number of associations, a greater concentration of associations in the cities and towns, a falling off in the farming communities, and, despite reduced numbers, a material increase in business transacted. The 60 remaining associations had 79,973 shares in force and combined assets of \$3,331,042.

Finances.—The total assessed valuation of property in 1898 was \$167,830,822. Besides the bonded debt of \$153,267, all held in the permanent school fund, that fund contained cash, \$238,468; United States bonds, \$15,000; and bonds of various Nebraska counties, \$3,033,029—total holdings, \$3,439,764.

Population.—As estimated by federal officials, the population on June 30, 1899 was about 1,410,000.

Legislation.—The election of a successor to United States Senator William V. Allen (Pop.), occupied the time of the legislature from January 7 to March 8, when the 42d ballot resulted in the election of Judge Monroe Leland Hayward (*q. v.*), whose death on December 5 following made a vacancy again, which was filled by the appointment by Governor Poynter of ex-Senator William V. Allen. The legislature abolished the power formerly exercised by justices of the peace to arrest in civil actions before judgment for fraudulent causes. It authorized the formation of mutual companies to furnish surety for members who occupy places of trust. The blanket system of voting was amended so that a vote may be cast for all Presidential electors and individually for all other candidates. Candidates for nomination and election are forbidden, under heavy penalties, to expend money for any purpose, except personal expenses, which are limited to \$100 where there are 5000 voters, and to \$1 for each 100 voters where there are not over 50,000 voters. After both nomination and election each candidate must file a verified statement of his expenditures fully itemized, and treasurers of parties must also file such statement. A State board is to be appointed to examine and license embalmers, and another one to examine and license barbers. A constitutional provision prohibits the creation of executive officers by legislative enactment, so the governor was made insurance commissioner, with power to appoint a deputy to perform the labor, and an elaborate law was passed regulating the formation, licensing, and operation of all insurance companies. In the same way, the governor will be food commissioner, and his deputy is to inspect and control the manufacture and sale of butter, cheese, and vinegar. Imitation of said foods must be marked and vendors licensed. Labor laws were passed in the interests of women and children. Railroads must not work trainmen or telegraph operators more than eighteen hours consecutively.

Party Platforms.—The Democratic, Populist, and Silver Republican State conventions were held in Omaha, August 22, 1899. These parties adopted a platform endorsing the Chicago platform of 1896, favoring an income tax, election of United States senators by popular vote and the initiative and referendum, and condemning the war against the Filipinos; it also demanded legislation by means of which the monopolization of industry by private corporations may be absolutely prevented.

The Republican State convention was held in Omaha, September 21, 1899, and a platform was adopted heartily endorsing what they deemed the wise, conservative, and patriotic administration of President McKinley, and approving his Philippine policy; expressing unequivocal adherence to the gold standard and unalterable opposition to the free coinage of silver; denouncing the alleged attempt again to array labor and capital against each other, and favoring the creation by act of Congress of a bureau of supervision and control of corporations engaged in interstate business, with powers similar to those exercised over national banks by the controller of the currency, enforcing such publicity and regulations as shall effectually prevent dishonest methods and practices.

Election.—The election in Nebraska was merely for one justice of the Supreme Court and two members of the board of regents of the State University, but it was considered important by Mr. Bryan and his friends, for the sake of its bearing on the situation in 1900. The three pro-silver parties not only united upon a platform, but also made up a fusion ticket, selecting a Populist, ex-Governor S. A. Holcomb, as their candidate for the Supreme Court. To each of the other parties was accorded one of the nominations for State regent. Judge Holcomb received 109,320 votes; Manoah B. Reese, the Republican candidate, 94,213. The result was conceded to be in large measure a personal victory for Mr. Bryan, who pronounced it a protest against the policy of the federal administration.

State Officers and National Representatives.—Governor, William A. Poynter; lieutenant-governor, E. A. Gilbert; secretary of state, W. F. Porter; treasurer, J. B. Meserve; auditor, J. F. Cornell; attorney-general, C. J. Smythe; adjutant-general, P. H. Barry; superintendent of education, W. R. Jackson. Supreme Court: Chief justice, T. L. Norval; associate justices, J. J. Sullivan, S. A. Holcomb; clerk, D. A. Campbell. The State legislature consists of 73 Republicans and 60 Fusionists. Senators, John M. Thurston (Rep.), from Omaha, and William V. Allen (Pop.), from Madison (*vice* M. L. Hayward [Rep.], who died December 5, 1899). Representatives, E. J. Burkett (Rep.), from Lincoln; David H. Mercer (Rep.), from Omaha; John S. Robinson (Dem.), from Madison; William L. Stark (Pop.), from Aurora; R. D. Sutherland (Pop.), from Nelson; William Neville (Pop.), from North Platte.

NEELY, HENRY ADAMS, D.D., Protestant Episcopal bishop of the diocese of Maine, died in Portland, October 31, 1899. He was born at Fayetteville, N. Y., May 14, 1830. After his graduation in 1849 at Hobart College, Geneva, N. Y., he was a tutor there for two years, was ordained to the diaconate in 1852, and consecrated to the priesthood in 1854. In 1853-55 he was rector of Calvary Church, Utica, and rector of Christ Church, Rochester, from 1855 to 1862; he then returned to Hobart College, where for two years he was chaplain. In 1864 he became assistant rector of Trinity Church, New York, and rector of Trinity Chapel, in which position he remained until he was consecrated second bishop of Maine on January 25, 1867. From 1889 to 1895 he was chairman of the House of Bishops. Through the influence of Bishop Neely was brought about the construction of the Portland cathedral, which was consecrated in October, 1877, and which at the time was one of the few Protestant Episcopal cathedrals in America. He established two parochial schools, St. John's School for boys, at Presque Isle, and St. Catharine's Hall, a seminary for young women, at Augusta. On December 13, 1899, the Rev. Dr. Robert Codman, Jr., of Boston, was elected to succeed Dr. Neely as bishop of the Maine diocese.

NETHERLANDS, THE KINGDOM OF THE, bounded on the north and west by the North Sea and on the east by Germany. The area is 12,648 square miles, and the estimated population on December 31, 1897, was 5,004,204. The density of population is 396 to the square mile. Emigration and immigration are inconsiderable, though the emigration to the United States in the fiscal year 1898-99 was 1029, an increase of 262 over the preceding year. The seat of government is The Hague, with an estimated population (December 31, 1897) of 196,325, the chief cities being Amsterdam, which had then an estimated population of 503,285, and Rotterdam, with 298,433. The other cities with a population of over 50,000 are Utrecht, Groningen, Haarlem, Arnheim, and Leyden. Transportation in the country is largely by means of canals, of which there are about 1907 miles, and by means of the 3000 miles of other navigable waterways. The railways in 1896 amounted to 749 miles. The chief crops of the country in order of value of exports are wheat, rye, oats, and potatoes; but in amount of production,

beet-root, tobacco and madder. There is an important herring fishery, valued in 1897 at \$5,567,756, and oyster trade. The reports for 1897 show 544 distilleries, 10 sugar refineries, 31 beet-sugar refineries, 47 salt-work works, 92 vinegar manufactories, and 498 breweries. There were in the same year 5075 steam engines in the country and 4375 manufactories making use of steam engines.

Commerce.—The Netherlands are very important from a commercial point of view. The imports were estimated in 1897 to amount to \$682,911,000, and the exports for the same year were estimated at \$599,820,000. The percentage of trade was as follows: To Prussia, 50 per cent., from Prussia, 17; to Great Britain, 21 per cent., from Great Britain, 15 per cent.; to Belgium, 12 per cent., from Belgium, 10 per cent.; to the East Indies, 4 per cent., from the East Indies, 14 per cent.; to Russia, 4 per cent., from Russia, 16 per cent.; to the United States, 3.5 per cent., from the United States, 10 per cent. The tonnage of vessels reported as entering and clearing the three Dutch ports in 1897 were: Entered Rotterdam, 5,071,050, Amsterdam, 1,335,996, Flushing, 668,706; and cleared at Rotterdam, 1,826,114, Amsterdam, 877,920, Flushing, 662,334. The most extensive traffic is with the Dutch colonies, and with South America. Lines of steamers ply between Rotterdam and New York, Philadelphia, Baltimore, Newport News, New Orleans, Mobile, Charleston, Savannah, and other ports in United States and Cuba. American lumber is in demand.

Religion and Education.—The royal family and most of the population belong to the Reformed Church, which is governed by a synod holding annual conferences at The Hague. Entire religious freedom is allowed, the other sects of most importance being the Roman Catholics, the Jews, and the Jansenists. The higher education is given at the universities of Leyden, Utrecht, Groningen, and Amsterdam. In 1897 but 4 per cent. of the conscripts could neither read nor write, and in 1896 only 9 per cent. of the total number of children of school age had received no elementary education. An effort was made in the legislature in 1899 to make education compulsory. For education the sum of \$301,232 was expended on government middle-class schools, \$208,786 on polytechnic schools, \$40,080 on technical schools, and \$185,600 on agricultural and horticultural schools. Navigation is taught in schools at Rotterdam, Harlingen, Terschelling and Helder.

Revenue and Expenditure.—The budget estimate of expenditure for the year 1899 was 152,613,959 guilders and of revenue 140,796,900. The largest part of the revenue is derived from excise taxes, next in importance being indirect taxes, post-office receipts, land tax, import duties. The separate budget for the colonies not included in the preceding figures shows for 1899 an estimated revenue of 132,742,514 guilders, and expenditure, 146,085,944. The gold standard is practically though not nominally the standard of currency in the Netherlands. The unit of currency is the guilder, which is equivalent to \$0.402.

Army and Navy.—The army, formed partly by conscription and partly by enlistment, consists on a war footing of 68,000 men, not including officers, and a militia of about 44,000; in peace the number in June, 1897, was 1971 officers and 27,834 men. A Dutch navy is gradually being formed, the programme introduced in 1897 providing for a fleet by 1910 composed of 6 armored vessels, 12 protected cruisers, 6 monitors, 15 gunboats and 32 torpedo-boats. Four cruisers have already been launched, the *Utrecht*, an armored cruiser of 4000 tons, being completed at Amsterdam in 1899. Three others are to be completed in 1900. Besides these the present fleet consists mostly of old and inefficient vessels.

Colonies.—The Dutch colonies include part of Borneo (203,714 square miles, population 1,250,000), Celebes (72,000 square miles, population 2,000,000), Java, with the island of Madura (50,554 square miles, population 25,500,000), the Moluccas (42,420 square miles, population 400,000), part of New Guinea (151,790 square miles, population 200,000), Sumatra (149,555 square miles, population 2,979,946), and other islands in the Asiatic archipelago with about 30,000 square miles, and about 250,000 population. Besides the foregoing East Indian possessions, the Netherlands have Bonaire, Curaçao, and other West Indian islands, with about 500 square miles and about 54,000 population, and the colony of Dutch Guiana, or Surinam, with 46,060 square miles and 65,000 population. The most important towns are Batavia, Java; Amboyna, in the Moluccas; Willemstadt, in Curaçao, and Paramaribo, in Surinam. The total area is estimated at 730,000 square miles, and the total population in 1896 estimated at about 35,000,000. The government of these dependencies is in some cases directly under the home office, in others the possessions are held as vassal and tributary or confederated states. For further information on the Dutch colonies see BORNEO; JAVA; SUMATRA; DUTCH GUIANA; CELEBES; DUTCH INDIES.

Events of the Year 1899.—The event of greatest general interest during the year 1899 was the assembling of the world's peace conference at The Hague, for an account of which see the article HAGUE CONFERENCE. On July 4 a celebration was held in Delft to honor the memory of Grotius, the father of international law, who died in 1645.

NEVADA, a State of the Pacific slope, has an area of 110,700 square miles. Capital, Carson City. Nevada was admitted to the Union in 1864.

Mineralogy.—A number of surprises marked the mining operations of 1898. The results of the year showed that the general attention was concentrated on the three metals, gold, silver, and copper, to the complete exclusion of several minor ones which had formerly yielded profitably. The first surprise was the output of gold. This had been estimated by the United States director of the mint as likely to amount to a value of \$2,959,731. The production, however, was 144,859 fine ounces, valued at \$2,994,500. Silver fell to 805,000 fine ounces, a decrease in a year of 423,900 fine ounces, of a coining value of \$1,040,808. Probably the largest surprise was in copper, which had been fluctuating wildly in production for many years. In 1883 the output was 288,077 pounds. From that year it steadily declined till in 1893 it amounted to 20,000 pounds only. Thence, till 1898, so little attention was paid to it that standard reports contained no mention of any annual production. In 1898, however, there was an output of 437,396 pounds, the largest on record in the State, and during 1899 there was a greater activity in known and suspected copper properties than in either gold or silver. Scarcely a fortnight passed that did not see the discovery or initial working of new veins or croppings. A number of new high-grade ore bodies that came under development contained also paying quantities of gold or silver, or both, and several well-known mines that were formerly worked for gold or silver and lead were found to be rich in copper also. New gold-mining camps were established at Searchlight, Selbyville, Morrison Hill, White Pine, and Soda-ville, the last on property known to be rich in gold, silver, and copper. The work of draining the famous Comstock mines had made such progress that in October the first ore shipped therefrom in more than a year was sent out from the Belcher mine. In all, 30 carloads were shipped. Mining operations on the Comstock lode are likely to be resumed with old-time vigor, as 27 different companies have arranged with an electric power company to supply the mines with 5000 horse-power from a plant at Floriston, Cal. The line for transmitting this power, which originates in the descent of the Truckee River from Lake Tahoe to Reno, 2000 feet, was under survey at the end of the year. This cheapened power is expected to recover large quantities of low-grade ore that heretofore has not been deemed worth the excessive cost of existing power plants. No official reports on the productions of 1899 were available at the time of writing, but the director of the mint estimated the output of gold as worth \$2,442,000, and that of silver as \$1,245,800.

Railways.—The new railway construction in the calendar year 1898 amounted to 12 miles, giving the State a total mileage of 920.37.

Manufactures.—Nevada is included in the internal revenue collection district of California, and the details of its taxable manufactures are consolidated with those of that State; but the amount of collections of revenue on its manufactures of this character, in the fiscal year ending June 30, 1899, was separately reported as \$31,911.

Banks.—On October 31, 1899, there were one national bank in operation and two in liquidation. The active capital was \$82,000; circulation, \$17,132; deposits, \$425,412, and reserve, \$54,487. The State banks, June 30, 1899, numbered 3, and had capital, \$270,000; deposits, \$997,514, and resources, \$1,395,035.

Education.—At the close of the school year 1897-98, the school population was 8996; enrolment in the public schools, 7348, and average daily attendance, 4982. There were 314 teachers, 224 buildings used as school-houses, and public school property valued at \$265,011. The revenue was \$206,821; expenditure, \$203,642, of which \$162,322 was for teachers' salaries. There were 8 public high schools, with 23 secondary teachers, 509 secondary students, and 5 elementary pupils; no private secondary schools; no normal schools, and a State university, which reported 3 scholarships, 19 professors and instructors, 327 students, 6457 volumes in the library, \$17,030 invested in scientific apparatus, \$156,184 in grounds and buildings, and \$95,000 in productive funds, and \$54,878 in total income. In 1899 there were 29 periodicals, of which 9 were dailies and 17 weeklies.

Finances.—In 1898 the assessed valuations were: Real estate, \$16,364,656; personal property, \$6,822,555, and net proceeds of mines, \$330,034—total, \$23,517,245, a slight increase over the total of 1897, chiefly in personal property; state tax rate, \$9.20 per \$1000. On January 1, 1899, the total debt, exclusive of the irredeemable bond for \$380,000, was \$287,364; cash in the treasury, \$136,699; net debt, \$151,265.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 45,000, or stationary as compared with the previous year.

Legislation.—A guardianship law, looking to the care of children and insane people, and their property, was enacted. A State live stock inspector and a State board of medical examiners were created. Soldiers may vote, and United States senators may be nominated and voted for.

State Officers and National Representatives.—Governor, Reinhold Sadler; lieutenant-governor, J. R. Judge; secretary of state, Eugene Howell; treasurer, D. M.

Ryan; comptroller, S. P. Davis; superintendent of public instruction, Orvis Ring; adjutant-general, J. R. Judge, *ex officio*; attorney-general, W. D. Jones. Supreme Court: Chief justice, M. S. Bonnifield; justices, W. A. Massey, C. H. Belknap; clerk, *ex officio*, Eugene Howell. The State legislature consists of 14 Republicans, 2 Democrats, 26 Silverites, and 3 Independents. Senators, John P. Jones (Sil. Rep.), from Gold Hill, and William M. Stewart (Sil. Rep.), from Virginia City. Representative, F. G. Newlands (Sil.), from Reno.

NEW BRUNSWICK, a province of the Dominion of Canada, with an area of 28,200 square miles, exclusive of the territorial seas; capital, Fredericton.

Industries.—The principal industries continue to be those connected with the fisheries, although reports for 1898 indicate a renewal of activity in other lines. The value of the total fishery catch in the calendar year 1897 (the last officially reported) was \$3,934,135; principal catch, herring, \$1,070,714; lobsters, \$592,956; smelts, \$363,917; sardines, \$352,276; cod, \$327,272, and salmon, \$275,896; exports of all fisheries (1898), \$677,624; distribution of fry, 4,847,000, and capital invested in all fisheries, \$1,755,324. Agricultural returns for 1898 showed the following crops: Oats, 4,971,019 bushels; potatoes, 4,954,510; buckwheat, 1,658,207; wheat, 409,943; barley, 108,967, and hay, 546,932 tons. The area devoted to these crops was 834,659 acres. Coal was mined in the year to the extent of 6100 tons, a slight increase over the output of the previous year, and the province imported 74,109 tons, and exported 7936 tons. New Brunswick is one of three provinces only in which gypsum deposits are now worked, and in 1897 it was the second largest producer, with an output of 82,658 tons, valued at \$118,116.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise aggregated in value \$4,925,662; exports, domestic and foreign, \$11,166,218, an increase in a year of \$1,581,236; duty collected, \$917,676. The registered tonnage of British, Canadian, and foreign vessels carrying cargoes in and out of the province was 1,215,698, and of all vessels in the coasting trade, 1,375,419. Navigation along the coast was facilitated by 93 light-stations, 117 light-houses, 8 fog-horns, 4 fog-whistles, and a light-ship. The registered merchant marine of the province comprised 117 steamers of 9858 gross tonnage, and 786 sailing vessels of 79,399 gross tonnage.

Banks.—On January 1, 1899, there were 30 chartered bank branches in the province, and during the previous year the exchanges at the clearing house in St. John amounted to \$30,349,264, a small decrease from the total of 1897. There were also 45 post-office savings banks, with 7012 depositors, and \$2,421,557 deposits, and 5 government savings banks, with 15,853 depositors, and \$6,111,750 deposits.

Railways and Telegraphs.—On June 30, 1898, the total length of railways in operation was 1447 miles, and the provincial and municipal grants to roads constructed and under construction then amounted to nearly \$5,000,000. Government telegraphs, consisting principally of the Bay of Fundy system, had a total length of 76 miles of land lines and 10¼ miles of cables, with 8 offices, and revenue, \$869; expenditure, \$3799.

Post-Offices.—At the end of 1898 there were 1182 post-offices in the province, in which were posted during the year 6,750,000 letters and 1,215,000 postal cards; and 127 money-order offices, which issued 66,929 orders.

Education.—At the close of the term ending June 30, 1898, the province had 1778 public schools, with 1864 teachers, 63,333 enrolled pupils, and 38,874 pupils in average attendance. The grammar schools had 28 teachers and 862 pupils, and the normal schools, 281 students, of whom 227 were females. The receipts were, from government grant, \$188,104; municipal appropriations, \$90,807, and district assessments, \$230,000—total, \$508,911, and expenditures, \$483,829. At the end of 1899 there were 46 periodicals, of which 9 were dailies and 26 weeklies.

Finances.—The revenue of the province in the year ending December 31, 1898, was \$708,809; expenditure, \$727,050; gross debt (October 31, 1898), \$3,198,859; Dominion government debt allowance, \$530,402; other assets, \$46,590—total assets, \$576,992. Besides these assets the province had public buildings valued at \$370,000, and about 7,000,000 acres of crown lands held at \$1 per acre.

Population.—Local estimates in 1898-99 gave St. John, 42,000; Moncton, 10,000; Fredericton, 7000; Chatham, 6000; Sackville, 5000; Woodstock, 3400, and St. Stephen, 2700. The Indian population of the province was 1627. There were 6 schools for Indian youth, which had an enrolment of 145, and an average attendance of 71. The Indians cultivated 1323 acres of land, had 280 head of live stock, and received \$22,425 from their fish, furs, and other industries.

NEWEL, STANFORD, A.M., United States minister to the Netherlands, was appointed by President McKinley a member of the American delegation at the peace conference, which met at The Hague in May, 1899. The appointment of the delegation was announced by Secretary of State Hay on April 6, 1899. Mr. Newel was

born in Providence, R. I., June 7, 1839; in May, 1855, he removed to St. Anthony's Falls, Minn. He was graduated at Yale in 1861, and at the Harvard Law School in 1864, in which year he began the practice of his profession in St. Paul, and has since that time been a resident of the city. He gained prominence as a lawyer and has been active in politics, having been chairman of the State Republican committee, and in 1888 and 1892 a delegate to the Republican national convention; but, excepting a few years, when he held an unpaid membership in the St. Paul Park Board, he never held public office until May, 1897, when he was appointed by President McKinley minister at The Hague.

NEW ENGLAND SOCIETY, founded in 1805, and incorporated in 1833, had in 1899, 1504 members. Annual meetings of the society are held in December. President, William E. Dodge; secretary, George Wilson, 32 Nassau Street, New York City.

NEWFOUNDLAND, a British colony in North America, comprising the island of that name, and the coast region of Labrador; area, island, 42,734 square miles; Labrador, dependency, about 120,000 square miles; capital, St. John's.

Industries.—The distinctive industries of the colony have been for generations those connected with fisheries; but the completion of the great railway between St. John's and Port-au-Basques (see INTERNATIONAL YEAR BOOK for 1898, title NEWFOUNDLAND) has already opened a new era to the colony and led to the organization of influential movements for the development of other industries, particularly in the line of mineralogy. An expert geological examination of Smith and Random Sounds and Random Island, on the west side of Trinity Bay, during the summer of 1899, disclosed the existence of one of the great roofing-slate deposits of the world, comparable with the well-known deposits in Wales, New York, and Vermont. This slate is of the green species, and has been quarried at one point on Smith Sound for many years, for purely local uses; but till 1899 there has never been even an approximate knowledge of the vast extent of the deposits. The value of the discovery is greatly enhanced by the fact that the largest ships can load on Smith Sound directly from quarries, thus reducing the cost of transportation to markets. A syndicate was organized later in the year to develop this industry. During the year a syndicate of Nova Scotia capitalists, which had acquired the newly developed hematite mines on Great Belle Isle, in Conception Bay, sold a part of the tract to the Whitney syndicate of Boston, Montreal, and Halifax, for \$1,000,000. The ore is found in blocks, and may be easily and cheaply handled direct from mine to steamer. Already a considerable quantity of this ore is being shipped to the great Krupp foundries at Essen, Prussia, and in the coming season this property will be the chief source of supply for the large steel plant begun at Sydney, Cape Breton, in 1899. The railway has stimulated surveys for other mineral properties in localities previously difficult of access, and considerable experimental developing was undertaken during the year.

Fisheries.—Both the cod and the lobster fisheries continue to show a decline, chiefly attributable to the vexatious "French shore question." In the season of 1898 the fisheries of the "banks" region employed 66 vessels and 872 men, and had a catch of cod equal to 58,762 quintals. Sealing employed 19 steamers and 4838 men, and had a catch of 243,014 seals, worth about \$607,535. All fisheries yielded a catch valued at \$4,571,808. The colonial government maintains an admirable hatchery in Trinity Bay, and in the summer of 1899 the waters of the bay as well as those along the coast were swarming with young cod. Operations on the Labrador "banks" in the season of 1899 were almost an absolute failure. So small was the catch of cod, the mainstay of the people, that the inhabitants were without funds to purchase supplies for the winter, and, without government aid, starvation seemed imminent in many places. An experimental steam whaler caught 91 whales in less than four months in 1898, earning \$22,000. There is a factory for the extraction of oil on Hermitage Bay, and a second one is being erected.

Commerce.—The total imports of the colony in 1897 amounted to \$5,938,336; exports, \$4,925,786. In 1898 Newfoundland imported from the Canadian provinces to the amount of \$2,170,518, and exported thereto, principally fish and fish products, \$464,560; and imported from the United States to the amount of \$1,175,733, and exported thereto, \$372,115. In that year the entrances of British, Canadian, and foreign vessels at local ports aggregated 840, of 179,850 registered tonnage, and the clearances, 991, of 222,508 tonnage. During the year ending June 30, 1899, the colony imported from the United States merchandise valued at \$1,595,495, and exported thereto domestic products valued at \$383,168. The registered merchant marine of the colony in 1898 comprised a total of 2363 vessels (35 steamers), of 106,118 tons.

Railway and Telegraph.—The colonial railway has a total length of 633 miles, and is connected with the railway system of Canada by a steamer plying between Port-

au-Basques and the mainland at Cape Breton. Government telegraphs have a total length of 1500 miles.

Finances.—In 1897 the revenue was \$1,610,789; expenditure, \$1,804,847, and public debt, \$16,639,946.

Population.—In 1898 the population of the island and the Labrador dependency was estimated at 208,000, exclusive of Indians; St. John's, 29,000; Trinity, 17,300; Harbor Grace, 6500; Carbonear, 4120; Twillingate, 3580; Bonavista, 3550.

French Shore Question.—The close of the year 1899 left the French shore question still unsettled, and it seemed likely to assume a more acute phase in the future than ever before since the Newfoundland legislature adjourned in the summer of 1899 without providing for a renewal of the *modus vivendi* in regard to the lobster industry, which was to expire on December 31, 1899. The history of this question may be recapitulated as follows: The treaty of Utrecht (1713), which was confirmed by the treaties of Paris (1763) and Versailles (1783), gave to France the right of fishing on the western and northeastern coasts of Newfoundland during the season and of drying the catch on a narrow strip of territory along that coast. It gave them the privilege of building temporary structures for the purpose and of procuring wood for these buildings from the forests. According to the Newfoundland view of the question, the right to fish was an exclusive one, and did not imply any territorial jurisdiction. The Newfoundlanders appealed to the interpretation of the treaties as evidenced by the policy of Great Britain down to 1820. During this period the view of Great Britain appeared to be that the sole right of the French in the region was that of catching and drying fish during the season. On the other hand, the French have declared that the right of France to the Newfoundland coast is only a part of her ancient sovereignty over the island, and in 1891 the French government definitely stated that no offers of purchase would be entertained, since the exercise of these rights on the Newfoundland coast was essential to a class of French citizens who had been depending for years upon this industry as a means of earning a livelihood. The colonists declared that the French claims had been greatly extended in recent years, and that recognition of them in their present form would check the industry and development of the entire region. These claims had been so strictly interpreted that no colonist was allowed to build a house, shed, wharf, or structure of any kind within the conceded area. Important industries like mining, lumbering, and pulp-making were completely checked, and the opening up of the country was prevented by the refusal of the French to allow a railway or tramway to be laid in the region. They accused the imperial government of weakness and apathy in the matter. In 1898, however, a royal commission having investigated the question, Mr. Chamberlain took a firm stand on behalf of the rights of the colonists, saying that by means of alleged rights under antiquated treaties the French had strangled the colony of Newfoundland. The crucial point in the dispute was the question whether the word fish meant cod, which was its local significance, and whether drying fish and the temporary structures necessary thereto was to be so widely interpreted as to include the canning of lobsters by the French in permanent buildings. In the colony it is contended that the French have a right to catch and dry cod only. The canning of lobsters was introduced in the treaty coast by the natives, and the French did not compete in the industry until a few years ago. As late as 1886 a French station owner on the coast was prohibited by the French commodore from exercising the right of canning lobsters. Another alleged injustice was the fact that the French fishermen were underselling the natives in the fish markets by reason of the bounties granted to them by the French government. In 1887 the colonial government prohibited the sale of bait to the French fishermen. This measure was vetoed by the colonial office, but was re-enacted the next year and finally sanctioned. Thereupon the French retaliated by bestowing a special bounty on the lobster canning industry and by demanding the removal of the colonial canning establishments. The opposition of the colonial government to the latter demand was not supported by the imperial authorities, but in 1890 a *modus vivendi*, renewable each year, was concluded between the British and French governments, providing for the reference of the lobster dispute to arbitration. From 1890 to December 31, 1899, the status of the lobster industry has been determined by this *modus vivendi*. The colonists complained that the *modus vivendi* established a monopoly of the industry by parcelling out the treaty shore among forty-five colonial and fifteen French factory owners. The settlers on the treaty coast were allowed only to trap lobsters and sell them to the monopolists, who practically could fix their own prices. The British war-ships kept a sharp lookout on illicit lobster canning, and offences were punished with severity. The hardships which this course entailed upon the natives caused a vigorous protest. It was said that the people of the coast were not allowed to sell bait to any one else until they had first supplied the French fishing schooners at a price far lower than what they otherwise could have obtained. The royal commission of 1898 presented its report to Mr. Chamber-

lain in March, 1899. The latter allowed the Newfoundland legislature to close its session without calling upon it for the renewal of the *modus vivendi*. This led the colonists to expect some definite action on their behalf, and there were signs that the French might be willing to come to a favorable arrangement. In 1899 the French had only 15 stations along the 800 miles of coast, and their industries had been comparatively unsuccessful. The number of visiting fishermen was said to be declining, and in France itself suggestions were made that the cession of their rights on the coast might be to their own advantage. The withdrawal of the *modus vivendi* would remove the restraints which during the decade have been imposed upon the colonists, and it was thought that unless some new arrangement were made the French might encounter difficulties in the course of the following season. In March, 1899, an attempt was made to bring about a crisis by burning a French lobster factory, but nothing came of this, and, on the whole, the people showed a law-abiding spirit. One of the considerations that have influenced the French in this matter has been the belief that the subsidizing of this industry supplied the French navy with trained seamen, but some of the leading naval authorities in France declared that the existence of the French shore made no difference to the navy. The expense to France of this heavy subsidization of the fisheries has been nearly 300,000,000 francs in the past twenty-five years. About \$250 has been given for every one of the 12,000 men employed. The colonists struck a heavy blow at the industry by the passage of their Bait act, but the proximity of the French settlement of St. Pierre to some extent modified its effect, since bait carriers found a profitable trade there, and were encouraged, it is said, to carry back cargoes of contraband goods to be smuggled into the colony. It was suggested in 1899 that the way out of the difficulty would be for England to prevent the French from taking lobsters, herring, or salmon, and from interfering with the natives or with the internal developments of Newfoundland. In other words, it was the view of the colonists that the French should be held to a strict interpretation of their treaty rights—an interpretation which there is nothing in the recent course of their diplomacy to indicate that they would accept.

NEW GUINEA, or PAPUA, is, if Australia be considered a continent, the largest island in the world, being nearly 1500 miles long and about 430 miles across at its greatest breadth, and embracing an area of about 313,000 square miles. New Guinea is apportioned between three European powers, the respective territories of which are known as British Guinea, Kaiser Wilhelm's Land, and Dutch Guinea. The latter comprises about one-half the island, the other half having been independent until 1884, when it was divided between England and Germany. From the protectorate thus established England erected a colony in 1888, and Germany, after leaving her portion for many years under the administration of the German New Guinea Company and an imperial commissioner, placed it in the year 1899 under more immediate protectorate control. Dutch New Guinea, with an area of 154,789 square miles, while the most important of the three divisions in extent, is surpassed by British Guinea in some ways. Its population is 200,000, and in government it belongs to the Dutch Indies system, and is administered by a Resident at Ternate. From the standpoint of population and natural resources, by far the most important section of the island is British Guinea. The latter has an area of only 88,460 square miles, about one-half that of Dutch Guinea, but the population is 350,000, or nearly twice as great as the population of the Dutch possessions. As to productiveness, there is said to be an abundance of good timber and valuable forest products. At present the chief exports are trepang, pearl-shell, copra, gold, sandal-wood, and pearls. The country is being gradually settled and the natives trained. In the work of educating and subduing the natives great credit is due the missionaries. It is hoped that the colony may become self-supporting by 1902, and thus allow the suspension of the annual guarantee of £15,000, which is granted by the colonies of Queensland, New South Wales, and Victoria to cover the expenses of administration, in which these colonies have some share. The territory is administered as a crown colony, the governor residing at Port Moresby. The area of Kaiser Wilhelm's Land is about 70,000 square miles, and its population about 110,000. Its chief products are areca, cabinet woods, live stock, and, in particular, tobacco. Gold also has recently been discovered. Some outlying islands are included in British Guinea, and the Bismarck archipelago belongs to the German colony. It was reported in November, 1899, that civil war had broken out among the native tribes of New Guinea.

NEW HAMPSHIRE, a New England State, has an area of 9305 square miles. Capital, Concord.

Mineralogy.—The granite output of 1898 reached a value of \$683,595, an increase in a year of \$41,904, and the largest in five years. Thus, a steady improvement is apparent in both building and monumental stocks, in both of which the State is rich in variety and quantity.

Manufactures.—The internal revenue collection district of New Hampshire also includes the States of Maine and Vermont. In the fiscal year ending June 30, 1899, the collections of revenue on taxable manufactures aggregated \$1,341,036 for the district and \$797,956 for New Hampshire alone. The district had 8 manufactories of tobacco and 196 of cigars, and the combined output in the calendar year 1898 was 14,707,277 cigars for the district and 7,631,615 for New Hampshire alone, and 4972 pounds of smoking tobacco. The total production of fermented liquors was 301,823 barrels. The general prosperity of the cotton industry in the season of 1898-99 was indicated in the annual reports to the stockholders by the officers of the Amoskeag, Stark, and Amory mills in Manchester. The Amoskeag plant produced 109,833,769 yards of cloth and 2,029,867 bags, and had a net profit for the year of \$440,862; the Stark had an increased production of 1,921,899 pounds and earnings of \$213,567; and the Amory had an increased output of bleached goods of 264,000 yards, paid its usual dividends, and had a net profit of \$94,000. All stocks of goods that had accumulated during the long depression were sold out, and all mills reported an inability to manufacture fast enough to supply the demands.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the port of Portsmouth aggregated in value \$17,014, a slight decrease from the total of the previous year; exports, none.

Railways.—There was no new railway construction of importance in either 1898 or 1899, and the present total mileage is 1174.61.

Banks.—On October 31, 1899, there were 52 national banks in operation and 11 in liquidation. The active capital aggregated \$5,400,000; circulation, \$3,769,504; deposits, \$13,582,039; and reserve, \$4,440,034. The State banks, June 30, 1899, numbered 9, and had capital, \$560,000; deposits, \$1,056,895; and resources, \$1,922,703; and the mutual savings banks, 52, with depositors, 133,174; deposits, \$52,131,879; resources, \$59,750,245; and surplus and profits, \$4,124,734.

Education.—At the close of the school year 1897-98 there were 52 public high schools, with 145 secondary teachers, 3325 secondary students, and 544 elementary pupils; 29 private secondary schools, with 159 secondary teachers, 2018 secondary students, and 2200 elementary pupils; and a State normal school, with 14 teachers and 340 students in all departments. Two colleges for men and for both sexes reported 200 scholarships; 64 professors and instructors, 691 students, 80,000 volumes in the libraries, \$102,000 invested in scientific apparatus, \$650,000 in grounds and buildings, and \$1,500,000 in productive funds; \$107,000 in total income and \$156,200 in benefactions. The legislature of 1899 made provision for equalizing the school privileges of the cities and towns by appropriating \$25,000 annually, 25 per cent. of this to be used to aid supervisory districts in hiring superintendents of schools, the State paying one-half of the salaries, and 75 per cent. to be distributed among cities and towns in which the equalized valuation is less than \$3000 for each child in average daily attendance in the public schools. Beginning with the year 1900 cities and towns wishing this aid must maintain not less than 20 weeks of school per year. Under the main provision, 41 towns fell below the \$3000 per child valuation in the school year 1899-1900, and the governor and council added 21 other towns, making a total of 62 towns, to whom \$18,750 was distributed. The remainder of the appropriation was held in the State treasury, no supervisory districts, as defined in the law, having been formed at the time of writing. In 1899 there were 109 periodicals, of which 14 were dailies, 77 weeklies, and 12 monthlies.

Finances.—The assessed valuations aggregated \$252,490,075 in 1898 and \$208,173,709 in 1899. The funded debt, June 1, 1899, was \$1,289,800; trust funds, \$734,749; floating debt, \$1472—total debt, \$2,026,021; assets, \$690,953—net debt, \$1,335,068.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 396,000.

Legislation.—Deposit books must be verified at the banks at least once in four years. Making or repairing tools known to be used for burglary constitutes a crime. The State and the national flag must not be desecrated. Those who consider themselves unfit to care for their property on account of age or infirmity may apply for the appointment of guardians. In the interests of health, plumbers and embalmers are to be examined and licensed, street cars are to enclose their platforms, and candy must not be adulterated. A law was passed prescribing the manner of sale of all liquors in the State, and the governor is to appoint a State liquor agent, from whom all liquors shall be bought by the liquor agents appointed by city and town authorities. All statutes giving any portion of a fine or penalty to those prosecuting or complaining were repealed. The question of holding a constitutional convention will be submitted to the vote of the people at the November election in 1900.

State Officers and National Representatives.—Governor, Frank W. Rollins; secretary of state, Edward N. Pearson; treasurer, Solon A. Carter; adjutant-general, A. D. Ayling; attorney-general, Edwin G. Eastman. Supreme Court: Chief justice, Isaac N. Blodgett; associate justices, William M. Chase, Frank N. Parsons, Robert G.

Pike, R. R. Wallace, Robert J. Peaslee, John E. Young; clerk, A. J. Shurtleff. The State legislature consists of 273 Republicans and 111 Democrats. Senators, Jacob H. Gallinger and William E. Chandler—both Republicans from Concord. Representatives, Cyrus A. Sulloway, from Manchester, and Frank G. Clarke, from Petersboro—both Republicans.

NEW JERSEY, a Middle Atlantic State, has an area of 7815 square miles. Capital, Trenton.

Mineralogy.—A revival, quite general and somewhat unexpected, has taken place in the iron industry of this State. The largest production of its mines in the days of the greatest prosperity was about 600,000 long tons. From that amount the production gradually declined to about one-third or even less. In 1898, the output, all of magnetite, rose to 275,438 long tons, valued at \$654,148, an increase in a year of 21,203 tons. During that year and the early part of 1899, a large amount of capital was put into the iron properties, and mines were reopened and furnaces put into blast, with the result that at the close of 1899 every iron furnace in Passaic, Morris, Sussex, and Warren Counties, were either in blast or getting ready to go into blast. Ore is mined in all these counties, Morris producing more than any of the others. A manganiferous zinc residuum, used in the manufacture of spiegeleisen, is obtained at the zinc mines in the northern part of the State, and of this there was a production in 1898 of 48,502 long tons, valued at \$26,676, the only output of its kind in the country. The boom in copper in 1899 again directed the attention of capitalists to the long-disused copper mine on the Arlington ridge, immediately west of the Hackensack meadows. This mine was once an exceedingly valuable property, because of the unusual purity of the metal. The bottom of the shaft is below tide-water, and for many years there has been no persistent working, owing to the necessity for costly methods of keeping the water out. Late in 1899 new blood and capital were interested in the property, and measures were undertaken for the recovery of the great mass of copper the mine is known to contain. Quarrying in 1898 yielded granite to the value of \$753,513; sandstone, \$257,217; slate, \$800; and limestone, \$146,611—total, \$1,158,141. In the summer of 1899 Thomas A. Edison began prospecting on the ridge which forms the foothills of the Pohatcong Mountains, near Stewartsville, which contain a practically inexhaustible body of cement rock and limestone. Acquiring options on 1800 acres of land, he began prospecting, and found sufficient cement rock, exclusive of limestone, to warrant the organization of a company, and the preparation of a plant, which, it is claimed, will be the largest cement mill in the country. Early in 1900 Mr. Edison expected to be turning out from 5000 to 7000 barrels of cement daily. See TRIASSIC.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$8,074,261. There were 64 manufacturers of tobacco and 1033 of cigars, and the combined output in the calendar year 1898 was 70,289,328 cigars, 488,450 cigarettes, 5,388,150 pounds of plug tobacco, 2,248,223 pounds of fine cut, 6,167,407 pounds of smoking, and 5,107,941 pounds of snuff. Grain and fruit distilleries in operation numbered 47; the amount of fruit brandy produced was 38,638 gallons; spirits rectified, 365,891 gallons; distilled spirits gauged, 1,638,263 gallons; and fermented liquors produced, 2,043,999 barrels. The chief of the State Bureau of Statistics of Labor, in his report for 1899, shows that out of nearly 10,000 industrial concerns in the State only 1464 submitted reports, owing to an impression that seems to prevail among some manufacturers that the purpose of the bureau is to assist legislation favorable to labor and antagonistic to capital. The reports submitted, however, cover all the large industries of the State, and show capital invested, \$196,798,843; persons employed, 147,604; paid for wages, \$56,509,382; paid for materials used, \$313,480,197, and selling price of combined output, \$264,274,214. In the silk industry the State leads all others in investment and product. The capital investment exceeds \$20,000,000; persons employed, 26,000; wages paid, \$10,650,789; and value of output, \$42,570,600, nearly double that of ten years ago. The higher grades of silks are now made almost exclusively in this State. (See SILK MANUFACTURES.) During 1898 the production of pig-iron was 100,681 long tons, an increase in a year of nearly 5000 tons, and of all kinds of rolled iron and steel, 98,281 long tons.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Bridgeton, Newark, and Perth Amboy aggregated in value \$635,175; exports, \$1,824,378; imports of gold and silver, \$1,472,018; exports, none; total foreign trade of the year, \$3,931,571, net increase in a year, \$21,770. As the large foreign trade at Jersey City is credited wholly to the port of New York, the manufacturers and others of Jersey City have petitioned Congress to constitute that city an independent port of entry and clearance.

Railways.—The new railway construction in the calendar year 1898 amounted to 7.22 miles, and in 1899 to 9.50 miles, giving the State a total mileage of 2252.52. The assessment of railroad and canal property, principally the former, in 1899 was

\$224,284,792, an increase in a year of \$1,867,044, and on this the railways will pay \$1,121,423 to the State and \$423,019 to the municipalities in which their property is situated.

Banks.—On October 31, 1899, there were 108 national banks in operation and 14 in liquidation. The active capital aggregated \$14,729,025; circulation, \$5,860,421; deposits, \$72,083,392, and reserve, \$20,307,327. The State banks, June 30, 1899, numbered 21, and had capital, \$1,753,000; deposits, \$8,541,779; and resources, \$12,103,321; loan and trust companies, 24, with capital, \$3,074,300; deposits, \$32,520,843; and resources, \$39,795,207; and mutual savings banks, 26, with depositors, 189,674; deposits, \$52,120,644; resources, \$57,403,925; and surplus, \$5,131,835.

Education.—At the close of the school year 1897-98 the school population was 466,714; enrolment in the public schools, 304,680; and average daily attendance, 200,278. There were 6276 teachers, 1850 buildings used as school-houses, and public school property valued at \$14,601,840. The revenue was \$5,757,679; expenditure, \$5,723,424, of which \$3,556,163 was for teachers' salaries. There were 85 public high schools, with 414 secondary teachers, 9690 secondary students, and 254 elementary pupils; 70 private secondary schools, with 386 secondary teachers, 3683 secondary students, and 3139 elementary pupils; and 3 public normal schools, with 72 teachers and 2005 students in all departments. Normal training was also given in 1 college and 10 public high schools. Four universities and colleges for men and for both sexes reported 12 fellowships, 105 scholarships, 145 professors and instructors, 1601 students, 186,762 volumes in the libraries, valued at \$176,200; \$570,000 invested in scientific apparatus, \$2,525,000 in grounds and buildings, and \$3,500,000 in productive funds; \$489,499 in total income and \$4000 in benefactions. One college for women reported 16 professors and instructors, 68 students, and \$12,000 income; and 2 schools of technology, 19 scholarships, 40 professors and instructors, 595 students, \$55,000 in scientific apparatus, \$407,000 in grounds and buildings, \$475,000 in productive funds, and \$67,423 income. During 1899 the State expended \$6,476,983 on public education, 6191 teachers were employed, the number of school buildings was 1887, total value of public school property, \$15,846,123, and the public school enrolment, 375,055. The total apportionment of State school money for the fiscal year beginning July 1, 1899, was \$2,533,550, based on the school census of 1898, 466,714. In 1899 there were 392 periodicals, of which 48 were dailies, 291 weeklies, and 41 monthlies.

Finances.—The assessed valuations in 1899 were: Real estate, \$758,570,962; personal property, \$141,747,356—total, less deductions for debts, \$866,029,771; an increase in a year of \$21,664,573; special railroad assessment, \$224,284,792. The income of the State fund in the year ending October 31, 1899, was \$3,049,700; ordinary disbursements, \$2,019,364; extraordinary disbursements, \$778,706. The balance on hand, November 1, 1898, was \$1,001,524; receipts during the fiscal year, \$3,049,700; disbursements, \$2,789,071; balance, October 31, 1899, \$1,253,153. During the fiscal year 1898-99 the number of companies incorporated under State laws was 1945, and the State received \$728,023 in fees. The total number of companies incorporated in the State on which the annual franchise tax was levied in 1899 was 2885, of which 2734 were capitalized at \$1,454,457,000. The tax aggregated \$901,277. The State bonded debt, October 31, 1899, was \$71,000, the last of the bonds issued on account of the Civil War expenses, which fall due January 1, 1902.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 1,890,000.

Legislation.—Laws were passed regulating assignments for the benefit of creditors and the incorporation of banks, trust companies, and safe deposit companies; a State board of children's guardians was created, with large powers over indigent, helpless, dependent, abandoned, friendless, and poor children who become public charges; policemen cannot be removed, except for cause, when disabled they are to be pensioned, and after their death their widows and minor children are to receive pensions; to take electric power illegally for light, heat, or power was made a misdemeanor, punishable by fine and imprisonment. A State sewage commission was created, with power to prevent the pollution of streams, create sewage districts, and authorize the construction of sewers by condemnation proceedings and assessments upon municipalities. The Board of Health has further power as to pollution of water, and may sue for penalties, or enjoin. Horses are recognized as proper human food, after inspection, but when slaughtered and offered for sale the meat must be labelled "horse flesh." Laborers not engaged in agricultural pursuits, or water-men, must be paid their wages every two weeks, and agreements to the contrary are void. Only citizens of the United States can be employed by public authorities or on public work. Extra pay and medals were voted to volunteers in the Spanish war, a monument to those who lost their lives on the *Maine*, and a sword to Admiral Sampson. See PAVEMENTS AND ROADS.

State Officers and National Representatives.—Governor, Foster M. Voorhees; secretary of state, George Wurts; treasurer, G. B. Swain; comptroller, W. S.

Hancock; attorney-general, Samuel H. Gray; adjutant-general, W. S. Stryker; superintendent of education, C. J. Baxter; commissioner of banking and insurance, William Bettle. Supreme Court: Chief justice, W. J. Magie; associate justices, D. A. Depue, J. Dixon, B. Vansyckel, C. G. Garrison, J. H. Lippincott, W. S. Gummere, G. C. Ludlow, Gilbert Collins; clerk, William Riker, Jr. The State legislature consists of 58 Republicans and 23 Democrats. Senators, William J. Sewell, from Camden, and John Kean, from Elizabeth—both Republicans. Representatives, H. C. Loudenslager (Rep.), from Paulsboro; John J. Gardner (Rep.), from Atlantic City; B. F. Howell (Rep.), from New Brunswick; J. S. Salmon, Jr. (Dem.), from Boonton; James F. Stewart (Rep.), from Paterson; Richard W. Parker (Rep.), from Newark; William D. Daly (Dem.), from Hoboken; Charles N. Fowler (Rep.), from Elizabeth.

NEWMAN, JOHN PHILIP, D.D., a bishop of the Methodist Episcopal Church, and a well-known pulpit orator, died at Saratoga, N. Y., July 5, 1899. He was born in New York City, September 1, 1826; was educated at Cazenovia Seminary; studied theology, and entered the Methodist ministry in 1849. He held pastorates in the Oneida and Troy conferences, and in 1858 was assigned to the Bedford Street Church in New York. In 1860-61 he travelled in Europe and Palestine. From 1864 to 1869 he was for most of the time in New Orleans; during this time he was actively engaged in reorganizing the Methodist Church of the South, and succeeded in establishing three annual conferences, two colleges, and a church paper. In 1869 he was called to Washington, where he organized and became pastor of the Metropolitan Memorial Church. President Grant and Chief Justice Chase were members of the congregation. From 1869 to 1874 he was chaplain of the United States Senate. President Grant appointed him in the latter year inspector of American consulates in Asia. Two years later he returned to his former charge in Washington, where he remained until 1878. He was then successively pastor of the Central Methodist Church and the Madison Avenue Congregational Church in New York, after which he went to California, and from 1885 to 1888 was for the third time pastor of the Metropolitan Church in Washington. He was elected a bishop in 1888. Dr. Newman delivered the funeral oration on General Grant in 1885, and on General John A. Logan in 1887. He wrote: *From Dan to Beersheba*, 1864; *Thrones and Palaces of Babylon and Nineveh*, 1875; *Christianity Triumphant*, 1884; *Evenings with the Prophets on the Lost Empires*; *America for Americans*, 1887; *The Supremacy of Law*.

NEW MEXICO, a southwestern Territory of the United States, has an area of 122,580 square miles. Capital, Santa Fé.

Mineralogy.—Contrary to expectations, the gold output during 1898 exceeded the estimate (\$360,000). The production was 26,074 fine ounces, valued at \$539,000. Silver showed a decline during the year, the output of silver having a coining value of \$549,883, making the total value of these metals \$1,088,883, a net increase of \$34,848. Coal from 16 mines in the calendar year 1898 yielded 992,288 short tons, valued at \$1,344,750, an increase in a year of 275,307 tons; and from 25 mines in the fiscal year ending June 30, 1899, 1,049,034 tons, valued at \$1,600,588, an increase of 100,451 tons over the production of the previous fiscal year. The coking industry in 1898 was represented by 3 plants, with 190 ovens, which used 12,557 short tons of coal and produced 6980 short tons of coke, valued at \$14,625. New Mexico shared generously in the remarkable appreciation in copper properties; but although the output of 1898 (1,592,371 pounds) was more than double that of 1897 (701,892), it was far short of the record-breaking year 1896 (2,701,664). The Territory has upward of 80 mining districts, which are widely distributed, showing that the mineral wealth is not confined to any one section. The known mineral resources include nearly every species of economic value, from salt and sulphur up to gold and silver and precious stones; and while there are numerous paying mines, none of them may be said to be well developed so far. An influx of capital would soon reveal New Mexico as one of the richest mineral-producing regions of the Rocky Mountain range. The mineral area already more or less developed equals 30,000 square miles, and there is large wealth in iron, lead, gypsum, and minor minerals, that only awaits intelligent development.

Agriculture.—The improved systems of irrigation, on which New Mexico has to depend for the enlargement of her useful land area, are developing rapidly, but there are still many opportunities for the investment of capital in profitable irrigation projects. Four large systems are now in operation—the Springer, with 50 miles of ditches and 5 reservoirs, covering 22,000 acres; the Vermejo, with 57 miles of ditches and 10 reservoirs, supplying 30,000 acres; a system in the northwestern part of the Territory, with 200 miles of ditches, supplying 24,000 acres; and an extensive one in the Mimbres region of Grant County. These systems are in the four corners of the Territory. In the great central portion more than 50 companies have been

organized for irrigation projects, and several have plants in operation. It is interesting to note here that there are nearly 57,000,000 acres of unappropriated public land in the Territory, and that agricultural public land is subject to entry only under the Homestead and Desert-Land laws. In horticulture, it is believed, New Mexico will find her greatest development. The best agricultural crop at present is alfalfa, which may be cut three and four times each season. Vegetables of all kinds yield abundantly. Experiments in sugar-beet growing in the Pecos Valley have yielded such encouraging results that a sugar factory has been established in Carlisbad, with a capacity of 200 tons of beets per day. There are now owned in the Territory over 4,000,000 head of sheep, and the wool clip in 1898-99 exceeded 18,000,000 pounds, worth from 12 to 15 cents per pound.

Manufactures.—The internal revenue collection district of New Mexico includes also the Territory of Arizona. In the fiscal year ending June 30, 1899, the collections of revenue on taxable manufactures in New Mexico alone aggregated \$66,932. There were 3 tobacco and 5 cigar factories, with a combined output in the calendar year 1898 of 353,045 cigars and 7650 pounds of smoking tobacco.

Railways.—The new railway construction during the calendar year 1898 was 159.21 miles, and during 1899, 137.70 miles, giving the Territory a total mileage of 1750.64. The entire mileage is owned and operated by 11 corporations.

Banks.—On October 31, 1899, there were 7 national banks in operation and 9 in liquidation. The active capital aggregated \$650,000; circulation, \$407,923; deposits, \$3,421,170; and reserve, \$1,006,287. Territorial banks, June 30, 1899, numbered 7, and had capital, \$272,400; deposits, \$1,145,347; and resources, \$1,471,177. No savings bank was reported.

Education.—At the close of the school year 1897-98 the school population was 50,667; enrolment in the public schools, 26,484; and average daily attendance, 16,950. There were 603 teachers, 548 public schools, and public school property valued at \$281,000. The revenue was \$203,219; expenditure, \$154,532, of which \$122,729 was for teachers' salaries. There were 4 public high schools, with 7 secondary teachers, 127 secondary students, and 25 elementary pupils; 3 private secondary schools, with 8 secondary teachers, 75 secondary students, and 221 elementary pupils; and a public normal school, with 5 teachers and 66 students in all departments. There were also the University of New Mexico, at Albuquerque; Agricultural College, at Las Cruces, with branches at Las Vegas and Aztec; School of Mines, at Socorro; Normal University, at Las Vegas; Military Institute, at Roswell; and School for the Deaf, Dumb, and Blind, at Santa Fé. The value of property embraced in these institutions is \$191,025. The Roman Catholic Church maintains 18 sectarian schools, with 72 teachers, 1602 pupils, and property worth \$231,700; the Methodist Episcopal, 11, with 462 pupils, and school property, \$10,000; the Presbyterian, 25, with 25 teachers, 1105 pupils, and school property, \$37,900; and the New West Educational Commission, 5, with 7 teachers, 219 pupils, and school property, \$44,000. The federal government maintains non-reservation Indian schools at Albuquerque and Santa Fé, 2 boarding schools at the Mescalero and the Puebla and the Jicarilla agencies, and 15 day schools at the latter agency. In 1899 there were 50 periodicals, of which 4 were dailies and 42 weeklies.

Finances.—The total assessed value of real and personal property for 1898 was \$40,124,724; the total Territorial debt, June 30, 1899, was \$1,243,400; aggregate of county debts same date, \$2,997,665.

Population.—On September 20, 1899, Governor Otero estimated the population by counties as 260,500; Indian population, 25,329—total, 285,829.

Legislation.—It was enacted that banks shall publish annually names and amount of deposits whenever accounts have not been drawn upon for three years. Cattle must be inspected before shipment and a record kept of cattle slaughtered, with description and names and addresses of vendors. Laws were passed to prevent pollution of springs, wells, and streams. County commissioners were authorized to make quarantine regulations as to diseased fruit. The District Court appoints three persons, who select the juries, and the party demanding a jury must pay \$24 a day in advance as jurors' fees, to be taxed as costs. A Territorial commerce commission was created, with extraordinary powers, among them that of fixing the minimum and maximum price at which coal-oil shall be sold, heavy penalties, with revocation of license, being imposed for selling under or over the prices fixed. Corporations producing, refining, and selling coal-oil or any product of petroleum must be licensed and pay \$500 annually to the Territory; those who do not produce, but sell only must pay a small license as wholesale or retail dealers.

Territorial Officers and National Representatives.—Governor, Miguel A. Otero; secretary, George H. Wallace; treasurer, J. H. Vaughn; auditor, L. M. Ortiz; adjutant-general, W. H. Whiteman; attorney-general, E. L. Bartlett; superintendent of education, M. C. de Baca. Supreme Court: Chief justice, William J. Mills; associate justices, John R. McFie, J. W. Crumpacker, F. W. Parker, C. C. Leland;

clerk, José D. Sena. The Territorial legislature consists of 30 Republicans and 6 Democrats. Representative, Pedro Perea (Rep.), from Santa Fé.

NEW SOUTH WALES is a British colony in southeastern Australia; it has an area of 310,700 square miles, and had a population on June 30, 1899, of 1,357,050; the city of Sydney, with a population, including the suburbs, of 426,950, is the capital and the chief city of the colony; it contains the government buildings, the royal mint, a university, a national art gallery, a public library, an observatory, and two cathedrals; Sydney is not only the chief distributing point for the trade of Australia, but according to United States Consular Reports for May, 1899, it is in the value of its tonnage probably the tenth commercial port of the world. In 1897 the tonnage was 4,257,299 and the total for all ports, 6,744,431. The principal occupations of New South Wales are pastoral and agricultural farming, and mining. The chief crops are wheat, maize, barley, oats, potatoes, hay, sugar, and tobacco, and the chief fruit cultures are those of the orange and the vine; from the latter 845,232 gallons of wine were produced in the year ending with March, 1899. Other figures for the given fiscal year are: Wheat and other grains, 15,728,496 bushels; oranges, 7,839,216 dozen; sugar-cane, 289,206 tons, and tobacco, 12,706 cwt. From the grazing interests of New South Wales the staple product wool is produced. At the beginning of 1899 there were 41,241,004 sheep in the colony, and the amount of wool produced amounted to 271,864,306 pounds, valued at £8,361,721. As an agricultural country the importance of New South Wales is steadily growing, but a succession of droughts during the last few years has severely told upon the colony and caused a decrease in crops of nearly all kinds. In live stock also the country has hardly held its own, the effect of the drought upon grazing having especially affected the production of wool; within eight years the number of sheep has decreased by over 20,000,000, placing the colony's proportion of the world's sheep at about one-thirteenth, as against one-eighth a few years ago. These figures were given by the government statistician at Sydney in a report dated early in 1899. He adds that although these statistics speak discouragingly for the immediate future of the colony, it must not be thought that the country is struggling under an overmastering depression. Owing to the energy and wealth of the people, the business of the country, he reports, can justly be said to be, on the whole, fairly prosperous, and there is no indication of industrial paralysis. Indications in 1899 were that the long-continued drought had broken, at least in a large portion of the colony, and a more hopeful feeling was gradually extending throughout business and industrial circles. The chief mineral products are gold and coal, others being silver, copper, iron, tin, antimony, bismuth, chrome, platinum, and precious stones, the total value of minerals taken out in 1898 being £4,794,928. One-fourth of this amount represents gold. As to the trade, the imports in 1898 were £24,453,560, and the exports £27,648,117. Not considering Great Britain and her colonies, which absorb a major part of the trade, the United States, France, and Germany took about equal amounts of exports, while in imports into New South Wales the United States led, with Germany second. At the beginning of 1899 the railway mileage of the colony was about 2700. The government is somewhat similar to those of the other Australian colonies. The executive authority is vested in a governor, who is aided by a cabinet of ten ministers. The Rt. Hon. Earl Beauchamp was appointed governor in 1899. The premier was W. J. Lyne, who succeeded to the office September 14, 1899, upon the resignation of Minister Reid and his cabinet. The legislative authority is vested in a bicameral parliament, the upper house being known as the legislative council and the lower as the legislative assembly. The members of the former are appointed by the crown for life, and those of the latter are elected by popular vote. Education is controlled by the state, and is compulsory for children between 6 and 14 years of age. There is freedom of religious worship, all sects being on an equal footing.

History, 1899.—In 1899, as during the previous year, the principal political question was the matter of federation, a full account of which is given in the article **AUSTRALIAN FEDERATION** (*q. v.*). New South Wales, as the oldest of the Australian colonies, was especially deferred to in the matter, and Queensland withheld its vote until the decision of New South Wales had been made. In 1898 the proposition was defeated in the latter state, the reasons given being that the constitution as drafted at Melbourne made it possible for the other colonies to outvote New South Wales, especially in tariff matters, and that there were other provisions relating to financial, legal, and territorial rights, etc., which were objectionable. A change in the government occurred late in the year, and in March the amended Federal Enabling bill was again submitted to the colonial legislature, and passed, and later in June approved by the people by a vote of 101,200 to 79,634. The imperial government was officially asked by the legislature also to endorse the bill. The reverses which affected all the colonies which had supported federation, due largely to the withdrawal from the government's support of those who had stood by it only until the bill had been passed, took place in South Australia under peculiar circumstances. The opposition

party, re-enforced by the labor party, passed in September a vote of want of confidence in the government, mainly on financial questions. Mr. Reid accordingly resigned, and Mr. Lync became premier in the new administration. A force for service in the South African war was offered to the imperial government, and accepted. The budget estimate for the year showed a revenue of £9,720,000 and an expenditure of £9,909,000. The public debt in 1898-99 was £67,000,000.

NEW YORK, a Middle Atlantic State of the United States, has an area of 49,170 square miles. Capital, Albany.

Mineralogy.—In 1898 the State maintained its rank as the first salt-producing State in the country, gained in 1893, with a total output of 6,791,798 barrels, valued at \$2,369,323. The principal grades and quantities thereof were, coarse solar, 2,493,285 barrels; rock, 1,556,300; table and dairy, 1,254,854; and common fine, 1,240,325. Quarrying yielded granite, used principally for building and road-making purposes, \$516,847; sandstone, \$566,133; slate, nearly all roofing, \$48,694; marble, \$342,072; and limestone, about equally divided between building, road-making, and lime-burning purposes, \$1,533,936—total value, \$3,007,682, giving the State fourth rank. The iron production was 179,951 long tons, mostly magnetite, valued at \$350,999. (See paragraph Manufactures.) Gypsum yielded 33,440 short tons, valued at \$78,684, the largest part being calcined into plaster of paris, and the next largest ground into land plaster; and fibrous talc, 54,356 short tons, valued at \$411,430.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$46,634,980, the second largest amount among the States. There were 503 manufacturers of tobacco and 7067 of cigars, and the combined output in the calendar year 1898 was 1,203,976,944 cigars, 1,963,720,602 cigarettes, 2,641,513 pounds of plug tobacco, 1,949,130 pounds of fine-cut, 11,245,064 pounds of smoking, and 91,457 pounds of snuff. Grain and fruit distilleries in operation numbered 37; the production of fruit brandy was 32,605 gallons; quantity of spirits rectified, 12,192,291 gallons; distilled spirits gauged, 28,762,319 gallons, and fermented liquors produced, 9,665,347 barrels. During the calendar year 1898 the production of pig-iron was 228,011 long tons, and of all kinds of rolled iron and steel, 83,735 long tons. New York and New Jersey together had an output of 47,957 long tons of open-hearth steel, 3110 long tons of steel plates and sheets, and 109,833 kegs of wire nails, and New York and Connecticut together produced 8365 long tons of crucible steel. The report of the Bureau of Labor Statistics showed that the percentage of idleness among members of labor organizations was reduced in 1899 from 10.7 on June 30 to 2.3 on September 30. On the last date there were 1320 trade unions with a membership of 209,120, of whom only 4788 were unemployed. See SILK MANUFACTURES.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at New York City (\$465,558,936) and eleven other ports aggregated in value \$484,144,866; exports at New York City (\$459,444,217) and other ports, \$487,999,957, an increase in a year of \$67,006,572 in imports and \$14,794,021 in exports. The movement of gold and silver was, imports, \$57,057,847; exports, \$87,023,327, making the total foreign trade of the year \$1,116,225,997, a net increase of \$68,523,193.

Transportation.—The new railway construction during the calendar year 1898 was 45.38 miles, and during 1899 40.65 miles, giving the State a total mileage of 8,193.29. In the fiscal year 1898-99 the steam surface roads had gross earnings of \$5,977,508 in excess of those of the previous year; the operating expenses were \$2,855,613 in excess, making the net earnings from operation \$3,121,895 in excess; and the income from other sources was \$2,034,990 in excess. The excess of taxes was \$506,051; declared dividends, \$534,692; capital stock, \$8,977,400; and funded debt, \$11,985,383. During the year 704 persons were killed and 1326 injured on the steam surface roads, an increase of 4 in killed and a decrease of 181 in injured. The street surface roads in the boroughs of the Bronx and Manhattan carried 509,314,816 passengers; the elevated roads, 213,248,419; and both systems in the boroughs of Queens and Brooklyn, 238,721,051. Steam roads, excluding elevated, carried 149,926,184 passengers.

Banks.—On October 31, 1899, there were 327 national banks in operation and 156 in liquidation. The active capital aggregated \$82,012,390; circulation, \$39,418,530; deposits, \$848,831,252; reserve, \$217,351,899; and resources, \$1,210,633,128. State banks, September 30, 1899, numbered 208, and had capital \$29,545,700; deposits, \$270,033,433; resources, \$372,982,538; and surplus and undivided profits, \$27,654,219; loan and trust companies, 52, with capital, \$38,050,000; deposits, \$594,462,705, and resources, \$722,356,523; and private banks, 15, with capital \$270,000; deposits, \$1,654,714; and resources, \$2,117,720. There were 130 mutual savings banks, with depositors, 1,865,653; deposits, \$816,144,368; resources, \$923,420,862; and surplus, \$106,896,623. During the year ending September 30, 1899, the exchanges at the United States clearing houses at New York, Buffalo, Rochester, Syracuse, and Binghamton aggregated \$57,785,850.085, an increase in a year of \$17,550,234.099.

Insurance.—Official reports for the calendar year 1898 show that, excluding indus-

trial policies, the State life insurance companies wrote 276,295 policies, insuring \$595,470,427, and terminated 166,952 policies, insuring \$412,666,510. Life companies of other States issued 209,440 policies, insuring \$422,895,600, and terminated 120,944 policies, insuring \$255,416,105. Life policies increased in the year 54,278, and the amount of insurance written, \$94,561,151. Industrial companies issued 8,242,198 policies in the year, insuring \$1,058,467,079, against 7,612,134 policies and \$958,449,297 insurance in 1897. Casualty and fidelity companies had capital, \$11,829,000; receipts, \$18,729,413; disbursements, \$16,577,508; risks in force, \$3,386,126,676; and assets, \$34,928,788. Assessment life companies reported receipts, \$18,857,426, a decrease of \$3,738,335; disbursements, \$17,935,250; and certificates in force, 529,628, a decrease of 77,537; and the various fraternal organizations had receipts, \$30,638,570, increase, \$497,331; disbursements, \$28,576,692; and certificates of membership, 1,374,371, increase, 43,141.

Education.—The State superintendent of public instruction reported that at the close of the school year 1898-99 the school population was 1,550,079; enrolment in the public schools, 1,179,351, and in private schools, 161,708. There were 33,992 public school teachers, who received an aggregate in salaries of \$16,484,646. The total expenditure for educational purposes was \$28,052,990, a decrease from the total of the previous year of \$422,881. This decrease was occasioned by a falling off in the money expended for schools, new building sites, furniture, and repairs. In 1898, \$8,611,548 was expended for such purposes, while in 1899 only \$6,417,915 was so used. This decrease of \$2,195,632, combined with a decrease of \$23,269 in expenditures for libraries, more than offsets the increase of \$1,328,368 in teachers' salaries, and produces the net decrease of \$422,881. The value of all the public school property in the State was reported as \$75,153,615, and the number of volumes in the public school libraries, 1,544,170. The State Board of Regents reported that during the past year there had been a decided advance in the standards of business education in the State, and that, largely on account of the movement here, there had been also a distinct increase in the interest taken in business education in other States. The high schools numbered 541, and academies 134, and together they had 69,776 students. High school expenditures aggregated \$3,708,195, and the total expenditure for secondary instruction was \$5,226,824, of which \$3,212,155 was from local sources. At the close of the school year 1897-98 there were 15 public normal schools, with 360 teachers and 5666 students in all departments and 2 private ones, with 83 teachers and 526 students. Normal training was also given in 9 colleges and 71 public high schools. Twenty-three universities and colleges for men and for both sexes reported 55 fellowships, 1522 scholarships, 1288 professors and instructors, 12,007 students, 949,342 volumes in the libraries, valued at \$1,802,397, \$1,413,727 invested in scientific apparatus, \$20,891,155 in grounds and buildings, and \$24,199,969 in productive funds, \$2,744,844 in total income, and \$1,190,861 in benefactions. Five colleges for women reported one fellowship, 35 scholarships, 183 professors and instructors, 1798 students, 49,907 volumes in the libraries, \$107,458 in scientific apparatus, \$2,191,512 in grounds and buildings, and \$1,272,204 in productive funds, \$489,222 in total income, and \$211,499 in benefactions. In all universities, colleges, professional, technical, and other special schools, there was a total of 31,499 students in 1899. The periodicals in that year numbered 2066, of which 180 were dailies, 1120 weeklies, 598 monthlies, and 47 quarterlies.

State Charities.—According to the annual report of the State Board of Charities, the number of State beneficiaries of charitable institutions, on October 1, 1899, was 71,261, while those receiving outdoor relief and living mainly at their homes aggregated more than 2,000,000. The property of the various State institutions was valued at \$111,000,000; the receipts were about \$25,000,000, and the expenditures exceeded \$22,000,000.

Finances.—In the State fiscal year ending September 30, 1899, the receipts of the State Treasury aggregated \$29,810,941, a decrease in a year of \$4,651,270; disbursements, \$25,306,126, decrease, \$8,451,855; balance on hand, October 1, \$4,504,814, increase, \$531,010. Among the receipts were \$2,266,650 from the annual tax on corporations; \$2,194,612 from the inheritance tax; and \$4,231,229, the State's portion of the revenue under the excise law, the total of which was \$12,582,248. The State Board of Tax Commissioners reported in 1899 that the taxable property of the State, based on assessors' reports for 1898, showed an increase over that of the previous year of \$177,785,805. The assessed valuations as equalized for taxation were: Real estate, \$4,413,848,496; personal property, \$662,548,328—total, \$5,076,396,824. The tax rate was \$2.49 per \$1000, and the amount of State tax levied, \$12,640,228. The bonded debt, September 30, 1899, was \$10,185,660, mostly represented by canal improvement bonds.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 7,175,000.

Elections.—The elections in New York resulted in the return of a Republican legislature. A member of Congress was elected also, the Republican candidate being

chosen. In New York City elections, however, Tammany won by 50,000 majority. Mr. Mazet, who stood for re-election to the Assembly on the Republican ticket, was defeated by the combined votes of Tammany and the Citizens' Union. Ex-Justice Daly, whose nomination was an endorsement of the principle of the independence of the bench, was also defeated, though supported by the Republicans, the Citizens' Union, and the Independent Labor party. Elsewhere throughout the State the Republicans made gains. In various cities local fusion tickets were formed for the pursuance of good government campaigns. Four constitutional amendments were submitted to the people in the State elections, all of which were carried. The most important related to the debt limit of New York City.

The Legislature.—When the session opened on January 4 the Republicans, with a majority of 3 in the Senate and of 24 in the Assembly, elected Senator Ellsworth president *pro tem.* of the Senate, and Samuel F. Nixon, speaker of the Assembly. The bill for a change from annual to biennial sessions was lost by 1 vote. The labor unions were against it, because, they said, it would tend to reduce the popular control over legislation. The legislature adjourned on April 28, but was called together in special session by the governor on May 22, in order to act upon certain amendments to the Ford bill on taxation of franchises, which had passed on May 11. On May 25 the bill, as amended in accordance with the governor's suggestions, was passed. Besides the Ford bill, important matters considered by the legislature were those regarding the Erie Canal investigation, the Mazet investigation, the State constabulary, civil service, anti-trust legislation, the Ramapo water scheme, the Raines Election law and the liquor amendment, and educational unification. Some of these subjects will be referred to in succeeding paragraphs.

The Ford Bill.—Early in the year Senator John Ford, of New York City, introduced a bill taxing the franchises of street railroads, gas companies, telephone companies, and the like, and attempted to show the analogy between the value of such franchises and the value of municipal real estate. Governor Roosevelt strongly supported the measure, and urged that it be passed in some form during the session. He explained that he had no sympathy with the outcry against corporations, but it was also his belief that they should be asked to bear their just proportion of taxation. The bill was passed in the Assembly on the last day of the session, and in a special meeting of the legislature called for that purpose the necessary amendments suggested by the governor were added to it. It is regarded as one of the most important measures of the year, and will create an additional tax income estimated at about \$17,000,000, of which New York City will contribute about 60 per cent.

Canals.—In view of the fact that the State appropriation of \$9,000,000 for the improvement of the Erie Canal had been expended with apparent recklessness, if not in a corrupt manner, there was a popular demand in 1899 for a public investigation of the former canal management. Governor Roosevelt engaged two well-known Democratic lawyers to represent the State in the investigation of the Republican management, and appointed a committee to examine the whole canal question, especially in relation to its commercial aspects. Their report was not ready at the end of the year. It was intended that the investigation of the charges against the former canal management should leave no room for any further question as to criminal proceedings. After several months' work a report was rendered to the effect that criminal prosecutions were unadvisable and impracticable, but that sufficient delinquency on the part of those charged with the work had been shown to justify public indignation. Consequently, a complete change in methods and management was made. Under the new superintendent of public works, Colonel John N. Partridge, of Brooklyn, at the end of a season of unusual activity on the canals, October 1, 1899, it was shown that although more business had been done than was done in the previous season, a net saving of nearly \$140,000, or about 25 per cent., had been effected, and that the canals had been managed with an eye single to the public good. The statement was made by Attorney-General Davies that claims aggregating nearly \$1,000,000 had been made by property owners for damage due to work under the \$9,000,000 appropriation for canal improvements.

Civil Service.—A bill to secure recognition of merit in appointments to the civil service was passed on April 18, under which the great bulk of the classified officers are taken out of the domain of politics. Since the new rules were promulgated examinations for all positions subject to them have been held in thirty cities, so as to accommodate applicants in every part of the State, and the increased attendance at these examinations indicates an appreciation of the relief from the double examinations required by the previous law. The present law is one of those especially fostered by Governor Roosevelt, who favored the re-enactment of a number of provisions which had been considered unpractical by the previous State administration.

Other Legislation.—The Primary Election law was amended so as to improve the methods of enrolment, as well as to make nominations more generally repre-

sentative. The Raines Election bill was passed, despite the bitter opposition of the minority, who called it the "Force bill." This law makes special provisions for legal proceedings, "including an extraordinary term of the Supreme Court, on notification from the attorney-general of a violation of the laws regarding honest elections in any county in the metropolitan elections district." An anti-trust law was passed, the validity of which is denied by some lawyers, but which was not opposed by the trusts. This law declares guilty of misdemeanor any officer of a corporation who enters into any trust agreement, and authorizes the attorney-general to bring action to restrain such action. Trusts and pools to control rates of transportation between this country and Europe were forbidden. The State Constabulary bill, which was defeated, aimed to create a State police under a single commissioner, with responsible heads placed over the State forces in the larger cities, the idea being to remove the police from political control. Efforts to bring about an educational unification scheme failed, but it is thought that it will be brought up again before long.

Labor.—A large number of strikes occurred during the year, many of which were closed, however, through arbitration. Amendments to the labor laws passed by the legislature of 1899 require inspection and license for all rooms used for manufacturing purposes in tenement-houses, adequate light and cubic feet of air space, and destruction of all infected articles and of all articles manufactured under unclean or unsanitary conditions. (See CONSUMERS' LEAGUE.) For the protection of workmen new safeguards were provided by the transfer from the police to the factory inspector of the duty of inspecting scaffolding, ropes, etc., and by requiring mechanical contrivances for safety in operating machines. For women and minors the hours of employment in any factory must not exceed the rate of 60 hours in 1 week or 10 hours a day for 6 days. For all work-people employed by the State the new law of May 12 limits work to an average of 8 hours a day.

Reform Conference.—A conference of about 200 delegates was held at Buffalo, June 28 to July 3, to discuss plans for changing certain social, political, and economic conditions. Certain inequalities of the present industrial system were condemned, and the present form of government was claimed to be non-representative, the will of the people being thwarted, it was affirmed, by the legislative bodies. The delegates pledged themselves to support the party putting into its platform the reforms most desired. Resolutions were adopted in favor of uniting educationally for direct legislation, and in favor of public ownership of public utilities, and a single tax and an income tax were approved of. The right of women to vote on terms of equality with men was unanimously approved. A committee was appointed, with the Rev. W. P. Bliss as chairman, to organize a Social Reform Union in support of the various reforms advocated. One outgrowth of the conference was the establishment of a School of Economic Research and Instruction, in which there shall be no restrictions upon the freedom of investigation, teaching, or expression of convictions.

The Independent Labor Party was formed August 17, 1899, at a conference of representatives of the working-men of Greater New York. The movement was an outgrowth of the Brooklyn and Manhattan street-car strikes, and the failure of the Tammany officials to enforce the ten-hour law as applying to the employees of the surface railroads. The platform demands, among other things, municipal ownership and operation of street railways, telephones, electric plants, gas-works, and all similar public utilities; eight hours' work for all employees engaged directly or indirectly on State and municipal work, and the strict enforcement by the authorities of all labor laws; the abolition of the contract system on public works, and the employment of labor at union wages in the manufacture of all articles supplied to the State and municipality; liability of employers for injury to health and body, or loss of life sustained by workmen in course of employment; home rule in taxation; municipalities to have full power to determine upon their system of taxation; the immediate construction by the city of the underground rapid-transit system in obedience to the will of the people, as decided by the overwhelming majority of the voters; and sufficient school accommodations for all children.

The Mazet Committee.—The State Assembly appointed a committee of five Republicans and two Democrats on March 31 to investigate the alleged corruption in the Tammany administration in New York City. The members of this committee were Robert Mazet, chairman, and Edward H. Fallows, Thomas M. Costello, James B. McEwan, Harris Wilson, Benjamin Hoffman, and Anthony J. Boland. The chief counsel was Frank Moss, former president of the New York City police board. Many departments of the city government were examined, and prominent officials were subpoenaed as witnesses. Dr. Parkhurst, who was closely identified with the Lexow investigation, which resulted in bringing about the reform administration of Mayor Strong, denounced the present movement as being of a partisan character. Although few new facts were disclosed, the investigation revealed anew the inefficiency of the Tammany government. It was the opinion of some, however,

including the committee's chief counsel, that the inquiry should have been extended to include also certain leaders of the opposite party. One revelation of importance was that Tammany candidates for the judges' bench were systematically levied upon under the form of campaign assessments. The New York Bar Association, one of the foremost legal bodies in the country, made this an issue in the November elections, but Judge Daly, who stood for the integrity of the bench, was defeated by an overwhelming Tammany vote. Another matter of interest during the session was the examination of Richard Croker, who frankly acknowledged his control of New York City affairs and his participation in the political spoils. His admission that he was "working for his own pocket all the time" created considerable diversion in the press. The committee's report was to be made to the legislature in 1900.

The Ramapo Water Scheme.—The New York City Board of Public Improvements received a report on August 16 from the commissioner of water-supply approving a contract for a term of 40 years, whereby the Ramapo Water Company was to supply the city with 200,000,000 gallons of water daily at a rate of \$70 per million gallons, the company to retain the ownership of the plant. The force of public indignation aroused by a contract of such a nature compelled the authorities to delay action pending investigation. Comptroller Coler, a Democrat, was especially active in opposing the scheme. By the aid of the Supreme Court he enjoined the board from confirming the contract, and the matter was carried into the State legislature. The Ramapo company claimed to have obtained the water rights in nearly a score of counties, its name being derived from the lake region in and about the Ramapo Mountains, near the New Jersey border line. Its opponents doubted its power to furnish a sufficient supply of water, and in any case, they said, it was absurd to contract for such a supply with a private company at such an enormous figure, and before a stroke of work had been done to assure the city that the proposal could be properly and effectively carried out. The company, they said, was asking the city to assure them of a capital of many million dollars, while the city might for a much smaller sum condemn the necessary lands, and in the end possess its own plant.

Other City Affairs.—On January 6, 1899, James A. Coogan was elected president of the municipal assembly for three years with an annual salary of \$5000. The refusal of the municipal council to approve issues of bonds indispensable for the carrying out of duly authorized public works led to proceedings against it. The council having refused to issue bonds to provide for the new hall of records, and having ignored the order of the Supreme Court to pass the issues, a number of members of the council were ordered by the court to be placed under arrest. The council met August 9 and passed the entire issue. There was much discussion in 1899 of defects in the charter, and some demanded an amendment abolishing the assembly and constituting the council alone as the municipal legislature. The borough system was also criticised, and many favored the abolition of the office of borough president. Another important matter during the year related to the payment of public-school teachers, whose salaries had been delayed for months. The Ahearn bill, making all public-school teachers in New York City eligible to an increase of salary under certain conditions, and providing that the lowest annual salary should be \$600, became a State law in April, and was welcomed as a compromise of a long undecided question.

State Officers and National Representatives.—Governor, Theodore Roosevelt; lieutenant-governor, Timothy L. Woodruff; secretary of state, John T. McDonough; comptroller, William J. Morgan; treasurer, John P. Jaeckel; attorney-general, John C. Davies; engineer and surveyor, Edward A. Bond; superintendent of public instruction, Charles R. Skinner; superintendent of insurance, Louis F. Payn; superintendent of banking department, Frederick D. Kilburn; superintendent of State prisons, Cornelius V. Collins; superintendent of public works, John N. Partridge. Court of Appeals: Chief judge, Alton B. Parker; associate judges, Albert Haight, John Clinton Gray, Irving G. Vann, Edward T. Bartlett, Dennis O'Brien, Celora E. Martin; clerk, William H. Shankland. The State legislature consists of 119 Republicans, 79 Democrats, and 1 Independent Democrat, and there is 1 vacancy. New York is represented in Congress as follows: Senators, Thomas C. Platt, of New York, and Chauncey M. Depew, of New York, both Republicans. Representatives, Townsend Scudder (Dem.), from Glen Head; J. J. Fitzgerald (Dem.), from Brooklyn; Edmund H. Driggs (Dem.), from Brooklyn; Bertram T. Clayton (Dem.), from Brooklyn; Dr. Frank E. Wilson (Dem.), from Brooklyn; Mitchell May (Dem.), from Brooklyn; Nicholas Muller (Dem.), from New York; Daniel J. Riordan (Dem.), from New York; Thomas J. Bradley (Dem.), from New York; Amos J. Cummings (Dem.), from New York; William Sulzer (Dem.), from New York; George B. McClellan (Dem.), from New York; Jefferson M. Levy (Dem.), from New York; William A. Chanler (Dem.), from New York; Jacob Ruppert, Jr. (Dem.), from New York; J. Q. Underhill (Dem.), from New Rochelle; A. S.

Tompkins (Rep.), from Nyack; J. H. Ketcham (Rep.), from Dover Plains; A. V. S. Cochrane (Rep.), from Hudson; Martin H. Glynn (Dem.), from Albany; John K. Stewart (Rep.), from Amsterdam; L. N. Littauer (Rep.), from Gloversville; L. W. Emerson (Rep.), from Warrensburg; C. A. Chickering (Rep.), from Copenhagen; James S. Sherman (Rep.), from Utica; George W. Ray (Rep.), from Norwich; M. E. Driscoll (Rep.), from Syracuse; Sereno E. Payne (Rep.), from Auburn; Charles W. Gillet (Rep.), from Addison; James W. Wadsworth (Rep.), from Geneseo; J. M. E. O'Grady (Rep.), from Rochester; William H. Ryan (Dem.), from Buffalo; D. S. Alexander (Rep.), from Buffalo; Edward B. Vreeland (Rep.), from Salamanca (*vice* Warren B. Hooker, who resigned March 30, 1899).

NEW YORK ACADEMY OF SCIENCES, incorporated 1818 as the Lyceum of Natural History in the City of New York, holds an annual reception and exhibition in the spring, and publishes *Annals* (current volume XII.). In 1899 it had 333 resident members and fellows, and 42 honorary members, besides corresponding members. President, Robert S. Woodward; secretary, Richard E. Dodge, Teachers' College, New York City. See ZOOLOGICAL SOCIETIES.

NEW YORK CHAMBER OF COMMERCE, organized in 1768 "to promote and extend just and lawful commerce," had in 1899 a membership of 1250. Secretary, George Wilson, 32 Nassau Street, New York City.

NEW YORK PUBLIC LIBRARY, ASTOR, LENOX, AND TILDEN FOUNDATIONS, consolidated in 1895, has at present two buildings, the Astor, 40 Lafayette Place, and the Lenox, which contains also an art collection, at 895 Fifth Avenue, both buildings being open free from 9 A.M. to 6 P.M. The number of visitors in the last fiscal year to the Astor was 84,977, and to the Lenox, 26,061. There were 33,569 visitors to the art gallery. Among the accessions during the year were: 800 volumes, purchased with the Schiff fund at the Joachimsthal sale in Amsterdam; the gift of the Gordon L. Ford library, by his sons, Worthington C. Ford and Paul L. Ford, a collection rich in American history between the years 1750-1850, containing early journals of Congress, American biography, and economics, and early American poetry; a number of books, pamphlets, and newspapers on music, and on the socialistic movement, given by F. A. Sorge; 200 volumes of rare Americana, dealing with the earliest period of American discovery, given by Mr. Maitland; and in December, 451 volumes, 325 pamphlets, and 52 volumes of newspapers, relating to Mormonism, presented by Miss Helen M. Gould. A department of Slavic literature was established during the year by the accession of 1300 volumes, and a course of instruction was given to apprentices. On March 19 the Board of Estimate and Apportionment authorized the issue of bonds for \$500,000 for removing the reservoir at Forty-second Street and Fifth Avenue, and for laying there the foundations of the new library building. The number of available volumes was 459,248, besides 117,000 pamphlets; the accessions during the year, exclusive of the Ford gift, which contains some 100,000 volumes and pamphlets, number 34,182, and 7436 feet of shelving were added to the two buildings. The law books were all transferred to the Lenox building. Director, John S. Billings.

NEW YORK UNIVERSITY, in New York City, was chartered in 1831. The year 1898-99 was noteworthy in the large attendance at the university, while its resources were increased by gifts in money of about a third of a million dollars. Among the many notable events of the year are the following: The newly consolidated University and Bellevue Hospital Medical College was opened in October, 1898, occupying the East College Building, the new College Building, and the Carnegie Laboratory, property representing about half a million dollars; the enrolment exceeding 400 students, and the faculty 95 members. The Graduate School was opened with an unusual representation of colleges throughout the United States—namely, 14 colleges in New York State, 7 in New England, 13 in the Middle States and Ohio, 14 in the Western and Southern States, besides foreign universities and gymnasias to the number of 17. The University Extension Work was strengthened by an endowment of \$12,000 for the Woman's Law Class, intended particularly for business women. The Hall of Pedagogy, comprising 21 rooms on the ninth floor of the Washington Square Building, was completed during the summer, representing \$100,000 investment by the University, besides \$8000 for new improvements. The name of the Undergraduate College was changed to the University College of Arts and Pure Science. A large gift from a German-American citizen of New York was received for a Library of German Language and Literature. The New York University School of Applied Science was announced in the spring, upon the occasion of a gift for an engineering endowment of \$200,000. The school was divided into four departments, civil, mechanical and chemical engineering, and industrial chemistry. For statistics see UNIVERSITIES AND COLLEGES.

NEW YORK ZOOLOGICAL SOCIETY. See ZOOLOGICAL SOCIETIES.

NEW ZEALAND is a group of islands belonging to Great Britain, and lies about 1200 miles east of Australia, with a total area of 104,471 square miles, and an estimated population in 1899 of 787,784, of whom 39,854 are natives or Maoris. Excluding the latter, 98 per cent. of the population is British, 63 per cent. being born in New Zealand and 31 per cent. in the United Kingdom. There are two principal islands, North Island, with an area of 44,468 square miles, and South or Middle Island, with an area of 58,525 square miles, containing most of the population. There is also Stewart Island, area 665 square miles, and small outlying islands, some of which are uninhabited. The principal cities are Wellington, the capital, population 47,207 in 1899, and Auckland, population 63,209, in North Island; and Dunedin, 49,492, and Christchurch, 56,330, in South Island. These estimates include the suburbs of the cities mentioned. In North Island are active volcanoes, and the famous geyser and hot lake regions. In South Island the western coast range rises to a height in Mt. Cook of over 12,000 feet. Besides dense forests, the colony contains considerable arable land, which is easily worked. The climate is unusually fine, and production is possible throughout the year. The chief occupations are agricultural and pastoral pursuits, and the exportation of frozen meat, a rapidly growing industry, is increasing. The principal crops are wheat, oats, barley, and hay, and hemp is an important product, while there are many million sheep in the colony. Mining is very important, among the metals being gold, the most important, and coal, silver, antimony, and manganese. Another valuable product is kauri-gum, from a valuable timber-pine of the New Zealand forests. In 1898 the commerce of New Zealand amounted to £10,517,955 for exports and £8,230,600 for imports. The principal exports were in the order of importance wool, frozen meat, gold, kauri-gum, dairy products, animal products, grain, and flour. The imports were chiefly cloth and clothing, and iron goods and machinery. Others were sugar, books and stationery, spirits, fruit, tea, tobacco, and oils. Among the British Australasian colonies New Zealand stands third in the magnitude of its trade. This trade is divided about equally between the four ports, Auckland and Wellington in North Island, and in South Island Dunedin and Lyttelton, the latter being the port of Christchurch. During 1898 about 620 vessels visited these ports, with a tonnage of about 765,500. There are regular lines to Australia and England. In March, 1899, there were 2257 miles of railroads, mostly state lines, including 81 miles under construction. The telegraph mileage was about 6800. Education is free and compulsory. At the beginning of 1899 there were 1624 public primary schools with an attendance of 131,621, and 294 private schools. There are also 25 endowed grammar schools and colleges, and the University of New Zealand, an examining body which grants degrees. The government consists of a governor and a responsible ministry and of a legislature. The latter is made up of a legislative council of 48 members, appointed by the governor for seven years, and of a house of representatives of seventy-four members elected for three years. Four of the representatives are Maoris, elected by the natives. Women have the right of suffrage, but may not hold office. The governor in 1899 was the Earl of Ranfurly, and the premier was the Rt. Hon. Richard J. Seddon. New Zealand was not included in the Australian federation scheme upon which the five Australian colonies and Tasmania voted in 1899, although she was represented at some of the earlier conferences on the subject. The great distance of the colony from the other British colonies of Australasia was one of the principal drawbacks to political union with those states. In common with the Australian colonies and Tasmania, however, New Zealand in 1899 offered a military force to the imperial government for service in South Africa, and a body of mounted rifles was sent to the Transvaal in October upon the acceptance of the offer. The treasury budget for the year 1899 estimated the public revenue at £5,300,000, and the expenditure at £5,060,000. It was stated that a loan of £1,000,000 would be necessary for the construction of roads and railways. In 1899 the public debt was £46,080,727. See LABOR.

NICARAGUA, a republic of Central America, lying between Honduras and Costa Rica on the north and south, and the Caribbean Sea and Pacific Ocean on the east and west respectively. The capital is Managua.

Area and Population.—The country comprises 13 provinces, the aggregate area of which is 49,200 square miles, and the population (1895) 420,000, including about 40,000 uncivilized Indians. Almost the entire remaining population consists of civilized Indians, negroes, mulattoes, and mestizos; the inhabitants of pure European blood, though increasing, number not many more than 1200. Approximate populations of the chief towns are: Leon, 34,000; Managua, 18,000; Granada and Masaya, each 15,000; Rivas, 8000; Bluefields, 2100; San Juan del Norte, 1500.

Government and Education.—By the constitution, dating from July 4, 1894, the chief executive authority is vested in a president, who is elected for a term of four years, and is assisted by a cabinet of responsible ministers, who direct the following departments: the interior, justice, war, and marine; foreign affairs and public in-

struction; finance, and public works. The president is Señor José Santos Zelaya, who was re-elected for the term ending in 1902. The legislative power devolves upon a congress composed of forty representatives, elected by popular vote for terms of two years. The regular army is reported to comprise an active force of 2000 men and a reserve force of 10,000; in addition there is a national militia of 5000. It was reported in October, 1899, that the government had purchased a new war-ship called the *Osorno*.

Education is in a very backward condition. In 1894 there were somewhat more than 1000 schools with an enrolment of about 20,000 pupils; but the instruction was not attended with great success. Roman Catholicism is the prevailing religion.

Finance.—The chief items of revenue are custom duties, national railway and steamboat returns, and imports on alcoholic liquors; the largest expenditures are for finance, war, and public works. In 1896 the revenue and expenditure in pesos were 3,572,497 and 4,688,061 respectively; in 1897 the revenue was 4,059,674 pesos and the expenditure 3,852,750 pesos. The expenditure authorized for 1898 was 5,097,588 pesos. In July, 1898, the foreign public debt, with arrears, amounted to \$1,404,899. In 1894 the internal debt was \$3,052,000; an additional debt of \$218,000 was contracted in November, 1896. On October 1, 1899, the value of the peso in United States gold was \$0.436. The financial state of the country in 1899 was not bright; great hopes of prosperity, however, were placed on the American plan for the Nicaragua Canal.

Industries and Commerce.—Cattle breeding and agriculture may be called the leading industries; only a small portion of the tillable soil, however, is under cultivation. The leading crop is coffee, with sugar and bananas ranking next. Under the concession made by the government to Mr. George D. Emery, of Chelsea, Mass., for the exploitation of mahogany, rosewood, etc., there were shipped from Rio Grande in 1898, 14,000 logs. The rubber industry is increasing, attention being given now to the culture of the trees; formerly the product was obtained solely from the wild growths. Gold and silver are found, and recently there has been mining activity in the department of Zelaya (Mosquito Reservation). About one-third of the coffee estates at the present time are owned, mortgaged, or worked by Germans, and "in other lines of business it is to be noted that there are from two to three German houses to one of other foreign nationality." About two-thirds of the foreign trade passes through the Pacific port, Corinto, where there entered in 1897, 50 sea-going vessels with a tonnage of 39,520. The arrivals of coasting vessels numbered 161 of 148,662 tons.

In a report written in July, 1899, the British consul in Nicaragua gave the following statistics for the commerce of 1897 and 1898. The amounts given are in United States gold. The total exports and imports in 1897 amounted to \$2,975,720 and \$2,571,116 respectively; total exports and imports for 1898, \$3,098,231 and \$2,789,366 respectively. The leading countries to which Nicaraguan produce is exported are Great Britain, the United States, Germany, and France, to all of which except Germany the 1898 export was larger than that of 1897. The decrease in the export to Germany was due to the falling off in the quantity and price of coffee. In the import trade for 1898 Great Britain was first, with 41½ per cent. of the total, the United States and Germany ranking next with 24½ per cent. and nearly 18 per cent. respectively, these percentages are larger than those for the preceding year, but the imports of France show a decrease. According to this same report, there were exported in 1898, 400,000 pounds of rubber, 2,000,000 bunches of bananas, 500,000 cocoanuts, and 5000 ounces of gold, and 120,000 bags of coffee, a decrease in a year of 34,000 bags. Of the coffee export 70 per cent. went to Germany and 20 per cent. to Great Britain.

Communications.—There are in Nicaragua, as in most Latin-American countries, very few good roads. There are two railways in operation, one 58 miles in length, from Corinto to Momotombo, and the other, 33 miles, from Managua to Granada. The government has under construction a railway from Masago to the small town of Jinotepe; this will effect communication between some of the coffee districts and Corinto. There are about 120 post-offices, and about 60 telegraph offices, with some 1250 miles of wire.

Insurrection.—During February, 1899, a revolutionary attempt was precipitated by General Juan Pablo Reyes, commandante of the Atlantic coast district of Nicaragua. The administration of President Zelaya had levied new taxes, largely upon business men, and had demanded that the payment of all taxes be in gold instead of paper currency; at the same time only a small part of the coast revenues were used in the development of that part of the country. So great was the discontent thus aroused that the president, fearful of an uprising, prohibited the importation of ammunition and firearms; in providing for the carrying out of this order he ignored General Reyes, who, thus piqued, secured a following, and, it is said, the approval of the foreigners on the coast, and starting an insurrection proclaimed himself commander-in-chief at Bluefields on February 3 and declared war against the government. Reyes

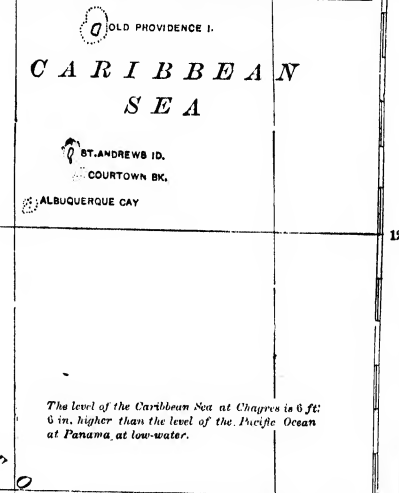

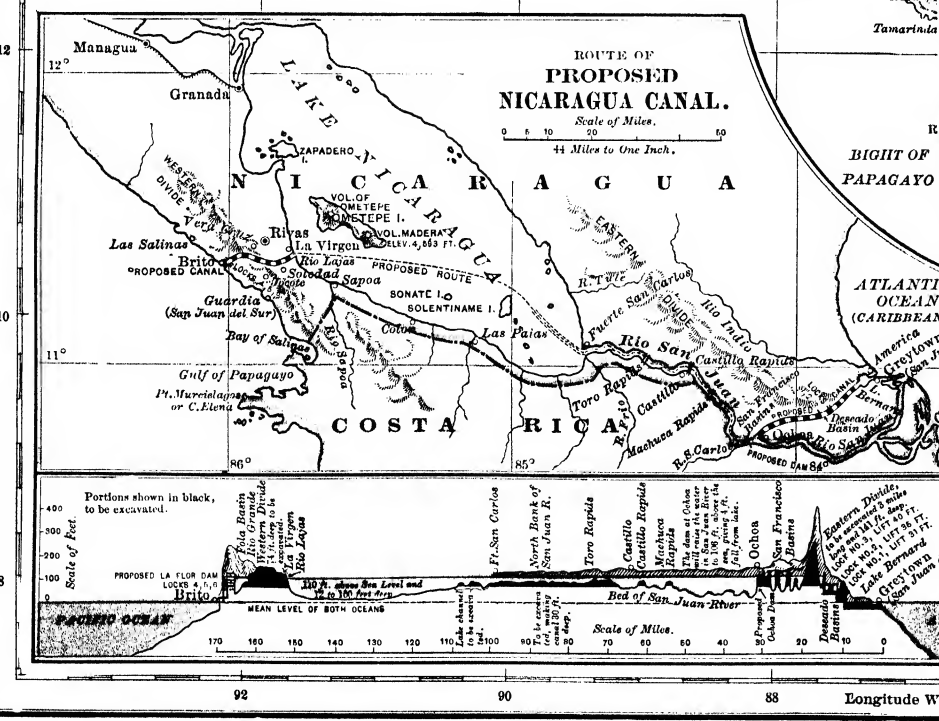

in a short time gained control of the coast region, but was unable to hold Greytown, where, a counter-rebellion developing, the government authorities came into power. So great, however, was the disaffection that on February 10 President Zelaya sent 1000 well-equipped troops toward Rama to check General Reyes, and declared the Atlantic coast districts in a state of siege and closed the eastern ports. The rebellion was practically ended about February 26, when the gunboat *San Jacinto* was taken from the insurgents, and General Rueling, leading the government forces, captured a number of important points, including a hill commanding Bluefields. During this time American and British interests had been guarded by the United States gunboats *Marietta* and *Machias* and the British second-class cruiser *Intrepid*. About the time of the success of the government troops near Bluefields the British and American commanders addressed a communication to President Zelaya, guaranteeing to disarm the insurgents on condition that their lives and property be safe. Accordingly, on February 28 General Reyes surrendered to the commanders, who had landed with marines from the *Intrepid* and *Marietta*. After order was restored the marines re-embarked. Reyes went to the British consulate for protection, whence he embarked for Bocas del Toro, Costa Rica. Among his supporters were a number of Americans who, it was said, had served with the "Rough Rider" regiment in Cuba. Disturbances again arose at the end of March, when General Rueling, leading some of the inhabitants of Leon, was reported to have captured and held for a time a number of towns near the San Juan River and Lake Nicaragua. A number of other attempts were made against the Zelaya government, but all were successfully repressed. A state of unrest, however, existed in Nicaragua, and the financial condition was such that in July the president issued an order for an immediate forced loan of \$500,000. The conciliation between General Reyes and President Zelaya seems to have been merely nominal, for in September, 1899, a court-martial at Managua sentenced Reyes and several of his conspirators to death. Since, however, the condemned men had escaped from the country, there is little likelihood that the punishment will be inflicted.

Customs Trouble.—Subsequent to the Reyes rebellion trouble arose between the American residents at Bluefields and the government over the forced payment of double customs duties. The American merchants stated that during the rebellion they were forced to pay import duties to the insurgent government; when order was restored and General Torres assumed command of the department of Bluefields, the Americans were obliged to make second payments to the regular government. To protect the interest of the Americans and to emphasize their protest, the United States cruiser *Detroit* was sent to Bluefields, and in May was replaced by the gunboat *Vixen*. General Torres was relieved of his command by the Zelaya government, and on May 6 a temporary arrangement regarding the claims of the merchants was made.

Archaeological Researches.—In 1899 a scientific commission sent out by the Danish government, and under the leadership of Dr. Johannes Neuhaus and Professor Halfau, both of Copenhagen, made investigations in prehistoric remains which are rather abundant in Nicaragua. The investigators, who returned to Denmark with about twenty tons of specimens, expected to return and continue their researches. Dr. Neuhaus believed that he had discovered a close relationship between the prehistoric civilizations of Nicaragua and Peru. Middens, ruins along the coast and the river Rama, and several old Toltec mines were visited by the party; the middens, which are particularly rich in relics, though most of the specimens found are naturally broken or worn, are situated at Kukra Point, near Bluefields. No metal implements were discovered, "but the stone hatchets and other tools were as admirably made as were the bronze tools of the Aztecs."

NICARAGUA CANAL, THE, continued during 1899 a subject of discussion both in Congress and the press.

Canal Commissions.—A synopsis of the report of the Nicaragua Canal commission under Rear-Admiral John G. Walker, appointed pursuant to an act of Congress of June 4, 1897, was given out by the Department of State, May 31, 1899. The commission reported unanimously in favor of the Childs route, first surveyed in 1852, from the Pacific to Lake Nicaragua, and the Lull route, surveyed in 1873, from the lake to the Caribbean Sea. The Childs survey, "leaving Brito, follows the left bank of the Rio Grande to near Bueno Retiro, and crosses the western divide to the valley of the Lajas, which it follows to Lake Nicaragua." The Lull survey, beginning at the head of the San Juan River, "follows the upper river to near Boca San Carlos; thence, in excavation, by the left bank of the river to the San Juanillo and across the low country to Greytown, passing to the northward of Lake Silico." The requirement of but one dam, with regulating works at each end of the summit level, is one of the advantages of the route recommended. "The surveys have in general revealed better physical conditions than were hitherto supposed to exist, especially as to the amount of rock in the upper river, whereby it is possible greatly

to reduce the estimated cost of construction." As to the cost of construction, the opinions of the commissioners were not so concurrent, the estimate of Admiral Walker and Professor Haupt being a sum not exceeding \$118,113,790, while that of Colonel Hains was \$134,818,308. It is said that these estimates were derived from computations based on "the actual prices for excavation on the Chicago Drainage Canal and for the government locks at Sault Ste. Marie, to which certain percentages were added to allow for differences in climate and location." The estimates were made with reference to a canal with a depth of at least 30 feet throughout.

On March 3, 1899, Congress passed an act providing for the appointment by the President of a new commission, which should make another investigation of both the Nicaragua and the Panama routes, for the purpose of which the sum of \$1,000,000 was appropriated. An investigation of the work already done toward canal construction (the work of the Maritime Company and of the Panama Company) was authorized, and an inquiry ordered concerning the cost of purchasing existing rights and franchises. "And generally the President is authorized to make such full and complete investigation as to determine the most feasible and practicable route across said isthmus for a canal, together with the cost of constructing the same and placing the same under the control, management, and ownership of the United States." In the spring of 1899 there was a revival of interest in the Panama route, which finally manifested itself in this bill. It was alleged by the proponents of a canal through Nicaragua that this revival was merely an obstructionist measure directed against any trans-isthmian waterway. On June 9, 1899, President McKinley appointed the following commission: Rear-Admiral John G. Walker, U.S.N., chairman; Mr. Samuel Pasco, former United States senator from Florida; Mr. Alfred Noble, C.E., of Illinois, who was a member of the Ludlow commission; Mr. George S. Morrison, C.E., of New York, an ex-president of the Society of Civil Engineers; Colonel Peter C. Hains, U.S.A.; Professor William H. Burr, of Connecticut, head of the department of engineering in Columbia University; Lieutenant-Colonel Oswald H. Ernst, U.S.A., formerly superintendent of the United States Military Academy at West Point; Professor Lewis M. Haupt, C.E., of the University of Pennsylvania; Professor Emory R. Johnson, assistant professor of transportation and commerce in the University of Pennsylvania. It may be noted that, as in the preceding commission, Rear-Admiral Walker is chairman, and that the other two members of that commission, Professor Haupt and Colonel Hains, are included in the new one. Since 1895 there have been three engineering commissions appointed under authority of Congress for investigations of the Nicaragua route. These were the Ludlow commission, of which General William Ludlow was chairman, authorized by an act of January 28, 1895, and for which there was appropriated the sum of \$26,176; the Walker commission, authorized by an act of June 4, 1897, as noted above, and for which the appropriation was \$300,000; and the second Walker commission, the appropriation for which was \$1,000,000. It was thought that a period of two years would be required before the final report of this last commission could be submitted. At the close of the year the commission was actively at work in Nicaragua.

The Nicaraguan Companies.—At the end of 1899 the canal concessionaires occupied an anomalous position. The ten-year concession granted by Nicaragua to the Maritime Canal Company expired on October 9, 1899, on which date the new concession granted to the Cragin-Eyre Company on October 31, 1898, is alleged to have taken effect. The Nicaraguan government defended its position on the ground that the maritime company failed to fulfil its contract to finish the construction of the canal within ten years. The company insisted upon its right to an extension of time, basing its claims on the statement that during the years of its concession there had been several financial panics, that ten revolutionary movements had taken place in Nicaragua, and that after the appointment of the first Walker commission the United States government had forbidden canal construction. The government of Costa Rica seemed to concur with the company, and refused to negotiate with the Cragin-Eyre Company. The Nicaraguan government finally appointed an arbitrator to determine whether the Maritime Company was entitled to an extension of its concession.

Current Opinion on the Canal Project.—During the year discussion, based on fairly reliable data, has been largely concerned with the engineering aspects of the subject, while that relating to the commercial and military questions involved has got little beyond the phase of hypothesis and generalization. While in America the consensus of opinion seemed to be that the United States government should build, own, and operate the canal, its neutrality was also insisted upon, so that both the merchant ships and the navies of all nations should pass through on equal terms. It was claimed by many, however, that in case the United States were at war with a stronger naval power this plan would be disastrous to the former. They held that it was decidedly unwise for the United States government not to insist that after having built the canal it have the right to exclude therefrom the war-ships of

a hostile nation. Moreover, it was argued that the constant political uncertainty in Central America made it necessary to have the entire line of the canal guarded by an American force. It thus seemed clear to a number of writers that the principle of absolute neutrality from the military point of view is untenable. On the other hand, the neutrality of the Suez Canal was pointed out and used as an argument for neutrality in Nicaragua.

There was much disagreement in regard to the commercial prospects of the canal. While in most quarters the belief prevailed that the shipping passing through the canal, diverted from other routes and created by a new, shorter, and cheaper route, would yield a revenue in tolls covering the cost of maintenance, it was held by others that the commercial prospects of the canal were by no means reassuring. Pertinent to this argument are the increased facilities of the trans-continental railways and their great reduction of freight rates.

The Clayton-Bulwer Treaty.—No small part of the discussion in 1899 concerning the Nicaragua Canal pertained to the Clayton-Bulwer treaty, which was regarded as a serious obstacle to exclusive American control of the proposed canal. Space is lacking for a discussion of the controverted points, but for convenience of reference we outline here the events that led to its adoption, and quote its more important articles. Toward the close of the eighteenth century a British settlement was made in Balize. Before this time the British authority had been extended over the Mosquito territory, but in 1814 this was abandoned according to the treaty of Madrid. Subsequently, however, Mosquitia was brought under the protection of the superintendency of Balize; an English settlement, Greytown, was made at the mouth of the San Juan River, and the district thereabout was forced from Nicaragua. This trouble with Nicaragua occurred in 1848. Great Britain thus commanded one of the two possible trans-isthmian waterways. The British policy, it should be noted, both in extending England's authority westward to the Pacific on Canadian soil, and in occupying a strategic position in Central America, was one of imperialism, the object being constantly to shorten the distances and to make communication easier between her colonies. It was this idea that recommended to England the Nicaragua Canal. On the other hand, the canal seemed desirable to the United States merely on economic grounds as affording a less difficult route from the Atlantic to the Pacific shores. The desirability of such a route was emphasized by the annexation of Mexican territory and the discovery of gold in California. It was to facilitate the construction of a trans-isthmian canal that on April 19, 1850, an Anglo-American treaty was signed by John M. Clayton, secretary of state, and Sir Henry Lytton Bulwer, British minister at Washington, and it is this treaty that to Americans has been one of the most annoying barriers to a realization of the canal. The two most important articles, I. and VIII., of the treaty are as follows:

ARTICLE I. The governments of the United States and Great Britain hereby declare that neither the one nor the other will ever obtain or maintain for itself any exclusive control over the said ship-canal, agreeing that neither will ever erect or maintain any fortifications commanding the same or in the vicinity thereof, or occupy or fortify or colonize or assume or exercise any dominion over Nicaragua, Costa Rica, the Mosquito coast, or any part of Central America; nor will either make use of any protection which either affords or may afford, or any alliance which either has or may have to or with any state or people for the purpose of erecting or maintaining any such fortifications, or of occupying, fortifying, or colonizing Nicaragua, Costa Rica, the Mosquito coast, or any part of Central America, or of assuming or exercising dominion over the same; nor will the United States or Great Britain take advantage of any intimacy, or use any alliance, connection, or influence that either may possess with any state or government through whose territory the said canal may pass, for the purpose of acquiring or holding, directly or indirectly, for the citizens or subjects of the one, any rights or advantages in regard to commerce or navigation through the said canal which shall not be offered on the same terms to the citizens or subjects of the other.

ARTICLE VIII. The governments of the United States and Great Britain having not only desired, in entering into this convention, to accomplish a particular object, but also to establish a general principle, they hereby agree to extend their protection, by treaty stipulations, to any other practical communications, whether by canal or railway, across the isthmus which connects North and South America, and especially to the interoceanic communications, should the same prove to be practicable, whether by canal or railway, which are now proposed to be established by the way of Tehuantepec or Panama. In granting, however, their joint protection to any such canals or railways as are by this article specified, it is always understood by the United States and Great Britain that the parties constructing or owning the same shall impose no other charges or conditions of traffic thereupon than the aforesaid governments shall approve of as just and equitable; and that the same canals or railways, being open to the citizens and subjects of the United States and Great

Britain on equal terms, shall also be open on like terms to the citizens and subjects of every other state which is willing to grant thereto such protection as the United States and Great Britain engage to afford.

NICHOLS, HENRY, captain U. S. N., died from sunstroke while in command of the monitor *Monadnock*, near Manila, Luzon, about the 8th of June, 1899. In 1861 he entered the Naval Academy at Annapolis, became an ensign in 1866, was advanced to the rank of master in 1868, lieutenant 1869, and captain in March, 1899.

NICHOLSON, HENRY ALLEYNE, M.D., D.Sc., F.R.S., Ph.D., regius professor of natural history at the University of Aberdeen since 1882, died January 19, 1899. He was the son of John Nicholson, the oriental scholar, and was born at Penrith, England, September 11, 1844; was educated at Appleby Grammar School, Göttingen, and the University of Edinburgh. After acting as lecturer for two years in the Extra-Mural School of Medicine in Edinburgh, he occupied the chair of natural history successively in the universities of Toronto (1871), Durham (1874), and St. Andrews (1875). He was Swiney lecturer on geology at the British Museum from 1877 to 1882, and again from 1890 to 1894. Among his publications are: *Essay on the Geology of Cumberland and Westmorland*, 1868; *Monograph of the British Graptolites*, 1872; *Reports on the Palaeontology of Ontario*, 1874-75; *Ancient Life-History of the Earth*, 1877; *Tabulate Corals of the Paleozoic Period*, 1879; *Structural Affinities of Monticuliporoids*, 1881; *Monograph of the British Stromatopora*; *Manual of Paleontology*; *Manual of Zoology*.

NICKEL. The domestic supply of nickel and cobalt in 1898 came from Mine La Motte, where the metal is obtained as a by-product in lead-smelting. 11,145 pounds of nickel were produced in 1898, or less than half that of 1897. The value was \$3956. Canada continues to be an important source of nickel ore. The nickel imports in 1898 were valued at \$1,534,262. The foreign production of nickel is given as:

	Pounds.	Value.
Canada.....	5,517,690	\$1,820,838
	Metric tons.	
France.....	1,245	704.425
Germany (1897).....	898	710.980

NICKEL STEEL. The value of adding about three per cent. of nickel to steel has been found to give it such additional desirable qualities that at the present time nickel steel finds wide application. An important use now is in the manufacture of high-grade bicycle tubing, for armor, owing to its hardness, and for various marine-engine forgings, such as crank-shafts, etc.

NIGER COAST PROTECTORATE or SOUTHERN NIGERIA, a British protectorate since 1884, occupies that part of the west coast of Africa between the British crown colony Lagos and Cameroon, German territory, excepting that part of the coast-line which lies between the Forcados and Brass Rivers, and which belongs to the Niger territories. Its boundaries have not yet been permanently determined, but now include the Niger delta, the entire Benin region, and the Cross River, from the rapids to the sea. The area is between 3000 and 4000 square miles, and contains some 400 towns and villages. No trustworthy estimate of the population has been made; in 1898 the number of European inhabitants was 206. The protectorate is administered by a British imperial commissioner and consul-general (Sir Ralph Dinham Rayment Moor, K.C.M.G., since 1896), and six vice-consuls; in addition there are native councils in each of the eleven districts of the country, and about fifteen minor native courts. The capital is Old Calabar, with a population of about 15,000. There are three missionary societies, and various schools receiving government aid have been established. The revenue is chiefly derived from customs. For the fiscal year 1898 the revenue and expenditure were £153,181 and £145,440 respectively; for the fiscal year 1899 the revenue amounted to £169,567. The leading exports are palm oil, palm kernels, rubber, ebony, ivory, camwood, indigo, gums, barwood, and hides; among the chief imports are cotton goods, hardware, cutlery, spirits, and provisions. The imports and exports for the fiscal year 1898 amounted to £639,698 and £750,223 respectively; for the fiscal year 1899, imports, £732,639, exports, £774,647. The trade is chiefly with British merchants, the majority of whom in 1889 formed themselves into the African Association, Limited, of Liverpool. The centres of trade are Old Calabar, Bonny, New Calabar, Brass, Benin, Opobo, Warri, and Saple. Akassa, at the mouth of the Niger, should also be included, as it was decided that on January 1, 1900, that town should pass from the administration of the Royal Niger Company to that of the protectorate. It was also stated that in the future the protectorate will be called Southern Nigeria.

NIGER TERRITORIES, or NIGERIA, in British West Africa, passed from the control of the Royal Niger Company at the close of 1899 to the ad-

ministration of the British Colonial Office as a recognized protectorate of Great Britain. By the Anglo-French treaty, agreed to in 1898 and ratified in 1899, whereby a readjustment of the frontier on the north and west was brought about, the total area of the territory was reduced from 500,000 square miles to about 350,000 square miles. The population of the Niger territories in 1898 was estimated at from 20,000,000 to 35,000,000.

The Royal Niger Company.—The Niger Company, whose charter dates from July 10, 1886, resulted from the amalgamation of various trading concerns in the Niger districts, by which, together with at least 500 different treaties with natives and native kings, it gained control of the vast territory which has been administered by it under the name of the Niger Territories. By Anglo-French and Anglo-German agreements in 1886, 1890, and 1893, its limits were fixed so as to include a territory of about 500,000 square miles, not only controlling the mouth of the Niger River, but having sovereign power over Sokoto, a dependent empire, with an area of 219,500 square miles, and a population of 15,000, which includes the kingdom of Gando in the middle Niger Valley. This portion of the Soudan is well peopled, the Fulahs being the dominant race. West of Sokoto lies the Borgu country, in which the company obtained rights similar to those exercised over Sokoto. The Royal British Company has supported its sovereignty in western Africa by its own army and navy, and has made and declared wars and treaties. Its military success has been notable, and it has practically subdued that part of Africa taken up by it. However, portions of the Niger country have long been looked upon with envy by other nations than Great Britain, and some British authorities have felt that the danger of foreign invasion, as well as some other matters, such as the development of common trade, the extension of effective rule, etc., could best be met if Nigeria were under the direct control of the home government, rather than under the administration of a commercial company, however efficient it might be.

Boundary Changes.—By the Anglo-French agreement, ratified in 1899, neither country obtained all that it claimed, but the French gained the advantage, receiving territory for which no satisfactory equivalent was rendered Great Britain. The territories in dispute included mainly the hinterlands of Lagos and Dahomey, and of the Gold Coast and the Ivory Coast. By the new treaty the line of delimitation starts at the Dahomey-Lagos boundaries, crosses the Niger ten miles above Ilo, so as to include the Borgu country within British territory, and gives France jurisdiction over Gurma and the station of Nikki, while excluding her from Bussa, Ilo, and other posts which she had seized. From the Niger the line runs northeast, transferring to the French a triangular tract of land between the port of Say, Mauni, and the Niger. It then curves beyond the former boundary so as to unite to Nigeria a tract of land north of Sokoto, and meets the German frontier in the middle of Lake Tchad, in the northeast corner of Nigeria. In the disputed area in the hinterland of the Ivory and Gold Coast, the western branch of the Volta River was made the boundary between the hinterlands of the two settlements, and the eleventh parallel the boundary between the British, or Gold Coast, hinterland, and the French Soudan territory in its rear. The adoption of the Volta River line gave France a strip theoretically belonging to the British, who were forced to evacuate the towns of Dokta and Bona, and the eleventh parallel boundary gave to France the rich territory of Mossi. The commercial conditions of the treaty gave France a thirty-year lease of two areas on the Niger, where French goods may be stored free of duty preparatory to transportation into French territory. Great Britain was conceded a period of thirty years' free trade in the French colonies between Liberia and the Niger.

Administrative Changes.—The assumption of authority over the Niger territories on the part of the British government was to take place January 1, 1900, when a complete administrative reorganization was to be brought about. The area formerly administered by the Royal Niger Company was to be divided into the protectorate of northern Nigeria, including all the company's territory lying north of Ilo on the Niger, the boundary of Lagos meanwhile being moved eastward to include additional coast-line. The southern portion of the Niger territories was to be incorporated with the Niger Coast Protectorate, as a protectorate under the name Southern Nigeria. The area of Northern Nigeria will be about 300,000. Jeba will be the present capital, with the probable future seat of government at Lokoja, at the junction of the Niger and the Benue. This protectorate, the largest and most important on the west coast of Africa, will be under the governorship of Lieutenant-Colonel F. D. Lugard. Colonel J. Willcocks, military commandant of Northern Nigeria, will act as commissioner and commander pending the arrival of Colonel Lugard. While North and South Nigeria and Lagos will be separated for administrative purposes, the whole protectorate will be known as Nigeria.

Details of the Transfer of the Niger Territories.—The British government made public in June, 1899, the reasons which led to the decision to take over the formal administration of the Royal Niger Company's territories. These were, briefly, the

advisability of direct imperial control over the frontier and commercial policy of Nigeria, and of the West African frontier forces, and the desirability of changing the situation whereby the company had a practical monopoly of trade. An arrangement was drawn up between the company and the British Treasury by which the former agreed to transfer to the government its administrative powers, and its treaty, land, and mining rights. It agreed also to transfer to the government its materials of war and its administrative buildings, and also a certain proportion of its plants, including docks and warehouses, steamers, buildings and lands at stations, etc., for which the Treasury agreed to pay to the company the sum of £115,000. In addition the government agreed to pay £150,000 as compensation for the rights surrendered by the company, and for the interruption of the latter's business, and £300,000 for the development which the company had brought about in the condition of the Niger territories, aside from its civil administration. It was decided to impose a royalty on certain mineral rights, one-half of which should go to the company. The total amount to be paid for the company's lands and rights is stated to be about \$4,325,000. Finally the British government agreed to assume liability on the public debt of about £250,000 which the company has maintained in Algeria. It is announced that the company will continue as "The Niger Company, Limited," embracing as heretofore the general lines of trading and banking, the working of mines and forests, and the cultivation of various native products, such as indigo, etc.

The Niger Trade.—The principal benefits coming to Great Britain from the administration of the Niger Company are thus far the establishment of order in the territories, their exploration, the putting down of slave-trading and slave raids, the lessening of the liquor traffic, and the many treaties, commercial and political, which have been made with the various kings and chiefs. Trade in the inland territories is comparatively small at present, but is capable of great development. There are many large centres of population and important market towns in the territories, some of which are Bida, with a population of 90,000; Yakoba and Florin, 50,000, and Kano, 35,000. The Niger River is navigable for steamers from the coast to the heart of the continent. Excluding Lagos and the Niger Coast Protectorate (*qq. v.*), the trade of the Niger country consists, for exports, principally of gum, hides, india rubber, ivory, palm oil, and vegetable butter. The cultivation of coffee and cocoa has been started, and a botanic garden is said to have been created. The chief imports are cottons, silks, woollens, earthenware, hardware, beads, tobacco, and salt. Owing to the fact that the Niger territories have not been classed as a British colony, no official statistics exist as to the amount of trade annually carried on. However, the work of the Niger Company has paved the way for the growth of a considerable commerce for the future. The credit for this is largely due to the energy and foresight of Sir George T. Goldie.

NISBET, JOHN FERGUSON, English journalist, died April 2, 1899. He was born in Lanarkshire, October 28, 1851; was educated at Glasgow University. He contributed to many periodicals; for many years he wrote special articles for the *London Times*, and from 1882 to the time of his death was dramatic critic on that paper. He published *The Insanity of Genius*, a psycho-physiological treatise.

NITROGEN THERMOMETER. See PHYSICS (paragraph Comparison of Platinum and Nitrogen Thermometers).

NOBLES OF THE MYSTIC SHRINE. See MYSTIC SHRINE, NOBLES OF THE.
NON-INFLAMMABLE WOOD. Wood rendered non-inflammable by being impregnated with certain chemicals is now manufactured on a commercial scale in both England and America. As conducted at the two principal American works, the process consists, first, in steaming the wood to soften the fibres and open the cells; second, in exhausting all the moisture from the wood, and, third, in forcing the adopted chemical into the wood to take the place of the moisture, which has been extracted. These operations are conducted in succession in a large steel cylinder which can be closed hermetically. After being removed from the cylinder the treated wood is seasoned and then ready for use. The principal use of non-inflammable wood so far has been in the finish and fitting of war-ships. It has been introduced into fire-proof building construction, however, and there seems to be a favorable field for its extended use for this and other purposes.

NORTH CAROLINA, a South Atlantic State, has an area of 52,250 square miles. Capital, Raleigh.

Mineralogy.—The most valuable mineral industry in the calendar year 1898 was quarrying, which yielded granite, valued at \$79,969; sandstone, \$9100, and limestone, \$1605—total, \$90,674. In iron ore North Carolina and Georgia together produced 79,125 long tons of red hematite, 78,869 of brown hematite, and 2089 of magnetite—total, 160,083 long tons, valued at \$129,468, a decrease in a year of 44,556 long tons. There was a notable gain in gold and silver mining, the output being, gold, 4064

fine ounces, valued at \$84,000; silver, 700 fine ounces, coining value, \$905—total, \$84,905, an increase of \$49,917. The single coal mine in operation yielded 11,495 short tons, valued at \$14,368, a large decrease, caused by a fire in the mine. Copper mining at Virgilina, just over the Virginia line, was chiefly in the line of development. The ores are a rich sulphide, containing a good deal of mineral as rich as glance, occurring in quartz and quartite. During the year a plant for smelting these ores was completed at West Norfolk, Va., and a company was organized to develop copper property near Gold Hill. In 1899 a rich bed of ore was discovered near Salisbury, carrying both gold and copper, and new veins of copper were found on the rocky corn and tobacco farms in the vicinity of Virgilina. What was pronounced to be the finest deposit of magnetic iron ore in the Southern States exists in Ashe County, and in November a tract of 10,000 acres was leased by two Pennsylvania steel companies, and railroad extensions to the seat of operations were ordered.

Agriculture.—In the cotton year ending August 31, 1899, the area in cotton was 1,311,708 acres, and the production 629,620 gross bales, and for the year 1899-1900 the area was 1,220,000, and the estimated yield 193 pounds of lint cotton per acre.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$4,921,016. There were 201 manufacturers of tobacco and 38 of cigars, and the combined output in the calendar year 1898 was 8,482,148 cigars, 20,940,896 pounds of plug tobacco, 12,044 pounds of fine cut, 9,239,870 pounds of smoking, and 48,552 pounds of snuff. Grain and fruit distilleries in operation numbered 1488; the amount of fruit brandy produced was 38,557 gallons; spirits rectified, 524,158 gallons; distilled spirits gauged, 2,358,425 gallons, and fermented liquors produced, 107 barrels. There was another noteworthy advance during 1899 in cotton manufacturing. The new plants put into operation numbered 28, and new spindles, 230,168, with an estimated capitalization of \$8,000,000. See COTTON AND THE COTTON INDUSTRY.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Pamlico and Wilmington aggregated in value \$145,260; exports, \$7,590,381—total foreign trade, \$7,735,641, a decrease in a year of \$43,037 in imports and \$2,174,218 in exports; net decrease, \$2,217,255.

Railways.—The new railway construction in the calendar year 1898 was 123.10 miles, and in 1899, 80.30 miles, giving the State a total mileage of 3653.57. The assessed valuation of railway property in 1898 was \$33,619,868, an increase in a year of \$4,462,769. An act of the legislature went into operation on April 4, 1899, which in place of a railway commission established a corporation commission to have control of all railways, banks, and building and loan associations in the State. Interested parties at once entered suit in the courts to test the constitutionality of the law.

Banks.—On October 31, 1899, there were 29 national banks in operation and 11 in liquidation. The active capital aggregated \$3,001,000; circulation, \$1,086,234; deposits, \$7,306,247, and reserve, \$1,822,175. The State banks, June 30, 1899, numbered 45, and had capital, \$2,029,898; deposits, \$5,424,085; resources, \$8,558,017, and surplus and undivided profits, \$543,906; private banks, 16, with capital, \$197,400; deposits, \$898,821; resources, \$1,350,262, and surplus and profits, \$143,558; and stock savings banks, 5, with capital, \$80,000; deposits, \$1,218,319, and resources, \$1,367,212.

Education.—Incomplete returns of the school census of 1898 showed a total enumeration of 613,802. At the close of the school year 1897-98, the enrolment in the public schools was 399,375, and the average daily attendance 214,540. There were 7217 teachers, 6817 buildings used as school-houses, and public school property valued at \$970,675. The revenue was \$986,514; expenditures, \$931,143, of which \$761,772 was for teachers' salaries. There were 14 public high schools, with 37 secondary teachers, 892 secondary students, and 387 elementary pupils; 111 private secondary schools, with 301 teachers, 5142 secondary students, and 7013 elementary pupils; 7 public normal schools, with 61 teachers and 1807 students in all departments; and 8 private ones, with 75 teachers and 1751 students. Normal training was also given in 5 colleges. Fifteen universities and colleges for men and for both sexes reported 198 scholarships, 181 professors and instructors, 2877 students, 110,100 volumes in the libraries, valued at \$204,000; \$33,550 invested in scientific apparatus, \$1,523,500 in grounds and buildings, and \$770,942 in productive funds; \$177,204 in total income, and \$151,573 in benefactions. Nine colleges for women reported 127 professors and instructors, 1224 students, 16,400 volumes in the libraries, \$591,000 invested in grounds and buildings, and \$16,000 in productive funds, and \$115,100 in total income. In 1899 there were 262 periodicals, of which 24 were dailies, 194 weeklies, and 28 monthlies.

Finances.—The assessed valuations in 1898 were: Real estate, \$155,280,169; personal property, \$76,967,160, and railway property, \$33,619,868—total, \$265,867,197; increase in a year, \$6,855,689; tax rate, \$4.30 per \$1000. The recognized funded debt in 1899 was \$6,090,850, and the recognized fundable debt, \$265,920—total, \$6,356,770.

Of the total, \$2,745,000 is in 6 per cent. consols, the interest on which is paid from proceeds of the lease of the North Carolina Railroad. Assessments are about 60 per cent. of cash values.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 1,855,000.

Legislation.—The State Board of Agriculture was authorized to investigate diseases of live stock, supervise trade in fertilizers, and report any dealers in the same who are members of trusts or pools. Foreign corporations may be domesticated by filing charter with secretary of state and paying legal fees. The railway commission was abolished and in its stead a corporation commission is to be elected, with large power as to fixing rates of charges in railroad, transportation, express, telephone, and telegraph lines; it will also regulate banks, trusts, and insurance companies, and will assess the property of transportation companies. An elaborate election law was passed creating a State board of elections, which appoints the county boards; all voters must be registered after payment of a poll-tax. The State Board of Agriculture is required to analyze food, and persons found guilty of adulteration will be punished; the water supply is also protected. The office of commissioner of insurance was created, with great power; also the office of commissioner of labor and printing, the incumbent to be elected. Local option for the sale of liquors was provided for, and the dispensary system was adopted as to certain counties. In the interest of good roads, a rebate of one-half the road tax is allowed to those who use broad-tire wagons. A general tax law was passed, about all occupations paying a license tax; telegraph, telephone, and express companies pay 2 per cent. on gross receipts from State business, corporations are taxed according to capital stock; all incomes derived from property not already taxed, and of over \$1000 derived from salaries or fees, are to be taxed. Formation of trusts was prohibited under heavy penalties, with forfeiture of charter, and contracts in relation thereto were declared void. A constitutional amendment fixing the suffrage for males will be voted upon at the general election in 1901; it will require of naturalized or native-born citizens a residence of two years in the State, the payment of a poll-tax for the previous year, and ability to read and write any section of the constitution in the English language. The avowed object of this amendment is to eliminate the ignorant negro vote, since there is a further provision in the interest of the white voter to the effect that any person can vote who was entitled to vote on January 1, 1867, or any time prior thereto, or whose ancestors were so entitled to vote.

State Officers and National Representatives.—Governor, Daniel L. Russell; lieutenant-governor, C. A. Reynolds; secretary of state, Cyrus Thompson; treasurer, W. H. Worth; auditor, H. W. Ayer; attorney-general, Z. Vance Walser; insurance commissioner, James R. Young; adjutant-general, R. B. Royster. Supreme Court: Chief justice, William T. Faircloth; associate justices, Robert M. Douglas, Walter Clark, D. M. Furches, W. A. Montgomery; clerk, Thomas S. Kenan. The State legislature consists of 134 Democrats and 36 Fusionists. Senators: Marion Butler (Pop.), from Elliott, and Peter C. Fritchard (Rep.), from Marshall. Representatives: John H. Small (Dem.), from Elizabeth City; George H. White (Rep.), from Tarboro; Charles R. Thomas (Dem.), from Newbern; John W. Atwater (Dem.-Pop.), from Rialto; W. W. Kitchin (Dem.), from Roxboro; John D. Bellamy (Dem.), from Wilmington; Theodore F. Klutz (Dem.), from Salisbury; R. Z. Linney (Rep.), from Taylorsville, and W. T. Crawford (Dem.), from Waynesville.

NORTH DAKOTA, a northwestern State, has an area of 70,795 square miles. Capital, Bismarck. North Dakota was admitted into the Union in 1889.

Mineralogy.—In the calendar year 1898 the State attained its maximum production of coal, with an output from 18 mines of 83,895 short tons, valued at \$93,591, an increase in a year of 6649 tons. The largest output was from 3 mines in Stark County, 45,280 tons, and the next largest producing counties were McLean and Ward, from 6 mines, and Morton, from 3. Of the total product, 71,223 tons were loaded at the mines for shipment. The average number of men employed in all mines was 151, and the average number of working days, 187.

Railways.—The new railway construction in the calendar year 1898 was 77.57 miles and in 1899, 41.16, giving the State a total mileage of 2703.15. Railway property was assessed at \$12,742,395 in 1898 and \$16,985,084 in 1899, the last an increase of \$8,212,381 over the total of 1897.

Banks.—On October 31, 1899, there were 23 national banks in operation and 20 in liquidation. The active capital was \$1,450,000; circulation, \$462,191; deposits, \$5,000,186; reserve, \$1,048,493; and resources, \$7,727,899. The State banks, July 1, 1899, numbered 106, and had capital, \$1,258,250; deposits, \$5,002,391; resources, \$6,858,194; and surplus and undivided profits, 365,785. In the year ending September 30, 1899, the exchanges at the United States clearing house at Fargo aggregated \$17,183,046, an increase in a year of \$4,064,111.

Education.—The corrected school census of 1897 gave a total enumeration of

76,651. At the close of the school year 1897-98 the public school enrolment was 67,375 and the average daily attendance, 41,155. There were 3637 teachers, 2304 buildings used for school purposes, and public school property valued at \$2,132,738. The receipts were \$1,666,368; expenditures, \$1,288,031, of which \$693,403 was for teachers' salaries. There were 24 public high schools, with 50 secondary teachers, 908 secondary students, and 12 elementary pupils; 2 private secondary schools, with 8 secondary teachers, 48 secondary students, and 304 elementary pupils; 2 public normal schools, with 19 teachers and 332 students in all departments; and 1 private one, with 9 teachers and 220 students. Normal training was also given in 1 college and 1 public high school. Three universities and colleges for men and for both sexes reported 31 professors and instructors, 611 students, 10,500 volumes in the libraries, valued at \$25,500; \$12,850 invested in scientific apparatus, \$230,000 in grounds and buildings, and \$34,000 in productive funds; \$44,300 in total income and \$14,203 in benefactions. In 1899 there were 149 periodicals, of which 8 were dailies, 130 weeklies, and 8 monthlies.

Finances.—The assessed valuations for 1899 were: Real estate, \$72,010,059; personal property, \$24,641,156; and railway property, \$16,985,084—total, \$113,636,299, an increase over 1898 of \$12,505,283, and over 1897 of \$20,164,806; tax rate for 1899, \$4.50 per \$1000. The total bonded debt, July 1, 1898, was \$845,300, none of which falls due till May 1, 1902.

Divorce Decision.—In November, 1899, the State Supreme Court rendered a decision holding that residence in the State must be *bona fide* and characterized by the intention to stay to give the litigant the benefit of the State laws concerning divorce, and that persons who go to the State for the express purpose of securing a divorce do not acquire a legal residence.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 258,000.

Legislation.—It was enacted that persons slaughtering cattle shall record description of animal and name and address of person from whom purchased, and make a monthly report to the secretary of state. Causes must be continued when any interested attorney is a member of the legislature. Corporations for religious or charitable purposes cannot acquire more than \$100,000 in value of real estate. Dairy products were placed under the control of the commissioner of agriculture; dairymen are required to take licenses, and renovated butter, oleomargarine, and filled cheese must be labelled. The office of State game warden was created, and license to hunt must be had, with fee of \$25 to non-residents and 75 cents to residents. Ten years' adverse open and undisputed possession makes title to real estate. Free text-books are provided in the schools, and physical training must be taught. Tax deeds are absolute and conclusive of the facts therein recited. Six constitutional amendments are under consideration and to be voted for: Providing for a board of pardons; that grain grown in the State, held in elevators, may be taxed at a fixed rate; that no lands other than school lands shall be sold at less than appraisal, and none less than \$5 an acre; that a State hospital for the insane and an institution for the feeble-minded be established; that the franchise, roadway, rails, and rolling stock of railroads, and all property of express, sleeping car, telegraph, and telephone companies shall be assessed at actual value, which shall be apportioned among the municipalities through which they pass; and that permanent school or educational funds may be invested in United States, State, county, school district and municipal bonds, and on farm lands to the extent of one-third of the actual value of said lands.

State Officers and National Representatives.—Governor, F. B. Fancher; lieutenant-governor, J. M. Devine; secretary of state, Frederick Falley; treasurer, D. W. Driscoll; auditor, A. N. Carlblom; attorney-general, J. M. Cowan; superintendent of education, J. G. Halland; adjutant-general, Elliot S. Miller; commissioner of agriculture, H. U. Thomas; commissioner of insurance, G. W. Harrison. Supreme Court: Chief justice, J. M. Bartholomew; associate justices, Alfred Wallin, N. C. Young; clerk, R. D. Hoskins. The State legislature is composed of 78 Republicans and 15 Fusionists. Senators, Henry C. Hansbrough, from Devil's Lake; and Porter J. McCumber, from Wahpeton—both Republicans. Representative, R. E. Spalding (Rep.), from Fargo.

NORTHUMBERLAND, sixth Duke of, ALGERNON GEORGE PERCY, died January 2, 1899. He was born May 2, 1810, and was educated at Eton. As a Conservative he represented Beeralston in Parliament in 1831-32 and North Northumberland from 1852 to 1865. In 1858 he was Lord of the Admiralty, and vice-president of the Board of Trade in 1859. He succeeded his father to the title in 1867. From 1878 to 1880 he was Lord Privy Seal. His son, Earl Percy, succeeded to the title.

NORTHWEST TERRITORIES, political designation of a vast part of British North America, under the jurisdiction of the Dominion of Canada, and besides

a large unorganized area, containing the following administrative districts: Keewatin, created in 1876, gross area, 756,000 square miles; Assiniboia, created in 1882, gross area, 90,340 square miles; Saskatchewan, created in 1882, gross area, 114,000 square miles; Alberta, created in 1882, gross area, 100,000 square miles; Athabaska, created in 1882, gross area, 251,300 square miles; Mackenzie, created in 1895, gross area, 563,200 square miles; Ungava, created in 1895, gross area, 456,000; and Franklin, created in 1895, gross area unknown. The known area of all districts is 2,330,840 square miles. In August, 1897, in consequence of the great rush to the Klondike gold region, the governor-general by proclamation established the Yukon judicial district, and in June, 1898, the Dominion Parliament rearranged the boundaries of the district and created the separate territory of Yukon, with a gross area of 198,300 square miles, and administrative centre at Dawson. Yukon territory to-day is wholly a mining region, with such interests as naturally attach to the industry; and as it is yet too young to possess the elements that would give it other importance and independent treatment, it is here considered as a part of the Northwest Territories.

Agriculture.—Returns from the various districts for the calendar year 1898 showed the following grain productions: Wheat, 5,542,478 bushels, from 307,580 acres; oats, 3,040,307 bushels, from 105,077 acres; and barley, 449,512 bushels, from 17,092 acres.

Mineralogy.—The second classified coal area of Canada is chiefly in the Northwest Territories, with an overlapping section in Manitoba, and mining operations in both regions are unified in official reports. In the calendar year 1898 the combined production was 340,088 tons, an increase in a year of 72,925 tons, and the largest output recorded. The exports were 40,434 tons. Gold-mining, the distinctive industry of the region, is confined to Yukon territory and Saskatchewan district. The remarkable development of the industry is shown by the returns of the last four years. In 1896 the production was: Yukon, \$300,000; Saskatchewan, \$55,000; in 1897, Yukon, \$2,500,000; Saskatchewan, \$50,000; in 1898, Yukon, \$10,000,000; Saskatchewan, \$25,000 (both returns for this year being subject to revision); and in 1899 the output of the entire Klondike region, excluding a number of important locations, such as Sulphur Creek, Stewart River, Upper Klondike, and Scroggie Creek, was conservatively estimated at \$19,000,000. No workings of consequence have yet been undertaken in the known great petroleum fields, nearly every possible mineral industry being subordinated to gold-mining.

Fisheries.—The value of all fishery catch in the calendar year 1897 (the last officially reported and for both the Northwest Territories and Manitoba) was \$638,416, a decrease of more than \$100,000 in a year and the lowest since 1891. The principal catch was whitefish, \$413,893; pickerel, \$117,667; pike, \$46,244; and sturgeon, \$20,831. Exports of all fisheries in 1898 amounted to \$211,748, a slight increase; and the capital investment in all fisheries to \$237,646.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise in the territories alone aggregated in value \$636,979, an increase in a year of \$346,542; exports, domestic and foreign, \$159,822; duty collected on imports, \$160,532.

Banks.—On January 1, 1899, there were 20 chartered banks and branches in the territories, including 2 in Yukon; and 25 post-office savings banks, with 1257 depositors and \$232,898 deposits.

Railways and Telegraphs.—In 1898 the total railway mileage was 1778, independent of special constructions in Yukon territory. Government telegraphs, comprising the Moose Jaw and Qu'Appelle systems, had a total length of 698 miles, all land line, with 17 offices; total expenditure, \$14,353.

Post-Offices.—At the end of 1898 the territories and Manitoba together had 796 post-offices, in which were posted during the year 10,350,000 letters and 1,250,000 postal-cards; and the territories alone had 49 money-order offices, which issued 45,304 orders.

Education.—Reports for the school year 1898 showed 426 public schools, 483 teachers, 16,754 enrolled pupils, 8827 pupils in average attendance, and revenue from the legislative assembly, \$133,643. At the end of 1899 there were 21 periodicals, of which 1 was a daily and 19 weeklies.

Finances.—Since confederation the Dominion government has expended on capital account for the territories \$3,800,126, and in 1898 it expended on consolidated fund account, for the government of the territories, \$347,687, and for the Yukon provisional district, \$47,027.

Population.—Local estimates in 1898-99 gave Regina, the seat of government, 2200; Calgary, 4310; Edmonton, 2800; Prince Albert, 1500. The Indian population of the treaty limits in the territories and Manitoba was 21,316; of the Peace River district treaty limits, 893; and of the territories outside of treaty limits, 17,648—total, 39,857. There were 60 schools for Indian youth in the treaty limits of the territories and 12 outside of those limits, with a total enrolment of 2652 pupils. The Indians

cultivated 15,488 acres of land, had 28,024 head of live stock, and received \$131,074 from their various industries.

NORWAY, one of the two kingdoms on the Scandinavian peninsula, being bounded on the east by Sweden and Russia and on the west by the North Sea and Arctic Ocean. The area is 124,445 square miles, and the population in 1898 was 2,168,000. The report of the United States commissioner-general of immigration shows that in the fiscal year 1898-99 the immigration to the United States was 6705, showing an increase of 1767 over the previous year. The capital is Christiania, which had in 1899 a population of 221,073. Other important towns having a population of over 20,000 in order of population are: Bergen, Trondhjem, Stavanger, and Drammen. The national religion is the evangelical Lutheran, which alone receives support from the state. The only Christian sect not tolerated is the Jesuits, while Jews are granted liberty of worship. Education is compulsory for children between 7 and 14 years of age. The imports for the year 1897 amounted to \$71,275,180 and the exports, \$45,323,432. A considerable increase of imports over the previous year is explained by the undertaking of new industries, involving the importation of much new machinery. The chief imports from the United States were pork, petroleum, leather and tanned skins, tallow, lard, margarine, flour, tobacco, and wood; and the principal exports were lumber, wood pulp, fishery products, matches, wrapping paper, condensed milk, and manufactures of wood. Though agriculture is one of the chief occupations in Norway, nearly three-fourths of the soil is unproductive, and only 3 per cent. is under cultivation. The fisheries are important, the cod fishery being valued in 1896 at 14,332,606 kroner, and the total, 21,714,253 kroner. The krone is equivalent to \$0.268. Other important fisheries are the mackerel, whale, walrus, seal, and shark fisheries. The commerce of the country is important, a large trade being carried on with Germany, Great Britain, Russia, and America, the countries named in order of importance. The number of Norwegian vessels in the foreign trade in 1898 was sailing vessels, 3109; steam vessels, 591—total, 3700. The budget for the year 1899 shows estimated revenue and expenditure of 86,591,837 kroner, the principal sources of revenue being the customs, which furnish 31,900,000 kroner; the railways, 10,139,440 kroner; loans for defence and railways (not made in 1898), 15,188,054; post-office, 4,350,000 kroner; excise on spirit and malt, 7,000,000; and income tax, 4,000,000 kroner. The army consists of 18,000 men, which number can be increased only with the consent of the Storting. The number of men trained for military duty is, however, twice as great.

A more vigorous policy is hoped for in reference to the Norwegian and Swedish navies. Two new Norwegian vessels are the *Harald Haarfagre* and the *Tordenskjold*, double-turreted armor-clads for coast-defence purposes. These vessels were built in England, where it was proposed three new armored ships be laid down in 1900.

Government.—Norway is a constitutional monarchy, the executive head being the King of Norway and Sweden, and the legislative power being vested in the Storting, a body representing the people, which is elected triennially, franchise being granted to all citizens over 25 years of age possessing certain property qualifications.

History of Year 1889.—A resolution of the Storting, calling for a separate flag for Norway, not bearing the emblem of the union, was carried into effect, notwithstanding that the King refused his consent. The Radicals in the same year stood for a separate Norwegian ministry of foreign affairs and a separate consular service for Norway. The result of the accomplishment of these designs would be the virtual separation of the two countries, Norway and Sweden, with the King as the only bond between the countries.

NOVA SCOTIA, a province of the Dominion of Canada, with an area of 20,600 square miles. Capital, Halifax.

Mineralogy.—Coal continues to be the most important mineral production. In 1898 the output was 2,582,061 tons, valued at \$4,034,471. Of the total output, 2,391,644 tons were sold and 190,417 tons consumed at the collieries. The production was about 90,000 tons in excess of that of the previous year. During 1898 the province imported 46,438 tons and exported 312,601, a decrease in the latter of more than 71,000 tons. Out of a total production of 58,161 tons of iron ore in the entire Dominion, the yield of Nova Scotia was 34,776 tons, an increase over that of the previous year, but a decrease of 20,000 from that of 1896. The largest production in a period of 23 years was in 1893—102,201 tons. Excepting Ontario, none of the provinces has done anything to encourage the iron industry, and the only stimulus of general application is found in several acts of the Dominion Parliament, the last, in 1899, modifying the payment of bounties. Gold-mining in 1898 yielded an output valued at \$538,590, a decrease of \$23,575 from the output of 1897, which was the largest on record. The province has petroleum fields believed to be capable of large

and profitable development, but they still remain practically unworked. Nova Scotia is the chief Canadian producer of gypsum, and in the calendar year 1897 had an output of 155,572 tons in a total of 239,691 tons for the entire Dominion. The output of that year, both in the province and the Dominion, was the largest since 1892, the record-breaking year. The province reserves all its minerals and ores (excepting limestone, plaster, and building stone) and leases the land under rent and royalty for revenue purposes. Gold and silver leases are for terms of 40 years, and those for other minerals for 80 years in 4 renewable terms of 20 years each.

Fisheries.—The value of all fishery catch in the calendar year 1897 (the last officially reported) was \$8,090,346, the largest total in all the provinces, and an increase in the year of more than \$2,000,000. The principal catch was cod, \$2,818,162; lobsters, \$2,191,263; haddock, \$769,158; herring, \$540,276; mackerel, \$463,372; and pollock, \$352,134. Exports of all fishery products in 1898 aggregated in value \$4,728,865, nearly one-half of the entire fishery exports of the Dominion; capital investment in all fisheries, \$3,149,174; distribution of fry, 3,000,000.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise aggregated in value \$6,949,216, nearly all of which was entered for home consumption; exports, \$10,930,936, a decrease as compared with 1897; duty collected, \$1,246,703. The registered tonnage of British, Canadian, and foreign vessels carrying cargoes in and out of the province was 2,397,451, and of all vessels in the coasting trade, 5,411,143. Navigation along the coast was facilitated by 173 light stations, 182 lighthouses, 1 light-ship, 19 fog alarms, and 32 whistling and bell-buoys.

Banks.—On January 1, 1899, there were 69 chartered bank branches in the province, and during the previous year the exchanges at the clearing house in Halifax amounted to \$62,523,827, a decrease of \$1,212,173 from the total of 1897. There were also 16 government savings banks, with 16,097 depositors and \$5,103,710 deposits, and 57 post-office savings banks, with 12,809 depositors and \$3,464,015 deposits.

Railways and Telegraphs.—On June 30, 1898, the total length of railways in operation was 961 miles, of which 28 miles were owned by 5 iron and coal companies. Various grants to roads in the province constructed or under construction to the above date aggregated \$2,571,802. Government telegraphs had a total length of 229¼ miles of land lines and 2¾ miles of cables, with 25 offices.

Post-Offices.—At the end of 1898 there were 1673 post-offices in the province, in which were posted during the year 9,450,000 letters and 1,765,000 postal-cards, and 203 money-order offices, which issued 118,444 orders.

Education.—At the close of the term ending July 31, 1898, the province had 2385 public schools, with 101,203 enrolled pupils, of whom 57,771 were in average daily attendance; an enrolment of 51 teachers and 1768 pupils in county academies, 7 teachers and 152 students in normal schools, 2 teachers and 126 students in the model school, and 14 government night schools, with 528 pupils. The receipts comprised \$245,837 from the government grant, \$119,869 from municipal appropriations, and \$473,104 from other sources—in all, \$838,810. The Victoria School of Art in Halifax had 96 students, \$2419 receipts, and \$1976 expenditures. Normal school expenditures were \$8660; model school, \$1200. At the end of 1899 there were 68 periodicals, of which 8 were dailies and 48 weeklies.

Finances.—The revenue of the province in the year ending September 30, 1898, was \$855,960; expenditure, \$849,330; gross debt, \$3,711,802; Dominion government debt allowance, \$1,056,133; other assets, excluding public buildings, \$268,355; total assets, \$1,324,488; net debt, \$2,387,314.

Population.—Local estimates in 1898-99 gave Halifax, 45,000; Truro, 6000; Amherst, 5000; New Glasgow, 5000; Spring Hill, 5000; Lunenburg, 4000; Stellarton, 3600; North Sydney, 3300; and Sydney, C. B., 3000. The Indian population of the province was 2027. There were 8 schools for Indian youth, with an enrolment of 157 pupils. The Indians cultivated 2450 acres of land, and received \$27,453 from their various industries.

NUBAR PASHA, Egyptian statesman, died in Paris, January 14, 1899. He was of Armenian descent, and was born in Egypt about 1825; was educated in Switzerland and France. He was recognized in public life as a man of honor and great ability. He held various diplomatic and cabinet positions. After serving as secretary to Mehemet Ali and Ibrahim Pasha, he became minister of public works, under Ismail, in 1864, and was minister of foreign affairs from 1867 to 1876. It was while he held the latter office that Ismail obtained from the Sultan the title of Khedive, with the provision of descent from father to son. The chief work of Nubar's life was the establishment of mixed courts for the adjudication of causes between Europeans and Egyptians. As the result of an official note addressed by him to the Khedive in 1867 on the dangers of judicial administration in Egypt, a commission two years later, attended by delegates from Great Britain, Russia, Prussia, France, Austria, and Italy, and presided over by Nubar, practically adopted his reform

measures, leaving him to work out the details. He was premier in 1878-79, 1884-88, and 1894-95; in November of the last-named year he resigned on account of old age, and was succeeded by Mustapha Fehmy Pasha.

NUGENT, Sir JOHN, M.D., died January 26, 1899. He was born in 1806, and was educated at Trinity College, Dublin. He will be remembered for his service during a long term of years—1847-90—as inspector and commissioner of control in lunacy in Ireland. Upon relinquishing this work in 1890 he was knighted.

NURSES, TRAINED. On the evening of March 6, 1899, the twenty-fifth anniversary of the founding of Bellevue Training School, New York City, was celebrated at the Waldorf-Astoria in that city. Over 800 nurses were present in uniform, representing twenty city hospitals. In 1872 Bellevue sent out the first class of trained nurses graduated in this country, numbering five women. The second annual convention of Trained Nurses of the United States and Canada was held in May, in New York City. Delegates were present from twenty-six hospitals. The president's address was delivered by Mrs. Hunter Robb, of Cleveland, O., formerly superintendent of Johns Hopkins Training School, Baltimore, Md. The various training schools in the country sent forth the usual number of graduates during the year 1899, one only meriting special mention. A class of twenty-seven women was graduated from Johns Hopkins Training School in June, 1899, the first in the world to complete a three-years' course, without payment of fees or tuition charges, the amount of practical work having been limited to eight hours a day. More time is given to educational features in this course than in most other schools, and a high order of attainment is required at graduation.

The American Society of Superintendents of Training Schools for Nurses has used the necessary influence with the Teachers' College of Columbia University, New York City, to secure the adoption of a course of hospital economics. This course is designed to prepare nurses to become teachers in training schools for nurses and superintendents of hospitals. Applicants for the teachers' course will be carefully examined by a special board of examiners, composed of hospital superintendents. Those who are found to possess the necessary requirements, and are probably fitted to be developed into superintendents, are admitted to the course of eight months' instruction. Three or four months of private duty are also required before the final examination for the certificate as a qualified superintendent. The school opened in the fall of 1899.

In July, Surgeon-General Sternberg ordered the organization of the Army Nurse Corps, under the supervision of Dr. Anita N. McGee, and provided in the order that female nurses may be assigned by the surgeon-general to duty at army hospitals where the patients require the care of trained nurses. The corps is to consist of chief nurses, nurses, and reserve nurses. Immune nurses will not be required to sign any contract, but others will be obliged to contract with the government for a year. The schedule of pay is thus arranged: In the United States a nurse will receive \$40, and in the colonies \$50 a month. Chief nurses, who are in authority over from five to ten nurses, will be paid \$10 additional, and those over more than ten nurses will be paid \$25 additional. The surgeon-general suggests to Congress that the superintendent of the Army Nurse Corps receive \$1800 annually. In November Dr. McGee reported that the corps had been organized, with about 230 nurses in the service. The method of organization of the corps has not been altogether satisfactory to the Associated Alumnae of the United States and Canada, who had offered their services to the government in the spring of 1898, when the possibilities of war with Spain menaced the nation, without receiving reply or attention. Their contention has been, and very properly, that the army nurses should be chosen only after affording some guarantee of fitness, and the corps should be organized from a strictly business standpoint. Instead of being put into the hands of the Alumnae organization, the matter of creating the corps was put into the hands of the Society of the Daughters of the American Revolution. While satisfied in the main with the result, the Alumnae consider that certain features of the service will be improved if a few changes are made. Hence, they have prepared a bill, which was to be presented to the House of Representatives in January, 1900. The following are some of the provisions of this bill: Women nurses, in the proportion of not more than 10 per cent. of the number of sick and wounded in general and post hospitals of fifty beds and upward, shall be employed by and constitute the women's nursing service of the medical department of the army. The superintendent of the women nurses in the army shall be a woman graduated from a general hospital training school for nurses, having a course of instruction lasting not less than two years, and who shall be appointed by the secretary of war, her salary to be \$2000 per annum. The nurses employed shall be graduates of general hospital training schools. Chief nurses shall be paid \$75 a month in the United States, and \$85 in the colonies. In addition to salary, each nurse, as well as the superintendent, shall receive travelling expenses

and necessary expenses when under proper orders, and they shall have quarters, subsistence, laundry for uniforms, medical attendance during illness, as well as nursing and medicines, and they shall be granted such leave of absence, without loss of pay, as the secretary of war may allow. That nothing in the bill shall prevent or limit the power of the secretary of war in time of war or of national disaster to avail himself of duly qualified Red Cross nurses (termed "sisters"), or of nurses of other worthy societies or associations. These provisions are all most desirable.

OATS. The following table, published by the department of agriculture, division of statistics, shows the acreage, production, and value of oats in the United States in 1899:

States and Territories.	Acreage.	Average Yield per Acre.	Production.	Average Farm Price per Ton December 1.	Farm Value December 1.

OCHRE. The production of ochre, umber, and sienna in 1898 came chiefly from twelve States, and amounted to \$143,257. Pennsylvania yielded over 50 per cent. of the output, while Georgia and Vermont were other important producers. Maryland produced 640 tons of the color known as Spanish brown, which was not produced by any other State.

ODD FELLOWS, INDEPENDENT ORDER OF, was organized in England in 1812, and in the United States in 1819, the first lodge in this country being established in Baltimore, Md. Mutual assistance is the primary object of the order. For the year ending December 31, 1898, the total relief paid was \$3,422,986.50; brothers relieved, 98,277; widowed families relieved, 5854; paid for relief of brothers, \$2,612,303.25; for widowed families, \$145,078.35; for education of orphans, \$40,996.89; for burying the dead, \$624,608.01. The membership, including the grand lodges of Australasia, Germany, Denmark, Sweden, and Switzerland, but not including female members, is 829,669. An English order, entitled the Manchester Unity of Odd

Fellows, and numbering 900,668, is not in affiliation with the American organization. The Encampment branch numbers 128,267 members. Rebekah lodges, sisters, 190,007; brothers, 123,156; chevaliers of the Patriarchs Militant, 16,169. Grand sire of the sovereign grand lodge, A. S. Pinkerton, Worcester, Mass.; grand secretary, J. Frank Grant, Baltimore, Md.

OGLESBY, RICHARD JAMES, ex-governor of Illinois, died at home in Elkhart, Ill., April 24, 1899. He was born at Oldham, Ky., July 25, 1824. In 1836 he moved with an uncle to Decatur, Ill., where he subsequently worked as a farm hand and carpenter. At the age of twenty he began to study law in the office of Judge Silas W. Robbins in Springfield, and in the fall of 1845 was licensed to practise. He commenced practice in Sullivan, but soon returned to Decatur. He then served through the Mexican War, participating in the battles of Cerro Gordo and Vera Cruz. He resumed his law practice, and in December, 1848, entered the Louisville Law School, receiving his diploma therefrom in the following spring. From 1849 to 1851 Oglesby was a gold-seeker in California, returning in the latter year to Decatur with about \$4500 as the result of his experiences. In 1858 he ran unsuccessfully for Congress, but in 1860 was elected to the State Senate. He resigned at the outbreak of the Civil War to become colonel of the Eighth Illinois Volunteers. He commanded a brigade at the capture of Fort Henry and Fort Donelson, and in March, 1862, was promoted for gallantry to the rank of brigadier-general of volunteers. In November of that year he became a major-general of volunteers. He fought under General Grant at Shiloh, and under General Halleck and General Rosecrans at Corinth, and he participated in the engagement at Pittsburg Landing. In the siege of Corinth he was so severely wounded that he was unfit for duty until the following April (1863), when he was assigned to the command of the Sixteenth Army Corps. In May, 1864, he resigned his commission, and in November of the same year was elected, as a Republican, governor of Illinois; he at once showed great activity in carrying out war measures. At the close of the war he visited Washington, arriving there on the 14th of April, the day on which President Lincoln was assassinated. He stayed with the President during the night of his death, and accompanied the funeral cortege back to Springfield. In 1864 General Oglesby had been elected governor by 30,000 majority; he was renominated in 1872, and this time received a majority of 40,000. Shortly after the assembling of the legislature he was elected to the United States Senate; he accordingly resigned the governorship and served until 1879 at Washington. In 1884 he was elected for the third time governor of Illinois; his term expired in 1889, after which time he lived on his farm near Elkhart.

O'HARA, Rt. Rev. WILLIAM, bishop of the Roman Catholic diocese of Scranton, Penn., died at Scranton, February 5, 1899. He was born in 1817 in County Derry, Ireland; after his education at Georgetown College and at Rome, he was ordained to the priesthood, becoming rector of St. Patrick's Church in Philadelphia, in which position he remained until 1856. For a time he taught in the Seminary of St. Charles Borromeo. In 1860 he was made vicar-general of the diocese of Philadelphia, and when from this the diocese of Scranton was formed in 1868 he became its bishop.

OHIO, an east central State of the United States, has an area of 41,060 square miles. The capital is Columbus. Ohio was admitted to the Union in 1803.

Mineralogy.—The maximum production of coal in the State was reached in 1898, when there was an output from 431 mines of 14,516,867 short tons, valued at \$12,027,336, an increase in a year of 2,319,925 tons. The most productive counties in their order were Perry, Jackson, Athens, Guernsey, Hocking, and Belmont. In the production of salt the State fell from third to fourth place, Kansas gaining third rank, although with an output of 1,682,247 barrels, valued at \$826,868, Ohio had an increase in the year of 106,833 barrels. Quarrying yielded sandstone to the value of \$1,494,746, a decline, and limestone, \$1,673,160, the highest since 1894. The greater part of the limestone was burned into lime, the value of which was \$911,482; the quantity used for paving and road-making was worth \$260,957; for building purposes, \$221,440, and for flux, \$210,000. The total output of iron ore was 43,868 long tons, valued at \$50,518, all carbonate ore, in the production of which the State held first place.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$21,341,065, the fifth largest amount among the States. There were 237 manufacturers of tobacco and 2324 of cigars, and the combined output in the calendar year 1898 was 518,043,756 cigars, 3500 cigarettes, 8,878,261 pounds of plug tobacco, 376,555 pounds of fine cut, 6,805,237 pounds of smoking, and 5024 pounds of snuff. Grain and fruit distilleries in operation numbered 53; the amount of fruit brandy produced was 41,839 gallons; spirits rectified, 10,503,099 gallons; distilled spirits gauged, 36,414,603 gallons; and fermented liquors produced, 2,785,489 barrels. The various iron industries showed sub-

stantial improvement, with a production of 1,986,358 long tons of pig-iron, there was an increase in the year of 613,469. The output of Bessemer steel ingots was 1,489,115 long tons; open-hearth steel, 79,888; iron and steel plates and sheets, 256,433; wire rods, 269,566; wire nails, 1,711,399 kegs; cut nails, 392,003 kegs, and all kinds of rolled iron and steel, 1,231,739 long tons. During 1899 more iron ore was received at the Lake Erie harbors than in any previous year. At Ashtabula the amount was 3,759,615 tons, the largest in the history of that harbor; at Cleveland, ranking second, 3,662,137 tons; at Conneaut, the new harbor of the Carnegie company, 2,599,180 tons; at Lorain, another new ore-receiving port, 1,212,301 tons, and at Fairport, 1,398,811 tons. Cleveland shipped 1,856,425 tons; Ashtabula, 1,151,746; Fairport, 203,228, and Conneaut, 115,039.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the port of Cuyahoga (\$1,203,196) and four other ports aggregated in value \$2,753,345; exports at Cuyahoga (\$2,175,849) and other ports, \$3,182,580—total foreign trade, \$5,936,225, an increase in a year of \$764,573.

Railways.—The new railway construction in the calendar year 1898 was 97.02 miles, and in 1899, 57.32, giving the State a total mileage of 8901.42.

Banks.—On October 31, 1899, there were 256 national banks in operation and 113 in liquidation. The active capital aggregated \$45,201,100; circulation, \$20,157,709; deposits, \$169,427,060; reserve, \$53,144,313, and resources, \$270,274,728. The State banks, April 3, 1899, numbered 155, and had capital, \$13,355,750; deposits, \$69,182,670; resources, \$87,772,790, and surplus and undivided profits, \$4,057,046; loan and trust companies, 5, with capital, \$1,150,000; deposits, \$4,204,208, and resources, \$5,954,038; private banks, 55, with capital, \$803,600; deposits, \$5,121,292, and resources, \$6,286,678; mutual savings banks, 4, with depositors, 78,944; and aggregate deposits, \$34,379,801; and stock savings banks, 5, with capital, \$527,868; depositors, 10,818; deposits, \$3,671,141, and resources, \$527,868. The exchanges at the United States clearing houses at Cincinnati, Cleveland, Columbus, Canton, Springfield, Toledo, Fremont, and Akron, in the year ending September 30, 1899, aggregated \$1,602,058,683, an increase of \$246,316,771 in a year.

Education.—The school census of 1898 gave a total enumeration of 1,198,704. At the close of the school year 1897-98 the enrolment in the public schools was 810,285, and the average daily attendance, 618,667. There were 25,256 teachers, 13,114 buildings used as school-houses, and public school property valued at \$41,428,289. The revenue was \$12,760,320; expenditures, \$12,563,949, of which \$8,588,191 was for teachers' salaries. There were 598 public high schools, with 1558 secondary teachers, 40,808 secondary students, and 13,341 elementary pupils; 54 private secondary schools, with 294 secondary teachers, 2689 secondary students, and 2514 elementary pupils; 5 public normal schools, with 42 teachers and 557 students in all departments; and 12 private ones, with 100 teachers and 6575 students. Normal training was also given in 13 colleges and 58 public high schools. Thirty-five universities and colleges for men and for both sexes reported 13 fellowships, 346 scholarships, 926 professors and instructors, 11,239 students, 434,641 volumes in the libraries, valued at \$589,248; \$442,800 invested in scientific apparatus, \$8,072,956 in grounds and buildings, and \$7,843,200 in productive funds; \$1,121,827 in total income, and \$508,314 in benefactions. Six colleges for women reported 105 professors and instructors, 575 students, 23,000 volumes in the libraries, \$21,500 invested in scientific apparatus, \$664,424 in grounds and buildings, and \$75,500 in productive funds; \$140,523 in total income, and \$9000 in benefactions. In 1899 there were 1233 periodicals, of which 163 were dailies, 805 weeklies, 182 monthlies, and 14 quarterlies.

Finances.—The assessed valuations in 1898 were: Real estate, \$1,244,817,473; personal property, \$515,439,970—total, \$1,760,257,443, an increase in a year of \$12,248,804; tax rate for both 1898 and 1899, \$2.84 per \$1000. The total bonded debt of the State in 1898 was \$1,241,665, and the irreducible State debt held in trust funds, \$4,679,228. The aggregate debt of the various counties was \$11,002,159; first and second class cities, \$69,053,693; incorporated villages, \$8,540,268; townships, \$838,286, and special school districts, \$7,568,180—total local debts, \$97,002,588.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 4,500,000.

Party Platforms.—The Republican State convention was held at Columbus, June 2, 1899, and placed at the head of its ticket George K. Nash (*q. v.*), who was generally admitted to be an excellent choice on the part of the Republicans. The platform reaffirmed the principles declared by the St. Louis platform of 1896; recounted the distresses alleged to have been caused by the last Democratic administration; endorsed the administration of President McKinley, expressing perfect confidence in its ability to solve the problem of the future of Cuba, Puerto Rico, and the Philippine Islands; commended the President for the modifications of the civil service rules recently promulgated; commended the action of the Seventy-third General Assembly of Ohio in passing the stringent law that prohibits the organization of

trusts, denouncing them as inimical to the interests of the people, and demanded the rigid enforcement of the law, and pledged the party to such further legislation as experience might determine necessary to prevent the formation and operation of such combinations. Other resolutions recommended a uniform system of selecting delegates to State conventions, and laws for equalizing taxes, protested against lynching, and strongly favored the Ohio Centennial at Toledo in 1902.

The Democratic State convention was held at Zanesville, August 30, 1899, and nominated for governor John R. McLean, proprietor of the Cincinnati *Enquirer*. The platform reaffirmed the entire Chicago platform of 1896, especially emphasizing its financial plank; expressed entire confidence in Mr. William J. Bryan, and demanded his renomination in 1900; declared radical and unalterable opposition to American "imperialism"; denounced what it alleged to be a secret alliance between Great Britain and the Republican administration; demanded that the Cubans and the Filipinos be not only permitted, but encouraged, to establish independent republics; declared a large standing army in our republic a menace to liberty; favored the initiative and referendum, the passage of the eight-hour labor law, the more rigid inspection of mines and workshops, the prohibition of sweatshops, and the abolition of the contract system of prison labor; declared that all unlawful combinations of capital are the legitimate fruits of a gold standard and Republican tariff legislation; and recommended a constitutional amendment providing for the election of President, Vice-President, and United States senators by a direct vote of the people.

The platform of the Non-Partisan party demanded direct legislation; public ownership of public utilities; union wages, hours, and conditions for skilled labor, and an eight-hour day with living wages for unskilled labor on all public works. It was also frankly opposed to the administration's Philippine policy.

Election.—The Ohio election was considered the most important of the year. While national issues were principally under discussion, personal and local party controversies had something to do with the results. The Republican candidate, George K. Nash, received 417,199 votes; John R. McLean (Dem.), 368,176; Samuel M. Jones (Non-Part.), 106,721; Seth H. Ellis (Union Ref.), 7799; G. M. Hammell (Pro.), 5825, and R. Bandlow (Soc. Lab.), 2439. Mr. Nash was elected by a plurality of 49,023, and the total vote cast was 908,159. The result was regarded by the Republicans as an emphatic endorsement of Republican policy, by the Democrats as a repudiation of Senator Hanna at home, and by the Non-Partisans as a justification of their cause, and as meaning the beginning of the end of government by parties and party bosses, and the inauguration of real government by the people.

State Officers and National Representatives.—Governor, George K. Nash; lieutenant-governor, John A. Caldwell; secretary of state, Charles Kinney; auditor, W. D. Guilbert; treasurer, Isaac B. Cameron; attorney-general, John M. Sheats; commissioner of common schools, Lewis D. Bonebrake; adjutant-general, H. A. Kingsley; secretary State Board of Agriculture, W. W. Miller. Supreme Court: Chief justice, John A. Shauck; associate justices, T. A. Minshall, William Z. Davis, Marshall J. Williams, Jacob F. Burket, William T. Spear; clerk, Josiah B. Allen. The State legislature consists of 73 Republicans, 1 Independent Republican, and 67 Democrats. Senators: Joseph B. Foraker, from Cincinnati, and Marcus A. Hanna, from Cleveland—both Republicans. Representatives: W. B. Shattuc (Rep.), from Cincinnati; J. H. Bromwell (Rep.), from Cincinnati; J. L. Brenner (Dem.), from Dayton; R. B. Gordon (Dem.), from St. Marys; David Meekison (Dem.), from Napoleon; S. W. Brown (Rep.), from Lebanon; W. L. Weaver (Rep.), from Springfield; Archibald Lybrand (Rep.), from Delaware; J. H. Southard (Rep.), from Toledo; S. R. Morgan (Rep.), from Oak Hill; C. H. Grosvenor (Rep.), from Athens; J. J. Lentz (Dem.), from Columbus; J. A. Norton (Dem.), from Tiffin; W. S. Kerr (Rep.), from Mansfield; H. C. Van Voorhis (Rep.), from Zanesville; J. J. Gill (Rep.), from Steubenville; J. A. McDowell (Dem.), from Millersburg; R. W. Tayler (Rep.), from Lisbon; Charles Dick (Rep.), from Akron; F. O. Phillips (Rep.), from Medina; T. E. Burton (Rep.), from Cleveland.

OHIO STATE ARCHEOLOGICAL AND HISTORICAL SOCIETY. See ANTHROPOLOGY IN AMERICA.

OIL PAINTERS, SOCIETY OF, a British society of artists, until 1898 called the Institute of Painters in Oil Colors, was founded in 1883. It holds annual exhibitions in November. President, Frank Walton; secretary, W. T. Blackmore. Headquarters, Piccadilly W., London, England.

OKLAHOMA, a southern Territory of the United States, has an area of 39,030 square miles. The capital is Guthrie. The Territory was organized in 1890.

Mineralogy.—The mineral resources, which are known to be numerous and of great promise for the future, are still either in a state of slow development or awaiting necessary capital. At the present time the extensive stone, cement, and salt de-

posits offer the chief inducements for immediate development. Several rich deposits of copper have been located recently on Carisco Creek, near Kenton, and at one place from 200 to 500 pounds of ore, assaying from \$75 to \$250 per ton, were taken out daily in 1899. Lead and zinc have been found in the Kiowa and Comanche Reservations, where excellent coal also exists, and salt is now being taken at a half-dozen primitive plants along Salt Creek. Oil and natural gas are believed to be abundant, as Oklahoma lies in a direct line between the oil fields of Kansas and Texas, and many paying wells have been drilled in the creek country just east of the Territory. Oil wells have been opened already near Pawhuska, in the Osage Reservation, and at Guthrie, and there are indications of much asphaltum in the known oil regions. At present the most productive industry is quarrying, which yields large quantities of fine stone for building and road-making purposes.

Agriculture.—The leading crop which the Territory markets is wheat, of which the production in 1899 was approximately 20,000,000 bushels. Kay County is the leading wheat county, the crop there reaching 3,500,000 bushels. A single field of 5000 acres yielded 90,000 bushels. The corn crop was estimated as at least 75,000,000 bushels. At the Omaha Exposition in 1898, Oklahoma produced the tallest stalk of corn, measuring over 19 feet. The cotton crop, which averages from one-half to three-fourths of a commercial bale per acre, was about 140,000 bales, worth in the market about \$5,000,000. Cotton is the chief ready-money crop of the Territory. Kaffir corn, a native of Africa, has become one of the valuable crops of Oklahoma, yielding from 40 to 80 bushels of thrashed seed per acre, and being able to withstand the hottest season. Oats, a comparatively new crop here, yield an average of about 60 bushels per acre, with a known maximum of nearly 100. Castor beans, bringing in the market from 85 cents to \$1 per bushel, yield about 125,000 bushels per annum, and peanuts, comparing favorably with those of Virginia, North Carolina, and California, yield from 50 to 100 bushels per acre, and bring 60 cents per bushel. Over 1000 acres were planted with this crop in 1899. There are now 79 grain elevators in the Territory, with an aggregate capacity of 1,341,000 bushels. Horticultural interests are represented by more than 20,000,000 fruit trees, and during 1899 over 12,000,000 jars were used in fruit-preserving for domestic use. Peaches, apples, and grapes are especially prolific. The live stock assessed in 1899 comprised 216,971 horses, 44,191 mules, 849,767 cattle, 36,652 sheep and 228,498 swine.

Manufactures.—The Territory had 35 flour-mills, with a combined capacity of 5100 barrels per day, in 1899; fully 200 cotton gins; cotton-seed oil mills in six cities; more than a dozen cotton compresses; foundries and planing mills in four cities; creameries in six cities and towns; canning factories in three; cheese factories at Perkins and Orlando; machine shops at Shawnee; carriage and wagon factories at Oklahoma City and Guthrie; more than a dozen cigar factories; several wineries; and brick-making plants in nearly every city and important town. Ten cities and towns have modern ice and cold-storage plants.

Education.—At the close of the fiscal year 1897-98, there was a school population of 101,474; public school enrolment, 77,121; and average daily attendance, 49,182. There were 1929 organized school districts; 1962 public schools, 2107 teachers, and public school property valued at \$600,000. The revenue was \$570,238; expenditure, \$415,347, of which \$291,052 was for teachers' salaries. There were 2 public high schools, with 7 teachers and 246 students; 2 private secondary schools, with 9 teachers, 45 secondary students, and 91 elementary pupils; a public normal school at Educond, with 9 teachers and 251 students in all departments; a Territorial university, with 10 professors and instructors, 367 students, 2300 volumes in the library; \$6000 invested in scientific apparatus and \$60,000 in grounds and buildings, and \$21,100 in total income; an agricultural and mechanical college, with an efficient experiment station; and Langston University for colored students. The oldest sectarian school is the Sacred Heart College, founded in 1876 for the education and conversion of Indians, and now devoted wholly to white pupils. The Roman Catholic Church has also a college for girls at Guthrie; the Congregational, one at Kingfisher; the Baptist is building one, and the Methodist, Episcopal, Congregational, and Presbyterian have mission schools among the Indians in the southwest. The Northwestern Normal School, at Alva, was completed in 1899. In that year there were 106 periodicals, of which 9 were dailies, 87 weeklies, and 9 monthlies.

Churches.—In 1899 there were over 630 churches, chapels, and mission houses, valued at more than \$400,000, with an aggregate membership of over 47,000; 850 Sunday schools, with 6000 officers and teachers, and 40,000 scholars, and 156 Young People's Societies of Christian Endeavor, with 7300 members.

Banks.—On October 31, 1899, there were 9 national banks in operation and 3 in liquidation. The active capital was \$425,000; circulation, \$104,720; deposits, \$1,414,344; reserve, \$575,642; and resources, \$2,116,021. The Territorial banks numbered 68, and had capital, \$604,600; deposits, \$3,022,373; resources, \$3,930,720; and surplus and profits, \$286,952. There were also four building and loan associations.

Insurance.—In 1899 there were 39 fire, 19 life, and 6 accident and casualty companies licensed to do business in the Territory. The local business of outside fire companies in 1898 was, insurance written, \$8,839,556; premiums received, \$167,680; losses incurred, \$24,637; life companies (incomplete), amount of policies issued, \$1,738,306; premiums received, \$76,515; losses incurred, \$55,842; other companies, outstanding risks, \$47,888; premiums received, \$72,098; losses incurred, \$1000. The last legislature authorized the organization of mutual companies of farmers to insure grain, live stock and farm buildings.

Railways.—The new railway construction in 1898 was 120.10 miles, and in 1899 156.29 miles, giving the Territory a total mileage of 761.26, according to the reports adopted in this volume. Local authorities claimed a total, in March, 1899, of 920.65 miles, of which 686.13 was main track. Railway property was valued for taxation at an aggregate of \$3,338,344.

Finances.—The total bonded debt, March 1, 1899, was \$48,000; outstanding warrants, \$250,000—total indebtedness, \$298,000. The assessed valuations for 1898 were \$40,623,816, and for 1899, \$42,982,414; tax rate for all purposes, 5.2 mills.

Population.—There was no enumeration in 1899, but Governor Barnes estimated the population at 375,000; Indian population, 12,041.

Legislation.—The Australian ballot law, with the "blanket" provision for voting, was passed. A department of geology and natural history was established. Two new officers were appointed, a bank commissioner and a chief grain inspector, the latter with supervision of all warehouses, elevators and granaries. A law was also passed regulating the organization and business of banking, and the duties and liabilities of officers and stockholders. School districts must levy a tax for public libraries. Notes and mortgages given by members of building and loan associations are exempt from taxation. Associations of not less than one thousand farmers may be formed for mutual insurance against loss by fire, hail, lightning, and cyclones.

Territorial Officers and National Delegate.—Governor, Cassius M. Barnes; secretary, William M. Jenkins; treasurer, F. M. Thompson; attorney-general, H. S. Cunningham; superintendent of education and auditor, S. N. Hopkins. Supreme Court: Chief justice, J. H. Burford; associate justices, C. E. Irwin, B. F. Burwell, B. T. Hainer, John L. McAtee; clerk, B. F. Hegler. The Territorial legislature consists of 25 Republicans, 5 Democrats, 6 Fusionists, and 3 Populists. National delegate, Dennis T. Flynn (Rep.) from Guthrie.

OLD-AGE PENSION MOVEMENT. The granting of pensions to persons incapacitated for labor by old age is based upon the principle that in the manual callings the physical strength and agility of youth are the chief qualities requisite in the workmen, and that, attaining their maximum soon after the age of twenty, they tend to decline rapidly at an age when in other occupations, such as that of the lawyer, physician, or the merchant, the knowledge gained by experience more than offsets the loss of physical energy. Such an offset is not present to like degree in manual callings, since from their very nature skill and intelligence play a relatively less important part in them. In the 1898 YEAR BOOK an account was given of the old-age pension legislation in New Zealand, including an explanation of the objects of this legislation, together with some criticisms which were made upon it at the time. It is still too early to test the efficiency of this measure by the results. During the year 1899 the most important seat of the old-age pension movement was England. Three valuable reports bearing upon the subject were published in that year—namely, the report of the Select Committee on the Aged Deserving Poor; the report of the Select Committee on the Cottage Homes Bill, and the report given by the Labor Department of the Board of Trade on Provision for Old Age by Government Action in Certain European Countries. The subject-matter of this article will therefore relate especially to England, but it may be of interest to give by way of introduction a brief outline of the attitude of other European governments toward this subject.

Old-Age Pension Systems.—Of the leading European countries Germany and Denmark alone have adopted a general system of pensions or relief in old age. The German system dates from 1889. It involves a compulsory insurance against old age or invalidism, and in 1897 it was estimated that over 400,000 persons drew pensions, amounting to \$13,831,000, of which over \$4,866,000 was derived from the state and the rest, in equal parts, from deductions from wages and from payments by employers. The average pension is about \$34 a year. This was the result of Bismarck's famous venture in imperial socialism. It has not been wholly satisfactory even to those who have benefited from it, nor has it fulfilled the hopes of its founder by checking the spread of socialism. In Denmark the system consists in a grant of old-age relief to needy persons of good character, but the amounts given are not large, and are bestowed as a supplementary income to persons who are already in receipt of some means, with a view to bringing up the total income to the point at which subsistence is possible. It closely corresponds to the out-relief granted in England to the deserving poor, except that it may be applied for as a matter of right, and brings no

civil disqualification. A system of compulsory insurance modelled on that of Germany was recommended by a royal commission in Holland in 1895, but it was not established by legislation. Sweden also has shown a tendency to follow the German example. In France there is a compulsory provision for old age in the case of seamen and miners, but in general all that the French have done is to place a sort of bonus upon savings, whereby persons 70 years old and over, who have paid contributions to the *Caisse nationale des retraites pour la vieillesse*, or subscribed to an approved friendly society, may secure from the state an addition to their pensions, but the whole pension together with this addition must not amount to more than £14 8s. a year. Belgium has a system somewhat similar to that of France, and in Italy a national pension fund for old-age contributions is aided by the state.

The English Movement.—Public attention was drawn to the necessity of providing a better system of old-age relief by certain reports which were made to Parliament in 1890 and 1891. From these reports it appeared that the relative increase of pauperism after the age of 60 years was remarkably rapid. On the basis of the figures given it was said that about 20 per cent. of the population over 65 years of age was in receipt of poor relief in one day, and about 30 per cent. in the course of one year. These conclusions led to the appointment of a royal commission in 1893 for the purpose of considering whether any alterations in the system of poor relief were desirable in the case of persons whose destitution was occasioned by incapacity for work resulting from old age, or whether assistance could otherwise be offered in those cases. After a session of two years and a careful study of the administration of the poor law the commission presented its report. In the first place, as to the ratio of total pauperism to the total population it was found to have declined greatly since the middle of the century, and this decline was attributed in part to the increase in the national wealth and in part to the disappearance of the able-bodied pauper as a result of a better poor-law system. In the second place, it showed that the recipients of relief were mainly aged and infirm; that the out-relief given to all the aged poor of fairly respectable character who are in need of relief amounts on the average to about half a crown a week; and that this relief is given on the assumption that its recipients have already some means of their own. It was further pointed out that this relief was granted with too little discrimination by the Board of Guardians; that the applicants for relief are not carefully watched, and that it often happens that too little or too much is granted. The commission's investigation of the condition of the workhouses showed that in their provision for material comfort they had greatly improved in recent years, and that it was this improvement mainly which had increased the expenditure under the poor law in England and Wales. Besides investigating the poor-law system the commission studied the various methods of granting old-age relief as through the endowed charities, friendly societies, etc., and also examined several old-age pension schemes. But when it came to recommending remedies the report was somewhat indefinite. The majority could not agree upon any old-age pension scheme, and the commission contented itself with recommending greater care on the part of the Board of Guardians in dealing with applicants for relief. The old-age pension schemes, however, were thought to be deserving of a more careful examination, and a new committee, known as the Rothschild Committee, was appointed by the government in 1895. It was to consider schemes for encouraging the industrial population, by state aid or otherwise, to make provision for old age, and to pay especial attention to the social, financial, and economic results of such schemes. The report of the committee was published in 1898. For one reason or another it condemned schemes for old-age endowment by means of deferred state-aided annuities. As to a pension system, it declared that it could not advise the government to establish one, since such a course would be difficult and expensive, and would not reach the really destitute. It rather weakly suggested a scheme of supplementing from the public funds incomes of persons 65 years of age, provided these persons could produce an income from an assured source of not less than 2s. 5d., or more than 5s. a week. The supplementary income from the public funds was to vary inversely with their own incomes, but was not to exceed 2s. 6d. a week. After making this suggestion the committee pointed out the dangers of counting upon it, showing that after a certain point was reached it might even tend to discourage thrift.

The Situation in 1899.—In 1899 the report of the Select Committee on the Cottage Homes Bill was published, and in so far as it related to the condition of the workhouses it confirmed the report of the earlier Royal Commission. Its chief recommendation was that there should be a better classification of the inmates of these houses; that the children should be kept outside; that pauper imbeciles and epileptics should be kept in separate institutions, and that cottage homes should be provided by the guardians for certain married couples and respectable old persons whose inability to provide for themselves was due to misfortune. Another and more important report published in this year was that of the Select Committee of the House of Commons on the Aged and Deserving Poor, which had been appointed to report

upon the best means of improving the condition of the aged deserving poor and providing for such of them as are helpless, and to make an especial examination of old-age pension schemes. The views of the members of this committee were divided. One set of opinions was represented by Mr. Lecky, who held that any such pension scheme was a dangerous and retrograde step likely to bring back the evils of the old poor-law system. It would tend, he said, to lessen the efficiency of voluntary organizations, weaken the habits of providence and thrift, and lead to the increase of pauperism. From this point of view the only thing to be done was by way of gradual improvement on the basis of the present poor-law system. This was not the attitude of the majority of the members, and the report embodying this principle was rejected. A view which met with some favor was that all persons having certain specified qualifications should be legally entitled to old-age pensions. The qualification commonly proposed was that the applicant must be a member of a friendly society for a specified length of time. The objection to this was that, in the first place, the fact of membership in a friendly society does not of itself prove that a person is entitled to a pension, nor is the absence of this qualification necessarily a sign of unfitness. It was urged that in Ireland membership in friendly societies was not common even among the thrifty, and again that such a qualification would bear hard upon women, since many of them, no matter how thrifty they were, could not find the means to pay the regular dues, and, since these friendly societies had for the most part something of the character of men's clubs, it furthermore seemed most unfair that a widow with children to support should be disqualified, while a prosperous artisan, able to lay by a little out of his earnings, should be entitled to a pension. Nor was there anything morally convincing in a rule that would exclude a man merely because he had preferred to place his earnings in a savings bank instead of the exchequer of a friendly society. A third and more radical view was that every person over 65 years of age who had not received poor relief under the poor law save under exceptional circumstances during the past twenty years, and who had never been convicted of a criminal offence, should be legally entitled to a pension provided his own income did not exceed 10s. a week. A scheme of this sort would have a very sweeping character, since the number of persons in the United Kingdom over 65 years of age is about 2,000,000, and of these it has been said that only about 700,000 have an income of more than 10s. a week. The clause excluding those who had received poor-law relief would of course reduce the number of persons entitled under the new system, but this exclusion would cease to operate after the present generation of paupers had died out. In the meanwhile all others would do their best to keep off the rates, and in this they would be aided by private charities. The result would be, it was feared, that the ranks of the pensioners would be recruited from above and below, and the burden upon the public purse would be enormous. Thus on the one hand was presented a plan that seemed unfairly exclusive, and on the other a plan that would impose an incalculable financial burden. The committee finally reached a compromise in their efforts to escape the vicious dilemma involved in these two schemes—that is, the danger which is at the root of all charitable endeavor, that in helping one class another class may be discouraged from helping itself. The compromise consisted in giving the right to pensions to any person over 65 years of age who had not received poor relief, or been convicted of a crime or possessed an income of more than 10s. a week, provided that such person had endeavored to the best of his ability to provide for himself. To prove that he had endeavored to the best of his ability to provide for himself, the applicant must show that either through membership in a benefit society or through some other medium he had tried to lay by a portion of his income for his future support. This again is a very elastic system, since the administrators of the law would be likely to interpret in different ways the nature of these qualifications. It was therefore impossible to ascertain beforehand what the expense entailed by this system would be. On this point the committee advised that the matter should be left in charge of competent experts. Another feature of the plan was the division of the country into pension districts corresponding with the unions. Within each district the scale of pensions was to be fixed at a sum not less than 5s. or more than 7s. a week. An additional point in which the scheme laid itself open to criticism on the score of undue elasticity was the provision that the pensioner should not have received poor-law relief, save in wholly exceptional circumstances. It was very doubtful what construction would be placed upon the term exceptional circumstances. Among the questions likely to arise there would be, for instance, the case of the person who had voluntarily reduced his income to a point just below 10s. a week in order to get the benefit of the pension. Such a course would obviously be to the advantage both of him and of his employer. But the critical point in the committee's plan is the proposition that the right to a pension shall be legally enforceable. Under the old poor-law system applicants for out-relief had a legally enforceable claim. The result was disastrous, and the reform of 1834 took away this legal title, so that under the present law no one has a legal right to more than the shelter of the workhouse.

The authority of the guardians in the matter of out-relief to the old and infirm is facultative merely. But as a matter of fact they have bestowed it in the great majority of cases. The present reform has for its object the substitution of fixed and adequate pensions for varying and inadequate doles of out-relief, and also the inclusion of a class of people just barely able to support themselves, and therefore ineligible for relief under the present system. The experience of England before the poor-law reform has led many to deplore the restoration of a legal right to relief. Those who take this view, while sympathizing with the objects of the reformers, think that they can best be gained by developing the existing poor law. They think that the aged poor should receive permanent, adequate, and discriminating relief, but that this result can be obtained without establishing the principle of a legally enforceable right. They urge, too, that if such right were once granted, it could not well be revoked, and that the safer course would be to see first how far the ends could be attained without the admission of this new principle. The difficulties involved in any system of old-age pensions which shall prescribe the classes entitled to relief are so great as to lead some to dismiss them all as impracticable. Mr. Charles Booth, for instance, goes so far as to say that the only principle upon which a good working scheme can be based is that of giving pensions without regard either to need or to desert, his maxim being that they should be given to all the old or to none at all. A writer in the *Edinburgh Review*, whose comments upon the recent pension schemes have been in part summarized in the above criticisms, sums up the present situation in the United Kingdom in the following paragraph:

"This, then, is the position which the government have to face. A royal commission, after examining the subject for two years, reported strongly against the adoption of any general scheme of old-age pensions. An expert committee, after another two years' meditation, found it impossible to recommend any scheme involving definite voluntary contributions by the pensioners. At the same time they clearly intimated their concurrence with the view held by the Royal Commission that a more general scheme would be injurious to the economic health of the community. A select committee of the House of Commons, chiefly composed of men already deeply pledged to some large change, has recommended a scheme of which the cost, depending as it does upon contingencies, cannot be estimated with any approach to exactness, but certainly will, in the near future, be very large. Even at first it will probably be so great as to make necessary a development of our financial system. Either there must be an increase of death duties and income tax or, as Mr. Chaplin and others have already proposed, a return to discarded customs duties, such as taxation of imported foodstuff. The results of any large step taken by the Cabinet will be as far-reaching in the way of finance as in that of industrial economy. It is possible that, as in that fatal year of poor-law reform—1796—we may be on the verge of doing much harm in order to do some good. The remedy may be more desperate than the disease. We think, indeed, that the hardship of the existing system to the poor has been somewhat exaggerated in the preliminary part of the Select Committee's report. There are, no doubt, a multitude of hard cases both below and just above the line of actual pauperism, but these may, perhaps, be met by a reform less full of risk to the social health of the nation. If the evil can only be met by a very large measure there is much to be said in favor of the adoption of that proposed by the select committee. But if the government think it best not to embark at once upon a scheme so large, and possibly so full of latent dangerous consequences, they will, as cautious trustees of permanent national interests, have good reasons for their decision. They may well prefer to submit to Parliament, at least as an interim experiment, some less ambitious measure, remembering that one can proceed if necessary from the smaller to the larger, but not conversely."

ONTARIO, a province of the Dominion of Canada, with an area of 222,000 square miles, exclusive of the parts of the great lakes of the St. Lawrence within the limits of Canada. Capital, Toronto.

Mineralogy.—Ontario is the only province in the Dominion that has legislated for the promotion of the iron industry. The production of pig-iron from all ores was 25,270 long tons in 1896, 23,854 tons in 1897, and 43,083 tons in 1898. The product of the last year was valued by selling price at \$530,789. During 1899 the output of pig-iron was largely increased by the establishment of the Deseronto smelter, but the exact amount was not available at the end of the year. Gold-mining showed an encouraging advance, the production of bullion being 3038 ounces in 1895, 7154 in 1896, 11,412 in 1897, and 16,075, valued at \$271,906, in 1898. Nickel-mining was the most extensively developed industry. Nickel and copper mines together employed an average of 610 men, and wages ranged from \$240,151 in 1896 to \$315,500 in 1898. The output of refined copper was 8,363,560 pounds, of which 4,571,000 pounds were exported; and the production of fine nickel was 5,517,690 pounds, valued at \$1,820,838. Almost the entire nickel product is exported to the United States for use in naval

construction. For regulations concerning the nickel industry see CANADA (paragraph Mineral Products).

Fisheries.—The value of all fishery catch in the calendar year 1897 (the last officially reported) was \$1,289,822, a decrease in a year of \$315,852, and the lowest value since 1884. The principal catch was trout, \$454,538; whitefish, \$228,664; and herring, \$157,349. Exports of all fisheries in 1898 amounted to \$381,045; the distribution of fry was 78,345,000; and the capital investment in all fisheries, \$744,431.

Agriculture.—In the calendar year 1898 the yield of winter wheat was 25,158,713 bushels; spring wheat, 6,873,785; oats, 86,858,293; barley, 12,663,668; turnips, 64,727,882; potatoes, 14,358,625; mangel wurzels, 21,957,564; corn for husking, 23,442,593; clover and hay, 4,399,063 tons; and tobacco, 10,560,590 pounds. The estimated value of all farm lands in 1897 was \$554,054,552; buildings, \$206,090,159; implements, \$51,299,098; and live stock, \$93,649,804—total, \$905,093,613.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise aggregated in value \$51,651,597, nearly all of which was entered for home consumption; exports, domestic and foreign, \$46,786,295, an increase in a year of \$7,473,069; duty collected, \$8,189,407. Navigation was facilitated by 189 light stations, 245 lighthouses, 3 light-ships, and 18 fog alarms. The registered merchant marine of the province comprised 924 steamers of 99,419 gross tonnage and 528 sailing vessels of 34,761 tonnage.

Banks.—On January 1, 1899, there were 306 chartered banks and branch banks in the province, and during 1898 the exchanges at the clearing house in Toronto amounted to \$439,489,330, an increase in a year of \$77,732,383, and in Hamilton, to \$35,637,964, an increase of \$2,287,422. There were also 478 post-office savings banks, with 95,663 depositors and \$21,585,079 deposits, and 1 government savings bank, with 1465 depositors and \$633,151 deposits.

Railways and Telegraphs.—On June 30, 1898, the total length of railways in operation was 6674 miles, the largest provincial mileage in the Dominion, and the total grants to roads constructed and under construction then amounted to \$20,002,773. Government telegraphs, comprising the Pelee Island system, had a total length of 24 miles of land lines and 10 miles of cables, with 10 offices, and revenue, \$1830; expenditure, \$1062.

Post-Offices.—At the end of 1898 there were 3213 post-offices in the province, in which were posted during the year 69,250,000 letters and 18,250,000 postal-cards; and 803 money-order offices, which issued 627,498 orders.

Education.—Reports for the school year 1897 showed school population 590,055; pupils registered in public schools, 482,777; average daily attendance, 273,544; schools open, 6009; teachers, 9128; receipts, \$4,988,155; expenditures, \$4,215,670. Roman Catholic separate schools numbered 340, and had 41,620 pupils, \$335,324 receipts, and \$302,169 expenditures. There were also 130 high schools, with 24,390 pupils, 579 teachers, \$767,487 receipts, and \$715,976 expenditures; 60 county model schools, 105 kindergartens, 73 teachers' institutes, 18 night schools, and 7 art schools, with about 500 students. The Department of Education also had under its control 244 public libraries, with over 418,000 volumes, and there were 103 other free libraries, with more than 371,500 volumes. At the end of 1899 there were 516 periodicals, of which 54 were dailies and 372 weeklies.

Finances.—The revenue of the province in the year ending December 31, 1898, was \$3,647,353; expenditure, \$3,802,591; liabilities payable in the next 30 years, \$2,066,642; excess of assets over liabilities presently payable, \$4,988,079.

Population.—Local estimates in 1898-99 gave Toronto, 186,517; Ottawa, 55,386; Hamilton, 50,035; London, 38,575; Kingston, 18,001; Brantford, 16,234; Windsor, 11,394; Guelph, 10,741; Stratford, 10,369; St. Catharines, 10,144; Belleville, 10,113; Woodstock, 9110; Chatham, 8923; Brockville, 8841; Owen Sound, 8120; Galt, 7501; Lindsay, 7142; Cornwall, 6334; Collingwood, 5514; Barrie, 5506; Pembroke, 5025. The Indian population of the province in 1898 was 20,618. There were 77 schools for Indian youth, which had an enrolment of 2670 and average attendance, 1441. The Indians cultivated 68,305 acres of land, had 17,835 head of live stock, and received \$336,466 from their various industries.

ORANGE FREE STATE, a republic of South Africa, is surrounded by four other states—namely, the Transvaal, or South African Republic, on the north; Natal and Basutoland, on the east, and Cape Colony, on the south and west. A large number of Boers came from Cape Colony to Natal in the first half of the century and attempted to set up a government there. Their efforts were made useless by the action of Great Britain in proclaiming that territory a colony in 1843, whereupon the Boers withdrew into the interior and founded the Orange Free State. In 1848 that territory also was proclaimed a British possession, but by a convention of 1854 its independence was acknowledged by Great Britain. In 1899 the state became involved in the Anglo-Boer war by reason of a defensive alliance between the two Boer republics. It has an estimated area of 48,326 square miles

and an estimated population of 207,503, including 129,787 natives and 77,716 whites. Eighty-five per cent. of the latter are Boers. The capital and largest town is Bloemfontein, with a population of about 4000. Pastoral lands make up the greater part of the country, and are well adapted to grazing. The chief occupation is the raising of live stock, especially sheep. Diamonds and coal are the principal minerals; gold and garnets and other precious stones are also found. Foreign trade passes principally through the ports of Natal and Cape Colony. The chief items of export are diamonds, wool, hides, grain, and ostrich feathers. In 1898 these exports were valued at £1,923,425 and the imports at £1,190,932. The chief destination of Orange Free State exports is the Transvaal. The revenue, which is derived principally from import duties, together with stamps, posts and telegraphs, transfer dues, and the native poll-tax, was in 1898, £799,757. The expenditure was £956,752, mainly for public service and works, education, posts and telegraphs, and artillery. The public debt, incurred mainly for railway purposes, was in 1898 about £1,830,000. The railroad mileage is 366, and is under state control. Defence is provided for by establishing liability for military service for all males from 16 to 60 years of age. At the capital are 4 batteries of artillery, with a reserve. It is estimated that in the fall of 1899 a force of about 20,000 burghers re-enforced the Transvaal army in the Anglo-Boer war, which broke out in 1899. The government is republican, and consists of a president (M. T. Steyn [*q. v.*] in 1899), chosen for five years, and of a legislative council, or *Volksraad*, chosen by the vote of the adult white males for four years, suffrage being restricted by a property qualification. The majority of citizens are members of the Dutch Reformed Church. Education is supported by the state, but is not compulsory or free.

Events in 1899.—The causes which led up to the rupture between the Transvaal Boers and the British in South Africa are fully treated in the article TRANSVAAL. It is necessary only to point out that the antagonism toward the British and British rule was largely shared by the Boers both of the Transvaal and of the Orange Free State, but the latter republic admitted the Outlanders, or non-Boer whites, to participation in the government, while that privilege was in large measure denied to the Outlanders resident in the Transvaal. From the first it was evident that the Orange Free State government was in sympathy with the position taken by the Transvaal, and during the earlier negotiations held by the latter republic with the British there was present at Pretoria in an advisory capacity, it is said, a member of the Free State executive. The Free State government endeavored to act as a mediator between the conflicting states, but at a meeting held at Bloemfontein in May, by invitation of President Steyn, between President Kruger and Sir Alfred Milner, British high commissioner of South Africa, no agreement was reached. Sir Alfred at a later date notified President Steyn that the massing of British troops on the Free State borders was a movement in no way directed against that republic, and that if the strict neutrality of the latter were maintained, there would be no reason to fear for the integrity of the Free State institutions. In reply President Steyn made it plain that the republic regarded unfavorably the presence of British troops, both on its own and on the Transvaal borders, and practically said that he could not be responsible if the burghers should become aroused over the matter. Upon the presentation of the ultimatum from the Transvaal (October 10) President Steyn made a formal statement of his intention to join forces against the British, and the Free State troops made, in fact, the first move of the war by the seizure of a train over the Natal frontier, which was followed up by the moving of a large body of troops into Natal to co-operate with the forces from the Transvaal, and on the west into upper Cape Colony, about Kimberley. Various proclamations were issued annexing to the Free State the colony of Natal above the Tugela River and parts of Cape Colony, and efforts were made to induce the colony Dutch to join the forces of invasion. Besides TRANSVAAL, see CAPE COLONY and NATAL.

ORATORIO SOCIETY, founded in 1873 by Dr. Leopold Damrosch, holds concerts in Carnegie Hall, New York City, and had 279 members in 1899. Secretary, William B. Tuthill, 287 Fourth Avenue, New York City.

ORE DEPOSITS. Turner shows that some of the metalliferous vein deposits may have been formed by replacement, even where the vein is composed entirely of quartz, and that the fissure was not filled by the deposition of the quartz from solution. The two kinds of quartz may be distinguished by their structure when observed with polarized light. Weeds points out that mineral veins may be enriched by a later deposition of metallic sulphides by descending waters, and that in many quartz and jasper veins of Montana the gold and silver ores have been deposited by hot springs. Vogt, in the *Zeitschrift für Praktische Geologie*, contributes a valuable series of articles on the relative distribution of the metallic elements and their concentration into the form of ore bodies. Gürich proposes a new classification of ore deposits, based on their origin.

OREGON, a Pacific coast State of the United States, has an area of 96,030 square miles. The capital is Salem. Oregon was admitted to the Union, February 14, 1859.

Mineralogy.—The production of the precious metals in the calendar year 1898 was: Gold, 56,966 fine ounces, valued at \$1,177,600, and silver, 130,000 fine ounces, coining value, \$168,081—total value, \$1,345,681. The official estimate for 1899 was: Gold, \$1,550,387 and silver, \$193,940—total value, \$1,744,327, indicating an increase of \$398,646. Coal, with an output of 58,184 short tons, valued at \$212,184 in 1898, showed a decrease in a year of 52,105 tons, caused by the closing down of the Beaver Hill mine. Quarrying yielded sandstone to the value of \$7864, and limestone, \$7480. This industry shows considerable fluctuation each year. No granite worth reporting was quarried in 1898.

Public Lands.—On June 30, 1899, the amount of public lands reserved was 5,500,821 acres; area appropriated, 3,697,962 acres; area unreserved and unappropriated, 35,328,338 acres, of which 24,145,544 acres were surveyed and 11,182,794 acres unsurveyed. The surveyor-general reported that the general contour of lands, particularly in the eastern and southern portions of the State, is such as to favor irrigation, which would convert into fertile farms the large semi-arid tracts which have hitherto been considered practically worthless; but in the last few years large irrigation companies have been formed, and water has been conducted for miles over unsurveyed and unoccupied lands, which in a few years will be settled.

Salmon Industry.—In the early part of the season of 1899 it seemed evident that the salmon catch on the Columbia River would fall far below the average; but at the end of the season, August 10, it was believed that the full returns would show about the usual results. The rapid growth of the cold-storage business has made a material difference in the relative proportions of the salmon catch and salmon pack. For this reason an apparent shortage of from 50,000 to 100,000 cases in the packs does not necessarily mean that salmon are becoming scarcer. It is held by experienced operators that with artificial propagation and well-enforced laws regarding close seasons and the methods of taking fish there is no apparent reason why the catch should not be maintained at its best proportions, and perhaps increased, even though the pack should show a decline.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise in the districts of Oregon and Willamette aggregated in value \$1,522,097; exports, \$9,116,973, a decrease in a year of \$10,745 in imports and \$5,144,855 in exports. Much of this decline in foreign trade is due to the shipment of local merchandise by rail and water to the ports of Washington and California, which receive credit that properly belongs to Oregon.

Railways.—The new railway construction in the calendar year 1898 was 62.25 miles, and in 1899, 22.90 miles, giving the State a total mileage of 1638.78.

Education.—The school census of 1898 gave a total enumeration of 130,750. At the close of the school year 1897-98 the enrolment in the public schools was 85,230; average daily attendance, 62,799. There were 3693 teachers, 2013 buildings used as school-houses, and public school property valued at \$3,748,154. The revenue was \$1,238,168; expenditure, \$1,274,937, of which \$795,052 was for teachers' salaries. There were 13 public high schools, with 47 secondary teachers, 1594 secondary students, and 85 elementary pupils; 19 private secondary schools, with 87 teachers, 861 secondary students, and 1565 elementary pupils; and 3 public normal schools, with 26 teachers and 894 students in all departments. Normal training was also given in 3 colleges and 1 public high school. Eight universities and colleges for men and for both sexes reported 27 scholarships, 155 professors and instructors, 1317 students, 27,413 volumes in the libraries, valued at \$59,415; \$23,650 invested in scientific apparatus, \$832,000 in grounds and buildings, and \$342,000 in productive funds; \$78,732 in total income and \$11,600 in benefactions. In 1899 there were 204 periodicals, of which 19 were dailies, 148 weeklies, and 25 monthlies.

Banks.—On October 31, 1899, there were 28 national banks in operation and 14 in liquidation. The active capital was \$2,420,000; circulation, \$978,039; deposits, \$6,463,155; reserve, \$2,643,507; and resources, \$19,197,038. State banks numbered 15, and had capital, \$858,467; deposits, \$2,864,564; resources, \$3,864,385; and surplus and profits, \$105,558. During the year ending September 30, 1899, the exchanges at the United States clearing house at Portland aggregated \$87,677,005, a decrease in a year of \$6,895,449.

Finances.—The assessed valuations as equalized for 1899 aggregated \$133,533,571, a decrease in two years of \$1,383,533. The bonded debt is limited to \$1829, of long-past-due bonds, probably destroyed. On January 1, 1899, there were outstanding warrants of various kinds amounting to \$248,910, for which the treasury held excessive assets.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 455,000.

Legislation.—A board of examiners of barbers was appointed, and barbers must

be examined, licensed, and registered; also a State board of dental examiners, and dentists must be examined and licensed. A State biologist and a game and forestry warden are to be appointed, the latter with large executive powers. Police duty shall not be performed by imported armed men, and such bodies shall not be brought into the State, except by the municipality. Crimes may be prosecuted by information, and grand juries may be dispensed with. Interest was reduced from 8 to 6 per cent. The Railroad Commissioner law was repealed, and there is now no such law in Oregon. The entire school system has been remodelled, and a board of text commissioners was created for uniformity of text-books. The State board of equalization of taxation was abolished. The constitutional amendments to be voted upon provide for the initiative and referendum system of enacting laws and for universal suffrage.

State Officers and National Representatives.—Governor, T. T. Geer; secretary of state and auditor, Frank I. Dunbar; treasurer, Charles S. Moore; superintendent of public instruction, J. H. Ackerman; adjutant-general, C. U. Gantenbein; attorney-general, D. R. N. Blackburn. Supreme Court: Chief justice, Charles E. Wolverton; associate justices, Robert S. Bean, Frank A. Moore; clerk, J. J. Murphy. The State legislature consists of 65 Republicans, 9 Democrats, 5 Fusionists, 6 Populists, and 4 Silver Republicans, with 1 vacancy, caused by death. Senators, Joseph Simon, from Portland, and George W. McBride, from St. Helen—both Republicans. Representatives, Thomas H. Tongue, from Hillsboro, and Malcolm A. Moody, from The Dalles—both Republicans.

ORIENTAL SOCIETY, AMERICAN, founded in 1842 for the study of oriental languages, had in 1899 a membership of 360. General meeting for 1900 at Philadelphia in April. The society publishes semiannually the *American Oriental Journal*. President, D. C. Gilman; secretary, Washburn Hopkins, 235 Bishop Street, New Haven, Conn.

ORMISTON, WILLIAM, D.D., LL.D., a well-known clergyman, died at Los Angeles, Cal., March 19, 1899. He was born in Lanarkshire, Scotland, April 23, 1821; was graduated at Victoria College, Cobourg, Ontario, in 1847, in which institution he served for a year as professor of moral philosophy. In 1849 he was ordained in the Scottish United Presbyterian Church. He was made master in the Normal School and later an examiner in the University of Toronto and inspector of the classical schools of the province; he was also an examiner in Knox College and for a time was pastor of a Presbyterian church at Clarke. In 1857 he left this charge to accept the pastorate of the Central Presbyterian Church at Hamilton, Ontario. Having remained here for thirteen years, he accepted a call to the Collegiate Reformed (Dutch) Church in New York, where he was one of the pastors until 1888. In 1890 he engaged in evangelistic work in California. He was a preacher of much force and impressiveness. Dr. Ormiston published various sermons, pamphlets, etc., assisted in the preparation of a series of school books, edited, with notes, *Meyer on the Acts*, and for a number of years prepared the international Sunday-school lessons.

ORNITHOLOGY. There has been little to note in the way of progress in ornithology during 1899 outside of the activities of the various organizations and the publication of an abundance of literature, for, unlike the preceding year, there were no unusually remarkable discoveries.

Organizations.—In spite of the fact that fashion has decreed an outrageous increase in the number of birds and feathers on women's hats, the Audubon societies have continued to grow and increase. In addition to them, the American Society of Bird Restorers has been organized, with headquarters in Boston, and Mr. Fletcher Osgood as general manager. The objects of the society are the protection of our native birds, especially during the nesting season, the appointment of "bird wardens," and the destruction, so far as possible without cruelty, of the English sparrow. A determined effort toward the latter end was made in Boston in the spring with the co-operation of the mayor, but unfortunately so much opposition was aroused that the work had to be given up. It is hoped to organize branches of the society in every town and city. A State organization of ornithologists has been formed in Colorado, and a similar one exists in Maine. These and the older ones, such as the Nuttall, of Cambridge, Mass.; the Cooper, of California, and the Delaware Valley, of Philadelphia, have flourished, and show what a strong hold ornithology has in America as a popular branch of natural history. The American Ornithologists' Union has enjoyed an even more prosperous year than in 1898, but the close was saddened by the death on Christmas day of Dr. Elliott Coues, who was perhaps the most generally known of American ornithologists. As the author of the *Key to North American Birds*; *Birds of the Colorado Valley*, and numerous other works, his name is an unusually familiar one to all bird lovers. The union held its seventeenth annual congress in Philadelphia, November 13-16, and the attendance of

members was larger than ever before. The union now has a membership of 744, of whom 613 are associates. The most important incident of the congress was the donation of \$100 by Miss Juliette A. Owen, of St. Joseph, Mo., an associate member, to be used as the council saw fit. It was voted to make the sum a nucleus of a fund, the income of which shall be used for the advancement of the science of ornithology. The bird protection committee made a very full and interesting report, deploring the increased use of birds and feathers, and showing what had been attempted and accomplished to check the evil. The difficulty lies in securing conviction of dealers, on account of lack of evidence. The hostility of fashion journals, and their publication of erroneous statements, has greatly hindered the work. When such a reputable journal as *Harper's Bazar*, publishes the statement that "égrets" are collected after being shed, and even from "domesticated" birds, so that "the most tender-hearted lady may wear this beautiful ornament with a clear conscience," and then declines to retract or modify it when the absurdity and error are pointed out, it is clear that the protection of birds is a Herculean task so long as fashion demands their use. One afternoon of the public sessions was given up to five papers, illustrated with lantern slides. Mr. Witmer-Stone read Audubon's letters to Baird, and this was one of the features of the congress. Another very interesting part of the programme was the account by Dr. A. K. Fisher of some of the interesting birds met with in Alaska in the summer of 1899, and the notes of the birds were imitated by Mr. L. A. Fuertes. Altogether more than twenty papers were presented, dealing with all phases of ornithology, though it was notable that no less than six of the papers dealt with questions connected with moulting and change of plumage. After the adjournment of the union a party visited Mill Grove, on the Perkiomen, the former home of Audubon.

Literature.—The ornithological literature of 1899 has been abundant, but there is no one work which stands out pre-eminently above the rest. The number of new species of birds described was not large, apparently less than one hundred having been named. The periodical literature has shown a distinct advance. The *Auk*, the official organ of the American Ornithologists' Union, has maintained its position at the head, and has contained numerous papers of popular as well as of technical interest. The first of the year saw the commencement of the new journal *Bird Lore*, under the editorship of Mr. Frank M. Chapman. It is the official organ of the Audubon societies, and contains each month a large amount of unusually high-class reading matter about birds. There are several other monthlies devoted exclusively to birds, most of them being the publication of some one of the ornithological clubs already mentioned. Several popular books on birds have appeared in this country, of very different degrees of merit. One of the best of these for small children is Mrs. Olive Thorne Miller's *The First Book of Birds*. An admirable book and well deserving wide circulation is Mr. D. Lange's *Our Native Birds: How to Protect Them and Attract Them to Our Homes*. It is full of helpful suggestions and sensible advice to all lovers of birds. Newton's *Dictionary of Birds* has been issued in a cheap, unabridged edition in one volume. One of the most readable papers published during the year appears in the *Proceedings of the Royal Physical Society of Edinburgh*, and relates to the habits of the *bower birds*. The paper is by Mr. A. J. Campbell, of Melbourne, and is adorned with excellent illustrations. Mr. Campbell describes the "bowers" of a number of species, from the simplest ones, consisting of a few leaves, up to the "elaborate, orchid-covered hut, with a mossy lawn in front, ornamented with brilliant flowers and berries," of the gardener bird of New Guinea. In the way of systematic works the most noteworthy is Dr. R. B. Sharpe's *Hand List of the Genera and Species of Birds*. This work, of which only the first volume has appeared, is based on the *Catalogue of Birds in the British Museum*. It includes all known birds, both living and fossil, but sub-species are not recognized. Mr. C. B. Cory has published in two volumes *The Birds of Eastern North America*. The books are profusely illustrated and are provided with very simple and useful "keys." A somewhat similar work on British birds has been published. It is called *An Illustrated Manual of British Birds*, and the author is Mr. Howard Saunders. The classification and nomenclature is simple and satisfactory, and the illustrations are good, while three excellent maps add greatly to the value of the book.

ORTON, EDWARD, Ph.D., LL.D., State geologist of Ohio, died October 16, 1899. Born in Deposit, N. Y., March 9, 1829, he was educated at Hamilton College, being graduated with the class of 1848. He devoted himself largely to the study of geology, and in 1869 was appointed State geologist of Ohio; he retained the position to the time of his death. In 1872-73 he was president of Antioch College, and in the latter year accepted a call to the presidency of the Ohio State University and to its chair of geology; from that time until he died he held the professorship, but in 1881 relinquished his position as president. In 1897 Professor Orton was president of the Geological Society of America, and for 1898-99 was president of the American Association for the Advancement of Science. His home was at Columbus, O.

Besides numerous geological papers, he wrote Volumes V., VI., and VII. of the *Geology of Ohio*, and was joint author of Volumes I., II., and III.

OSTREO-TOXISMUS, or oyster poisoning, has received a name and a place in medicine because of its prominence and frequency. It occurs in one of three forms: (1) An acute gastro-enteric catarrh; (2) a specific continued fever, probably due to ptomain poisoning; (3) as true typhoid fever, the oysters having acted as hosts for the typhoid bacillus. In the first variety the symptoms are, a few hours after the stale oysters have been ingested, nausea, vomiting, purging, and loss of appetite. Recovery follows in a few hours. In the second series a fever presents itself a few hours after the oysters are eaten, and lasts a week or ten days, accompanied by profound mental and bodily depression. Convulsions, coma, heart failure, or peritonitis may lead to a fatal issue. True typhoid fever may follow either of these two types.

OTIS, ELWELL STEPHEN, major-general, U.S.V., and brigadier-general, U.S.A., commander of the American forces in the Philippines, was born in Frederick City, Md., March 25, 1838. After his graduation at Rochester (N.Y.) University in 1858 he studied law and was beginning to practise when, in September, 1862, he entered the Union service as a captain in the One Hundred and Fortieth New York Volunteer Infantry, with which regiment he remained to the close of the war. In December, 1863, he became lieutenant-colonel, and in June, 1865, was mustered out. He was brevetted colonel of volunteers for gallantry at Spottsylvania and brigadier-general of volunteers for distinguished services at Chapel Hill. He bore a conspicuous part in the battle of Gettysburg, where his regiment lost 133 men in killed and wounded. In the battle of the Wilderness Lieutenant-Colonel Otis commanded the picket line of the Fifth Corps; in this battle his regiment lost 255 men. Colonel Ryan of the One Hundred and Fortieth was killed at Spottsylvania, and Otis succeeded to the command. The regiment experienced much hard fighting in Virginia between the Rapidan and the James, and through various casualties the command of the regular brigade devolved upon Otis. In an engagement near Petersburg on October 1, 1864, Otis was so severely wounded that he was not able to return to duty. Among the engagements in which he participated were Fredericksburg, Chancellorsville, Rappahannock Station, Spottsylvania, the Wilderness, Gettysburg, the North Anna, Totopotomy Creek, Bethesda Church, Petersburg, Weldon Road, and Chapel House.

On July 28, 1866, Otis was appointed lieutenant-colonel of the Twenty-second United States Infantry; he became colonel of the Twentieth Infantry in February, 1880; brigadier-general, U.S.A., November 28, 1893; and major-general, U.S.V., May 4, 1898. From 1867 to 1881 he served against the Indians. In the latter year he organized the United States infantry and cavalry school at Leavenworth, Kan. In 1893 he was assigned to the command of the Department of the Columbia, and in 1897 was transferred to the Department of Colorado. In the army General Otis is recognized as a strict disciplinarian and a man of judicial ability, and he has repeatedly been called upon to preside at military tribunals. After his appointment as a major-general of volunteers he was given command of the Department of California, succeeding General William R. Shafter. He was then ordered to the Philippines, and assumed chief command when Major-General Wesley Merritt, U.S.A., sailed from Manila on August 30, 1898, to confer with the peace commissioners at Paris. General Otis was a member of the Philippine commission, the appointment of which was announced by President McKinley on January 17, 1899. The Filipino insurrection began on February 4, 1899, and throughout the year General Otis had command of the American forces. He did not take to the field, but directed the movements of the army from his headquarters in Manila. During the summer and fall of 1899 there appeared in the American press not a little dissatisfaction with General Otis for alleged remissness in pushing forward the war. For an account of the campaigns in the Philippines during the year see the article *UNITED STATES*. General Otis published in 1878 an authoritative work, entitled *The Indian Question*.

OTIS, HARRISON GRAY, who was in command of volunteer troops in the Philippines in 1899, was born in Marietta, O., February 10, 1837. In the Civil War he served with the Twelfth and Twenty-third Ohio Volunteers, was twice wounded, and was promoted to the rank of lieutenant-colonel. After the war he turned his attention to journalism, and became editor of the *Los Angeles Times*. He became brigadier-general of volunteers in 1898, and was sent to the Philippines, where he led the American forces at the capture of Caloocan, Luzon, February 10, 1899.

OXYCAMPHOR. Alfred Ehrlich published in 1899 the results of his observation of oxycamphor, or oxyphor, an antidyspeptic and sedative. It is a new derivative of camphor, in which a hydrogen atom is replaced by a hydroxyl molecule. It is a white, crystalline, odorless, somewhat bitter powder, soluble in cold water (1 to

50), readily soluble in hot water and in alcohol. It is ruined by exposure to light and moisture, changing into a soft, slimy, sticky mass of yellowish-white color. It remains unchanged in tablet form or as a 50 per cent. tincture. It is not always well borne by the stomach. The best results were obtained in the dyspnœa of tuberculosis and in cardiac dyspnœa.

OYSTER FISHERIES. See FISH AND FISHERIES (paragraph United States Fish Commission).

OZONE. See WATER PURIFICATION.

PADEREWSKI, IGNACE JAN, the famous pianist, was born in Podolia, Russian Poland, November 6, 1860. He played the piano at the age of three, and was taught seriously at the age of seven. In 1872 he went to Warsaw, to study under Roguski and Kiel, and he made a tour through Russia, Siberia, and Roumania. In 1878 he became a professor in the Warsaw Conservatory and in 1884 in the Conservatory of Strasburg; but he left to study under Leschetitzky in Vienna. In 1887 he made a successful *début*, and visited several continental cities. In 1889 he attracted great attention in Paris. In 1890 he appeared in London with great success, and early in 1892 went to the United States, where he gained a fortune. He returned to America in 1896 and again in 1899, having played in the meantime in Europe. He has composed more than eighty works. His *Polish Fantasia* was first performed at the Norwich Festival in 1893.

PÆDIATRIC SOCIETY, AMERICAN, organized in 1888; in 1899 had 57 members. President, Henry Koplik, M.D.; secretary, Samuel S. Adams, M.D., 1 Dupont Circle, Washington, D. C. General meeting for 1900, Washington, May 1-3.

PAGET, Sir JAMES, F.R.S., D.C.L., LL.D., M.D., first baronet, one of the famous English surgeons of the century, died December 30, 1899. He was born January 11, 1814, and was educated at St. Bartholomew's. Since 1863 he had been surgeon to the Prince of Wales, and since 1877 sergeant-surgeon to Queen Victoria. He had for many years been consulting surgeon of St. Bartholomew's Hospital, and was a corresponding member of the Institute of France. He became a member of the Royal College of Surgeons in 1836, and in 1843, after some brilliant medical operations, he was made an honorary fellow of that institution. In 1875 he was elected its president. He was vice-chancellor of London University from 1884 to 1895. His baronetcy was created for him in 1871 in recognition of his many discoveries in surgery. Ten years later he was appointed a minister of the royal commission to inquire into the condition of the London hospitals for smallpox and fever cases. In the following year, at the jubilee commemorating the three hundredth anniversary of the founding of the University of Würzburg, he was one of the foreign scientific celebrities who received honors. He was a fellow of the Royal Society and of many other societies and institutions. Among his best-known publications are *Lectures on Surgical Pathology*; *Records of Harvey*; *Pathological Catalogue of the Museum of the College of Surgeons*; and *Results of the Use of the Microscope*. He also contributed extensively to the transactions of the Royal Society.

PAILLERON, ÉDOUARD JULES HENRI, dramatist and member of the French Academy, died April 20, 1899. He was born in Paris, September 17, 1834. He was clerk in a notary's office, but turned to literature, and in 1860 published a comedy, *Le Parasite*, and a volume of satirical poetry. He wrote the following plays: *Le Dernier Quartier*, presented at the Théâtre Français in 1863; *Le Second Mouvement*, 1865, brought out at the Odéon; *Le Monde où l'on s'Amuse*, 1868, produced at the Gymnase; *Faux Ménages*, 1869; *Hélène*, 1872; *L'autre Motif*, 1872; *Petite Pluie*, 1885; *L'Étincelle*, 1879; *L'âge Ingrat*, 1879; *Le Chevalier Trumeau*, 1880; *La Souris*, 1887; *Cabotins*, 1893. He wrote *Le Monde où l'on s'ennui*, produced at the Comédie Française in 1881, and its success was so great that he was elected to the Academy in the following year. Pailleron wrote also the following volumes of poems: *Amours et Haines*, 1869; *Prière pour la France*, 1871; *La Poupée*, 1884; *Discours Académiques*, 1886.

PAINTING. *Europe.*—Two of the most interesting events of the year 1899 were the celebration of the third centenary of the birth of Velasquez, held in Madrid on June 3, and the Van Dyck exhibition held in Antwerp from August 12 to October 15. The Knights of the Order of Santiago, of which Velasquez was a member, paraded in his honor, and a hall in the Prado, dedicated to Isabella of Braganza, was established. Thirty-nine of the great painter's masterpieces were placed there, including the "Adoration of the Kings," "The Surrender of Breda" (Las Lanzas), "Philip IV.," "Anne of Austria," and the "Infantas." A literary and musical celebration was given, at which Spanish music of the sixteenth century was performed under the direction of Philippe Pedrell, and a statue by Romanos

was unveiled by the young King. The Van Dyck celebration consisted also of a procession and festivities, and 120 masterpieces, several of which were lent by the Duke of Devonshire, were exhibited.

At the exhibition of the Royal Academy Mr. Alma-Tadema contributed a picture of unusual size for him, entitled "*Thermæ Antoninianæ*," the Baths of Caracalla. The foreshortening of the central figure is a masterly example of drawing, and the detail of the whole work is superbly executed. Two pictures of Queen Victoria's Jubilee also attracted notice. The one was John Charlton's "*God Save the Queen*," showing the portico of St. Paul's seen from the south corner, with the Queen's carriage in the centre. Conspicuous is a fine group of Indian cavalry in blue and red, with head-gear of cloth of gold. The Queen's famous cream-colored horses in their crimson trappings are beautifully painted, as well as the horses of foreign princes near Queen Anne's statue. The gentlemen-at-arms, the yeomen of the guard, and the dignitaries of church and state afford splendid masses of color. The other was Gow's picture, "*St. Paul's: the Queen's Diamond Jubilee*"; it was full of animation, light, and color. The figures are larger than Mr. Charlton's, and the portraits are particularly fine. The scene chosen is the moment when the Archbishop of Canterbury bestowed his benediction upon Queen Victoria sitting in her carriage. This picture is the gift of Mr. Henry Clarke to the Guildhall. Sir E. J. Poynter contributed only a portrait of the "*Hon. Violet Monckton*," in white, seated on a garden bench; Mr. Watts also contributed but one picture, the portrait of the Right Hon. Gerald Balfour; Mr. F. Goodall sent a portrait of Mr. Gladstone, and also "*On the Road to Mandalay*." The Royal Academy elected on January 31, 1899, for associates, A. S. Cope and A. East, painters, and W. Goscombe John, sculptor; as honorable foreign academicians, M. Jules Breton was selected out of eighteen candidates.

One of the most important exhibitions of the year was that of Sir Edward Burne-Jones's works at the Royal Academy. Of the 225 works, 130 were oil paintings, and happily illustrated the genius of the painter. It was generally concluded that the artist was more reminiscent of Botticelli than of Rossetti, and that his works fully illustrated the fact that "a picture is a painted poem." Sir Philip Burne-Jones exhibited in the garden-studio, Lisgar Terrace, West Kensington, about 50 of his father's pictures, some of which were unfinished. The following examples were shown: "*Venus Concordia*," "*Venus Discordia*," "*Love's Wayfaring*," "*The Fall of Lucifer*," several replicas of the "*Perseus*" series, "*Fortitude*," a beautiful pastel for a large picture, "*The Sirens*," and many others.

A remarkable exhibition was held at the Royal Academy of Rembrandt's pictures from English private collections.

Particularly fine was a magnificent collection of Turner's exhibited at the Guildhall Gallery, comprising 160 of Turner's pictures and drawings, and also choice impressions from the "*Liber Studiorum*."

Turner's superb "*Raby Castle*" formed the feature at an exhibition in the French Gallery. This masterpiece was painted about 1818, and was exhibited in that year. It was added to the Raby gallery by the late Duke of Cleveland. Not only does it represent a poetic view of the castle, but its clouds and light and delicate grading of tones and tints are rendered with a magical brush. Dogs are cleverly used in the foreground to show the undulations of the ground. The exhibition at the New Gallery contained many fine works, the most noticeable being Holman Hunt's "*Miracle of Sacred Fire in the Church of the Sepulchre, Jerusalem*," and Mr. Watts's "*Dedication*," showing an angel kneeling before an altar, and his "*Portrait of Lord Roberts of Kandahar*."

Among the minor exhibitions were twenty selected pictures by Italian masters at Agnew's; pictures by living artists of the French school at the Continental Gallery, including works by Anders, Bertolon, De Breanski, Checa, Darien, and Veber; Byam Shaw's pictures, interpreting passages of British verse; A. Severn's landscapes, and Gaston la Touche's impressionist pictures at the Fine Art Society. At Egyptian Hall were shown English landscapes by R. W. Allan, Aumonier, Hill, Peppercorn, Thompson, and Waterlow; F. Thaulow's pictures were exhibited at the Goupil Gallery; Verestchagin's at the Grafton Galleries; Von Glehn's 58 paintings, at the Goupil Gallery; modern Dutch paintings at Tooth's; and there were exhibitions by the Society of British Artists, miniature painters, Society of Painters in Water Colors, and Society of Women Artists. Mr. Watts exhibited at Messrs. Agnew and Sons, a small but poetical painting, "*The Good Samaritan*"; the victim lying naked in the road, while the rescuer, who has alighted from his mule, feels the man's side. The glow of the sky and the twilight effects are particularly fine. Alma-Tadema exhibited at Tooth's his "*Conversion of Paula*," which attracted so much attention at the Royal Academy in 1898, and late in the year placed his "*Thermæ Antoninianæ*" on view.

A new organization, the Pastel Society, was formed, and held its first exhibition

in the galleries of the Institute of Painters in Water Colors. Watts, Abbey, Boughton, Walter Crane, and Kolshoven contributed. The motive of this new society is to encourage pastel painting in England. The Royal Water Color Society had an excellent array of landscape. The Royal Glasgow Institute of the Fine Arts held its thirty-eighth annual exhibition; the Arts and Crafts held an important exhibition in October-November, reserving one room for the late William Morris's works; there was an autumn exhibition of pictures and sculpture at Liverpool; an exhibition of works of Sir Alma-Tadema and other noteworthy Dutch artists at the Holland Fine Arts Gallery; an exhibition of Henry and Albert Moore's works at Collingham, Maresfield Gardens; R. Caton Woodville placed on view his famous "Charge of the Twenty-first Lancers," and there were many minor exhibitions.

The National Portrait Gallery acquired an oil painting of "Jane Welsh Carlyle," by Samuel Lawrence; "Alexander Pope," by Sir Godfrey Kneller; "William Carr, Lord Beresford," by E. Beresford; "Admiral Sir George Rooke, K.B.," by M. Dahl, and "J. W. M. Turner," drawn in colored chalks by Charles Turner; "Earl Cowper," by Sir Godfrey Kneller, and a "Portrait of Queen Victoria," by Sir George Hayter (presented by the Queen). The National Gallery received a "Virgin and Child," by Francesco di Giorgio (an example of early Siennese art). The National Gallery of Edinburgh (which had no less than 72,000 visitors during 1899) acquired a portrait by Raeburn; Hogarth's full-length portrait of "Sarah Malcolm" (the Temple murderess), painted just before her execution in 1733 (a bequest from Lady Jane Dundas), and Wilkie's "The Gentle Shepherd." The British Museum was enriched by some small panels painted in encaustic in the decoration of a villa at Boscoreale—a group of Dionysus, Silenus, and a panther, two marine views, and two groups of birds, colored with much spirit—also a large mosaic representing Amphitrite, with two female attendants, rising from the sea. The National Gallery, London, obtained three new Rembrandts for the Dutch Room.

A reputed Rembrandt was discovered by Sir J. C. Robinson in a remote country house in Wales. The picture is 5 x 4 feet, painted on an oak panel, and is in a perfect state. It is a still-life study, representing a pile of vellum-bound books and papers, plaster casts of busts, an hour-glass, a steel cuirass, and a skull crowned with laurel. A large placard attached to the table, on which three objects stand, bears in Roman letters, "Servare modum, finemque tueri. Naturamque sequi." The signature, "Van Ryn, f. 1621," is placed below. This "Vanitas" picture occasioned much discussion. It was exhibited at the Burlington Arts Club. Another supposed Rembrandt, representing a handsome youth, was discovered in a Baptist church in Amsterdam. It is thought to date from 1632. Several wall paintings in distemper, representing scriptural subjects, were uncovered during the repairs of the church of Ashmansworth, near Highclere. Some of the paintings date from the thirteenth century.

Two civic pictures attracted great attention in London, both for their subjects and the skill with which they were treated. One was the work of Mr. Stanhope Forbes, who was commissioned by the authorities of the Sun Fire Insurance to paint one of the panels for the Royal Exchange. His large picture represents the "Great Fire of London," as described by Pepys. The scene is a quay at Thames side, where a crowd of men, women, and children are struggling to embark at early dawn. "Volumes of flame issue from the casements behind the fugitives, among whom are a sick boy who is being carried to one of the shallops at the foot of the steps, several other children in great distress, and sundry watermen and sailors. The figures are life-size, well and boldly drawn, and marked by a sense of style such as is not often found in English pictures as large as this. The artist's touch is firm and telling, his light and shade massive and effective. The expressions are appropriate, and the attitudes are spirited and natural. The river's surface, shining brightly in the combined lustre of the sky and the burning town, is turned to good account." The second was undertaken by Mr. E. Crofts for one of the panels of the Royal Exchange Arcade. This is the gift of the Mercer's Company to London, and represents Queen Elizabeth opening the first Royal Exchange.

The two Salons held their exhibition together for the last time in the Great Hall of the Machinery Annex, for the two societies, the Société des Artistes Français (the Old Salon) and the Société Nationale des Beaux Arts (the New Salon), will no longer exhibit under the same roof, as the galleries of the Palace of Art at the Exposition of 1900 will not be sufficiently spacious to contain the two collections of contemporary French art.

Old Salon: Last year Henner won distinction by his "Levite of Ephraim"; this year his "Portrait of an Old Woman" and "Dead Christ" were especially notable. Jean Paul Laurens, president of this society (which has gained 1000 members

since 1898), exhibited a ceiling intended for the *Galérie des Illustres* at Toulouse, glorifying the "Victory of Toulouse over Simon de Montfort." Toulouse is represented as a lamb, overpowering the lion, De Montfort, while the Muses, poets, and warriors symbolize Toulouse's glory. Albert Laurens, son of the president, had a fine "Portrait of his Brother, Pierre," and a painting of "Venus Welcomed by the Horæ." Pierre Laurens sent a portrait and "Sailors at the Capstan." The medal of honor was given to F. Tattegrain, his competitors being Henri Martin, Ferdinand Humbert, and Marcel Baschet. Paul Chabas won the Salon prize, and nine travelling scholarships were awarded—three to painters, three to sculptors, two to architects, and one to an engraver.

New Salon: Carolus Duran succeeded the late Puvis de Chavannes as president, and the picture that attracted most attention was the latter's portrait of "Mme. Puvis de Chavannes, née Cantacuzène," who died a few months before her husband. This portrait belongs to the Lyons Museum. Carolus Duran's "Christ Upon the Cross" was much admired. He also sent two portraits. Dagnan-Bouveret contributed a fine portrait.

The Louvre received as a bequest from the Baroness Nathaniel de Rothschild her famous Greuze, "La Laitière," and twelve pictures of the early Italian school; to the Musée Carnavalet she left a portrait of Mme. Geoffrin by Nattier, and a portrait of Lucie Desmoulins, by Boilly. The "Océanide" of Chassériau was recovered from the Cour des Comptes, Paris, and transferred to canvas for the Louvre. The Louvre also acquired the famous painting by Ingres of "L'Odalisque Couchée," one of his most characteristic works, painted in 1814, a commission from Queen Caroline of Naples; a series of fourteen pictures found in the house of Gustave Moreau, forming a "Chemin de Croix," were placed in the new Moreau museum.

Ferdinand Humbert finished the mural decorative pictures in the Panthéon—eight panels—"Faith," "Patriotism," "The Family Tie," and "Charity"; the panels left unfinished by Puvis de Chavannes have been completed by Cazin. Joseph Israëls also completed his "Saul and David," on which he had been engaged for years.

There was an exhibition of the works of Adolph Schreyer in the National Gallery, Berlin; an important collection of pictures by Lucas Cranach was on view in Dresden from April 20 to September 15, some paintings being sent from Hungary; and the *École des Beaux-Arts* exhibited 300 oils by the late Eugène Boudin, besides water colors and drawings. There was also an exhibition at the Villa Medici, Rome, presided over by M. Leygues, minister of public instruction in France, and honored by the presence of the Queen of Italy; and the inauguration of the Hall of the German Embassy at the Palazzo Caffarelli took place, the frescoes of which were executed by Professor Hermann Prell, inspired by Emperor William. Prince Chigi sold at auction in Rome his "Madonna and Child," by Sandro Botticelli, which belongs to the cycle of the "Vierge aux Roses," in the Louvre. The Virgin Mary holds the infant Christ in her lap, while an angel offers him grapes and ears of grain. The picture was sold for £12,600 (315,000 lire) to a purchaser, said to be bidding for the Rothschilds. This Botticelli was the gem of the Chigi collection. The polyptych of the fifteenth century in the Church of San Sisto at Viterbo, a masterpiece of the early Siennese school, also left Italy.

There was an upward tendency in prices in Paris and London. The famous Bordini collection passed under the hammer, realizing £21,699, and also the collection of old masters formed by H. F. Broadwood, the collection of the late Sir John Fowler, Sir J. Kelk, and others of note. The Fowler sale reached £65,355; the Kelk, £22,000; the Miles, Methuen, £35,000; the Sykes, Napier, and Ettrick, £20,000; the Marlborough gems sold for £34,827; the Vienna collection for £21,699, and the Miéville collection for £41,751. The most notable picture of the year was Sir John Fowler's "Landscape," by Hobbema, which brought 9550 guineas, the highest price ever given for a Hobbema. There was a great demand for Turners and other English masters, especially for works of Hoppner and Raeburn, and pastels by J. Russell. Franz Hals was also in demand. Botticelli's "Holy Trinity and Saints" fetched 1100 guineas; Troyon's "The Dairy Farm" sold for £6720; "Cattle Market and Fair in France by the Sea," £3780, and "A View on the French Coast," £2600; Sir John Fowler's "La Petite Mathématicienne," by Greuze, reached 1600 guineas; Sir J. Kelk's Constable's "Views of Salisbury Cathedral" reached £1365, and "Hook's Acre by the Sea, Cornish Coast," £441. Millais's "The Minuet" (for which his daughter posed), sold for 4500 guineas. Turner's "Port Ruysdael," a magnificent picture of a stormy sea (which in 1863 sold for 1995) reached 4800 guineas at the Kelk sale, and his "Venice" 8200 guineas at the Fowler sale. Rosa Bonheur's "Going to Covent" reached 800 guineas at the Kelk sale, and her "Highland Cattle and Sheep" 1450 guineas at the Fowler sale. Sir Joshua Reynolds's "Strawberry Girl" sold for £472; Berkheyden, "Buildings on a Canal," £173; Franz

Hals, "Head of a Youth in a Red Cap," £110; K. du Jardin, "Portrait of the Artist," £173; Jan van Ravestein, "Portrait of an Old Woman in Black," £220; Rembrandt, "Head of a Rabbi," £278; H. Fragonard, "The Coquette," £210; Francia, "The Madonna and Child," £152; J. Ruysdael, "A Landscape, with Cottages and Windmill," £147; Botticelli, "Madonna and Infant Saviour, with St. John and an Angel," £168; J. Hoppner, "Portrait of a Young Girl with a Blue Kerchief around her Head," £168; G. Morland, "A Winter Scene," £199, and N. Lancret, "A Woody Lake Scene Near a Castle," £1071; Sir John Gilbert's "Scene from King John" fetched £48; "Rosalind and Celia in the Forest of Arden," £52; "Italian Piper and Attendant," £62; V. Cole, "Holmburg Hill," £100; Rossetti's "Jehanne la Pucelle," £90; Sir Joshua Reynolds's "Portrait of John H. Hutchinson and His Wife," the property of the Earl of Donoughmore, fetched 1250 and 2300 guineas; 1500 guineas were paid for Sir J. Watson Grahame's "Portrait of Sir Walter Scott," and a Botticelli, discovered by Sir Henry Layard in an Italian pawnshop, fetched 1100 guineas; Watteau's "L'Accordée du Village," at the Broadwood sale reached 1250 guineas, and his "La Musette," 1380 guineas; a portrait by Boucher, 1050 guineas, and J. B. Pater's "Wedding Party," 500 guineas. At the Bardini sale a "Judith" by Botticelli, similar to the "Judith" in the Uffizi, realized £1100. Paolo Uccello's "St. George and the Dragon," £1450. Paris Bordone's "Baptism of Christ" reached 1070 guineas; a Cuyp at the Miéville sale brought 980 guineas; a bouquet of flowers by Jan van Huysum, 700 guineas; a landscape by Ruysdael, 850 guineas; Jan Steen's "The Doctor's Visit," 195 guineas; Rubens's "Holy Family" at the Leigh Court sale reached 8300 guineas. Romney's "Lady Hamilton as a Bacchant" sold for 4300 guineas; Romney's "Mrs. F. Newberry," 1650 guineas; Sir Alma-Tadema's "Listener," 745 guineas; Bonnington's "Scene on Coast of Normandy," 1700 guineas; W. Collins's "Sunday Morning," 1380 guineas; Sir E. Landseer's "Ptarmigan Hill," 2000 guineas; Turner's "View of Oxford," 4200 guineas. A high price (3000 guineas) was paid at the Fowler sale for Turner's water color, "View of Lake Nemi."

At the Doria sale in Paris Durand-Ruel paid 22,000 francs for "La Danseuse chez le Photographe," by Degas; 22,100 for Renoir's "La Pensée"; 7200 for Manet's "Jeune Femme"; \$7000 for Monet's "Bateaux sur la Fleuve"; 34,500 for Corot's "Lake in Italy"; 21,000 for Rousseau's "Vallée d'Auvergne"; 16,100 for Jongkind's "Rue de Delft"; 46,500 for Daumier's "Compartment de Troisième Classe," and 19,500 for Delacroix's "Chasse aux Lions." At the same sale Millet's "Young Shepherdess" fetched 17,800, his "Rentrée des Vaches" 6300, and "A Squall" 2500 francs. "Le Rêve," by Bouguereau, sold in Paris for 13,200 francs; Sisley's "Route aux Environs de Marly," for 9300 francs; Girard's "Portrait of Napoleon I. in his Coronation Robes" fetched 16,500 francs; Delacroix's "Medea," 40,500 francs, and Nattier's "Portrait of the Duchesse de Chateauroux," 18,000 francs. At the Schubert sale in Munich, Rubens's "Bath of Diana," with a copy by H. van Balen, reached 126,000 marks; Rubens's "Ascension," 6200 marks; a Jan Steen, 8000 marks; Ruysdael's "Dutch Winter Landscape," 10,800 marks; Lucas Cranach's "Madonna with the Cake," 9000 marks, and "Nymph Reposing at a Well," 9150 marks. Christopher Amberger, two portraits, 51,000 marks; Watteau's "Musical Entertainment in the Open Air," 23,000; Wouverman's "Farriers on a Hill," 19,000, and G. Dow's "Housekeeper," 35,000 marks.

United States.—The seventy-fourth exhibition of the National Academy of Design was held from April 3 to May 13. Horatio Walker's "Oxen Drinking," Childe Hassam's "By the Sea," Frederick Remington's "Missing," and George H. Bogert's "September Evening" were noticeable. Miss Matilda Brown's "The Last Load" won the Dodge prize, Edward Potthast's "The Carpenter" the Clarke prize, G. H. Bogert won the first Hallgarten prize, L. P. Dessar the second Hallgarten, and Carle J. Blenner the third Hallgarten.

Frederick Dielman was elected president of the National Academy of Design.

The Society of American Artists held their spring exhibition as usual at the American Fine Arts Society Building. Dagnan-Bouveret's "The Disciples at Emmaus," purchased for the Carnegie Art Gallery, Pittsburg, was exhibited. Whistler's "Music Room," Charles Hopkinson's "Little Red Head" and "Expectation," Sargeant Kendal's "Portrait of a Lady," Will H. Low's "Four Seasons," were conspicuous. Kenyon Cox's frieze for the new Appellate Court Building—"Mercury and Ceres"—was also shown. Douglas Volk took the Shaw prize with his "Woodland Maid," and Mr. Lathrop's "Clouds and Hills" carried off the Webb prize.

At the tenth annual water color exhibition, at the American Fine Arts Society Building, Albert Herter's "Patricia" held the place of honor. Albert Herter's "Gift of Roses" gained the Evans prize. The Ten American painters held an exhibition at Durand-Ruel's, where works by Robert Reid, Decamps, Childe Hassam, Twachtman, J. Alden Weir, Benson, Edward Simmons, and T. W. Dewing were

shown. Twelve artists withdrew from the Society of American Artists to form the Society of Landscape Painters. At their first exhibition works by Bruce Crane, Frederick W. Kost, C. Davis, Walter Palmer, Walter Clark, Leonard Ochtman, Robert C. Minor, J. F. Murphy, George H. Bogert, R. H. Gifford, and William A. Coffin were shown.

The "Portrait Show" at the Academy of Design attracted many visitors. Among the most interesting pictures may be mentioned Whistler's "Girl in White," Sir Joshua Reynolds's "Strawberry Girl," Sargent's "Portrait of Calvin S. Brice," A. L. Zorn's "Portrait of Susan White Hildreth," A. de la Gandara's "Portrait of Mrs. Burke-Roche," and Raymundo de Madrazo's "Portrait of the Duchess of Morny."

On Founders' Day (November 2) at the Carnegie Art Galleries, Pittsburg, prizes were distributed. Cecilia Beaux won a gold medal and \$1500 for her "Mother and Daughter," F. W. Benson a silver medal and \$1000 for "The Sisters," and André Sanchez a bronze medal and \$500 for "The Boats." Lucien Simon and J. H. Twachtman received honorable mention. It is estimated that 469,000 persons visited this gallery within the past year.

The Boston Art Students' Association gathered an interesting collection of Sargent's works and exhibited them at Copley Hall. The Yale School of Fine Arts awarded to John Alden Twachtman the William Wirt Winchester fellowship of \$2000, providing two years' study abroad. The Page travelling fellowship of the Boston Museum of Fine Arts was given to Miss Mary B. Hazelton, an assistant teacher of drawing in one of the schools of the museum. The Colonial Dames of Massachusetts offered two prizes for a second exhibition of historical pictures, to be held at the Boston Art Club in December, 1899, the purpose being to stimulate an interest in the early days of the country.

The Boston Museum of Fine Arts purchased Turner's magnificent "Slave Ship," and the Metropolitan Museum of New York was enriched by Turner's "Grand Canal at Venice," valued at \$100,000, the bequest of Cornelius Vanderbilt. The spring opening of the Metropolitan Museum revealed several important gifts. Edward Brandus presented "St. Peter's Repentance," by Ary Scheffer; Jacob Schiff, Henry Mosler's "A Wedding Feast in Brittany"; Lyman G. Bloomingdale, George Inness's "Pine Grove of the Barbarini Villa," and Charles Sprague Pearce, George Inness's "The Delaware Valley" (from the Clarke collection).

When the Walters Gallery in Baltimore was opened several new pictures were noticed: Fortuny's "Arab Fantasia" (from the Stewart sale); two portraits by Van Dyck, one by Sir Peter Lely of Charles II.; a portrait by Sir Thomas Lawrence, and a "Holy Family," by Bonifacio, were among them.

A new gallery was added to the Chicago Art Institute by Mr. and Mrs. C. H. McCormick, in memory of Mrs. E. S. Stickney.

The important sales in this country were the Clarke, the Havemeyer, the Harris, Holbrook, Blakeslee, the Evans, and the Mendonça. The Clarke sale brought together 31 Winslow Homers, 39 George Innesses, 7 of Homer D. Martin, and examples by George Fuller, William M. Hunt, and William T. Dannat. George Inness's "Gray Showery Day" reached \$10,150; George Fuller's "Romany Girl," \$4100; George Inness's "Delaware Valley," \$8100; "Wood-Gatherers," by the same artist, \$5600; Winslow Homer's "The Life Line," \$4700, and his "Maine Coast," \$4400; and Homer D. Martin's "Adirondack Scenery," \$5500. At the Havemeyer sale Inness's "Georgia Pines" fetched \$1000; "Sunset-Star Island," by De Haas, \$1100; "In Strange Seas," by George W. Maynard, \$500; Benjamin West's "Design for a Monument to Admiral Nelson," \$250; and Edward Savage's "Washington and His Family at Mount Vernon," \$3000. \$20,930 was realized altogether.

The total reached at the sale of old English and Dutch and modern French masters from the collections of Dr. E. M. Harris, of Providence, Edward Holbrook, and Mr. Blakeslee, was \$173,515. The highest price was paid for Mr. Blakeslee's "Portrait of the Earl of Arundel," by Van Dyck, \$8500; Van Dyck's "Portrait of Lord Dudley" fetched \$4100; Sir Joshua Reynolds's "Lady Mary Nugent Temple," \$4700; a Coello brought \$1750; Van Ravesteyn's "Portrait of a Dutch Lady," \$800, and "Elizabeth Brandt," \$1900; Pieter Codde's "Princess Palatine," \$6500 (bought by the Willstack Museum, Philadelphia); Diaz's "Diana and Her Nymphs" fetched \$7800; Corot's "Le Rousseau Sous-Bois," \$4900; Dupré's "The Old Oak," \$3300; Daubigny's "Coteaux de Villeneuve St. George," \$4000; Diaz's "Wood Interior," \$5300; Decamps's "Le Boucher Turc," \$5500; Corot's "Bord de l'Etang," \$5500; Rousseau's "Gorges d'Apremont," \$3500; Gericault's "The Quarry Team," \$5100; while a landscape by Gainsborough reached but \$900. The collection of William T. Evans included pictures by Homer D. Martin, George Inness, Chase, Homer, Cox, Weir, Church, Bridgman, Curran, and Walker.

Among the minor exhibitions we may mention Carolus Duran's pictures at Boussod-Valadon's; thirty paintings by the late Alfred Sisley at Durand-Ruel's;

figures by Monticelli and landscapes by Michel at Avery's; landscapes by William A. Coffin at Knoedler's; twenty-four paintings by Julian Rix at Schaus's; Charles Caryl Coleman's "Moonlight at Capri," "Azaleas and Vesuvius," and other Neapolitan scenes, at Avery's; portraits by William Thorne and landscapes by Alexander Harrison at Boussod-Valadon's; pictures by Charles Rollo Peters, a California landscape painter, at the Union League; J. F. Raffaelli's oils, pastels, and etchings at Durand-Ruel's; Herman G. Herkomer portraits were shown at Boussod-Valadon's; Frederick A. Bridgman's at Boussod-Valadon's; Carle J. Blenner's portraits and Inness's "Winter Morning at Montclair" at the Oehme galleries; William M. Chase exhibited his Velasquez, "Las Meninas"; Holbein's "Portrait of Cardinal Fischer," shown at the Alsace-Lorraine Exhibition of 1864, was exhibited at Durand-Ruel's; Edward Brandus imported Rembrandt's "Man with the Cane"; Sargent's "Portrait of Calvin S. Brice" was shown at Schaus's; two recent works by Gerôme were exhibited at the new Carmer galleries; Rufus Zogbaum's picture of Admiral Dewey on the fighting-deck of the *Olympia* was shown at Schaus's; and "May-day Festival in the Time of Louis XIV.," by a new Italian painter, Andriotti, at Fishel, Adler, and Schwartz's.

A loan exhibition of paintings by Claude Monet attracted much attention at the Lotos Club; the Salmagundi Club exhibited works by Frank Russell Green, Edward Potthast, J. Francis Murphy, George Elmer Brown, H. Bolton Jones, Bruce Crane, Homer Lee, W. J. Whittemore, Carle J. Blenner, Herbert A. Levy, and others. Turner's "The Funeral Cortège of Lord Nelson Departing from Greenwich Hospital" fetched \$3300. It was purchased by C. R. Flint, who also bought Franz Hals's "Portrait of a Professor" for \$2000. William Clausen bought Raeburn's "Portrait of Lord Byron" for \$2000; G. W. Thorne, a so-called Paul Veronese for \$2500; Corot's "Berger jouant avec une Chevre" reached \$4600, and F. L. Loring acquired a "Magdalen," attributed to Murillo, for \$4550. The Bridgman pictures realized \$15,500 at their special sale. "The Music of the Past" fetched \$4000, "The Fête of Ourdel-Kebir" \$800, and "Our Neighbors: Women of Constantinople," \$700.

PALEONTOLOGY. Among the most important contributions of the year is the *Geschichte der Geologie und Palaeontologie*, by Karl von Zittel, and *Bibliographic Index of North American Carboniferous Invertebrates*, by S. Weller, *Bulletin*, 153, United States Geological Survey.

W. E. Hobbs notes the presence of annelid remains in the Lincoln slate, near Boston, Mass. The age of these is between cambrian and ordovician, and they represent the oldest fossils thus far found in Massachusetts. G. F. Matthew reports the presence of a paleozoic terrane beneath the cambrian. Wortman describes the extinct *Camclida* of North America and some associated forms; also the evolution of the *Amblypoda*. See GEOLOGY.

PAN-AMERICAN EXPOSITION will be held in Buffalo, May 1 to November 1, 1901, for the purpose of illustrating "the marvellous development of the Western Hemisphere during the nineteenth century by a display of the arts, industries, manufactures, and the products of the soil, mine, and sea." Congress has already appropriated \$500,000 for a government building and exhibits, including exhibits from Puerto Rico, Cuba, Hawaii, and the Philippine Islands. In January, 1899, the New York State legislature created the Exposition Association, with power to develop and direct an international exposition, and authorized it to issue \$2,500,000 of stock and \$2,500,000 of bonds; private subscription to the capital stock has been very large. The legislature also appropriated \$300,000 for a State building and exhibit. John G. Milburn is the president of the Exposition Association, and Edwin Fleming, secretary. Other States have also created commissions for state representation, and assurances have been received that the Dominion of Canada, Mexico, and the Central and South American republics will make unique, interesting, and instructive exhibits, peculiarly illustrative of their progress during the nineteenth century.

PARAGUAY, one of the two interior republics of South America, is bounded on the north by Bolivia and Brazil, on the east by Brazil and Argentina, and on the south and west by Argentina. The capital is Asuncion.

Area and Population.—The country is divided into 23 *partidos*, or counties, the total area of which is estimated at 98,000 square miles. Besides about 60,000 semi-civilized and 70,000 uncivilized Indians, the estimated white population in 1897 was 600,000, an increase of about 168,000 over the estimate of 1895. Hitherto immigration has been small, but is now being encouraged by the government. During the fiscal year 1899 the number of immigrants reported was 405; more than one-half of these came from Sicily. In 1895 the population of the principal towns was as follows: Asuncion, 45,000; Villa Rica, 19,000; Concepcion, 10,000; San Pedro, 8000; Luque, 8000.

Government.—By the constitution, which dates from November, 1870, the executive authority is vested in a president, elected for a term of four years, and assisted by a responsible cabinet of five members, appointed by himself and presiding over the following departments: The interior, foreign affairs, finance, worship and justice, and war. The president, for the term beginning November 25, 1898, is Señor Emilio Aceval. The legislative authority devolves upon a congress of two houses, a senate and a chamber of deputies, the members of both being chosen by popular vote, senators in the ratio of one to 12,000 inhabitants, and deputies one to 6000; a greater ratio, however, obtains in the sparsely inhabited districts. The *partidos* are administered by chiefs and justices of the peace, who are assisted by town and city councils. There are various inferior courts, with local magistrates, and a high court of justice.

Army and Navy.—The chief purpose of the army is the maintenance of order in the republic. There are infantry, cavalry, and artillery, numbering in all 82 officers and 1345 men. Citizens between the ages of twenty and thirty-five years are liable to military service. For river service there are a steamer of 440 tons and four guns, and two smaller steamers.

Finance.—The chief sources of revenue are customs, stamps, and sale of government lands. The budget for the fiscal year 1897 was estimated to balance at 5,462,475 pesos; of the revenue 3,562,560 pesos were reported as available for public service. The budget estimate for 1900 places the revenue and expenditure at 1,152,254 pesos, gold, and 8,065,781 pesos, paper, respectively. In the latter part of 1899 gold was at a premium of 700—that is, the gold value of the Paraguayan paper peso is about 15 cents. The outstanding debt in 1898 was £994,600 (\$4,839,723). In 1897 the guarantee debt to the Paraguayan Central Railway was £429,471 (\$2,089,806). The government is reported to owe to Argentina 12,393,600 pesos, and to Brazil 9,876,500 pesos. There are five banks. The chief circulating medium is paper, the amount now in circulation being about 5,957,000 pesos. Paraguay has no coin of its own stamping; the peso of other South American countries is current, and has the same values as in the countries of issue. The fixed values in United States currency of the peso of Argentina and Uruguay are \$0.965 and \$1.034 respectively.

Industries and Commerce.—The chief industry is the raising of *yerba maté*, Paraguay tea, but attention is also given to the rearing of cattle and the cultivation of tobacco, fruits, maize, mandioca, and beans. The estimated number of cattle in the country in 1899 was 4,000,000; this estimate, however, was probably too high. There are extensive forests containing valuable woods, but as yet the timber industry is little developed. About 100,000 hides are exported yearly to Buenos Ayres. The *maté* leaf exported in 1896 amounted to 5141 tons, and in 1897 to 6548 tons. About one-half the *yerba maté* produced in Paraguay is for local consumption, and the other half is exported. Sugar-cane grows readily in Paraguay, but no sugar is produced. Mining has not been developed, though copper, pyrites, and kaolin are found and iron is abundant in the north and marble in the south. Throughout the country there are rum (caña) distilleries, and in and about Asuncion are a number of breweries, flour-mills, tanneries, and match, soap, and brick factories. The leading imports are textiles, wines, and rice, and the most important exports are *yerba maté*, hides, timber, tobacco, and oranges. The value of the imports in gold pesos and of the exports in paper pesos have been reported: for 1896, imports 2,786,335, exports 12,292,000; for 1897, imports 2,203,459, exports 12,908,299. Nearly one-half of the imports come from Great Britain. The import of cotton textiles in 1898 amounted to \$186,325. In this year the total value of imports was about \$2,143,300 and the aggregate exports were valued at about 13,888,500 paper pesos.

Communications.—Transportation in the rural districts is difficult and expensive, as the roads, for the most part, are no better than paths. There is one railway, under private control, running from Asuncion to Pirapó, a distance of about 156 miles. Telegraph lines aggregate only 360 miles; the two principal ones are the line in connection with the railway and the line between Asuncion and Corrientes in Argentina. In 1897 the post-offices numbered 95. In the same year there entered the port of Asuncion 367 vessels of 132,592 tons.

Religion and Education.—Religious toleration prevails in Paraguay, but the state church is Roman Catholic. In 1896 the public and private elementary schools numbered 358; the enrolment was 23,000 pupils and 680 teachers. It is reported that in 1887 only one in five of the adult natives and three in five of the adult foreigners could read and write. Education is now free and nominally compulsory. Besides supporting the public schools the government grants small subsidies to the private ones. There is a national college at Asuncion with 15 professors and over 200 students. The capital also has a public library and five newspapers are published there.

The Plague.—In the early part of December, 1899, it was announced that the plague, or some very similar disease, had become serious in Paraguay. It first ap-

peared in the army, and cases of the disease became so numerous that the government, lacking adequate medical facilities, was obliged to ask the Argentine government for tents to accommodate the plague-stricken soldiers.

PARIS INTERNATIONAL EXPOSITION, THE, has been planned to be held in 1900 from April 15 to November 5. The exposition movement was officially inaugurated in July, 1892, when M. Jules Roche, who was then minister of commerce, addressed a communication on the subject to President Carnot. The latter, on the 13th of the month, issued a decree in which he proclaimed a "universal exposition of works of art and of industrial and agricultural products."

The cost of the exposition has been estimated at 100,000,000 francs (\$19,300,000), and this sum has been covered by a guarantee fund, consisting of 20,000,000 francs contributed by the French government, 20,000,000 francs contributed by the city of Paris, and exposition bonds for 60,000,000 francs. The fund will probably be allotted approximately as follows: Works, 73,000,000 francs; exploitation, 12,000,000 francs; administration, 8,000,000 francs; the reserve amount being 7,000,000 francs. Some of the more detailed, but still approximate, allotments in francs are: Palaces of the fine arts in the Champs-Élysées, 21,000,000; buildings in Champs de Mars, 18,000,000; mechanical and electrical service, 6,750,000; fêtes, 5,500,000; buildings on the Esplanade des Invalides, 5,000,000; bridges across the Seine, 5,000,000; circular railway, 1,500,000; buildings on the Quais, 1,500,000; fountains and gardens, 1,200,000; music, 1,200,000; the judges of exhibits, 1,000,000; lighting and illuminations, 800,000. The space covered by the exposition will probably be 12 per cent. greater than that of the Paris exposition of 1889. It will occupy the public grounds on both sides of the Seine, including parts of the Esplanade des Invalides, the Trocadéro, the Quai d'Orsay, the Quai de la Conférence, the Champs de Mars, the Cours de la Reine, and that part of the Champs-Élysées "where until recently stood the Palais de l'Industrie, a landmark of the Exhibition of 1855." There are numerous entrances to the exposition grounds, but the main entrance is to be off the Place de la Concorde, near the Seine. The number of admissions to the Paris exposition of 1889 was over 32,000,000; the attendance in 1900, it is estimated, will be over 50,000,000.

The exposition administration is divided into the following seven departments: "1. Secretariat-general, which deals with all matters of general business," such as employment, fire service, medical service, police, and the press; "2. Architecture, which deals with the erection of palaces and pavilions, control of metallic structures, and all devices erected by foreign nations, colonies, and industrial exhibitions; 3. Roads, streets, parks, gardens, and lighting; 4. Exploitation, which deals with French, foreign, and colonial sections, installations, the fine arts, agriculture, catalogues, and diplomas; 5. Finance; 6. Litigation; 7. Fêtes." The French minister of commerce, M. Millerand, has the general direction of the exposition, but executive power in the various sections is delegated as follows: Commissioner-general, M. Alfred Picard; director-general of exploitation, M. Delaunay-Belleville; director of finance, M. Grison; director of architecture, M. Bouvard; director of agriculture, M. Vassilière; director of fine arts, M. Roujon; director of streets, parks, etc., M. de France; director of litigation, M. E. Moreau; delegate for the colonies, M. Charles-Roux; general secretary, M. Henri Chardon.

The exhibits will be classified as follows: "1. Education and instruction; 2. Works of art; 3. Instruments and general methods of letters, sciences, and arts; 4. Machinery and processes of mechanism; 5. Electricity; 6. Civil engineering and transportation; 7. Agriculture; 8. Horticulture; 9. Forestry, hunting, fishing, crop-gathering; 10. Alimentation; 11. Mines and metallurgy; 12. Decoration and furniture of public buildings and dwellings; 13. Cotton fabrics, textures, and clothing; 14. Chemical industry; 15. Various industries; 16. Social economy, hygiene, and public assistance; 17. Colonization; 18. Territorial and naval armies." The jury, or judges of the exhibits, will comprise men of various nationalities, and the prizes awarded will consist of diplomas, the diplomas being those of honorable mention, bronze medal diplomas, silver medal diplomas, gold medal diplomas, and grand prize diplomas.

The interests of the United States at the exposition are under the direction of Mr. Ferdinand W. Peck, of Chicago, who was appointed commissioner-general by President McKinley on July 22, 1898. The space allotted to the United States at the exposition amounts to 200,000 square feet, and the appropriation made by Congress is \$1,210,000. At the Paris exposition of 1889 the appropriation was \$250,000, and the space allotment 113,300 square feet. The United States building, designed by Mr. Charles A. Coolidge, of New York, and M. Morin-Goustiaux, and situated near the Seine on the Quai d'Orsay, is 85 feet wide and 90 feet long, with a dome 160 feet high.

PARIS EXPOSITION.—1. The Palace of Horticulture. 2. The Grand Gateway of the Exposition.

PLAN OF PARIS EXPOSITION GROUNDS.

Among the official congresses of the Paris exposition of 1900 the following relate to political and social science: The International Congress of Friendly and Provident Societies will meet on June 7, continuing its session for four days. The attention of the congress will be given especially to societies of mutual aid, the various questions connected therewith, and to the question of old-age pensions. Three other congresses for the discussion of kindred subjects will also meet during the month of June: from the 11th to the 13th, aid societies for young workmen; June 18 to 21, cheap dwellings; June 25 to 30, labor accidents and society insurance. The International Congress of Workmen's Associations of Production will meet July 13-15 for the consideration of the philosophy of co-operation, co-operation from the industrial point of view, and the relations of production associations with supply societies. The International Congress of Profit Sharing will be held July 15-18, and will discuss the following questions: The method of determining the profit-share of employees; methods of sharing, *pro rata*, salaries, etc.; use of the amounts thus resulting; settlement of claims; management of funds; checking of accounts; consulting committees; financial and moral results of profit-sharing. The International Congress of Colonial Sociology will be held August 6-11, immediately following the International Congress of Colonial Economy. The political, juridical, moral, and material conditions of the natives will constitute the theme of the conference. The congresses named above, it may be seen, are so arranged that persons who choose may attend all.

PARKER, HORATIO WILLIAM, American composer, born at Auburndale, Mass., September 15, 1863, was educated in music by Stephen A. Emery, of Boston, and George W. Chadwick. In 1882 he went to Munich to study composition with Rheinberger and conducting with Ludwig Abel. His ballad, *King Trojan*, was performed in Munich in 1885. Returning to the United States, Mr. Parker became organist and choirmaster of Trinity Church, Boston, and was made professor of music at Yale. He has composed many excellent works, including *The Legend of St. Christopher* (New York, 1898) and *Hora Novissima*, performed with much success at the Festival of the Three Choirs, Worcester, England, in 1899, conducted by the composer. In 1899 he also won the prize of \$250 offered by the Musical Arts Society of New York for the best *a capella* chorus with a composition entitled *Astant Angelorum Chori*.

PARKS, PARKWAYS AND PLAYGROUNDS. Figures showing the acreage of parks in 15 American cities, with the total area of each city, its estimated population and expenditure for park maintenance during the last fiscal year are given in the accompanying table. The cities included are designed to be representative in size only; figures for places of less than 30,000 inhabitants were not available. In Baltimore the expenses of the park department are largely met by the revenues from street railways, paid the city as a percentage of gross receipts on account of franchise rights. For the year 1898, \$248,700 of the \$250,930 expended on the parks came from the street railways.

Greater New York has a number of fine parkways, especially in the boroughs of Brooklyn and Queens. The following may be named: Ocean Parkway, from Prospect Park to Coney Island, 5½ miles in length; Eastern Parkway and Extension, Prospect Park to Ridgewood Park, 4¾ miles; Fort Hamilton Parkway, Prospect Park to Fort Hamilton, 4½ miles; Bay Parkway, Ocean Parkway to Bensonhurst Beach, 3 miles; Shore Drive, Fort Hamilton Avenue to Fort Hamilton, 3 miles; total 20¾ miles. The Speedway, or Harlem River Drive, in old New York, is 2.2 miles long and up to January 1, 1900, had cost \$3,025,000.

On January 31, 1899, Boston had ten playgrounds, ranging in size from ¼ of an acre to 40 acres and aggregating 111¼ acres. On December 31, 1898, the city council accepted an act of the legislature authorizing it to purchase 20 additional playgrounds, at a cost not to exceed \$500,000, and not more than \$200,000 to be expended in any one year. In 1898, Milwaukee established an open-air gymnasium in one of its parks. Boston has had such a gymnasium and playground at Charlesbank for a number of years. Classes are held for boys at 4 P.M., and other classes at 8 P.M. There are baths here free to all, and in winter the gymnasium grounds are flooded for skating. There is a Woman's and Children's Division at the Charlesbank Gymnasium which for eight years has been under the direction of a committee of the Massachusetts Emergency and Hygienic Association. The total weekday attendance of women and children recorded by the committee during the season of 1898 was 144,787, or 999 a day; Sunday, 18,214, or 759 a day. The total gymnasium attendance for the season was 57,499, the larger portion including patrons of the kindergarten, sandpens, and grass plots. Morning, afternoon, and evening classes were held for women, and girls' classes twice a day, each for two days in the week during the summer. In the winter there are also evening classes under the direction of the committee.

Taunton, Mass.....	30,000	32,000	8	983

* Compiled from *Statistics of Cities*, Bulletin 24, September, 1899, United States Department of Labor. The populations and figures are for January 1, 1899, or the year ending then, as nearly as possible.

PARTRIDGE, General FREDERICK W., former consul-general to Siam, died January 22, 1899, in his seventy-sixth year. He was a resident of Sycamore, Ill. During the Mexican War, when sent on a secret mission by President Polk into the enemy's country, he was captured as a spy, and imprisoned in San Juan d'Ulloa. He entered the Union service in the Civil War as a captain in the Thirteenth Illinois, and was rapidly advanced for bravery. For gallantry at the battle of Missionary Ridge he was brevetted brigadier-general. In 1869 President Grant appointed him consul-general at Bangkok, where he served eight years.

PATENT STATISTICS. One of the causes for the falling off of 24 per cent. in the number of patents applied for at the United States Patent Office in 1898 as compared with the number in 1897, was the Spanish-American war. This cause ceased to operate in 1899. There were received in the fiscal year ending June 30, 1899, 35,352 applications for mechanical patents, 1610 caveats, 2292 applications for designs, 91 applications for reissues, 1861 for trademarks, 612 for labels, and 112 for prints. There were 23,550 patents granted, including reissues and designs, as against 22,267 patents, reissues, and designs in the calendar year 1898. The number of patents that expired was 16,670. The total receipts of the office were \$1,209,554.88; the total expenditures were \$1,148,663.48, and the surplus for the year was \$60,891.40. The surplus for the calendar year 1898 was but \$1538; for the calendar year 1897, \$252,798. The patents granted in the latter year, however, numbered but 23,794, a very little more than for the fiscal year ending June 30, 1899.

An advance of the year 1899 in the work of the Patent Office was the establishment of a classification division, placed in charge of a principal examiner, with the title chief of the classification division. To him is assigned the work of revising and perfecting a classification of all letters patent and printed publications in the patent office which constitute the field of search in the examination as to the novelty of inventions applied for. It is a work of great magnitude, involving the consideration of upward of 620,000 United States patents, and over one million foreign patents, and a large number of technical and scientific publications. It will, however, prove of great usefulness to the department, and the public will receive corresponding benefit.

PATERSON, WILLIAM, jurist, died at Perth Amboy, N. J., January 1, 1899. He was born in 1817; in 1835 was graduated from Princeton, and was admitted to the bar three years later. In 1844 he was made secretary of the convention that framed the present constitution of New Jersey. He was chairman of the Presidential electoral college for his State in 1864, and voted for McClellan. He was appointed judge of the Court of Errors and Appeals in 1882. Judge Paterson was of a well-known New Jersey family; his father was a prominent lawyer in the State, and his grandfather, after serving as State attorney-general, governor, and New Jersey's first United States senator, became a justice of the United States Supreme Court.

PAUNCEFOTE, of Preston, First Baron, Sir JULIAN PAUNCEFOTE, ambassador of Great Britain to the United States, was born in Munich, Germany, September 13, 1828. He was educated in Paris and Geneva, and at Marlborough College, and was called to the bar in the Inner Temple in 1852. In 1865 he became attorney-general of Hong-Kong, and acted there as chief justice of the Supreme Court in 1869 and again in 1872. In 1873 he became chief justice of the Leeward Islands, was knighted by patent in 1874, and in that year was made legal assistant under-secretary of state for the colonies. Two years later he was appointed assistant legal under-secretary of state for foreign affairs, and in 1882 he became permanent under-secretary of state for foreign affairs. In 1885 he was first British delegate to the conference at Paris for drawing up an act relative to navigation of the Suez Canal. In 1888 he succeeded Lord Sackville as British minister to the United States, and in 1893 he was raised to the rank of ambassador. During a visit to England in 1894 Sir Julian was sworn of the Privy Council. He has received several honorary titles. He was one of the most important delegates to the peace conference at The Hague in 1899. In this year he was raised to the peerage.

PAVEMENTS AND ROADS. Progress in street-paving is in the line of improved methods of doing the work, careful selection of material, and constant and intelligent watchfulness on the part of the inspectors, rather than in the adoption of any new material. In America asphalt continues to be the general favorite where it can be afforded, with brick coming next, except where heavy traffic demands granite

SECTIONS OF CONCRETE CURBS AND GUTTERS, CHAMPAIGN, ILL. (From *Engineering News*.)

blocks or some other strong, tough material. In England wood continues in favor, especially the hard woods of Australia. Wood pavements in this country fell in general esteem some years ago, largely because unsuitable woods, with improper or no preservative treatment, were laid on poor foundations, or directly on the earth. It is now recognized that foundations should be prepared with the utmost care, in order to secure good drainage and stability, and that the visible part of the pavement should be considered as a wearing surface only, like plank on a bridge. Foundations are generally of concrete, or a mixture of stone or gravel, sand, and cement. The last named serves as a binding material, to hold the mass together; its selection should be made with the greatest care, and there should be frequent tests of samples from each lot to see that none of it falls below the standard. For this and other features of paving work the most progressive cities now have well-equipped laboratories for conducting chemical and physical tests of paving materials. Such laboratories are also of great value in connection with other branches of municipal work. Asphalt paving materials, in particular, demand the closest inspection in order to see

that the several parts—*asphalt, powdered limestone, and sand*—are adapted to one another and used in the proper proportions. The contractors for asphalt pavements have to provide quite expensive plants for mixing the ingredients. These may be portable or stationary, according to the amount of work involved and the time it covers. Some of the portable plants are mounted on railway cars, for ready transportation from place to place without being taken down. Three such plants were built during 1899 by the Iroquois Iron Works, of Buffalo, N. Y. The whole plant is concentrated on two flat cars, 45 feet long and 10 feet wide. One car carries the boiler and steam plant for melting the asphalt, and the other carries the sand dryers and storage bin. The asphalt is hoisted by buckets to the melting tanks, in which a heat of 320° Fahr. is maintained. Compressed air under 15 pounds pressure, is blown through the asphalt to keep it stirred up. Compressed air is also used to force the liquid asphalt to a bucket on a weighing scale. The sand is lifted by an elevator, discharged into drums 40 inches in diameter and 18 feet long, where it is heated to 400° Fahr., after which it goes to a rotary screen and thence to a storage bin, and then, as needed, to a measuring box. Finally, all the ingredients go to a steam-jacketed mixer, containing two revolving shafts, set with blades arranged on the screw principle. Here thorough mixing takes place, after which the product is dumped into wagons and hauled to the streets for laying. The maximum capacity of the plant in a ten-hour day is said to be sufficient to cover 1750 square yards to a depth of 2 inches, or 2275 square yards 1½ inches deep, these being common depths for the top coating or wearing surface of sheet asphalt. There are, of course, other styles of portable asphalt-mixing plants, notably the Hetherington type. The first plant of the sort was designed in 1889 by Samuel Whinery, of New York City.

One of the greatest causes of destruction of pavements is the openings in the street for placing pipes, wires, and other underground fixtures. The committee on street paving of the American Society of Municipal Improvements made some sensible recommendations on this subject at the 1899 convention of the society, the importance of which should be impressed on every city official responsible for pavements. The gist of the suggestions is that previous to paving or repaving any street all underground work likely to be needed during the life of the pavement should be put in; and that once paved, no openings of any sort should be allowed, except in emergencies, until a written application, accompanied by an indemnity bond, had been filed by the person or corporation proposing to do the work. At the same meeting, Mr. George W. Tillson, engineer of the department of highways of Brooklyn, New York City, read a paper on *The Life of Pavements*; the life he estimated to be as follows: Granite on concrete, 25 years, and on sand, 20 years; brick, 15 years; wood, 10 to 15 years; asphalt, 18 years.

State aid for road construction was authorized in New York in 1898, and \$50,000 was appropriated for the first year's work. To the close of 1899 contracts had been made for the improvement of 25 miles of highways, of which 13½ miles, on five different roads, had been practically completed and the balance, on six roads, was under construction. Surveys had been made for 142 miles of roads in 14 counties and petitions had been filed for some 300 miles in addition. The State engineer and surveyor, under whose charge this work is done, recommends that a State quarry and crushing plant be established, and Sing Sing convicts employed to produce trap rock for building macadam roads. Under the New York law the cost of road work is paid as follows: 50 per cent. comes from the State funds, 35 per cent. from the county, and 15 per cent. from owners of abutting property. Thus every dollar of money appropriated by the State means two dollars available under the act, since in New York, as elsewhere, petitions accumulate faster than the State funds become available. In New Jersey 85 miles of road were improved under the direction of the commissioner of public roads in 1898, and 115 in 1899, making 440 miles for the period 1893 to 1899, inclusive. The total mileage is distributed throughout 12 of the 21 counties of the State.

PAYNE, CHARLES HENRY, D.D., LL.D., corresponding secretary of the Board of Education of the Methodist Episcopal Church, died at Clifton Springs, N. Y., May 5, 1899. He was born at Taunton, Mass., October 24, 1830; was graduated at Wesleyan University, Middletown, in 1856, and subsequently studied at the Concord (N. H.) Biblical Institute. From 1857 to 1876 he held pastorates at Sandwich, East Bridgewater, and Fall River, Mass., and in Providence, Brooklyn, and Cincinnati. From 1876 to 1888 he was president of Ohio Wesleyan University, Delaware, O. From the latter year to the time of his death he served as corresponding secretary of the Board of Education of the Methodist Church. Dr. Payne had been a member of many important Methodist conferences; he had travelled extensively in western Europe, Greece, Syria, Palestine, and Egypt. He wrote: *Guides and Guards in Character Building; Daniel, the Uncompromising Young Man; Temperance; The Social Glass and Christian Obligation; Methodism, Its History and Results; Women and Their Work in Methodism.*

PAYNE, SERENO E., member of Congress from the twenty-eighth New York district, was appointed chairman of the committee on ways and means by Speaker T. B. Reed, January 20, 1899, to succeed Nelson Dingley, Jr., deceased January 13. After the Fifty-sixth Congress convened Speaker D. B. Henderson reappointed Mr. Payne chairman of this important committee, December 18, 1899. On January 28, 1899, President McKinley appointed him a member of the Anglo-American Joint High Commission, also to succeed Dingley. Mr. Payne was born at Hamilton, N. Y., June 26, 1843; after graduation at the University of Rochester in 1864 he studied law and was admitted to the bar in 1866; since then he has practised his profession in Auburn. In 1868-71 he was city clerk for Auburn and supervisor in 1871-72; from 1873 to 1879 he served as district attorney of Cayuga County, and from the latter year to 1882 was president of the Auburn board of education. He was elected, as a Republican, to the Forty-eighth Congress and was returned to the Forty-ninth; in 1888 he was elected to the Fifty-first Congress, and has been returned to each Congress since then. In the Fifty-fifth Congress he was chairman of the committee on merchant marine and fisheries.

PEMBERTON, MAX, author and editor, was born in Birmingham, England, June 19, 1863. He graduated at Caius College, Cambridge, and in 1885 joined the staff of *Vanity Fair*; became editor of *Chums* in 1892, and of *Cassell's Magazine* in September, 1896. He has published: *The Diary of a Scoundrel*, 1891; *The Iron Pirate*, 1893; *The Sea Wolves* and *Jewel Mysteries I Have Known*, 1894; *The Impregnable City* and *The Little Huguenot*, 1895; *A Puritan's Wife* and *A Gentleman's Gentleman*, 1896; *Christine of the Hills* and *Queen of the Jesters*, 1897; *The Garden of Swords* and *Signors of the Night*, 1899.

PENNSYLVANIA, a Middle State of the United States, has an area of 45,215 square miles. The capital is Harrisburg.

Mineralogy.—In the calendar year 1898, the production of anthracite coal was 53,382,644 short tons, spot value, \$75,414,537; and of bituminous coal, 65,165,133 short tons, spot value, \$43,352,588; in all, 118,547,777 short tons, valued at \$118,767,125. The production showed an increase in the year of 11,518,123 short tons, of which all but about 700,000 tons was the bituminous output. This increase was 58 per cent. of the total increase of the country, and the combined product of both kinds of coal in 1898 was 4 per cent. of the entire output. It is here interesting to note the effect of the increased activity in the iron and steel industries in 1898 on the coal production. The Connellsville region, famous for its great coking interests, is in Fayette and Westmoreland Counties. In the former high-water mark was reached in coal-mining, with an output of 12,696,663 short tons, an increase in a year of nearly 3,000,000 tons; and in the latter the output of 11,414,989 short tons was an increase of about 1,500,000 tons. Allegheny County, the centre of the iron-making district of western Pennsylvania, increased its production 1,673,958 tons; and Cambria County, containing the great Johnstown plant, had an increase of 1,323,511 tons. Fayette County had the largest increase, and Somerset County practically doubled its output of 1897. Anthracite mines numbered 340, and employed 145,504 persons, and bituminous mines, 689, and employed 79,611 persons. The production of iron ore was, red hematite, 13,975 long tons; brown hematite, 142,725; magnetite, 614,818, and carbonate, 1564—in all, 773,082 long tons, valued at \$877,365, a net increase of 49,340 tons. As in iron, the State also produced each of the commercial grades of stone, the output values being: Granite, \$237,780; sandstone, \$478,451; slate, \$2,491,756; marble, \$39,373; and limestone, \$2,746,256—total, \$5,993,616, an increase in a year of over \$500,000. Granite, in decreased output, was used almost wholly for building and road-making; marble, for building and cemetery work; slate, two-thirds of the total production of the country, mainly for roofing; sandstone, increased production, for bridge and building work; and limestone, in which the State held first place, for lime, \$1,201,352, flux, \$965,526, and paving and road-making, \$256,961. Salt declined about 10,000 barrels, with a production of 154,287 barrels, valued at \$46,000.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$23,335,573, the third largest amount among the States. There were 295 manufacturers of tobacco and 6220 of cigars, and the combined production in the calendar year 1898 was 1,321,772,005 cigars, 1,713,300 cigarettes, 100,203 pounds of fine-cut tobacco, 2,996,457 pounds of smoking, and 3,681,671 pounds of snuff. Grain and fruit distilleries in operation numbered 78; the amount of fruit brandy produced was 2624 gallons; spirits rectified, 8,608,606 gallons; distilled spirits gauged, 26,434,831 gallons; and fermented liquors produced, 4,290,006 barrels. The annual report of the Bureau of Industrial Statistics for 1898 (issued in 1899) showed that there were 88 silk plants in operation that year, with a total of 699,308 spindles, 117 hand looms, 9238 power looms, and

3401 machines. The number of persons employed, skilled and unskilled, was: Males, 5441; females, 10,999; and children, 3926—total, 20,366. The output, in round numbers, was 70,000,000 yards of ribbons, valued at \$32,334,620, just about double the production of 1895. Pig-iron production amounted to 5,367,979 gross tons, valued at \$53,331,228, the industry employing 11,911 persons; Bessemer steel, to 3,357,784 gross tons; all steel, to 5,275,984 gross tons; and steel billets and puddle bar, to 5,537,249 net tons, valued at \$136,820,442, the steel industry employing 56,230 persons. There were 18 out of 20 tin-plate works in operation, and the production was 344,064,000 pounds of black plate, or 44 per cent. of the entire production of the country. Of this output, 222,528,000 pounds were tinned. The total production of tin and tin-plate was 261,934,000 pounds. This industry employed 5036 persons. The great advance in the allied iron and steel industries began to develop in 1898, and while the statistics for 1899 are not yet available, the extraordinary conditions of that year are suggested by the facts that in 1898 refined bar-iron was delivered in New York at one cent a pound, and at the close of 1899 it was worth two and a quarter cents a pound, and that when 1899 opened the entire production of pig-iron in the country was about 230,000 tons a week, while at its close the weekly output was 295,000 tons, or the enormous annual amount of 15,000,000 tons. At the close of 1898 there were in the State 151 coking plants, with 27,157 ovens of all kinds, and 292 ovens were building. During the year these plants, together with one in New York, used 16,307,841 short tons of coal, and produced 10,715,302 short tons of coke, valued at \$16,078,505. Pennsylvania led all the States in the production of coke, with West Virginia second and Alabama third. For silk, see article SILK MANUFACTURING.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Philadelphia (\$41,222,528), Erie, and Pittsburg aggregated in value \$42,335,377, and the exports, at Philadelphia (\$60,950,065) and Erie, \$60,952,247, an increase in a year in imports of \$10,259,048, and in exports of \$4,704,120. The movement of gold and silver was, imports, \$21,430; exports, none, making the total foreign trade of the year \$103,309,054, a net increase of \$14,248,420.

Railways.—The new railway construction in the calendar year 1898 was 104.54 miles, and in 1899, 189.65, giving the State a total mileage of 10,128.39, according to the reports adopted in this volume. Local authorities claim a total of 10,308.05 miles.

Banks.—On October 31, 1899, there were 438 national banks in operation and 74 in liquidation. The active capital aggregated \$74,804,020; circulation, \$32,871,906; deposits, \$403,886,435; reserve, \$121,446,230; and resources, \$603,862,234. State banks numbered 90, and had capital, \$9,295,980; deposits, \$67,104,694; resources, \$86,073,732; and surplus and undivided profits, \$8,191,819; loan and trust companies, 88, with capital, \$36,590,215; deposits, \$151,606,689; and resources, \$219,198,571; private banks, 29, with capital, \$1,281,789; deposits, \$7,925,618; and resources, \$9,954,407; and mutual savings banks, 15, with depositors, 334,178; deposits, \$97,404,243; and resources, \$106,702,966. The exchanges at the United States clearing houses at Philadelphia and Pittsburg in the year ending September 30, 1899, aggregated \$5,028,322,323, an increase in a year of \$1,300,608,268.

Education.—In 1897-98 the enrolment in public schools was 1,173,082; average daily attendance, 864,626. There were 20,080 teachers, 14,666 buildings used as school-houses, and public school property valued at (1896-97) \$48,917,003. The revenue was \$21,538,153; expenditure, \$19,644,401, of which \$10,332,760 was for teachers' salaries. There were 292 public high schools, with 1022 secondary teachers, 27,082 secondary students, and 2332 elementary pupils; 135 private secondary schools, with 856 teachers, 8618 secondary students, and 8152 elementary pupils; 15 public normal schools, with 359 teachers and 9646 students in all departments, and 6 private ones, with 54 teachers and 1366 students. Thirty-two universities and colleges for men and for both sexes reported 36 fellowships, 412 scholarships, 929 professors and instructors, and 11,396 students, 638,842 volumes in the libraries, valued at \$621,880; \$1,084,198 invested in scientific apparatus, \$12,263,682 in grounds and buildings, and \$9,465,206 in productive funds; \$1,575,680 in total income, and \$658,387 in benefactions. Eleven colleges for women reported 14 fellowships, 34 scholarships, 174 professors and instructors, 1282 students, 59,760 volumes in the libraries, valued at \$91,100; \$62,500 invested in scientific apparatus, \$1,420,000 in grounds and buildings, and \$1,000,000 in productive funds; \$345,594 in total income, and \$21,000 in benefactions. In 1899 there were 1448 periodicals, of which 199 were dailies, 920 weeklies, 240 monthlies, and 12 quarterlies.

Fisheries.—The annual report of the State Fisheries Commission in 1899 showed that 22,000,000 shad were incubated at the Bristol station on the Delaware; 25,000,000 Susquehanna salmon and 1,500,000 blue pike were hatched at the Erie station, and more than 4,000,000 of different kinds at the Corry and Allentown stations. The commission proposes to have the subject of fish culture introduced into the public schools, and for that purpose a large quantity of gold fish is being raised for distribution.

Forest Preserve.—Dr. J. T. Rothrock, the State forestry commissioner, made a tour of the State in 1899, and secured options on several tracts of land aggregating about 100,000 acres, which can be purchased for about \$1 per acre. Governor Stone was anxious to promote the forestry movement, but, in view of the serious depletion of the State treasury, was unwilling to sanction the appropriation of the necessary funds till the treasury reached a better condition.

Finances.—In 1898 the assessed valuations, excluding railway property, were: Real estate, \$2,685,199,712; personal property, \$846,751,853—total, \$3,431,951,565, an increase in a year of \$74,248,788. The total public debt, December 1, 1898, was \$6,815,299; sinking funds, \$5,789,317; net debt, \$1,025,982. The sinking funds held railroad bonds, \$1,100,000; interest thereon, \$22,917; United States consols, \$3,108,000, and cash, \$1,558,400. On March 31, 1899, the State treasurer issued a statement showing a balance in the general fund of \$512,552, the smallest balance in the State treasury since the close of the Civil War. Claims then due and payable aggregated at least four times that amount, and he saw no prospect of accumulating funds by June 5, when the public school appropriation of \$5,000,000 for the fiscal year became due, to pay any part of the appropriation during that month. In October following the State treasury was about \$3,000,000 behind in its payments.

Population.—As estimated by federal officials the population on June 30, 1899, was about 6,115,000.

Legislature.—Few bills of importance were passed during the session which closed April 20. The energies of the legislative body were absorbed in the contest over the election of a United States senator to fill the vacancy which occurred in March on the expiration of the term of M. S. Quay. George A. Jenks and B. F. Jones were the chief candidates opposed to the re-election of Mr. Quay, and during the session the latter was charged with criminal use of State funds for his personal advantage. He was tried by jury, acquitted, and, April 21, was appointed by Governor Stone to temporarily fill the vacant seat in the National Senate. This action of the governor was criticised on the ground of the validity of a senatorial appointment during the session of legislature. The charges of attempted bribery which were alleged against Senator Quay and his adherents were investigated by a committee of nine, with a result that several State officials were implicated. The committee recommended criminal proceedings against them in the Court of Quarter Sessions. A law enacted early in the session provided for the appointment of a committee to confer with other State legislatures concerning the advisability of submitting an amendment to the federal constitution whereby the President, Vice-President, and United States Senators may be elected by direct popular vote, the committee to report to the legislature at its session in 1901. A law was passed providing that all merchants of the State shall pay a flat tax: retail merchants, \$2; wholesale merchants, \$3; and an additional tax of one mill on the dollar on the gross volume of business done by retail merchants during the year, and a tax of one-half mill on the dollar of the business of the wholesale merchants. It was further enacted that existing Pennsylvania corporations may increase their capital stock to any amount, and the incorporation of companies to do all kinds of business was provided for.

Party Platforms.—On August 24 the Republican State convention was held at Harrisburg, and endorsed the national administration. The question of the validity of Governor Stone's appointment of Mr. Quay to the United States Senate again was raised, but the anti-Quay faction was hopelessly in the minority. The following nominations were made for the November elections: For Supreme Court judge, J. Hay Brown, of Lancaster; for Superior Court judge, Josiah R. Adams, of Philadelphia; for State treasurer, Lieutenant-Colonel James E. Barnett. On June 14 the Democratic State convention endorsed the Chicago platform of 1896; condemned the growing expense of administration; charged the Republicans with gross corruption; promised tax and ballot reforms and legislation against the growing power of trusts. On September 7 the Populist State convention adopted a platform declaring "That there are two great domestic questions before the American people: First, the money question, and second, the railroad question, which involves the trust question. And these questions we would solve by the issue of paper money irredeemable in coin and by the nationalization of the railroads." It protested against the war of "criminal aggression" being carried on in the Philippines, and opposed an alliance with Great Britain or any foreign nation. The platform of the party was announced "as standing for a rule of love on earth, not of greed; for liberty, equality, fraternity, and the brotherhood of man."

Elections.—The only State offices to be filled at the November election were those of judges of the Supreme and Superior Courts and State Treasurer. The Republican candidates were all elected, Colonel James E. Barnett, of the Tenth Pennsylvania Volunteers, recently returned from the Philippines, being elected by a plurality of 110,488 votes. In Philadelphia and in Pittsburgh the municipal elections were wholly sub-

ordinated to the remarkable political conditions that were disclosed in the protracted deadlock at Harrisburg over the election of a United States senator.

State Officers and National Representatives.—Governor, William A. Stone; lieutenant-governor, J. P. S. Gobin; secretary of the Commonwealth, William W. Griest; treasurer, James E. Barnett; auditor-general, L. G. McCauley; adjutant-general, Thomas J. Stewart; attorney-general, John P. Elkin; Superintendent of public instruction, N. C. Schaeffer; insurance commissioner, Israel W. Durham; commissioner of banking, Thomas J. Powers. Supreme Court: Chief justice, James P. Sterrett; associate justices, Henry Green, J. Hay Brown, James I. Mitchell, J. B. McCollum, John Dean, D. Newlin Fell. The State legislature consists of 104 Republicans, 84 Democrats and 6 Fusionists. Senators: Boies Penrose (Rep.), from Philadelphia; and Matt. S. Quay (Rep.), from Beaver, appointed by the governor to fill the vacancy which the legislature failed to fill. Representatives: G. A. Grow, at large (Rep.), from Glenwood; S. A. Davenport (Rep.), from Erie; H. H. Bingham (Rep.), from Philadelphia; Robert Adams, Jr. (Rep.), from Philadelphia; William McAleer (Dem.), from Philadelphia; James R. Young (Rep.), from Philadelphia; Alfred C. Harmer (Rep.), from Philadelphia; Thomas S. Butler (Rep.), from West Chester; Irving P. Wanger (Rep.), from Norristown; Laird H. Barber (Dem.), from Mauch Chunk; Henry D. Green (Dem.), from Reading; Marriott Brosius (Rep.), from Lancaster; William Connell (Rep.), from Scranton; S. W. Davenport (Dem.), from Plymouth; James W. Ryan (Dem.), from Pottsville; M. E. Olmstead (Rep.), from Harrisburg; Charles F. Wright (Rep.), from Susquehanna; Horace B. Packer (Rep.), from Wellsboro; Rufus K. Polk (Dem.), from Danville; Thaddeus M. Mahon (Rep.), from Chambersburg; Edward D. Ziegler (Dem.), from York; Joseph E. Thropp (Rep.), from Everett; Summers M. Jack (Rep.), from Indiana; John Dalzell (Rep.), from Pittsburg; William H. Graham (Rep.), from Allegheny; Ernest F. Acheson (Rep.), from Washington; Joseph B. Showalter (Rep.), from Chicora; Athelston Gaston (Dem.), from Meadville; Joseph C. Sibley (Dem.), from Franklin; James K. P. Hall (Dem.), from Ridgway.

PENNSYLVANIA, UNIVERSITY OF, at Philadelphia, chartered in 1875, is non-sectarian, and co-educational in the graduate department. Provost, Charles C. Harrison, LL.D. According to the treasurer's report of August 31, 1899, the property of the university, including real estate, libraries, securities, etc., amounted to \$7,538,595; obligations, \$379,764; net balance, \$7,158,831. At the same time the library comprised some 145,000 bound volumes and 100,000 pamphlets. The officers of instruction for the college year 1899-1900 numbered 260. The student enrolment was as follows: The college, 968; department of philosophy, 172; law, 312; medicine, 682; dentistry, 484; veterinary medicine, 46; laboratory of hygiene, 19—total, excluding 10 duplications, 2673. The degrees in course conferred at the commencement of 1899 were as follows: B.A., 20; B.S., 28; B.S.: in architecture, 11; in biology, 4; in chemistry, 11; in chemical engineering, 1; in civil engineering, 5; in economics, 14; in electrical engineering, 14; in mechanical engineering, 7; B.Mus., 1; C.E., 3; M.S., 3; M.A., 4; Ph.D., 10; LL.B., 98; M.D., 211; D.D.S., 158; D.V.M., 12. The following, who were or had been members of the faculty, died during the year: Dr. E. Otis Kendall, professor of mathematics; Dr. Charles Janeway Stillé, formerly professor of the English language and literature, and provost; Dr. Daniel G. Brinton, professor of American archaeology and linguistics; Mr. W. H. Carson, formerly lecturer in the law department. See **UNIVERSITIES AND COLLEGES; ANTHROPOLOGY IN AMERICA**.

PENSIONS. The report of the commissioner of pensions for the year ending June 30, 1899, shows a total enrolment of 991,519 pensions, a decrease of 2195 as contrasted with an increase in the previous year of 17,700. New names to the number of 40,991, of which 37,077 were on original application, were added to the rolls; of the 43,186 names dropped from the pension list, 34,345 were on account of the deaths of pensioners. The report also shows a slight increase during the year in the average annual value of all pensions—namely, from \$131.79 to \$132.74, the rate under the general laws having increased from \$103.21 to \$165.70, and that under the act of 1890 from \$108.11 to \$108.99, while the average annual value of the pensions granted under the war with Spain amounts to \$196.53. The large value of the latter is explained by the fact that only about 300 pensions have been issued on account of the Spanish war, and these exclude pensions for minor disabilities, which have not as yet been considered. Thus, while the roll decreased in numbers during the year, it increased in total annual value \$649,496, owing to increased ratings for increased disabilities. It is expected that the roll will increase not only in amount, but in numbers, for the fiscal year 1899-1900, by reason of the war with Spain. Notwithstanding the increase in annual value, the actual total amount paid out in the fiscal year 1898-99 for army and navy pensions was only \$138,355,053.

which is a decrease from the foregoing fiscal year of \$6,296,826. This decrease is due in part to the assumption in the previous year of payments held over from the year 1897, and the fact that the first payments in 1898 were considerably larger than in 1899. The latter fact was due to the adjudication and disposition of claims of long standing. The total number of pensions, classified by wars and as pensioned under the various laws, is given in the following table:

	1899.	1898.	1897.
Widows of Revolutionary soldiers.....	4	5	7
Daughters of ".....	7	7	9
Survivors of War of 1812.....	1	3	7

Navy invalids.....	6		
Navy widows.....	11		
Total.....	991,519	993,714	976,014

Considerable attention was given by the commissioner in the report for 1899 to the question of claims, due in part to the increased business of the bureau, arising from the war with Spain, and to the discussion brought about by pension claim agents and members of the Grand Army of the Republic regarding the justice of certain orders pertaining to the granting of pensions. The total number of claims of all classes pending June 30, 1899, was 477,239, a decrease for the year of 157,820 claims, a very considerable reduction, since the number of cases reported pending includes 17,560 claims arising out of the war with Spain, and no claims of this class were embraced in the number reported as pending June 30, 1898. Of the claims filed on account of the war with Spain, 303 only had been allowed up to the close of the fiscal year, these being claims of widows and invalids, granted by reason of gunshot wounds and for the more severe disabilities.

Of the 477,000 odd pensions of all classes now pending, attention is called by the commissioner to the fact that 305,042 are claims in which pension has heretofore been granted, and in which an additional allowance or an increase of rate is claimed. Delay in the adjudication of claims, the report continues, is in most cases the fault of the claimants or their attorneys. He recommended that a commission be appointed to revise the laws and regulations regarding the filing of claims, and that the law requiring biennial examinations of discharged pensioners be re-enacted.

Considerable attention is given in the report to the reasons by which what is officially known as Order No. 225, which has been objected to by a portion of the Grand Army, was substituted for Order No. 164. Order No. 225 made no change, excepting that it required pensions granted while Order No. 164 was in force to be revised and made to conform to the interpretation of that law as given at the time it was revoked. These "orders" in the Pension Office are based upon semi-official decisions, the final decision resting with the secretary of the interior. Secretary Noble, under the Harrison administration, declared that Order No. 164 had been misconstrued and misapplied, and it was revoked. By its construction a pensioner having two or more separate applications might draw in total an unfair amount of pension, though his injuries in the aggregate might not disable him for the performance of manual labor to a much greater degree than either of them existing alone. This is the point in dispute. The Grand Army committee's position has been that these separate rates for various disabilities should be added together and the applicant given a pension accordingly. In the decision in the case of Henry H. Weeks, January 7, 1893, the state of affairs is given as follows: "Conceding that

\$8 is the correct rate for the disability resulting from rheumatism, the question arises, Is the claimant necessarily entitled to a higher rate because another disability is shown to exist? In other words, where more than one disability is involved, should the rate which would be allowed under the old law for each disability be added to the others to determine the total rate?" The conclusion is, that "in the claim of Mr. Weihe, now under consideration, while it is conceded that a disability from another disease exists, which alone would be ratable under the old law, if of service origin, it is not believed that this disease, combined with rheumatism, disables him for manual labor to an extent which entitles him to a higher rating than \$8 per month. Rheumatism is his chief disability. . . . He is evidently able to perform considerable manual labor."

During the year 1899 an active campaign was instituted against attorneys illegally registered upon the roster, with the result that 24,662 were disqualified, of whom 1163 were debarred or suspended and 2961 disqualified by other causes. There were on the records of the Pension Bureau when the present commissioner came into office the names of over 50,000 attorneys or claim agents. This number has been reduced to 18,491 attorneys entitled to recognition. The amount paid to these agents last year was \$476,961 as compared with \$702,000 the preceding year.

The following figures are for the last two fiscal years ending July 1, the totals being for the years from 1866 to 1899 inclusive:

FISCAL YEAR	DISBURSEMENTS FOR PENSIONS.		FEES OF EXAMINING SURGEONS.	
	Army.	Navy.	Army.	Navy.
1898.....	\$140,924,346.71	\$3,727,531.09	\$894,249.08	*
1899..	134,671,258.68	3,688,794.27	715,191.26	*
Total, 1865-99	\$2,338,559,870.58	\$51,351,104.16	\$15,181,708.12	\$309,278.11

FISCAL YEAR	Cost of Disbursement, Pension Agencies, etc.	PENSION BUREAU.		Number of Pensioners on Rolls
		Salaries	Other Expenses.	
1898.....	\$536,629.64	\$2,254,181.40	\$429,031.14	993,714
1899.....	522,496.49	2,151,578.85	465,805.63	991,519
Total, 1865-99.....	\$12,092,178.63	\$44,442,110.75	\$7,795,115.67	

* Now included in army.

PENYOINK EXPERIMENTS. See BIOLOGY (paragraph Hybridization).

PENZANCE, BARON, JAMES PLAISTED WILDE, British jurist, died December 11, 1899. Born in London, July 12, 1816, and educated at Winchester and at Trinity College, Cambridge, he became a barrister in the Inner Temple in 1839 and a Queen's counsel in 1855. From 1860 to 1863 he was a baron of the exchequer, and from the latter year to 1872 judge of the Court of Probate and Divorce. He became in 1875 judge of the provincial courts of Canterbury and York, and held the position until he died. He was the first Baron Penzance, created in 1869, and left no heir.

PEOPLE'S CHORAL UNION, an association of singers, organized in 1894 in New York City, with Frank Damrosch as director, had in 1899 a membership of 1667. Secretary, John McDonough, 47 Morton Street, New York City.

PEROSI, LORENZO, composer and Roman Catholic priest, was born December 20, 1872, at Tortona, in Piedmont. He took holy orders, but also studied music at the Milan Conservatory in 1892-93, and in 1894 was under Franz Xaver Haberl at Ratisbon. He then became director of music in a church at Imola, but soon was called to the position of vice-director at St. Mark's, Venice. Perosi's oratorio trilogy, *The Passion, The Transfiguration of Christ, and The Resurrection of Lazarus*, made such a sensation in Italy that at the end of 1898 he was given the position of music director at the Sistine Chapel in the Vatican. The first performance of a new oratorio, the *Resurrection of Christ*, was given at Paris under the composer's personal direction about March 20, 1899. The first performance in America of *The Resurrection of Lazarus* was given in the Metropolitan Opera House, New York, April 16, 1899. Perosi's work has not aroused in Germany so much enthusiasm as in Italy; in any event, however, and especially when his age is considered, he is regarded as a remarkable composer. His compositions, besides those mentioned

above, include twenty-five masses, an Easter oratorio, a requiem for male voices with organ accompaniment, psalms, etc.

PERSIA, called by the natives Iran, is an Asiatic monarchy lying between the Turkish possessions on the west and Afghanistan and Baluchistan on the east, and between Russian territory and the Caspian Sea on the north and the Persian Gulf and the Arabian Sea on the south. The capital is Teheran.

Area, Population, etc.—The country extends some 900 miles from east to west, and 700 miles from north to south, the total area being about 628,000 square miles. A large part of this is desert. The number of inhabitants is about 9,000,000, and a large proportion of the rural population consists of nomadic tribes of Turks, Arabs, Kurds, Lurs, etc. The approximate populations of the chief cities are: Teheran, 210,000; Tabriz, 180,000; Ispahan, 80,000; Meshed, 60,000; Barfurush, 50,000; Yazd and Kerman, each upward of 40,000. The great mass of the population belongs to the Shiah sect of the Mohammedans; there are about 800,000 Lunnis, 45,000 Armenians, 25,000 Jews, and 25,000 Nestorians. The resident Europeans are said not to exceed 800. Instruction is carried on by means of private tutors, primary schools, and a large number of higher schools, receiving public support, where Persian and Arabic literature, religion, and some science are taught. The greater part of the people, however, who receive any instruction at all, learn only to read the Koran.

Government.—Persia is regarded as an absolute monarchy, the Shah being entirely autocratic so far as his rulings do not conflict with the precepts of the Koran. For the last few years the Shah has to some extent exercised his power through a responsible ministry. Persia is divided into thirty-three provinces, administered by governors-general, who are responsible to the Shah. Justice, which is said to be always summary, is administered by these governors and their representatives, by the priests, and by the Sheikhs-el-Islam. The standing army does not comprise more than 24,500 men; the entire army (only one-half of which is liable to service) is reported to number 105,500. The so-called navy comprises only one small steamship and a still smaller river steamer.

Finance.—The chief sources of revenue are ports and mines, fisheries, and various other concessions; about 15 per cent. is derived from customs. The largest items of expenditure are for the army and pensions. The estimated revenue for the fiscal year 1899 was £1,500,000 (\$7,299,000); the estimated expenditure for 1898 was 50,100,000 kran. On October 1, 1899, the kran was valued at \$0.08 in United States currency, so that the above amount represents \$4,008,000. The whole revenue is at the disposal of the Shah, whose private fortune is said to amount to a sum between \$19,000,000 and \$24,000,000. A large part of this treasure is in precious stones.

Industry, Commerce, etc.—The leading agricultural products are wheat, barley, rice, gums, fruits, cotton, sugar, opium, tobacco. Opium culture is increasing, the export amounting to over \$3,640,000. The mineral wealth is by no means small, though at present undeveloped; among the minerals found are salt, iron, coal, copper, lead, sulphur, antimony; there are also found turquoises and some other precious stones. Among manufactures silk is the most important, the annual production of which is about 606,000 pounds, of which about two-thirds are exported. The annual export of wool is about 7,714,000 pounds; cotton, 9,934,000 pounds; tobacco, 5500 tons. The yearly export of hand-made carpets amounts to more than \$680,000. Persian fabrics are noted for their excellence of dye. The leading imports are cotton and woollen goods, sugar, petroleum, tea, coffee, drugs, hardware, glass. Trade is chiefly with Great Britain, though in the northern part of the country Russian merchants are in the ascendancy. In 1898 the direct trade with Great Britain was: Imports to Persia, £338,017; exports from Persia, £193,291. In December, 1899, it was reported that the high price of bread had caused much distress in Persia and that famine was threatening the poorer classes.

The only railway in operation is from Teheran to Shah Abdul-azim, a distance of only six miles. Methods of transportation are primitive, carrying being done principally by pack-mules and camels. (See AFGHANISTAN.) The only two wagon roads in the country are from Teheran to Korn and Teheran to Kazvin, each about 90 miles in length. There are about 4150 miles of telegraph line and 95 stations. The post-offices number less than 90.

PERU, a republic of South America, is bounded on the north by Ecuador and Colombia, on the east by Brazil and Bolivia, on the south by Chile and the Pacific Ocean, and on the west by the Pacific Ocean. The capital is Lima.

Area and Population.—The country comprises eighteen departments and two littoral provinces, the total estimated area of which is 463,747 square miles. The last census was taken in 1876, when the population was reported to number 2,621,844, exclusive of about 350,000 uncivilized Indians. The population at present is estimated at 3,000,000, and is said to be nearly stationary on account of the high rate of infant mortality among the lower classes, and alcoholism and small-pox among the Indians.

Another estimate, however, published in the spring of 1899, places the number of inhabitants between 3,700,000 and 4,000,000; the following figures also are given for the population of the principal cities: Lima, 113,000; Callao, 48,000 Arequipa, 35,000; Cuzco, 30,000; Catacaos, 25,000; Ayachuco, 20,000; Cincha, 18,000. Though their number is unknown, it is estimated that the aboriginal Peruvians (Indians) constitute more than one-half of the population, that nearly one-quarter are mestizos, and that about one-fifth are of Spanish blood. The final disposition of the provinces of Tacna and Arica, now held conditionally by Chile, had not been made at the close of 1899.

Government.—By the constitution, dating from 1856, with a revision in 1860, and based on that of the United States, the executive authority is vested in a president, who is chosen by popular vote for a term of four years, and is assisted by a ministry of six members, holding office during his pleasure and representing the departments of the interior, foreign affairs, finance, public works, war and marine, and justice. The president is Señor Eduardo Lopez de Romaña, who, in May, 1899, was elected to succeed Señor Nicolás de Piérola, and was inaugurated on September 8. Under him the new president of the council and minister of foreign affairs is Señor Manuel María Galvez. The legislative power devolves upon a congress of two houses, the senate and the house of representatives. Senators are deputies of the provinces, there being one senator for each 30,000 inhabitants or fraction thereof over 15,000; representatives are chosen by electoral colleges of the provinces, there being two representatives from each department containing two provinces, and one more representative for each additional two provinces in a department. The departments are subdivided into 95 provinces, and these into 779 districts; the two littoral provinces and the departments are governed by prefects, the provinces by sub-prefects, and the districts by governors.

Army and Navy.—The peace footing of the regular army numbers 3157 officers and men, comprising infantry, cavalry, and artillery. A reorganization of the army has been undertaken for the government by a number of French officers. There is a military school at Chorillos, near Lima. The navy consists of twelve vessels; ten of these are very small and of little value, one is a screw steamer, and one a cruiser of 1700 tons.

Finance.—Customs duties constitute the chief item of revenue; others are taxes, the salt monopoly, and posts and telegraphs. The largest expenditures in 1898 were for the departments of war and marine, finance, and the interior. The estimated revenue and expenditure in soles for 1897 were 10,721,520 and 11,308,240 respectively; for 1898, 10,785,850 and 11,488,240 respectively; of the revenue for the latter year, according to estimate, 6,320,000 soles were derived from customs. The estimated revenue for the fiscal year 1899 was stated to be \$5,767,495 in United States currency. Stamp revenues and taxes on opium, tobacco, and alcohol were farmed out in 1896 for two years, at the expiration of which time the contract was renewed for five years, with an increased advantage to the government. In 1890 Peru was released from her foreign debt, contracted in England, amounting to £31,579,080 and £22,998,651 arrears, by a cession to the bondholders for a term of sixty-six years of all the federal railways, mines, lands, and guano deposits. Since 1896 the salt industry has been a government monopoly, the proceeds of which are placed in fund for the redemption from Chile of the provinces of Tacna and Arica. The total internal debt in 1898 was estimated at 47,591,760 soles. An attempt is being made to establish a gold currency. In April, 1897, the coinage of silver was suspended, and the importation of silver specie prohibited. Much silver coin has been melted down to be exchanged for gold. Since December, 1897, customs duties have been leviable in pounds sterling, though they may be paid in silver at the rate of 10 soles to the pound; the 10 soles, however, fall somewhat short in value of the English pound, and consequently the government exacts a surcharge of 5 per cent. Besides the International Bank of Peru, there are three commercial banks. The value of the sol in United States currency on October 1, 1899, was \$0.436. The New York *Journal of Finance* announced in September, 1899, that Peru had changed the monetary unit from the sol to the libra, the value of the latter being equal to the English pound sterling. This alteration was caused by the recent measures for substituting the gold standard for the silver standard of currency in the republic, and by the fact that the bulk of Peruvian trade is with Great Britain.

Industries.—Agriculture and mining are the principal industries; manufactures have not yet become important. The chief crops are cotton, coffee, and sugar, while other products of importance are tobacco, cocoa, rice, potatoes, cereals, wines and spirits, dyewoods, medicinal plants, alpaca, and fruits. Coffee is produced chiefly in central Peru, in the districts of Paucatambo, Perené, and Chanchamayo, where the Peruvian Corporation has concessions amounting to 5,000,000 acres. The industry, however, like other agricultural industries and mining in Peru, is seriously impeded by difficulties of transportation; also the number of laborers is insufficient. It was

reported that the coffee exports for 1897 amounted to 1239 tons; the amount forwarded from the Perené and Chanchamayo districts to Lima in 1898 was about 1350 tons. The transportation difficulties and the depreciation of coffee have discouraged producers. About 187,000 acres, chiefly in the coast region, are given to sugar cultivation. The output for 1897 is stated to be 105,000 tons. The mineral wealth of Peru is exceedingly great; among the minerals taken out are gold, silver, copper, mercury, zinc, lead, sulphur, salt, coal, and petroleum. In 1897 the number of mining claims recorded was 3475, but many were unworked. About one-half of the mining companies are controlled by Peruvians. Coal of excellent quality has been found on both the east and west sides of the Andes, but its exploitation has not hitherto been profitable. The silver output for 1896 was estimated at 3,300,000 ounces; the value of the output in 1897, including bar silver and silver sulphides and ores, was put at 9,730,000 soles, and the value of the total mineral production at 11,000,000 soles. At Cerro de Pasco, long famous for its silver mines, copper mining was carried on extensively in 1898 and 1899. During the year ending June 30, 1899, there were exported from Cerro de Pasco and Yauli about 17,000 tons of copper ore and mattes, the value of which, exclusive of the silver and gold contained therein, was placed at £306,000. It is estimated that the deposits at Cerro de Pasco contain 15,000,000 tons of copper ore, representing at least 3,000,000 tons of metallic copper.

Commerce and Shipping.—The principal exports are sugar, silver, copper, cotton, coffee, wool (sheep and alpaca), rubber, cocaine, and cacao leaves; the chief imports are cotton and woollen textiles, iron, and machinery. This commerce is carried on mainly through the ports of Callao, Mollendo, Chimbote, Salaverry, Paita, Eten, Trujillo, and Pisco. In 1897 the imports and exports in soles amounted to 18,004,048 and 31,025,381 respectively; for 1898 the reported amounts were: Imports, 19,207,300 soles; exports, 30,274,800 soles. The countries leading in imports in the latter year were: Great Britain, 8,632,800 soles; Germany, 3,401,900; United States, 2,078,400; France, 1,554,000; Chile, 1,368,500. The principal countries receiving the exports were: Great Britain, 17,153,900 soles; Chile, 4,588,500; United States, 2,873,500; Germany, 2,703,800. In 1898 there were exported 103,718 metric tons of sugar, 6712 of cotton, and 4295 of rice. Trade with the United States at present is very small, but is said to be increasing. In 1898 the sugar export was to a considerable extent diverted to this country from England. In 1897 the coca leaves exported amounted to 493,677 kilos, and crude cocaine 5207 kilos. In the latter half of 1899 disturbances in the interior of Peru prevented the gatherers of coca from making shipments to Lima, and in consequence the price of raw cocaine in the United States increased more than 100 per cent.

In 1896 the merchant marine comprised 132 vessels, aggregating 11,199 tons; of this tonnage 9953 tons were carried by 36 vessels. In 1897 there entered at Callao 492 vessels, of over 50 tons, with a total tonnage of 600,049, and cleared 503 vessels, aggregating 618,677 tons. Vessels under 50 tons numbered 889, and had a total tonnage of 10,966. In 1896 the entering tonnage at Trujillo was 446,520.

Communications.—The roads of Peru are in wretched condition; they are usually simply bridle paths. Difficulties of transportation, not only in Peru, but in other South American countries, are among the chief obstacles to industrial and commercial progress. There is under construction a road from La Merced in Chanchamayo to Puerto Bermudez on the Pichis River, establishing communication with the Amazon; this undertaking has not yet achieved great success, though much money has been expended for it. In the fall of 1899, however, it was reported that 145 of the total 175 kilometres of the road were completed. "With the completion of the Pichis road the journey between the two oceans will be made in the following manner: From Callao to Oroya, by rail, 220 kilometres; from Oroya to Puerto Bermudez, on horseback, about 300 kilometres; from Puerto Bermudez to Iquitos, by steamer, approximately 1500 kilometres; and from Iquitos to the mouth of the Amazon, 3500 kilometres; a total of 5520 kilometres" (3430 miles). A carriage road has been projected from the railway terminal Sicuani to Cuzco, 90 miles distant, and in June, 1899, was reported to be completed as far as Urcos; this road will pass through the provinces of Canchis, Quispicanchis, and Cuzco. In 1895 there were 924 miles of railway, of which 800 miles belong to the state; the state railways constitute a part of the property mortgaged in 1890 to the Peruvian Corporation, which is chiefly controlled by English capital, for sixty-six years. The cost of these railways, private and state, and including those ceded to Chile, is about \$175,000,000 (gold). In the summer of 1899 it was announced that a contract had been signed with the government for the construction of a railway, 66 miles in length, from Oroya, the present railway terminal, to Cerro de Pasco. The road is to be completed in 1903. It will connect with Callao the great mineral region around Cerro de Pasco, and will doubtless give a great impetus to the mining industry, augmenting especially the output of copper and silver.

Telegraph lines at the beginning of 1899 aggregated 1928 miles, of which about

1400 miles belonged to the state; there are 48 telegraph offices. The submarine telegraph cables touch at Callao, Mollendo, and Paita, and there is a station at Lima. Telephone lines aggregate 2300 miles. The postal department is self-supporting, and yields a small revenue besides; there are 320 offices. It was announced in the summer of 1899 that a steam launch for carrying the mails had begun to make fairly regular trips between Puerto Bermudez on the Pichis River and Iquitos on the Amazon.

Religion and Education.—The constitution guarantees political but not religious freedom; the state church is Roman Catholic, and the public exercise of other faiths is prohibited; the law, however, is not strictly enforced, as there are Anglican churches and schools in Lima and Callao. Moreover, in the spring of 1899 a publication of the Peruvian government announced that to foreigners "the most ample and complete liberty of conscience is guaranteed, without any further obligation than that of respecting the state religion." It was also stated that the children of foreigners may receive public instruction on the same basis as Peruvian children. An act of December 23, 1897, established the validity of civil marriages of non-Catholics or of a Catholic and a non-Catholic, and also marriages solemnized by ministers of dissenting churches; such marriages must be registered, and those of a date previous to the passage of the act will be deemed legal if registered before the end of 1899. On May 9, 1899, a supreme presidential decree was promulgated, supplementary to the law of 1897, and relative to the method of establishing proper proof in the case of civil marriages.

Primary education is nominally obligatory and in the municipal schools gratuitous. In the departmental capitals the government maintains high schools. The old University of San Marcos, having schools of science, law, medicine, theology, and economics, is situated at Lima, in which city also is a school of mines and civil engineering. There are two universities of lesser importance at Cuzco and Arequipa. On September 3, 1899, the corner-stone of a new school of medicine, to be erected by the government at an estimated cost of 203,297 soles, was laid in the Botanical Garden at Lima by President Piérola.

A New President.—The administration of President Nicolas de Piérola, which came to an end in the summer of 1899, brought to Peru quiet and comparative prosperity. Previous to the last election, in May, a friend of Señor Manuel María de Romaña, a candidate for the presidency, instigated an ineffectual revolt for the purpose of furthering the interests of Romaña. The attempt, however, was ill-advised, and Romaña was quietly elected with little opposition. On the 14th of August he was officially proclaimed president, and on September 8 was inaugurated.

Rebellion.—In the fall of 1899 a revolutionary movement of considerable strength developed, which, after an attack on the custom house at Pisco, culminated in a battle that was announced to the authorities at Lima on November 5. The conflict took place at Huanuco, capital of the department of that name, about 180 miles northeast of Lima, and resulted in the complete defeat and rout of the insurgents, who were led by General Durand. Besides a large quantity of arms and ammunition and many horses, the insurgents lost many men in killed, wounded, and prisoners. Though General Durand and his brothers effected their escape, the defeat was regarded as a death blow to the revolt.

Cabinet Crisis.—A ministerial crisis came in the latter part of November, and on the 2d of the following month the cabinet resigned. A new cabinet was announced on December 15, with Dr. Rivaguero as president of the council and minister of foreign affairs and Dr. Belaunde as minister of finance.

PESNELLE, Very Reverend EUGENE, superior-general of the Roman Catholic order of the Fathers of Mercy, died in Paris, July 6, 1899, at the age of seventy-five years. He was born in Bordeaux, France, and became a professor of law and theology at the seminary in that city. He was elected superior-general of his order in 1893.

PETERS, J. B., sometime chief justice of Kentucky, died at his home in Mount Sterling, Ky., September 18, 1899, in his ninety-second year. For many years he was a member of the Kentucky Court of Appeals, and for sixteen years was chief justice. He was a schoolmate of Jefferson Davis at Transylvania, and was an intimate friend of John C. Breckinridge and other famous Kentuckians of a past generation.

PETROGRAPHY. The higher part of the central and nearly the entire width of the southern Sierra Nevada Mountains in California are found to consist of a mass of granular rocks, in part gneisses, which are the oldest of the series, but largely of granular igneous rocks, among which are granites, grano-diorites, gabbros, peridotites, pyroxenites, etc. The term *granulite* has been suggested by Pirsson for all igneous rocks of granitic or holocrystalline texture. Merrill considers that the term weathering should be restricted to those superficial changes in a rock mass brought

about by atmospheric agencies, and resulting in the more or less complete destruction of the rock as a geological body. It has been proposed to establish an international journal of petrology, in order to have one source to which one can turn for up-to-date and reliable information on the subject. A paper on the petrographical province of Essex County, by Washington, discusses the chemical and genetic relationships of a classic area in eastern Massachusetts. Smith finds that the rocks of Mt. Raimier are basalts and andesitic lava and tuffs, that pass into each other by insensible gradations, while Hague notes that the lavas of the early tertiary volcanoes of the Absaroka range on the east of the Yellowstone Park are a repeated succession of hornblendic and micaceous andesites, basalts, and pyroxene andesites, and finally a series of basaltic flows, while with these are associated a great series of tuffs and igneous conglomerates. A. Harker gives the average composition of the British igneous rocks from 397 analyses, and compares them with the average of 680 analyses of American igneous rocks. In most instances there is a striking similarity. J. A. L. Henderson has published petrographical and geological investigations of certain Transvaal norites, gabbros, and pyroxenites. A translation of Lewinson-Lewssing's classification of rocks and differentiation of magmas is given in the *American Geologist* for June, 1899.

Books.—*Die Eruptivgesteine des Kristianiagebietes, III.*, W. C. Brogger; *Recherches Géologiques et Pétrographiques sur le Massif du Mont Blanc*, Louis Départ and L. Murazec. See GEOLOGY.

PETROLEUM. Corrected returns for 1898 give the production as 55,364,233 barrels, valued at \$44,193,359. No new fields of importance have been discovered, but several new wells of large capacity have helped to increase the production. The petroleum industry has been aided by the prevalence of good prices. There have also been increased exports of crude oil, naphthas, illuminating oil, and paraffine, in the face of keen competition with Russia and other foreign countries, especially those of the Far East. There has, however, been a falling off in the export of residuums, such as tar. The Appalachian field, which includes New York, West Virginia, Ohio, and Pennsylvania, continues to be the leading producer, and the price per barrel for petroleum for this year was from \$1.36 to \$1.60. It is stated that in this region 7026 new wells were completed in 1899. In certain parts of the United States much attention is being given to the use of petroleum for fuel in locomotives, and the results indicate success. A composite paper on the origin and chemical composition of petroleum by Sadtler, Peckham, Day, Phillips, and Mabery gives a valuable summary of our knowledge of petroleum and natural gas, and incidentally of all the native bitumens. Dr. Day, for instance, develops a suggestion as to the origin of Pennsylvania petroleum, in which he considers that the oils have been derived by distillation from the underlying silurian strata. Among other things, Professor Mabery shows the difficulty which exists in correlating the composition or specific gravity with the distribution or geological occurrence, and points out that even the high sulphur oils, which some have regarded as characteristic of limestones, may also be typically developed in sandstones and shales.

PHI BETA KAPPA, a Greek-letter society, chapters of which are found in 50 American colleges, organized in 1776, had in 1899 an active membership of 12,385. The next triennial meeting is to be held in 1901. The government of the chapters is directed by the national council, consisting of 11 senators and delegates from the various chapters. Officers of the national council: President, Hon. J. A. De Remer, LL.D., Schenectady, N. Y.; secretary and treasurer, Rev. E. B. Parsons, D.D., Williamstown, Mass.

PHILADELPHIA EXPOSITION. See NATIONAL EXPORT EXPOSITION.

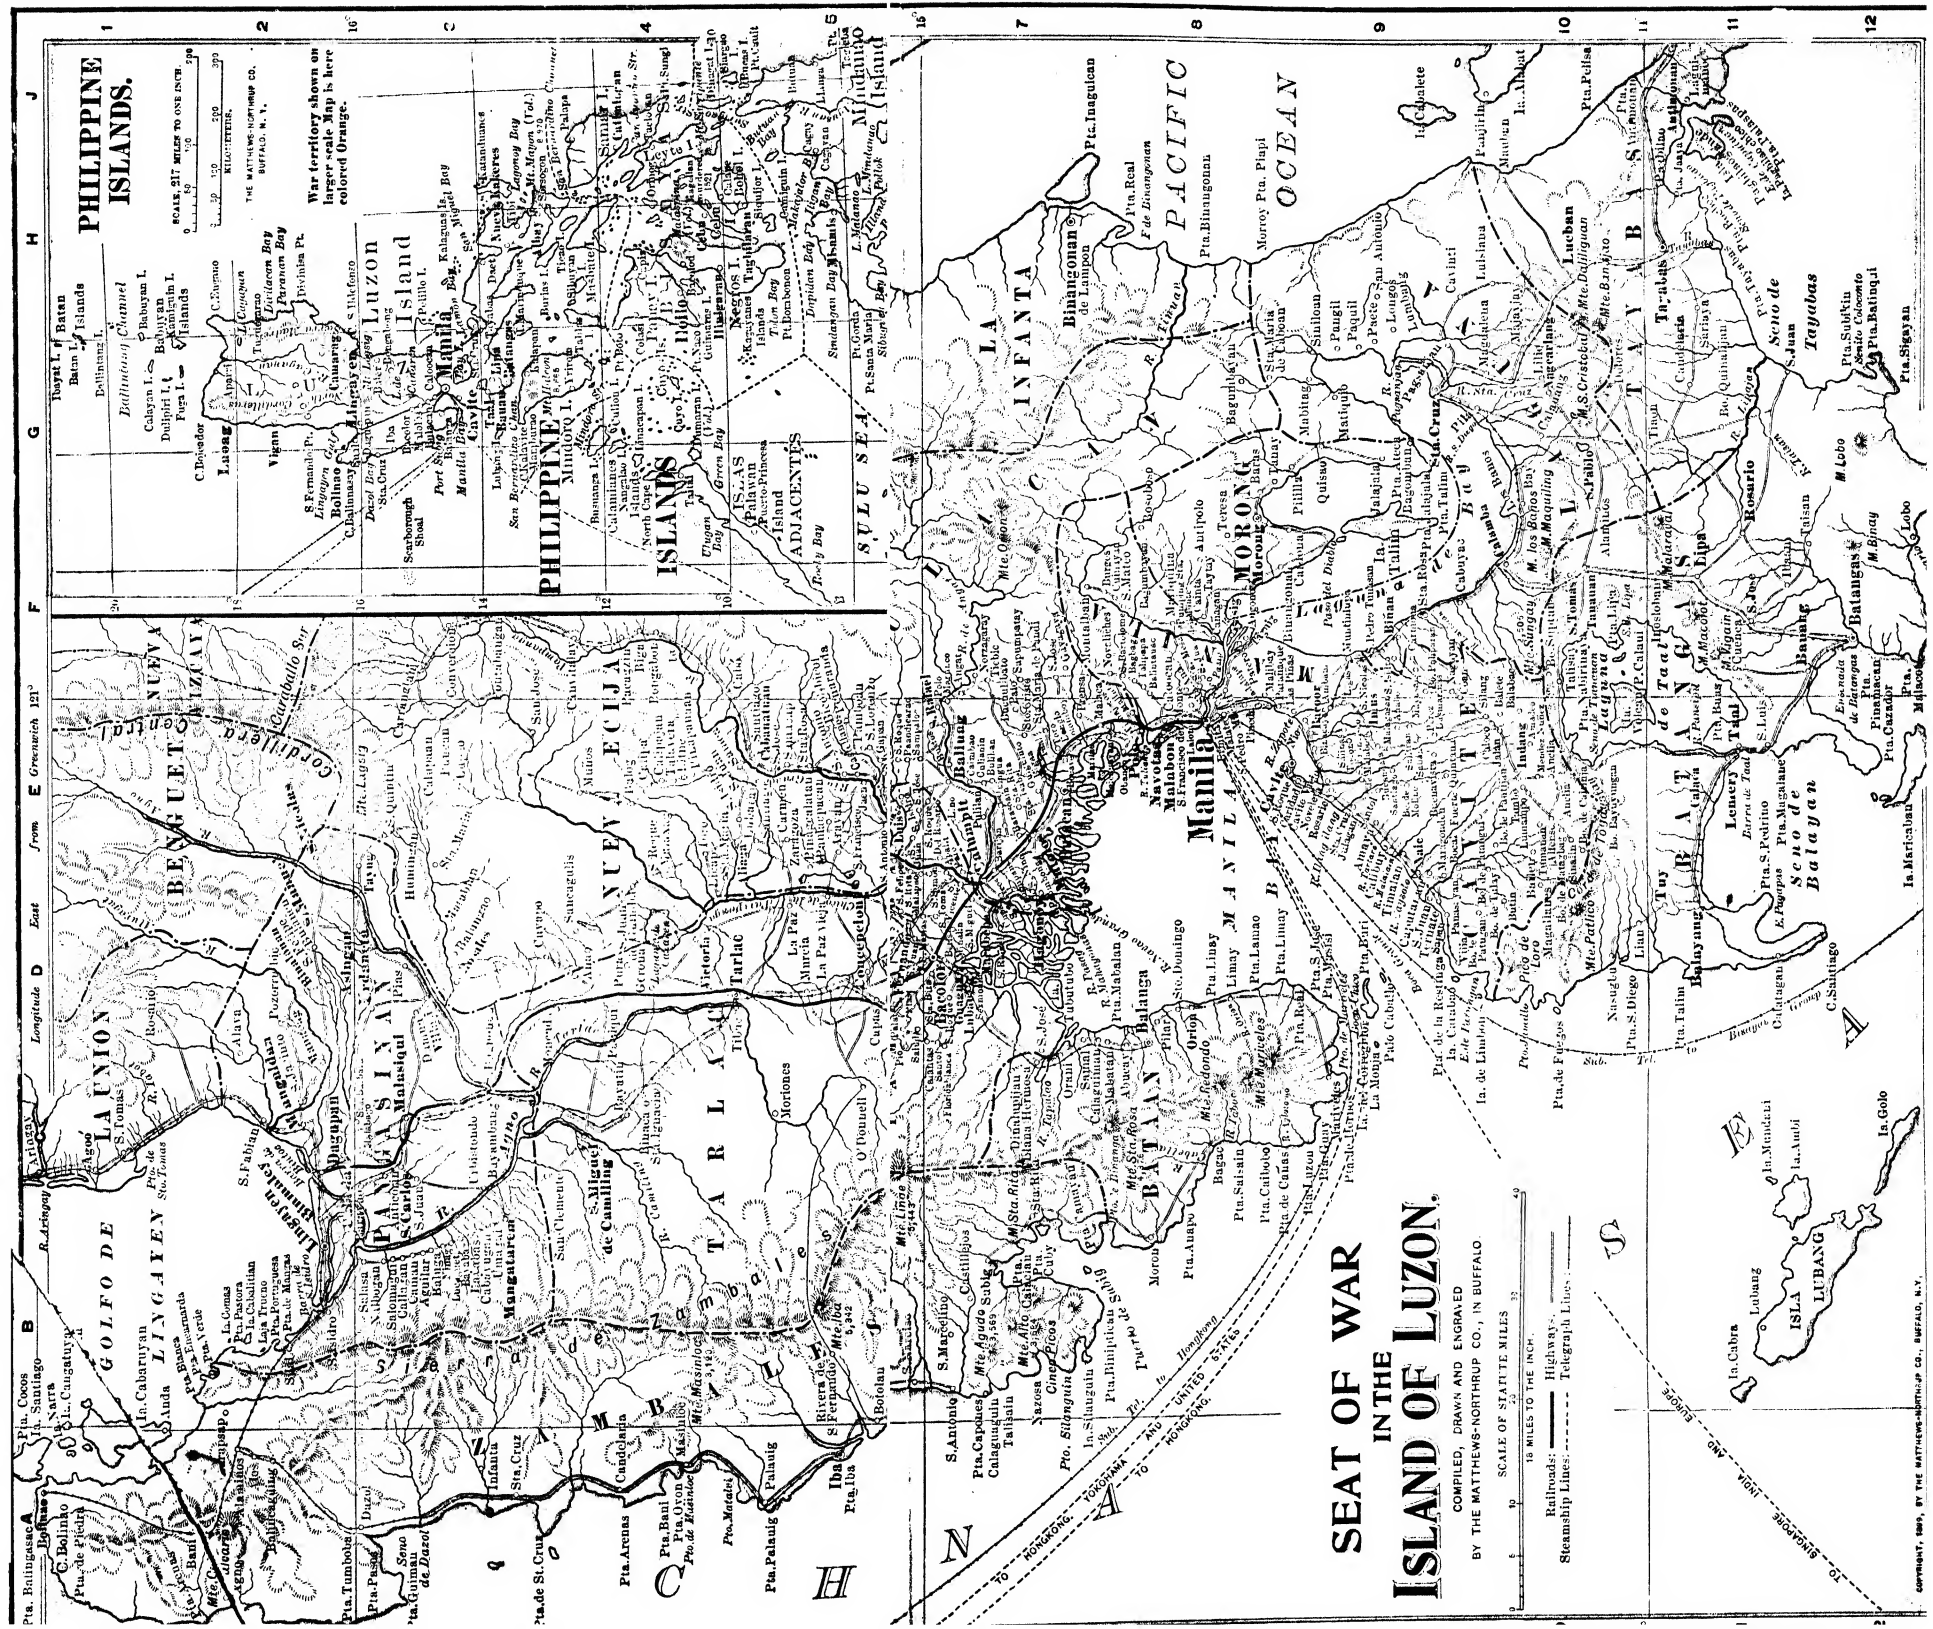

PHILHARMONIC SOCIETY, New York, was founded in 1842 and incorporated in 1853. On the death of Anton Seidl in 1898, Emil Paur, formerly conductor of the Boston Symphony Orchestra, was appointed musical director. Among the soloists in 1899 were the violinist Petschnikoff and the pianist Mark Hambourg. There were over 100 performers in the orchestra. President, E. Francis Hyde; secretary, August Roebelen.

PHILIPPINES, a group of islands acquired by the United States from Spain in 1898, lie in the Pacific Ocean between 4° 45' and 21° north latitude, and in longitude between 118° and 127° east from Greenwich. The number of islands has been estimated from 1200 to 1800, the greater number being small and of no value.

Area and Population.—The total population is estimated at about 8,000,000; the islands of chief importance and where 90 per cent. of the Christian population may be found are the first six of the following, the area and Christian population of each being given:

**PHILIPPINE
ISLANDS.**

War territory shown on larger scale Map is here colored Orange.

COPYRIGHT, 1909, BY THE MATTHEWS-NORTHROP CO., BUFFALO, N. Y.

Islands.	Area.	Population.	Per. sq. m.
Luzon	44,400	3,426,000	79
Panay	4,700	735,000	155
Cebu	2,400	504,000	210
Leyte	3,800	270,000	71
Bohol	1,300	245,000	188
Negros	3,300	242,000	73
Mindanao	34,000	209,000	6
Samar	4,800	186,000	38
Mondoro	4,000	67,000	17
Romblon	600	35,000	58
Nasbate	1,400	21,000	15
Total	104,600	5,940,000	57

Other smaller islands increase the area to about 140,000 square miles, and 6,000,000 population, or 43 to the square mile. Mountain ranges in all the islands make a great part uninhabitable, so that in several places the density of population is greater than that of any of the United States, except Massachusetts and Rhode Island. To the Christian population should be added the following estimates of non-Christian population:

Chinese	75,000
Moors or Mohammedans in Paragan and Jolo	100,000
Moors or Mohammedans in Mindanao and Basalan	209,000
Heathens in the Philippines	830,000
Heathens in the Carolines and Palaos	50,000

Total 1,264,000

There are at least thirty different races, each speaking a different dialect, but about 82 per cent. of the Christians are either Tagals or Visayas. The Tagals of Manila are short and of a coppery-brown color, and are said to be industrious. The greater part of the population is engaged in agriculture. The half-breeds, or persons with a mixture of Spanish and native blood, are called mestizos, and are a comparatively small number, found in the vicinity of Manila. Some of the natives have become prosperous lawyers, doctors, priests, and merchants. There are said to be about 4500 books published in the native language.

Climate.—The thermometer during the year ranges from 61° to 97°, though in July and August it rarely goes below 79° or above 85°. Three seasons are well marked: (1) The temperate and dry, from November to February; (2) hot and dry, from March to May, and (3) temperate and wet, from June to October. The rains are constant and very heavy in July and August. The total annual rainfall has been known to be as great as 114 inches, which is greater than the average annual rainfall at Hong Kong. A report upon the expedition sent in 1899 by the Johns Hopkins University to investigate the prevalent diseases in the Philippines, shows that skin diseases, including smallpox, are prevalent among the natives, as well as leprosy, tuberculosis, venereal diseases, and beri-beri. "The chief causes of disability among the American land forces are the enteric diseases. These are diarrhœa, dysentery, typhoid-fever, and gastro-intestinal catarrhs. Other infectious fevers are relatively infrequent. A small number of cases of scarlet-fever and diphtheria only were encountered. The malarial fevers prevailed, but not seriously, during the months of May, June, and July. Dysentery is responsible for the greatest amount of invalidation and the highest mortality. . . . In the worst season of the year the climate is very trying, and especial precautions are to be taken if Americans are to keep well there. The extremes of temperature are not great, but the constancy of the high temperature, together with a high degree of humidity, make the climate peculiarly enervating."

The tropical fruits are supplemented by many products of the temperate zone, such as potatoes, barley, and wheat. The chief exports are, however, sugar, hemp, tobacco, and coffee, together with indigo, sapan-wood, and copra. Rice and maize are grown, but are not exported. The finest tobacco grown in the islands comes from the northern part of Luzon. Hemp is the best known product of the Philippines, the name Manila having been given to various products made of it, such as rope, paper, etc. A writer, Max L. Tornow, says of it in the *National Geographic Magazine* (February, 1899): "It is remarkable that, although there are the most various species of the *musa* flourishing in warm climates generally, the *musa textilis* (hemp-tree) appears to thrive to the best advantage only in the Philippines. Attempts to grow the plant in other places have been uniformly unsuccessful. Like its better-known relative, the edible banana (*musa paradisiaca*), the stem of the plant is formed by the leaf stalks, in the centre of which again is the blossom-stem. The finest growth is obtained in the volcanic and rainy districts of the

Philippines, particularly in Camarines Sur, Albay, Samar, Leite, Marinduque, Cebu, and in some of the small neighboring islands, as well as in Negros and Mindanao. The valuable hemp-fibre is found in the petioles, from which it is taken before the plant has borne fruit, as otherwise the fibre loses in elasticity and lustre. In two or three years the plant has usually attained such growth that it can be cut down, the leaves removed, the green epidermis stripped from the stem, and either the bast-strips torn off lengthwise or the petioles separated singly, and the inner membrane, with the pulpy portion of the plant, removed. The bast-strips thus obtained are drawn under a knife in order to scrape away any pulp that may have remained on them. The product, after having been dried in the sun, is then ready for shipment. This process, though simple, involves a great loss of fibre, which might be avoided by the use of more efficient stripping machines. It is difficult to accustom the natives to anything novel, but when once progress has gained a general footing, headway will be made in particular paths also. Manila hemp has so far been equalled by none, much less excelled." The number of bales of hemp exported to the United States in 1897 was 417,473, or 50 per cent. of the total output. The United Kingdom received in that year 385,182 bales, and the continent of Europe, 22,373 bales, the total number of bales exported being 825,028.

There is a large quantity of timber found in the archipelago. The mineral wealth of the islands, consisting of coal, iron, lead, sulphur, copper, gold, and petroleum, is considered to be great, but is comparatively undeveloped. It is believed that coal is to be found in all the islands. First discovered in Cebu in 1827, it has since been found in Negros, Mindanao, Luzon, Camarines, and Albay. The coal of Cebu is said to be of the finest quality, comparing well after many experiments with the best Newcastle coal. So great have been the hindrances to the successful mining and exploitation of this product that a large quantity of coal is imported from Australia and Japan. The best iron is found in Luzon, where the ore has 75 to 80 per cent. pure iron. Copper of the best quality is found in the district of Lepanto, on Luzon, mines having been worked for a time, but abandoned about 1875 through lack of workmen. Gold occurs in many places on the islands, but it has not yet been made a profitable industry, a small quantity only having been washed by the natives from the river deposits. Sulphur is found in Albay, but the beds have not been worked for 20 years.

Other important products of the Philippine Islands other than those already mentioned are rice, corn, cocoanuts, and cacao. Coffee and cotton, though formerly produced in large quantities, have of recent years declined, the former having been almost exterminated by insects, and the latter driven out by the competition of cotton goods imported from England. Rice produced on the islands is not sufficient for home consumption, and a large amount is imported from Saigon, Hong-Kong, and Singapore. Sugar-cane is raised in the Visayas, and there are 2 large refineries in Manila. In 1897 sugar was exported from the Philippines to the amount of 153,576,125 pounds, of which 43,261,182 pounds (over 28 per cent.) went to the United States, 106,578,638 pounds went to the United Kingdom, and 3,736,305 pounds to the continent of Europe. The export to the United States has greatly declined, having been 284,654,552 pounds in 1889 and 174,066,872 pounds in 1896.

Of domestic animals, cattle, goats, and sheep, introduced from Spain, are of comparatively little importance, but swine and chickens are plentiful. The carabao, or black water-buffalo, is largely used as a beast of burden and for ploughing in the rice-fields. A kind of small horse, very tough and of great endurance, is also used.

Religion and Education.—The religion of the majority of the population is the Roman Catholic, introduced by the Spaniards. (For figures see paragraph Area and Population.)

The great diversity of dialect in these islands, there being about 30 different dialects spoken on the several islands, is partially exhibited by the following table from the latest report of the commissioner of education in Washington:

Dialect.	Number who Speak It.
Visaya.....	2,094,409
Tagalo.....	1,316,508
Cebuano.....	385,866
Ilocano.....	354,878
Vical (Bicol).....	312,554
Pangasinan.....	263,000
Pampango.....	198,424
Total.....	4,750,139

SCENES IN THE PHILIPPINES.—1. The Puerta de Isabel II., one of the gateway between Manila and Malolos. 3. Warfare in the Pasig River, with the

3

4

ed City of Manila. 2. An Insurgent barricade, with an old Spanish gun, on the rail-
 merican artillery in the trenches outside of Manila. 4. Manila
 connecting the walled city with Binondo.

The school system of the Philippines was organized by the Catholic missionaries; and as early as 1858 the University of the Philippines had an attendance of about 1000. At the time of the conquest of the islands by Spain the Visayas and Tagals had a written language, though there was nothing that could be called a literature. They are considered by some authorities to be more capable of education than the natives of Central or South America. The other tribes are of a lower intellectual order. "Two-thirds of the Tagals can read and about half of them can write. They are a cheerful, peaceable people, are disposed to enjoyment, and have an eye rather to pleasures and things that are beautiful and attractive than to the useful and profitable, in which they are totally unlike their Chinese neighbors. They work enough to supply their needs—an easy task, because of the superabundance of rice and fish—and are willing to work just a little more to provide brilliant colored clothes, festivities, etc. Art, especially music, is their passion. The village vagabond will sit all day over his violin or flute, and even the meanest village has one or more bands of 20 to 30 pieces, and they will play much better than the regimental bands of the surrounding English colonies. They like the *dolce far niente*, revery, melancholy, but are also eager to hear stirring tales of adventure, new discoveries and inventions, mythological and ghost stories. Their superstition is rather practical than religious, by which is meant that they believe less in spirits than in the magical action of healing herbs, in the laying on of hands in disease, etc., and therefore they were early attracted by the Catholic Church. Unfortunately they know very little of Spanish, so that they have no means of improving themselves by reading, their material in this respect being almost exclusively prayer-books, a few stories about the saints, etc. Whenever any other kind of reading in their language comes in their way, such as tales of chivalry and enchantment—even quack advertisements and the like—they devour them greedily. In another passage in his letters, Zobel, speaking of the relation of the natives to the monks and the tobacco monopoly, says that the latter were attempting to represent both to the colonial and the home governments that they alone can offer a sure support to the government, since they can keep the mass of the natives in check by their moral influence without other aid. This claim, he continues, was only true to the extent that the natives, timid, indifferent, and lazy as they are, fear the white monks and pay them a superstitious obedience, but do not love them. In the provinces where tobacco is grown the natives are not allowed to cultivate anything else. The state sells it for cash, but pays the farmers in paper, which is not redeemable for two, three, or even four years, so that they are compelled to sell their certificates to the Chinese or Spanish usurers at a great discount. Even this is borne patiently by the easy-going people. But religious fanaticism, which is not rare among the lower native priests (who are excluded from all higher spiritual dignities), sometimes leads to dangerous revolts of the natives (as in 1842), whose customary mildness and indolence are liable occasionally to change into blind fury." It is stated by travellers that in all villages there are schools under the supervision of the priests. In 1889 a school of agriculture and in 1890 a school of arts and sciences were established in Manila. There are four Paulist colleges and seminaries in the islands Luzon, Cebu, and Iloilo, with (in 1885) 1580 male and 40 female students. According to a Spanish authority, there were in the archipelago 1016 schools for boys, 592 for girls—total, 1608; and an attendance of 98,761 boys and 78,352 girls—total, 177,113.

Commerce and Transportation.—The commerce between Manila and the other islands of the archipelago, while quite large, does not afford any official statistics, and is carried on in steamers of from 500 to 100 tons. Mail steamers ply regularly on four routes. There are 17 principal and 16 secondary lighthouses on the coasts to facilitate navigation. A single railway, built by English capital, runs from Manila to Dagupan, about 120 miles. The roads about Manila are macadamized, but elsewhere they are largely of mud, and transportation is by means of sledges drawn by the buffaloes. Telegraph lines connect Manila with the different provinces of Luzon, and there are cables to the Visayas and other islands, connecting with Borneo and Singapore, besides a cable from Manila to Hong-Kong direct. The telegraph lines are owned by the government, the cables, heavily subsidized, being the property of an English syndicate.

The total value of exports for the year 1899 from the Philippines to the United States was \$4,409,774. The imports (including gold and silver) from the United States were in the same year \$404,193.

The Civil Commission.—On January 21 President McKinley appointed a commission to investigate the state of the Philippines. The commission was composed of Dr. Jacob Gould Schurman, president of Cornell University; the Hon. Charles Denby, at one time United States minister to China; and Professor Dean C. Worcester, of the University of Michigan. They were instructed to act in association with Admiral Dewey and General Otis, and to "facilitate the most humane and effective extension of authority throughout the islands, and to secure with the least

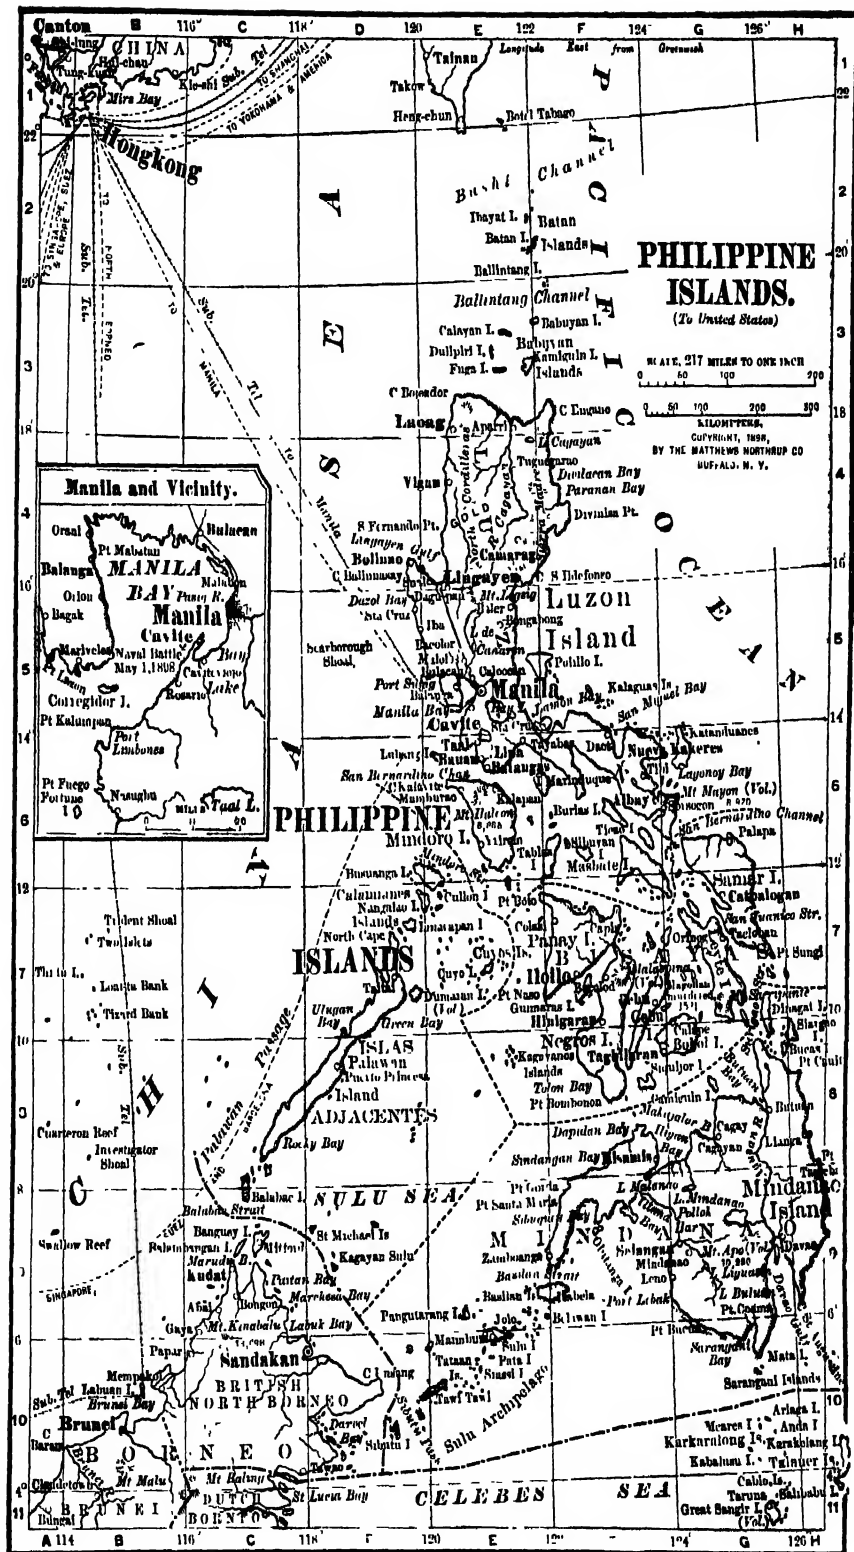

possible delay the benefits of a wise and generous protection of life and property to the inhabitants." A preliminary report of the work of the commission was published on November 3, 1899, and formed a part of the President's annual message on December 5, 1899. The report states that at no time have the Filipinos, or that portion of them who are Aguinaldo's followers, fought for independence, and the whole insurrection is the result of the personal ambition of Aguinaldo himself. The rebellion is therefore in no sense a national uprising, many of the Filipinos being friendly to the Americans, and in the provinces outside of Luzon the insurrection is looked upon by the natives with indifference where it has not inspired actual fear. Upon the arrival of the commissioners they instituted municipal governments, first in Bacoor and Imus and later in Paranaque, Las Pinas, and a dozen or more other towns. (For the organization of provisional governments in Negros and Sulu see the article UNITED STATES.) The report concluded by pointing out that withdrawal of the American forces would end in a state of anarchy in the islands, and result in their division among other great powers of the world; and that the Filipinos, never having had any experience in governing themselves, are, while naturally an intelligent race, incapable of self-government, which, though the final aim of American control, should be but gradually intrusted to them. For a more extended account of the operations of the United States Army in the Philippines during 1899 see UNITED STATES (paragraph History).

PHILOLOGICAL ASSOCIATION, AMERICAN, organized in 1869, had in 1899 a membership of 483. General meeting for 1900 at Madison, Wis., July 3-5. Publishes *Transactions and Proceedings*. President, Professor Abby Leach; secretary, Professor Herbert Weir Smyth, Bryn Mawr, Penn.; acting secretary, 1899-1900, Professor Harold N. Fowler, 49 Cornell Street, Cleveland, O.

PHILOLOGY. As a consequence of the necessarily protracted nature of philological work of whatever kind it may be—in phonology or any branch of comparative grammar, in lexicography or in text editing and criticism—it is a matter of extreme difficulty to state with definiteness a particular year's results. "Epoch-making" works at the present stage of the development of the science are destined rarely to appear, and although there never was in the history of Indo-Germanic philology such widespread activity and interest as is evinced at the end of the century, in Europe and America, by the publication of philological material, it is not at all an easy task to show clearly in an article of the scope of the present the direct bearing of the year, either upon the general science or, except in single instances, upon its special phases. Philological results, to an extent shared by scarcely another science, are given to the world in fragments, which take the form of fascicles, that frequently enough do not appear consecutively. This is particularly true of almost all extended dictionary undertakings, many of which are now under way: The great *Oxford English Dictionary* and the *English Dialect Dictionary* in England; the *Deutsches Wörterbuch* in Germany; the *Woordenboek der Nederlandsche Taal* in Holland; the *Ordbog öfver svenska språket* in Sweden; and the *Dictionnaire général de la langue française* in France, let alone various important dictionaries of epochs of a language, like Godefroy's *Dictionnaire de l'ancienne langue française*, or glosses of a dialect like the *Schwizerisches Idiotikon*, or the *Wörterbuch der elsässischen Mundarten*, all of which are in more or less active progress, but none of which is complete.

The same thing is true of important publications of sources, to cite single instances, like the great *Corpus inscriptionum latinarum* of the Berlin Academy; the *Inscriptiones græcæ insularum maris Ægæi* (Berlin); the *Codices græci et latini photographice depicti duce Scatoni de Vries* (Leiden); the *Quellenwerke der altindischen Lexicographie* of the Vienna Academy; or the verbatim edition after the MS. of Middle High German poems, *Die grosse Heidelberger Liederhandschrift*, all of which have been substantially added to during the year. The same is true, again, of numerous text publications in all parts of the field, which perforce appear slowly and by instalments, so that a long series of years is needed to complete them. The report of a single year can be in almost countless cases but the familiar one of "progress."

With regard to work more specifically grammatical, the difficulty is still further complicated by the fact that such material is more than ever fragmentary, and is scattered, often in short articles, through the numerous *Journals and Zeitschriften*, or in the *Proceedings* of learned societies throughout the world. It is only comprehensive works of extended scope that can, for a considerable period of development within the science, even reasonably control the wealth of such material. Such works are in progress in various parts of the field. There is, for instance, in the whole broad subject of comparative grammar the new edition, necessitated by the growth of the subject, of Brugmann's *Grundriss der vergleichenden Grammatik der indo-germanischen Sprachen* (Strasburg); in the special field of Germanic philology the new edition of Paul's *Grundriss der germanischen Philologie* (Strasburg); in Romance philology, Gröber's *Grundriss der romanischen Philologie* (Strasburg);

in Iranian, Geiger's *Grundriss der iranischen Philologie* (Strasburg). All of these are under way, but appear at irregular intervals in parts and fascicles, as the case may be.

The present article, in the face of such conditions as have been indicated, does not attempt an exhaustive bibliography of the philological output of the year. A selection only has been made of important works, that are either complete in themselves, or else exhibit tendencies that are of general or special interest for their bearing upon the development of the science.

An important monograph bearing upon a law of language is by Lionel Horton-Smith, *The Establishment and Extension of the Law of Thurneysen and Havet* (Cambridge). The Thurneysen-Havet Law of the change of Latin *ōv* to *āv* was first formulated in Kuhn's *Zeitschrift*, Vol. XXVIII., and in *Mémoires de la Société Linguistique*, Vol. VI. The present monograph is essentially the reprint of two articles which originally appeared in the *American Journal of Philology*. Its purpose is to extend the application of the law and to establish its chronology. According to the author, as a consequence of a very open pronunciation of the Latin *o* before *u* and *v*, *ov* was changed to *av*, *ōv* to *āv*, *ou* to *au*. This change took place in the latter part of the third century, B. C., among the educated class; not, however, before the beginning of the second century among the lower classes. The change of *ov* to *av* is absolutely proved by the imperative *fove* for *fave* in an inscription of the third century, printed by Bücheler in the *Rheinisches Museum*, Vol. LII. There is no such absolute proof for *ōv* to *āv*, *ou* to *au*, but there is an altogether strong probability of the integrity of the assumed working of the law in its entirety. The Thurneysen-Havet Law is entitled by the establishment of the change of *ov* to *av*, as explained, to be ranged with the already long list of the laws of language as understood by present-day philologists: with Grimm's Law, Grassmann's Law, Verner's Law, Conway's Law, Moulton's Law, Sievers's Law, Paul and Kluge's Law. For concise formulations of these laws of sound change, with illustrative examples, see Clark's *Manual of Linguistics* (New York, 1893). Immediately bearing upon Greek and Latin is the syntax part of Riemann and Goelzer's *Grammaire comparée du grec et du latin* (Paris). Like the Horton-Smith monograph, this has, however, a wider importance for its connection with the whole science of comparative linguistics. Monographs on particular phases of Indo-Germanic philology are: H. Hirt, *Der indogermanische Ablaut* (Strasburg), and E. Audouin, *De la déclinaison dans les langues indo-européennes* (Paris). Of importance for its general bearing upon the whole field is the fact of the completion of the extremely useful dictionary of the Amsterdam professor, C. C. Uhlenbeck, *Kurzgefasstes etymologisches Wörterbuch der altindischen Sprache* (Amsterdam), which distinguishes itself, as did its predecessor, the etymological dictionary of Gothic (1896), for its admirable precision and clarity.

Greek.—The year has seen the completion of the second volume of the important *Sammlung der griechischen Dialekt-Inschriften*, under the general editorship of Hermann Collitz (Göttingen). The present volume contains the Doric inscriptions from North and Middle Greece and the Peloponnesian Achaia, together with its colonies. The greater part of the work is made up of the Delphic inscriptions, upon which alone their editor, Johannes Baunack, has worked for thirteen years. This whole undertaking is one of the most important extended philological labors at present in progress, and in its results will be of the utmost value not only for its bearing upon the history of the Greek language, but upon broader questions of general linguistics. Bearing upon single phases of the history of the Greek language is an able monograph by O. Lagercrantz, *Zur griechischen Lautgeschichte* (Upsala). On Greek metre is a suggestive little work by P. Masqueray, *Traité de la métrique grecque* (Paris).

The most important book of the year in Homer criticism is Victor Terret's *Homère étude historique et critique* (Paris). The author's purpose is to show the futility of the attack made during the last hundred years—namely, since the appearance of Wolf's *Prolegomena*—upon the unity of the Homeric poems. According to him, all such efforts have failed in the light both of the undeniable structural unity of the poems and of the unmistakable testimony of antiquity. Homer to him is a historical person who was born in Smyrna in the tenth century, B.C., and lived a part of his life in Chios. The *Iliad* and the *Odyssey* are both his works—the *Iliad* having been composed in the best period of his maturity, the *Odyssey* in his old age. Both arose without the aid of writing, and only at a later period were written down and spread abroad by rhapsodists. He further insists that they are thorough unities in the sense of Aristotle. To disprove the contrary opinion, he investigates their construction, particularly as compared with other long poems, and considers in detail the arguments that have been brought against them. In carrying out his investigation, the author takes account not only of the writings of Wolf, Lachmann, Kirchoff and the rest, whose work stands in the front row of Homer criticism, but of out-of-the-way monographs and articles in the philological journals. Four maps are given

to illustrate the text, and beside other illustrations there is a facsimile of the papyrus *Louvre No. 3*, and a specimen extract from the *Iliad picta*. Not the least valuable part of the book is the bibliography at the end, which contains not only a short description of the principal manuscripts and the oldest editions of the poems, but also a chronological view of the whole Homer literature since Wolf. The 75 pages devoted to this bibliography show the extraordinary attention and the tremendous amount of labor that has been bestowed within the century upon the Homeric epics.

An addition to the abundant literature of last year on Bacchylides is by Joh. Schöne, *De dialecto Bacchylidea*, an inaugural dissertation published as a number of the *Leipsiger Studien*. The monograph is a systematic consideration for the first time of the language of the newly discovered fragments of the poet whose renaissance has attracted such widespread attention.

One of the most important publications of the year is the second volume of the Egypt Exploration Fund material, *The Oxyrynchus Papyri*, edited with translations and notes by B. P. Grenfell and A. S. Hunt (London). This second part does not yet exhaust the material found in Oxyrynchos alone, in that some three-fifths still remain to be deciphered. Some of the principal contents of the volume are: No. 208, the badly mutilated parts of a papyrus of the third century, which contained the gospel of John; No. 211, fifty-four verses of Menander, tolerably well preserved, forming nearly the entire close of one of the comedies and containing many marginal notes as to the entrance and exit of the actors; No. 212, fragments of Aristophanes; No. 215, prose of an Epicurean, possibly of Epicurus himself; No. 220, a treatise on metrics, with citations of verse, in part new, in a MS. which appears to be from the beginning of the second century; No. 222, fragments of a complete list of the Olympic victors in the years 480, 476, 472, 468, 456, 452, 448—namely, just at the time of Pindar and Bacchylides; No. 223, considerable fragments of the *Iliad*, without particular value; No. 224, fragments of Euripides's *Phænissa*; No. 225, a small fragment of Thucydides; No. 226-227, fragments of Xenophon's *Hellenica* and the *Œconomics*; No. 228-229, fragments of Plato's *Laches* and *Phædo*; No. 230-233, parts of Demosthenes's *De corona* and *c. Timocratem*. The book also contains non-literary material; among the most important is a petition, from the time of Commodus, directed to the Prefects by Dionysia, in the matter of a suit brought against her by her own father. Although this second volume contains but little new material in actual literature, it is, nevertheless, like its predecessor, of the utmost value not only for its wide bearing upon our whole knowledge of antiquity, but in a narrower way upon text criticism, grammar, and phonetics. A work belonging to the same category is *Greek Papyri (B.C. 100 to A.D. 700) in the British Museum*, edited by F. G. Kenyon (London). The book, the second volume of the work, contains a catalogue with texts. The accompanying *Atlas of Fac-Similes* has no less than 123 plates. The same author publishes this year *The Palæography of Greek Papyri* (Oxford, Clarendon Press), which contains as comprehensive an account as it is possible at this time to give of the results of the recent extraordinarily fruitful labor in this field. The book considers the preparation of the papyrus, the size of the rolls, the codex form, accentuation, word separation, and abbreviations. Three periods of non-literary papyri—which on account of their documentary character are in the main readily dated—are to be distinguished: the Ptolemaic, for which the form of the Ξ , made up of three unconnected lines, is an unmistakable criterion; the Roman, with its rounded forms, and the Byzantine. Accompanying fac-similes illustrate these differences. On the basis of this knowledge, furnished by the non-literary papyri, the literary, which sometimes are written on the back of the others, are dated. These belong exclusively to the Ptolemaic and the Roman periods; no literary papyri whatever appear in the Byzantine period, since parchment then wholly takes the place of the other material. The alphabets of the literary papyri are illustrated. Another work of the year in paleography that may be mentioned in this connection is Ch. Reusens's *Éléments de paléographie* (Paris).

E. Legrand and H. Pernot in *Chrestomathie grecque moderne* (Paris) have put together a number of reading extracts intended as an introduction to the popular language of modern Greece.

Latin.—In Latin one of the most important text publications of the year is the sixth and last volume of *The Correspondence of M. Tullius Cicero*, by R. Y. Tyrrell and L. C. Purser (Dublin). As the sub-title states, the work contains Cicero's correspondence arranged in chronological order, with a revision of the text, commentary and introductory essays by the authors, who have been engaged for twenty years on their edition. The present book includes no new manuscript material, but considers and tabulates new readings with the use of the entire critical literature at hand. The work will remain for a long time to come the definitive one in its special subject.

A number of works of greater or less extent bear upon the history of the Latin language. W. Heraens's *Die Sprache des Petronius und die Glossen* (Leipsic) is a programme. B. Maurenbrecher, in the first number of a series of important investigations

to bear the common title: *Forschungen zur lateinischen Sprachgeschichte u. Metrik* (Leipsc), considers *Hiatus und Verschleifung im alten Lateinischen*. R. S. Conway, in a little book with the title: *Dialectorum Italicarum exempla selecta* (New York and London), brings together for purposes of instruction specimens of the Italian dialects. G. Mohl furnishes new subsidia in his *Introduction à la chronologie du latin vulgaire* (Paris).

A. Cappelli's *Dizionario di abbreviature latine e italiane* (Milano) is, in part, subsidia in a new field. Walter's *Lexicon diplomaticum* is, as is generally recognized, the best aid to the intelligibility of Latin abbreviations in the manuscripts of the Middle Ages, a work to which Chassant's *Dictionnaire des abréviatures latines et françaises* forms at times a useful pendant. This new book, however, not only admirably covers the Latin ground, but puts us into possession, for the first time, of a dictionary of Italian abbreviations. The book contains over 13,000 abbreviations, in connection with which, in every case, the century is given in which the particular form occurs. The book is accurate and altogether useful.

Romance.—A new historical grammar of French has been begun by K. Nyrop, who has issued the first volume with the title: *Grammaire historique de la langue française* (Kjbenhavn). An English translation of Darmesteter has appeared during the year with the title: A. Darmesteter, *A Historical French Grammar*, edited by E. Muret and L. Sudre. English edition by A. Hartog (New York and London). A new edition has also appeared of E. Schwan's *Grammatik der Altfrenchösischen*, revised by D. Behrens (Leipsc). A monograph bearing upon the history of French is H. Bergen's *Die Lehnwörter in der französischen Sprache ältester Zeit* (Leipsc), which considers, as its title indicates, the borrowed words in the oldest period of the language. On French dialects are: Guerlin de Guer's *Essai de dialectologie normande* (Paris), and E. Mâzuc's *Grammaire languedocienne (dialecte de Pézenas)* (Toulouse).

A historical grammar of Spanish is M. E. Torres y Gómez's *Gramática histórico-comparada de la lengua castellana* (Madrid).

What promises to be an extremely valuable addition to existing subsidia for the study of the Rhetoromanic dialects of Switzerland and the adjacent linguistic territory, for what, in short, has been called "the Swiss language," is the dictionary—the first part of which has appeared during the year—by E. Pallioppi, *Wörterbuch der romanischen Mundarten des Ober- und Unterengadins, des Münsterthals, von Bergun und Filisur* (Basel). This dictionary will form an admirable complement to Decurtins's *Rätoromanische Chrestomathie*, which is still under way.

A. Tobler's *Vermischte Beiträge zur französischen Grammatik, 3. Reihe* (Leipsc), contain a number of grammatical monographs which originally appeared in philological journals, for the most part in the *Zeitschrift für romanische Philologie* and the *Archiv für neuere Sprachen*. The book has, as an appendix, the author's rector's address of October, 1890, entitled, *Romance Philology at the German Universities*. In his preface the author vigorously expresses his discontent at the meagre result of his own efforts to enliven the interest in grammatical studies in Germany, and his general dissatisfaction with the whole recent trend toward utilitarianism in the study of the modern languages.

Germanic.—Carl Kraus's *Heinrich van Veldeke und die mittel-hochdeutsche Dichtersprache* (Halle) is an important book bearing upon the history of the German language and literature. The problem for solution is how and why Van Veldeke, a Netherlander, should have become, as he undoubtedly was, the father of the Middle High German Court epic. The character of Van Veldeke's rhymes is in sharp contrast with the usage of the other Middle Dutch poets. The author shows that Van Veldeke, bearing in mind the High German public to whom he wished to appeal, consciously avoided wherever it was possible all peculiarities in rhyme that were specifically Dutch, although it is apparent that this could not be done invariably. The exigencies of rhyme play here, from the nature of the case, an extremely important rôle, and not infrequently the poet, in spite of his desire to avoid them, was obliged to use dialectic combinations to express his thought. This conscious normalization of his language is particularly apparent in his epics. His lyrics, however, are written in his own Limburg dialect. The normalization of his language rendered it readily acceptable in Germany; it brought in its wake, on the other hand, a considerable number of Low German elements, which then found their way into the language of the Middle High German poets.

A work of a kind that stands, it may be, apart from work truly philological, and yet is of extreme importance for its bearing upon the present and future history of language development, is Paul Horn's *Die deutsche Soldatensprache* (Giessen). As student life has its own by no means inconsiderable vocabulary, so army life has evolved a vocabulary that to a certain extent is peculiar to it. It follows as a matter of course, however, that not all words that differentiate such a soldier vocabulary, whether it be German or English, from the normal language are specifically army

evolutions. Every such vocabulary of a class or a calling will necessarily contain, together with its own special creations or adaptations, elements from other non-literary sources: common slang, thieves' jargon, student terms, popular expressions, and the like. Such a soldier language will inevitably have, too, its influence upon the others, and also upon the literary language by their ultimate adoption of its expressions. A work like this in inherent kind is by B. E. Gent, *New Dictionary of the Terms, Ancient and Modern, of the Canting Crew in its Several Tribes of Gypsies, Beggars, etc.* (London).

D. C. Hesselings's *Het Afrikaansch* (Leiden) is, as its subtitle states, a contribution to the history of the Dutch language in South Africa, which subject, apart from its inherent philological interest, has acquired a specific interest from the Anglo-Boer war in this very territory. This is not the first work in the same field. Its author has used material from Manjvelt, Schuchardt, Viljoen, and te Winkel, but has also collected a mass of new material from newspapers and from manuscript documents of the earlier Dutch Cape government in the archives at The Hague. The results of the author's investigations are as follows: The great majority of words and forms is from the dialect of North Holland, brought by the first colonists from their mother country. The terms for objects and acts which belong only to their new home have been taken pre-eminently from the Hottentots and Kaffirs. A slight accession to their vocabulary they owe to the French Huguenots, who came in after 1688 as a consequence of the religious persecutions of Louis XIV. A number of vigorous and abusive terms have come in from High German, in that a large number of German soldiers and officials have always been in the service of the Cape government. A considerable body of expressions has been borrowed, too, from the Malayan-Portuguese dialect, which since the sixteenth century has been, like the *lingua franca* of the Mediterranean, the language of commerce in all the important seaports of the Indian Ocean and the medium of communication between the slaves who were brought into the country from all parts of Africa and India. In late years the language has naturally and irresistibly been influenced by the continually growing use of English in all parts of South Africa. This is such a monograph as sometime will be written on the history of the English language in America.

Slavonic.—New works in the Slavonic field important for their general bearing are: W. C. Morfill's *A Grammar of the Bohemian or Czech Language* (London) and the first part of a Polish grammar, A. Soerensen's *Polnische Grammatik* (Leipzig).

Journals in the field of Indo-Germanic philology published in America are: *American Journal of Philology* (Baltimore), quarterly, Volume XX. in progress; *Modern Language Notes* (Baltimore), monthly, Volume XIV. in progress; *Journal of Germanic Philology* (Bloomington), quarterly, Volume II. in progress; *Americana Germanica* (Philadelphia), quarterly, Volume II. in progress.

Series of monographs in this field in America, in which issues appear with more or less regularity are: (Harvard), *Studies in Classical Philology*; (Harvard), *Oriental Series, Studies and Notes in Philology and Literature*; (University of Pennsylvania), *Series in Philology, Literature, and Archaeology*; (University of Wisconsin), *Series in Language and Literature*; (University of Chicago), *Studies in Classical Philology, Germanic Studies, English Studies*; (Cornell), *Studies in Classical Philology*.

The *Publications of the Modern Language Association of America* (see MODERN LANGUAGE ASSOCIATION OF AMERICA) are contained in Volume XIV., made up, like its predecessors, of a number of monographs. The American Philological Association issues its yearly volume of *Transactions and Proceedings*.

PHOSPHATES. In 1898 the phosphate rock produced in the United States amounted to \$3,453,460, distributed as follows: Florida, \$1,847,796; South Carolina, \$1,107,272; Tennessee, \$498,392. Of the Florida output, amounts valued at \$360,505 were exported to various countries of the world, some of it going as far as Australia. C. W. Hayes contributes an article on the Tennessee Phosphate Fields to the Twentieth Annual Report of the United States Geological Survey.

PHOTOGRAPHY. In color photography, three negatives of the subject are made: one through a colored screen, allowing only the red rays to pass; one through a screen allowing only the blue rays to pass, and a third through a screen allowing only the yellow rays to pass. In 1899, Mr. Frederick E. Ives invented an instrument he calls the kromscop. This contrivance has on its surface three glasses, red, blue, and green, against which are placed the corresponding images of the color record. Below the colored glasses, within the instrument, are transparent reflectors of colored glass, and without is a reflector for throwing light into the interior of the instrument. When looking through the eyepiece, set like the eyepiece of a stereoscope, the different images are apparently seen in the same place with the result of a single image in solid relief and in the natural colors.

PHOTOTHERAPY. Dr. Finsen, of Copenhagen, has devised recently a method of applying light for therapeutic purposes, founded on the following data: (1) The bactericidal property of the chemical rays of light; (2) the power of the chemical rays of light to produce an inflammation of the skin (sunburn, *crythema solare*); (3) the power of the chemical rays of light to penetrate the skin. The violet and ultra-violet rays of light obtained from the sun or from an electric arc-lamp will, in a few hours, kill plate-cultures of *bacillus prodigiosus* at a great distance. The so-called sunburn is not a burn. If sunlight or electric light be passed through a layer of distilled water so as to cut out the ultra-red rays (the dark rays of heat), the resulting skin-inflammation is as great as if the light were uncontrolled. If sun light be thrown upon the skin through a glass screen which cuts out the violet and ultra-violet rays, there is no resulting inflammation. To establish the third datum, small sealed bottles, containing muriate of silver, were placed under the skin of some animals kept in the dark, and of some animals exposed to sunlight. An hour later the tubes were removed, and it was found, in every experiment, that the muriate of silver was blackened in the cases of those animals which were exposed to the sun, but not in those kept in the dark. Experiments were made to show that the chemical rays of light penetrate more easily in bloodless tissues than in those filled with blood. A piece of sensitized paper was put against the back of a man's ear, and the blue and violet rays of light were allowed to fall on the front of the ear. No reaction took place in five minutes, the paper remaining unchanged. Replacing the paper and pressing the ear closely between two glass plates, the paper was blackened after 20 seconds' exposure to the same chemical rays. Quoting from the article by Bie, Finsen's assistant, in the *British Medical Journal*: "In the treatment of patients sunlight is used in the summer, when the sky is bright, otherwise the light of electric arc-lamps of 50 to 80 ampères. As already explained, it is only by concentration that the light becomes so powerful that its bactericidal property can be used in treatment. In order to avoid burning the skin it is also necessary to cool the light. This double object—to make the light stronger and cooler—is attained, in regard to the sunlight, by an apparatus consisting of a lens of about 20 to 40 centimetres in diameter. The lens is composed of a plain glass and a curved one, which are framed in a brass ring, and between them there is a bright blue, weak, ammoniacal solution of copper sulphate. As one surface of the liquid is plain, the other one being curved, its optical function is that of an ordinary plain convex glass lens. By making the lens of a blue liquid instead of solid glass a considerable cooling of the light will be obtained, because water absorbs the ultra-red rays, and because the blue color excludes a considerable amount of the red and yellow rays. These three kinds of rays have particularly strong heating effect, while their bactericidal power is insignificant. On the other hand, the blue, violet, and ultra-violet rays, which it is important to procure in as great a number as possible, are but very slightly impaired by passing through the blue liquid. The lens hangs on a foot, made in such a way that the lens can be raised and lowered as well as turned on a vertical and horizontal axis; therefore it is easy to place the lens perpendicularly to the sun-rays, and at such a distance as to make the light strike the area of skin which it is intended to treat. Finsen's apparatus for concentrating the electric arc-light consists of lenses of quartz framed in two brass tubes which can be moved, the one into the other, like the two pieces of a telescope. Lenses of quartz are used because this material in a far higher degree than glass allows the ultra-violet rays of shortest wave-length to pass through, and it is just the ultra-violet rays that have a considerable bactericidal effect. The apparatus for concentrating the sunlight may, on the other hand, be made of glass, because all the ultra-violet rays of the sunlight have a long wave-length, that they can pass through glass; those of a shorter wave-length are already absorbed by the atmosphere.

"In the part of the apparatus which faces the lamp, two lenses are placed that have together a focal distance of 12 centimetres; when the apparatus is placed in such a way that the first lens is exactly at this distance from the points of the carbons of the lamp, they consequently will concentrate the divergent rays coming from the lamp and make them parallel; these rays pass through the brass tubes, at the distal end of which they meet again with two lenses of quartz, which concentrate the parallel rays, making them convergent in such a way that they are united about 10 centimetres outside the outer quartz lens. Between these two lenses there is distilled water, which cools the light by absorbing the intensely heating ultra-red rays, but does not impair the blue, violet, and ultra-violet ones. It is not possible, as in the apparatus for the sun, to make the water blue in order to cool the light further, because the extreme ultra-violet rays, which abound in the electric light, may well pass the quartz, but get absorbed by the blue coloring matters; the advantages of using the lenses of quartz would consequently be lost if the light got cold through a blue solution. Of course the distilled water between the quartz lenses gets heated by

the absorption of the ultra-red rays. In order to avoid too much heating (boiling), cold ordinary water may be run through the mantle surrounding this end of the apparatus.

"Four such apparatus for concentrating are fixed to an iron ring round each lamp, this ring again being fixed to the ceiling by four iron supporters. The lamp is movable up and down by a mechanism, and can be put exactly into the centre of the ring by the aid of four strings, which are connected with screws in the iron support. The apparatus for concentrating hangs on iron arms, fastened to the ring, and depends from this at an angle of about 45° , because the lamp sends out the strongest light in this direction; the apparatus for concentrating can be put nearer to or further from the lamp by sliding on the iron arm. By this disposition the lamp and the apparatus for concentrating can be fixed so that the points of the carbons are exactly in the focus of the front lenses of all the four apparatus. The apparatus for concentrating can be revolved on a perpendicular axis and a horizontal one by three screws; by this they can be so placed that the axis of the apparatus gets fused with the axis of the parallel rays, so that no light may strike the brass cylinders. The distant focus can be placed at the height which suits the patient by pushing the lowest cylinder into the uppermost one of the concentrating apparatus.

"Through the two forms of apparatus for concentrating already described the concentration and cooling of the light are thus affected. But the light is still too warm to be applied to the skin without hurting it; the skin must therefore be cooled in order to avoid burning. This is effected by a little apparatus consisting of a plate of quartz and a plain convex lens of quartz, both framed in a conical brass ring, which carries two small tubes and four arms; to each arm is fastened an elastic band, by means of which the apparatus is pressed against the skin. By making cold water run into one of the tubes and out of the other one, the skin may be cooled to such a degree that it can stand even the strongest light. By the pressure which the plano-convex quartz lens excites on the skin this is made anemic, so that the chemical rays penetrate it much better, as I have described it already.

"In this manner an area of skin of $1\frac{1}{2}$ centimetres in diameter is treated for one hour each day. The treated skin reddens and swells, a bulla may appear, but necrosis has never been observed.

"We have tried to treat different skin-diseases known or supposed to be of microbic origin, but it is only of *lupus vulgaris*, *lupus erythematosus*, and *alopecia areata*, that we have treated a number of cases great enough to estimate the value of the method."

PHYSICAL GEOLOGY. Alexander Agassiz has published a volume on the island coral reefs of Fiji, and shows that the islands of the whole group have been elevated, and then remained nearly stationary, and exposed to a great and prolonged process of denudation and submarine erosion, which has reduced them to their present height. The submarine platforms upon which the barrier reefs have grown are merely the flats left by the denudation and the erosion of the central island. His observations on Fiji intend to emphasize that no general theory can be formulated for all coral reefs. Formerly the Yellowstone Lake had an outlet to the south at Overlook Mountain, but now the lake empties to the north over the great falls of the Yellowstone and through the Yellowstone Cañon, which is very young geologically, and was formed by the backward cutting of the upper waters of Sulphur Creek, an arm of the Lamar River, the cutting having taken place through one of the ridges of the continental divide. Recent studies made of the Triassic of eastern North America indicate that the Virginia-North Carolina Triassic region was an area of maximum stability, or of minimum movement during Triassic time. Tolman discusses the carbon dioxide of the ocean and its relations to the carbon dioxide of the atmosphere. F. P. Gulliver, in a paper on Shore-line Topography, points out the origin of the different coast forms, and suggests a number of new names. Recent movement on the line of a tertiary fault, along the northeastern base of the Lepini Mountains of Italy, has produced a well-defined scarp in places 100 to 200 feet high, and traceable five miles or more.

Among other important publications are: one on the elevated sea margins of northern Europe, by the Finland Geological Survey; Preliminary Notes on the Surface Geology of the Yukon Territory, by O. Nordenskjöld, *American Geologist*, May, 1889; Planation and Dissection of the Ural Mountains, F. P. Gulliver, *Bull. Geol. Soc. Am.*, Vol. X. *The Earth's Sculpture, or the Origin of the Land Forms*, by James Geikie, is a very readable little book.

For several years American geologists have been in the habit of explaining a certain levelness of hill crest in many regions, as, for instance, New England, on the basis of the assumption that they have been worn down to the condition of almost a plain, or peneplain, as it has been called, then elevated and dissected by weathering and erosion. This explanation, which has usually been accepted, has in

the last year been questioned, with the result of bringing forth much desirable discussion, which may result in showing that the theory has not as wide a range of application as formerly supposed.

PHYSICAL SOCIETY, AMERICAN, organized May 20, 1899, for the advancement and diffusion of physical knowledge, held its first regular meeting October 28, 1899. Four regular meetings are to be held each year, ordinarily in New York. Annual dues, \$5; membership, 90. President, Professor Henry A. Rowland; secretary, Professor Ernest Merritt, Ithaca, N. Y.

PHYSICAL TRAINING. The recent introduction of physical training into American public schools makes appropriate, at the present time, some account of the history of physical training in Europe and America. Systematic physical training as a part of the regular public education dates from 1774, though the greatest development has taken place since 1860. In Germany teachers are carefully prepared to give instruction in gymnastics, and are required to pass theoretical and practical examinations, the former both oral and written. The subjects include anatomy, physiology, history of the various systems of gymnastics, and first aid to the injured. Physical training is made compulsory for all pupils in Prussian schools; and in the cities there is much appropriate apparatus supplied, instruction is given in swimming, and skating-ponds are devoted to use of pupils. A regular course of gymnastics begins at as early an age as 6 years, and continues in gradual increase of complexity and difficulty. The course includes free light and heavy gymnastics, fencing, marching, jumping, and climbing exercises, etc., for boys, and for girls the ordinary free gymnastics, class gymnastics, with skipping ropes, dumbbells and wands, marching, balancing and dancing, ball games, jumping, swinging, climbing, and the parallel and horizontal bars. The exercises are often accompanied by singing.

Probably the most famous system of gymnastics is the Swedish, founded by Peter Henry Ling, who was born in Sweden in 1776, and died in 1839. At the age of 24 he was appointed fencing master at the university in Lund, Sweden, and in 1813 in the gymnastic institute of Stockholm. He recognizes four divisions of gymnastics, as follows: (1) Pedagogical gymnastics, by which one learns to bring his body under the control of his own will. (2) Military gymnastics, in which one seeks by means of an external thing, for example, a weapon or by means of his own bodily power, to subject the will of another person to his own. (3) Medical gymnastics, by means of which one seeks either by his own proper posture or with the help of another person, and by helpful movements, to diminish or overcome the ailment which has arisen in his body through its abnormal relations. (4) Æsthetic gymnastics, through which a person endeavors to give bodily expression to the inner being, thoughts, or impressions. He developed his ideas as to the therapeutic value of exercise into what has since become the "Swedish movement cure." The military gymnastics resemble the German gymnastics. In the school physical training, much emphasis is placed on accuracy of movements, and the progress from day to day and from one exercise to another is rational. The Swedish system is gradually growing in favor now in European countries, which previously followed the German system. In the United States the physical training is as yet in a relatively backward state, but a fresh interest is springing up and much progress is being made. Schools for the instruction of teachers of physical training are found in Milwaukee, Springfield, Boston, and Cambridge, Mass., and New Haven, Conn., and there is a number of summer schools. The number of teachers of physical training increased fourfold between the years 1887 and 1896. Public swimming baths and schools and open gymnasiums have been equipped in Boston and Brookline, Mass., and in New York. Not only is more attention being paid to physical training in the public schools of the country, but exercises and games are being taken up in the posts of the regular army, in insane asylums, and, notably, in the Elmira, N. Y., reformatory. Swedish educational gymnastics were largely introduced in Boston by Americans interested in it, and not by the Swedes in this country, unlike the German systems which have been industriously propagated by the many *turnvereins* in the United States.

PHYSICIANS, ASSOCIATION OF, AMERICAN, held its fourteenth annual session at Washington, D. C., May 2-4, 1899. This being a society for the special study of special diseases, nearly all the time was devoted to the discussion of scientific subjects. Officers elected: President, E. G. Janeway, M.D., New York City; secretary, Henry Hun, M.D., Albany, N. Y.

PHYSICS. In this article is given a brief account of some of the important advances that have been made in physics during the year 1899. Each subject is treated in a paragraph by itself with an appropriate heading. Frequent references are given, so that the reader may go to the original publications if he desires. The abbreviations are explained at the end of the article.

DYNAMICS.

Quartz-Thread Gravity Balance.—Professor R. Threlfall and J. A. Pollock have designed and constructed an instrument for measuring variations in gravity from one place to another, which seems to have some great advantages over any previous instruments. In principle it consists of a spring, operating on a mass, the spring tending to move the mass in one direction, while the gravitational attraction of the earth tends to move it in the opposite direction. The spring consists of a horizontal quartz thread stretched between two supports. A small piece of brass wire is fastened at right angles to this thread at the middle. One of the supports to which the thread is fastened is capable of being turned around the axis of the thread, with a divided circle to measure the amount of turning, so that the thread can be twisted. The small piece of brass wire has its centre of gravity a little distance from the thread, and if the thread is twisted through about three complete turns, the wire becomes horizontal. This wire is then acted on by the earth's gravitational force tending to turn it in one direction, while the elastic force of the thread tends to turn it in the other. If the instrument is moved to a different place where the gravitational force is different, the brass wire will move a little from its position, and it will require a little turning of the support at one end to counterbalance this. The amount of the turning is used to measure the difference in the acceleration of gravity at the two stations. It is necessary to keep the instrument at a constant temperature, as the elasticity of the quartz changes with the temperature. There are other precautions and corrections that must be observed, but the authors believe, as a result of a good many tests, that an accuracy can be obtained of 1 part in 500,000 of the value of the acceleration of gravity. The instrument, of course, only measures differences in the acceleration in terms of some standard difference, that must be previously measured by some absolute method, as with the pendulum. —*Proc. Roy. Soc.*, 65, 123, 1899.

Mass of a Cubic Decimetre of Water.—The mass of a cubic decimetre of water has just been measured with a greater degree of accuracy than heretofore. In the metric system (*q. v.*) of weights and measures it is well known that starting with the unit of length, called the metre, it was decided to take for the unit of mass, to be called the gramme, the mass of 1 cubic centimetre of water at its greatest density, which is at 4° Centigrade. As a material standard a mass of platinum was prepared, intended to be the mass of 1 cubic decimetre, or 1000 cubic centimetres of water at 4° C. This mass, which is called the Kilogramme des Archives, is kept in Paris, and is the standard of mass for the metric system. It was made, as was afterward found, a little too large to agree precisely with its intended size. The mass of a cubic decimetre of water, measured in terms of this platinum kilogram, was therefore a little less than a kilogram. The recent accurate measurement of the mass of a cubic decimetre of water, referred to above, was carried out by MM. Ch. Fabry, J. M. de Lepinay, and A. Perot. The point of their experiment consists in an extremely accurate measurement, by a method depending on the interference of light, of the volume of a cube of quartz. The quartz cube was placed between two perfectly plane and parallel pieces of glass, and by means of violet light interference fringes were obtained, which were photographed, and from them the departure of the cube from a perfectly cubical form could be determined. It was necessary also to determine the mass of water at 4° displaced by this cube. Then, of course, the mass of this quantity of water had the same ratio to the volume of the water—that is, the volume of the quartz cube—as the mass of 1000 cubic centimetres of water at 4° has to 1000 cubic centimetres—that is, we have the proportion,

$$\frac{m}{v} = \frac{M}{1000 \text{ cc.}}$$

in which m = the mass of the water displaced by the quartz cube, v = the volume of the cube, and M = the mass to be determined, the mass of 1 cubic decimetre of water at 4° C. The result of their experiment was that at 4° C. the mass of 1000 cubic centimetres of water =

999.9786 grammes = 1 kg. — 21.4 mg.

—*C. R.*, 129, 709, 1899.

HEAT.

Solidification of Hydrogen.—Professor James Dewar, who succeeded last year in liquefying hydrogen, as noted in the 1898 YEAR BOOK, succeeded in 1899 in reducing it to the solid state—that is, in freezing it. This, of course, requires a much lower temperature to be attained than that needed merely for the liquefaction of the gas. This low temperature was brought about by allowing liquid hydrogen to evaporate rapidly under a low pressure, much lower than the atmospheric pressure. The first attempts were made in an arrangement represented in Fig. 1. Liquid hydrogen was placed in a small double-walled test-tube suspended inside

a larger double-walled test-tube, also containing liquid hydrogen. The gas above the liquid was exhausted at a very rapid rate, so that the pressure was only that of 10 millimetres of mercury. This attempt, however, was unsuccessful, as it required too large a supply of liquid hydrogen. It should be stated that the air is exhausted from the space between the walls of the double-walled test-tubes. Vessels of this type are much used in dealing with liquid air and other gases at very low temperatures. The vacuum prevents all conduction of heat.

The next attempt was made with an arrangement as represented in Fig. 2. The vessel *C* was filled with pure, dry hydrogen gas. This vessel was provided with a mercury manometer, and had a long tube, *AB*, which extended downward into the double-walled test-tube containing liquid hydrogen. The pressure of the gas over this liquid hydrogen was then reduced below that of the atmosphere, and liquid hydrogen immediately began to condense in the tube, *AB*. When the pressure reached about 30 to 40 millimetres the liquid hydrogen in the test-tube suddenly changed to a foam-like mass. This was suspected to be solid hydrogen mixed with solid air, which had leaked through the cracks in the corks. The whole apparatus was then turned upside down, to see whether the hydrogen in *AB* had solidified, and as it did not run out, it was assumed that this was the case. By looking at the tube in a strong light, and lowering the pressure still more, the solid mass in the test-tube became more transparent, and then the material in *AB* was seen to be a transparent, ice-like mass. By this apparatus the maximum fluid density of hydrogen was found to be .086, the liquid at its boiling-point under one atmosphere pressure having a density .07. Solid hydrogen melts when the pressure of the saturated vapor reaches about 55 millimetres. The temperature was determined, in the absence of any better way, by two constant volume gas thermometers enclosing rarefied hydrogen. Assuming these to work regularly at such low temperatures, the mean temperature of solid hydrogen was found to be 16° absolute under a pressure of 35 millimetres. The boiling-point is 21° absolute at one atmosphere pressure. The experiments show that solid hydrogen has not a metallic character, as was at one time thought to be probable.—*Nature*, 60, 514, 1899; *C. R.*, 129, 451, 1899; *Ann. Ch. Ph.*, 18, 145, 1899.

FIG. 1.

FIG. 2.

Specific Heat of Water.—The heat capacity of water, like its other physical properties, is one of the most important physical constants, as water is used as a standard in so many calorimetric determinations. The experiments made for the purpose of measuring this have, however, not given results which are sufficiently concordant. This is owing to the difficulty of the experiments, especially the thermometric part of them.

Heat is a form of energy, and in the C. G. S. system the unit of energy or work is the **erg**. This is the amount of work done by 1 dyne, the unit of force, when the point at which it is applied is displaced a distance of 1 centimetre. The specific heat of water, measured in mechanical units, is the number of ergs required to raise

the temperature of 1 gramme of water 1° C. This number is different for water at different temperatures, as the heat capacity or specific heat of water varies with the temperature. At a temperature of 10° C. it is not far from 4.2×10^7 ergs—that is, 4.2 Joules. The fact that the specific heat varies was discovered by Regnault, but H. A. Rowland, of Baltimore, was the first who discovered that it decreased from 0° to about 30° or 40° , and then increased again. The specific heat of water when measured in mechanical units has usually been called the mechanical equivalent of heat, and it is in the experiments made to measure this that the variation of the specific heat with the temperature first became evident. H. L. Callendar and H. T. Barnes have just published the results of some experiments made at McGill University, Montreal, to measure the specific heat of water by a new method. In their method there is a steady current of water flowing through a tube. In the middle of the tube there is a platinum wire, which is heated by an electric current, and a known amount of heat is thus supplied to the water per second. The difference of temperature of the stream before and after it reaches the electrical source of heat is observed by means of a differential platinum thermometer—that is, a platinum thermometer arranged so as to measure merely differences of temperature down to 0.001 . If E is the difference of potential between the ends of the platinum wire

which supplies the heat, C the constant current flowing through the wire, and t the time the current is kept flowing, then by Joule's law ECt is the amount of heat in mechanical units supplied in that time. If M is the mass of water that flows past the instrument in this time t , $\alpha\theta^{\circ}$ the change in its temperature, and J the heat capacity or specific heat in ergs—that is, the mechanical equivalent of heat, as it used to be called, at the mean temperature of the water—then $JM\alpha\theta^{\circ}$ is the amount of heat carried off by the water. A small amount of other heat will be lost by radiation. Let this amount, which can be allowed for, be called H . Then the total amount of heat carried off is $JM\alpha\theta^{\circ} + H$, and this is equal to the amount of heat supplied by the electrical current—that is, we have the equation,

$$ECt = JM\alpha\theta^{\circ} + H.$$

Solving this equation for J , we have its value in terms of quantities which can be measured. On account of the variation in the heat capacity of water a different value of J is found for every different mean temperature taken. The result of their experiments, a preliminary account of which was presented to the British Association for the Advancement of Science, at Dover in 1899, may be gathered from an inspection of the curves plotted in the accompanying diagram. The best previous determinations of the specific heat are shown by the curves marked R_p , which is Rowland's, reduced to the Paris hydrogen scale, and G , which is Griffiths's. Callendar and Barnes's curve comes in between these two, and is flatter than Rowland's. It has a minimum value at 40° higher in the scale. It shows also a much more rapid decrease in going from 0° to higher temperatures. Their results may also be

expressed between 10° and 60° by the following formula, in which S_t is the specific heat of water at t° and S_{40} is the specific heat at 40° , which is thus taken as a unit:

$$S_t = S_{40} \{1 + 0.0000045 (t - 40)^2\}.$$

This formula represents the experiments accurately through the range indicated, to within 1 part in 5000.—*Elect.*, 43, 775, 1899.

Comparison of Platinum and Nitrogen Thermometers.—During the past year a very careful comparison has been made between some platinum resistance thermometers and a nitrogen gas thermometer by Drs. J. A. Harker and P. Chappuis at the International Bureau of Weights and Measures in Paris. The measurement of temperature by platinum thermometers depends on the fact that the electrical resistance of a piece of platinum wire changes with a change of its temperature. When once the manner in which this change takes place for a piece of platinum wire has been ascertained, it is only necessary to subject the wire to the temperature to be measured, as would be done with the bulb of a mercury thermometer when that kind of a thermometer is used, and then to measure its electrical resistance, in order to find out the temperature. H. L. Callendar showed that if we call ρt the platinum temperature, represented by the equation

$$\rho t = 100 \frac{R}{R_1 - R_0},$$

in which R = the resistance of the wire at that temperature ρt , R_1 = the resistance at 100° C. and R_0 = the resistance at 0° C., then the temperature on the air thermometer scale T could be represented by the equation

$$T = \rho t + \delta \left[\left(\frac{T}{100} \right)^2 - \frac{T}{100} \right].$$

In this equation, δ is a constant number for any one piece of platinum wire, but it would in general be different for another piece. This equation holds true with great accuracy for the range from 0° to 600° C. In order to find the value of δ for any particular thermometer, it is necessary to subject the thermometer to three different known temperatures, and measure its resistance at those temperatures. The temperatures selected are usually 0° , 100° , and the temperature of sulphur vapor at a pressure of 1 atmosphere, which is about 445° C. The work of Harker and Chappuis had the important purpose of comparing the scale of some of these platinum thermometers with the nitrogen thermometer of the International Bureau of Weights and Measures, which is, together with the hydrogen gas thermometer, a recognized international standard. During the course of this work the experimenters redetermined the boiling-point of sulphur on the constant volume nitrogen scale, and found it to be 445.27° . Callendar and Griffiths had previously found for the same temperature, expressed on the constant pressure air-thermometer scale, the value 444.53° , which is quite close for a measurement at that high temperature. The experimenters found that the differences between the platinum scale reduced by the formulæ given, and the constant volume nitrogen scale below 100° were exceedingly small. Even at the highest temperatures the differences amount to only a few tenths of a degree.—*Proc. Roy. Soc.*, 65, 327, 1899.

LIGHT.

Zeeman Effect.—Some progress was made during the year 1899 in increasing our knowledge of the Zeeman effect, a preliminary account of which was given

in the YEAR BOOK for 1898. The accompanying diagram gives an idea of the normal Zeeman effect, together with some variations from it as observed in some cases by different observers. The facts about the Zeeman effect so far discovered are briefly as follows: (1) The displacement in any given spectral line is proportional to the magnetic field; (2) different lines in the spectrum of the same element and in different elements have in general different displacements in the same magnetic field. This displacement is not a simple function of the wave length; (3) many lines, instead of becoming triplets when viewed perpendicularly to the magnetic field, become quadruplets or sextets, etc.; (4) there appears to be an important connection between the displacement of a line and the posi-

Along lines of force.					Right Circularly Polarized
					Left Polarized

tion of the line in one of Kayser and Runge's series. On the simple theory of the Zeeman effect, if $\delta\lambda$ is the difference in wave length of the outside lines in the triplet, and if λ is the original unchanged wave length, e the negative electric charge on an ion, m the mass of the ion, H the strength of the magnetic field causing the Zeeman effect, v the velocity of light, and π the number 3.1416, it can be shown that

$$\frac{\delta\lambda}{\lambda^2} = \frac{e}{m} \cdot \frac{H}{2\pi v}.$$

Calling $\frac{\delta\lambda}{\lambda^2}$ the displacement, this equation shows that the displacement, for the same value of the magnetic field, is proportional to the quantity $\frac{e}{m}$. As the displacement is different for different lines of the same element, it is evident that on this theory the quantity $\frac{e}{m}$ must be different for different lines. In regard to the Kayser and Runge series, spoken of above, it has been found, principally through the labors of Kayser and Runge, that many of the lines of the spectra of some of the elements, particularly of the first few of Mendeleef's groups of elements, can be arranged in definite series. Each line represents a particular wave length, of course. If, instead of considering the wave lengths, we consider the frequency, or wave numbers, which are proportional to the reciprocals of the wave lengths, Kayser and Runge found that the equation

$$\frac{1}{\lambda} = A + \frac{B}{n^2} + \frac{C}{n^4}$$

would represent the facts of the case for a great many lines. In this equation, λ is the wave length, A , B , and C are constants for one set of lines, and n is one of the ordinal numbers beginning with the number 3—that is to say, it is possible to find a series of lines whose wave lengths are given by the equation—the constants A , B , and C being the same for all the lines, the different values of λ for the different lines being given by substituting for n in the equation in succession the ordinal numbers 3, 4, 5, 6, etc. In the spectra of the elements sodium, potassium, rubidium, caesium, copper, silver, aluminium, indium, and thallium, two sets of lines can be found whose wave lengths are given by the equation, taking the same values for B and C for both sets, but taking A different—that is, the lines are found in pairs, with a constant difference in the wave numbers of corresponding lines of the pair. Two such sets together form what is called a series—that is, a series of pairs. All the elements mentioned have at least two of these series, and perhaps all other elements would also under suitable conditions. One of the series, called the first subordinate series, has strong but diffuse lines, while the second subordinate series has weaker but sharp lines. The alkali metals, the first four of those mentioned, have in addition a third series, called the principal series. The lines in the principal series are the strongest lines in the spectrum. In some case the series, instead of being composed of a number of pairs, is composed of a number of triplets. Now, in Kayser and Runge's formula, given above, all lines which have the same value of n may be called corresponding lines, unless they are members of the same pair or the same triplet in a series. So far as the investigation has gone up to the present time it seems to be a law that the displacement $\frac{\delta\lambda}{\lambda^2}$ has the same value for corresponding lines in the different series of the same element and even in different elements, and the lines are modified in the same way. As an example, consider the case of the three elements magnesium, cadmium, and zinc. Let us consider the second subordinate series in each element. These series are made up of triplets, each triplet corresponding to a certain value of n , B and C remaining the same, but A being different for the different lines of the triplet. Consider in each element the triplet corresponding to the value 3 of n . The following table, given by T. Preston, gives the wave length of the lines, the value of $\frac{\delta\lambda}{\lambda^2}$, which is proportional to $\frac{e}{m}$, and a statement of the character of the lines when they are modified by the magnetic field.

Magnesium.	Cadmium.	Zinc.	Displacement.	Character.
5183.8	5086.0	4810.7	18.0 approx.	Diffuse triplets.
5172.8	4800.0	4722.0	11.5	Quartets.
5167.5	4678.0	4680.0	10.0	Pure triplets.

The wave lengths are given in Angström units (10^{-10} metres). This relation at present is not very enlightening, it is true, but it is, no doubt, the first step in the way of unravelling some of the peculiarities of the Zeeman effect.

No satisfactory theory to explain these more complicated kinds of Zeeman effect has yet been put forward. Some writers, such as Stoney, Lorentz, Larmor, and Voigt, have shown that disturbing forces in addition to the magnetic force considered in the simple case were sufficient to cause the effects observed on the spectral lines—that is to say, they have produced equations which show the changes in the period actually observed—but there is no theory or explanation given as to what kind of a mechanical system is sufficient to show such effects when placed in a magnetic field. It amounts to having the equations without being able to interpret them in terms of the facts.—*T. Preston, Phil. Mag.*, 47, 165, 1899.

Becquerel Rays.—The new radiations recently discovered by H. Becquerel (see YEAR BOOK, 1898), and called after his name, and which are similar to the Roentgen rays in many of their properties, have been the occasion of recent interesting discoveries. Last year M. and Mme. P. Curie, by means of them, discovered two new elements in the mineral pitchblende, and called them polonium and radium, elements almost identical in many of their properties with bismuth and barium respectively. During this year, 1899, M. Debiegne, working under the direction of M. and Mme. Curie, has discovered a third new substance, probably an element, whose chemical reactions are mostly like those of titanium, but whose radio-activity is 100,000 times greater than that of uranium.—*C. R.*, 129, 593, 1899.

Mme. S. Curie has continued her researches on the element radium, resembling barium in all its chemical compounds, and by taking advantage of slight differences of solubility, has obtained salts of the element which are pure enough to determine the atomic weight. The atomic weight of barium was determined at the same time and by the same method, and was found to be 137.8, which is close to the accepted value. The atomic weight of radium, however, is considerably larger, being 145.8. If the salts she used were not pure, it may be even larger than this. It was necessary, in order to isolate enough of the radium salt to experiment with, to work over half a ton of uranium residues from a factory. The compounds of radium have a greater radiating power for Becquerel rays several days after they are formed from precipitation than they have at first. This fact was also discovered by Giesel.—*C. R.*, 129, 760, 1899.

M. Eugene Demarçay has continued his observations of the spectrum given by the new radio-active compounds. He has found a number of new spectral lines belonging to the new element, of which the following are the strongest. The numbers represent the wave length in Angstrom units, 10^{10} metres. 4826.3, 4683.0, 4340.6, 3814.7, 3649.6.—*C. R.*, 129, 716, 1899.

M. and Mme. P. Curie have also discovered the remarkable fact that a great many substances which are not radio-active themselves, if exposed to the radiations from radium compounds, become somewhat radio-active, this property lasting some time after they have been removed from the influence of the Becquerel rays. The substances tried were zinc, aluminium, brass, lead, platinum, bismuth, nickel, paper, barium carbonate, and bismuth sulphide. Curiously enough, all these substances seemed to have the property in about the same degree. The induced radio-activity decreases gradually, and two or three hours after the exposure it is reduced to one-tenth of its original value.—*C. R.*, 129, 714, 1899.

These Becquerel rays from the radium compounds also produce certain chemical effects. M. Demarçay discovered accidentally that they changed oxygen into ozone. M. and Mme. Curie also discovered that they produced a discoloration of glass. If a radium salt is placed in a glass flask, at the end of ten days the bottom of the flask is colored nearly black. When the coloration is not so intense, it is seen to be violet. The radiations also produce a brown coloration of barium-platino-cyanide. When this salt is first exposed to the Becquerel rays it becomes quite strongly fluorescent, but it gradually changes to a yellow, and then to a brown color, and at the same time becomes much less fluorescent. If the salt is exposed to sunlight, it turns white again, and regains its original fluorescent property. This same property was discovered by Villard in the case of Roentgen rays.—*C. R.*, 129, 823, 1899.

H. Becquerel experimented with a sample of radium chloride given him by M. and Mme. Curie, testing the phosphorescence of a number of bodies after they had been exposed to the radiations. He found that different bodies acted very differently under these radiations, and that by interposing different kinds of screens, which were partially transparent to the rays, he could get effects on the bodies which did not have the same relation to one another as when no screens were interposed. This shows that the radiations are not all of the same kind, but that, as in the case of light, there is a number of different kinds of radiations which are absorbed differently by different substances.—*C. R.*, 129, 912, 1899.

Becquerel also made some experiments as to the effect of a strong magnetic field on the Becquerel rays. He finds a very marked effect in the case of the radiations from the compounds of the element radium, but no visible effect in the case of the polonium compounds. Becquerel's experiments show some very curious effects, but

without going into a detailed description of them, it may be said that he decides from them that the radiations when in a magnetic field act in a manner very similar to that in which the cathode rays act under similar circumstances. The cathode rays, it will be remembered, are the rays produced in the inside of a Crookes's tube when an electric discharge is passed through it, and they are shot out from the cathode at right angles to its surface. The general opinion at present is that these cathode rays are particles of matter charged with negative electricity. If a charged particle of matter is moving in a magnetic field in a direction perpendicular to the lines of magnetic force, it is acted on by a mechanical force perpendicular to both the direction of its motion and to the lines of force. This force, of course, continually deforms its path, so that it will not be a straight line. The radium radiations in a magnetic field act as if they were such charged particles. Becquerel tried to get an observable deflection of these rays from radium in an electrostatic field, but was not able to do so. He says that if we consider a magnetic field to be similar to a medium possessing gyrotory motion, and if we take some of his measurements made previously on rotary magnetic polarization, which give for the angular velocity of these vortices, $2\pi \times 6.6 \times 10^9$ per second, the velocity of the radiations from radium can be measured from the results of his experiments, and it is found to be of the same order of magnitude as the velocity found for the cathode rays. These results are very remarkable, and if they can be relied on, we have in them a peculiar case of cathode rays in air at ordinary pressure, and without there being any electric discharge of the ordinary kind through the air. Further experiments with these rays and the substances producing them cannot fail to be of great interest.—*C. R.*, 129, pp. 996 and 1205, 1899.

Spectroscope of Fixed Deviation.—MM. Ph. Pellin and A. Broca have devised a spectroscope of fixed deviation, as they term it, which may be a useful addition to the laboratory.

In place of the usual 60° prism, they use one having angles like those represented in the diagram. The angles are, $A = 75^\circ$, $B = 135^\circ$, $C = 60^\circ$, and $D = 90^\circ$. The light enters at the face AD , is totally reflected from the face AB , and goes out at the face DC . The properties of this prism are such that every ray of light which falls on it at the angle of minimum deviation finally comes out at right angles to its original path. With such a prism on the spectroscope, all parts of the spectrum can be seen in the position of minimum deviation by simply revolving the prism. Several of these prisms can be combined in the most convenient manner, so that the collimator and telescope can have any angle that is a multiple of 90° .—*Journ. de Phys.*, 8, 314, 1899.

ELECTRICITY.

The Nature of Electrification.—To understand the possibility of ever getting at an explanation of the nature of electrification, we must consider what an explanation really is. In physics and other sciences, an explanation is in effect a showing of what is not evident at first, that the thing explained belongs to a class of things already familiar, or at least to a class the individuals of which are alike in some respect, even though outwardly different. In this sense the atomic theory of matter and the kinetic theory of gases is an explanation. The kinetic theory of gases, for example, explains how the heat energy of a gas, which seems a thing of its own kind, is really a particular case of ordinary kinetic energy. The pressure of a gas is explained as really a particular case of a force produced by impact, in this case the constant force produced by the continual impact of an extremely large number of small particles. In this same sense we may hope to arrive at an explanation of electricity and of electrification. Our knowledge of electricity at present, so far as what may be called its engineering aspect, is very complete, as complete, in fact, as our knowledge of matter. There is a great deal still to be learned about electricity, and also about matter, but it cannot be said to be mysterious in the sense of a hundred years ago, or of ideas belonging intellectually to that period, when everything otherwise unexplained was "explained" by ascribing it to electricity or magnetism. It was doubtless in the hope of finding out something about the nature of electrification, and of the connection between matter and electricity, that guided the genius of J. J. Thomson, Cavendish professor of experimental physics in the University of Cambridge, England, to the study of the discharge of electricity through gases. His experiments have continued for many years, and at last he seems to be coming within sight of the goal, if it is possible to conceive of

there being an ultimate goal in science. It is impossible here to give more than an outline, necessarily incomplete, of the present state of the investigation, together with the recent most interesting and important discoveries.

One of the first facts discovered was that when a gas conducts electricity the process is quite similar to that which takes place when an electrolyte conducts. That is, some of the molecules of the gas are dissociated into two ions; to take a simple case, one of which is charged positively, and the other negatively. Ion is the name applied to such charged particles, which are not necessarily identical with atoms. When a gas with such ions in it is subjected to an electrostatic force, conduction takes place by means of the positive ions travelling in the direction of the force, and the negative ions in the opposite direction. In its normal state a gas is not ionized, and is not a conductor of electricity, but is, so far as we can tell, a perfect insulator. There are many different ways in which a gas may become ionized. The gases which come off from a flame, or from the electrodes when an electric current is passing through an electrolyte, or the gas in the neighborhood of a glowing platinum wire, or in the neighborhood of a polished metal plate on which ultra-violet light is falling, or a gas through which Roentgen or Becquerel rays are passing, or the gas near where electric sparks are passing, or near an electric arc—in all these cases the gas is ionized more or less. When a gas is ionized, it not only conducts electricity, but it affords facility for the condensation of water-vapor out of even an unsaturated state. If dust-free air, which has water-vapor in it, is suddenly expanded until it would be naturally supersaturated, if there are any ions present they form nuclei on which the water condenses in the form of a cloud. This effect would not take place with the same degree of expansion if there were no ions present. If electrified air is introduced into a vessel containing air that has a certain amount of water-vapor mixed with it, even if the water-vapor is not saturated, there is formed a cloudy condensation on the ions. Negative ions condense water on them more readily than the positive ions do. (See paragraph on Atmospheric Electricity.) The questions which J. J. Thomson's experimental skill has enabled him to solve are, What is the ratio between the charge of an ion and the mass of the ion? and finally, What is the actual charge, or the actual mass of an individual ion? Of course, a knowledge of the ratio of the charge to the mass together with a knowledge of the actual charge on each ion gives at once the mass of the ion.

Thomson first in 1897 made a measurement of the ratio $\frac{e}{m}$, e denoting the charge on an ion and m denoting the mass of the ion. He made this measurement in the case of the cathode rays, which are the rays found in a Crookes tube when an electric discharge is sent through it, and are believed to be streams of negatively electrified particles shot off from the cathode at right angles to its surface. His method of measuring the ratio depends on the fact that the path of the cathode rays, normally straight lines, becomes curved when they are subjected to a magnetic field. This curvature depends on the strength of the field, the velocity of the particles, and the ratio to be measured. A year later, in 1898, he succeeded in measuring the charge e contained on a single ion in the case of a gas ionized by the Roentgen rays. He made this measurement by taking advantage of the condensation of water-vapor on the ions in the form of a cloud in the manner to be described shortly. This year, 1899, however, he has succeeded in measuring the ratio $\frac{e}{m}$ and the charge e in the same case, which makes the results of much more value than the separate results heretofore had been. The measurements were made in the case of a polished zinc plate, negatively charged, on which ultraviolet was allowed to fall. The method of measuring $\frac{e}{m}$ was in brief the following. The zinc plate was placed in a gas at the low pressure of about .01 millimetre of mercury, because then the motions of the ions did not interfere with one another, the mean free path of the molecules being quite large. The zinc plate is charged with negative electricity, because only in this case do the ions get removed from the neighborhood of the plate. They are repelled and move away from it at right angles, under the influence of the electrostatic repulsion. He produced a magnetic field which was parallel to the surface of the plate. The effect of this was to make the charged particles move in cycloids instead of in straight lines perpendicular to the plate. The particles would move away from the plate for a while and then would move toward it again. He found by calculation that if he knew the strength of the electrostatic and of the magnetic field, and the greatest height of the cycloid above the plate, he could calculate the ratio $\frac{e}{m}$. He found the greatest height of the cycloid by placing near the zinc plate and parallel to it another perforated plate. When this was nearer to the zinc plate than the height of the curves, the ions continually carried electricity from the charged plate to the perforated one. When the perforated plate was moved farther away than the height of the cycloids, it ceased to receive any of the electricity. His experiments made in this way gave as a result a mean value for $\frac{e}{m}$ of 7.3×10^{10} , in which e is measured in C. G. S.

electromagnetic units and m in grams. He had previously found for this ratio in the case of the cathode rays 5×10^4 . Lenard found for the case of the cathode rays 6.4×10^4 . Thomson next measured the charge on the individual ions. His method depended on the property of the ions by which they condense moisture out of the air. By allowing the air where the ions are to become nearly saturated with water-vapor and then suddenly expanding it, a cloudy condensation is produced. The cloud was allowed to settle, and the rate at which it fell was measured. From the rate of fall and the known viscosity of the gas, he calculated the diameter of each drop. From the amount of expansion he calculated how much water should be condensed per cubic centimetre, and combining this with the size of the drops, he deduced the number per cubic centimetre. This was the number of ions per cubic centimetre. He also measured the current produced in the gas by a known electromotive force, and from these, together with the velocity of the ions previously measured by Rutherford, he was enabled to deduce the value of e . His experiments gave a mean value of 6.8×10^{-10} in C. G. S. electrostatic units or 2.3×10^{-20} in electromagnetic units. For the ions produced by Roentgen rays he had previously found the value 6.5×10^{-10} . Towsend has shown that this charge is the same as that on the hydrogen ion in electrolysis. The charge e being the same as in electrolysis, if the mass m were also the same the ratio $\frac{e}{m}$ would be the same. But the ratio $\frac{e}{m}$ is not the same. For the hydrogen ion it is about 9600 in electrolysis, using electromagnetic units and grams, in round numbers say 10^4 . Therefore the mass of the ion in the case of the ionized gas is smaller than the hydrogen ion in electrolysis by the factor 1.4×10^{-3} . This is a remarkable result, as the hydrogen atom, which, when charged, becomes the ion in electrolysis, is the smallest portion of matter that we have previously had any experience of. It brings J. J. Thomson to his new working hypothesis as to the nature of electrification in the case of a gas, or, indeed, of matter in any condition. Quoting mostly his own words, he regards the atom as containing a large number of smaller bodies which he calls corpuscles. These corpuscles are equal to each other, and the mass of a corpuscle is the mass of a negative ion in a gas at low pressure—that is, it is about 3×10^{-26} grams. In the normal atom this assemblage of corpuscles forms a system which is electrically neutral. Electrification of a gas is the splitting up of some of the atoms, resulting in the detachment of a corpuscle from some of the atoms. The detached corpuscles behave like negative ions, each carrying a constant negative charge which he calls for brevity the unit charge. The part of the atom left behind behaves like a positive ion with a unit positive charge, and a mass large compared with that of the negative ion. The corpuscles are the vehicles by which electricity is carried from one atom to another. We are thus led to the conclusion that the mass of an atom is not invariable. The amount by which it may vary depends on the charge of electricity it can receive. So far as we know, the greatest charge an atom may receive is the unit charge multiplied by the valency of the atom. It is probable in the case of a gas ionized by Roentgen or Becquerel rays, that not more than one corpuscle becomes detached from a single atom. It does not follow, however, that there may not be more corpuscles left behind which could be detached by more powerful means. In the case of the Zeeman effect, the ratio of the charge to the mass is of the same order as in the case of an ionized gas. If there were only one or two corpuscles in the atom it would be expected that only one or two lines in the spectrum would show the Zeeman effect. As there is, however, in most cases a considerable number of lines which show the Zeeman effect, it may be concluded that there is a considerable number of corpuscles in the atom giving the spectrum.

If these views of J. J. Thomson become finally accepted, and prove themselves able to meet all the criticism that will be made, there is no doubt that they will mark an epoch in our knowledge of the nature of electricity and of the connection between electricity and matter. It is for this reason that so much space has been devoted to them here.—*J. J. Thomson, Discharge of Electricity through Gases, New York, 1898; Phil. Mag., 46, 528, 1898, and 48, 547, 1899.*

Wehnelt Interrupter.—The Wehnelt interrupter, or electrolytic break, is a device which has occasioned considerable interest during the past year. It is named after its inventor, A. Wehnelt, of Charlottenburg, Germany. It is a device for rapidly breaking and making again an electric current, and its principal use is in connection with the primary circuit of an induction coil. The induction, or Ruhmkorff coil, consists of two coils of insulated wire, a short coil of coarse wire and a long coil of fine wire, wound around the same core of iron wire in the form of a spool, the coarse wire being inside. When a current in the primary circuit, which is the short coarse wire, is suddenly broken, an induced current is suddenly produced in the secondary circuit, and this current has an enormous electromotive force so that it will spark across an air gap. The more frequently the primary circuit is broken,

the more frequently the spark in the secondary is obtained. The more suddenly the primary is broken, the greater the electromotive force of the secondary, and the greater distance will the spark leap across the spark gap. The means heretofore used for breaking the primary circuit have been purely mechanical. The Wehnelt interrupter is very simple, and consists of an electrolytic cell inserted in the circuit, one electrode, usually the cathode, being quite large, and the other one, the anode, being quite small. This arrangement brings about a great current density at the anode and a great production of heat. Little bubbles of gas and steam are continually being formed, which break the circuit for a moment, and then collapsing, or moving away, allow it to be continued again. In contrast with the old mechanical breaks, which gives only a few breaks per second, the Wehnelt interrupter will give so many as to make a musical note, in some cases as many as 2200 per second. This gives a note not far from the C two octaves above the middle C of the piano. The effect of this on the spark gap of the secondary circuit is quite remarkable. The sparks succeed each other so rapidly as to make an arc which looks like a thread of flame. The best electrolyte to use for the purpose, as Wehnelt found, after trying a good many, is sulphuric acid of a density 1.16 to 1.2. A lead plate may be used for the large cathode, but for the small anode it is necessary to use platinum wire. All other metals are too rapidly disintegrated. The platinum wire used for the small anode is usually introduced into the electrolyte through a glass tube, out of which it projects for a short distance. The gases produced at the large electrode are those usually produced in the case of electrolysis, but this is not the case at the small anode. At the anode, when sulphuric acid is used for the electrolyte, there is produced an explosive mixture of oxygen and hydrogen, instead of oxygen alone, as might be expected. In order to operate the interrupter, it is necessary to have a voltage not less than 12 volts, and it works better with considerably greater. As the voltage is increased, the frequency of the interruptions becomes greater. Decreasing the self-induction of the circuit also has the same effect. When the temperature of the cell is increased above 70° C. it does not work so well. The sparks in the secondary of the induction coil becomes shorter. Wehnelt made a study of the current curve, which shows how it varies with the time, and he found that it decreased almost instantaneously to zero when the break was made. It immediately, however, increases again, but at a much slower rate, to its maximum value, and then breaks again, and so on. The current curve is changed a little by the presence of the secondary when the interrupter is placed in the primary circuit of an induction coil.

Various forms of the interrupter have been constructed, but the main principle is the same—that is, to have a large current density at one electrode and a small current density at the other. The interrupter enables induction coils to give out much longer sparks than they are constructed to give. For use with Roentgen ray tubes, if the electrodes are large enough to stand the current the interrupter is very valuable, as with it a Roentgen ray photograph can be obtained in a fraction of a second. It is also of great use in getting the spark spectra of substances. It can also be used with an induction coil in the preparation of ozone. On account of the extremely rapid sparking produced in the secondary by its means, the interrupter can be used to make some striking and interesting experiments which illustrate the heating effect of the electric spark, and the effect of a magnetic field on it.—*Wied. Ann.*, 68, 233, 1899.

Atmospheric Electricity.—In this subject there is still a great deal to learn, but a certain amount of light has been thrown on parts of it during the year. Atmospheric electricity includes, of course, lightning and the aurora borealis, but atmospheric potential is the phenomenon most usually considered under the name, probably because it is easier to investigate than the others. The electric potential at any point in the air, like the electric potential anywhere, is measured numerically by the amount of mechanical work that would be necessary to move a unit positive charge of electricity from the earth to that point against the force of electric repulsion. A positively charged body repels another positively charged body, and therefore it takes mechanical work to move a unit positive charge from the earth toward any positively charged body. In moving the charge in this way against the force of repulsion it is moved into positions of continually higher and higher potential. It is possible by means of appropriate instruments to determine the potential of points in the atmosphere that can be reached by our instruments. In clear weather points above the ground are usually at a higher potential than the ground itself, and the potential increases with the distance from the ground. This fact indicates that the surface of the earth at such times has a negative charge, while somewhere above the surface of the earth there is a positive charge. Until recently there was no information as to where this positive charge was, whether on the other heavenly bodies or in the upper layers of the atmosphere. Recent experiments by Bornstein, Baschin, and Cadet in balloons have shown that the potential at a height

greater than 1000 metres does not increase at so rapid a rate, the rate of increase apparently growing smaller and smaller. This indicates that some at least of the positive charge is distributed in those parts of the atmosphere.

There is on the average a somewhat regular variation of the atmospheric potential on clear days. Chauveau has investigated a number of records of meteorological observatories in which the atmospheric potential has been observed continuously, and has come to certain conclusions, which will doubtless help in time to explain the origin of atmospheric potential. He finds that on clear days when there are no accidental circumstances to disturb the indications there are two kinds of curves formed, one of which is characteristic of summer and the other of winter. In summer, at stations near the ground, and at all times at stations in the tropics, there are two maxima and two minima each day. The maxima come at 7 to 9 A.M. and 6 to 8 P.M. The minima come at about 4 A.M. and 3 P.M. In winter, on the other hand, the afternoon minimum becomes faint and disappears, while the early morning minimum becomes of comparatively much greater importance. These curves can be shown from the records of the Central Meteorological Bureau in Paris. At the top of the Eiffel Tower, only a few hundred metres distant from the bureau, the curves of summer show a great analogy to those of winter at stations near the ground. Chauveau concludes that an influence of the soil, the principal factor of which, he thinks, is the evaporation of water-vapor, comes in as a perturbing cause in hot weather. The general law, which comes out clearly at the elevated stations in all seasons, and at all stations in the winter time, is a simple oscillation, with a maximum in the daytime and a minimum between 3:30 and 4:30 in the early morning.

Another discovery, made by C. T. R. Wilson, and communicated to the Royal Society of London in June, 1899, is that negatively charged ions condense water on them more readily than do positively charged ions. (See paragraph on the Nature of Electrification.) Dust-free air, saturated with water-vapor, according to Wilson's experiments, must expand in the ratio 1.25, in order to make the water condense on negative ions, while it must expand in the much greater ratio, 1.31, in order to make the water condense on the positive ions. In the first case, the supersaturation is fourfold and in the latter case it is nearly sixfold. If, then, it should happen that in the upper regions of the atmosphere there were free ions charged with both kinds of electricity, the condensation of water would take place more readily on the negative ions, drops of rain would be charged negatively, and the negative charge would be brought to the ground with the rain. The continual effect of rain at various parts of the earth's surface would thus be to charge it negatively, leaving the corresponding positive charge in the air. Mr. Wilson was not able to obtain any very sure evidence that there are free ions in the air at all times, and this part of the subject, he says, needs further investigation.—*Chauveau, C. R.*, 129, 500, 1899; *Wilson, Proc. Roy. Soc.*, 65, 289, 1899.

Pellat has performed some experiments, the complete account of which is not yet accessible, which show, he thinks, that when water evaporates from a surface charged with electricity some of the charge goes off with the water-vapor. As many observers in the past have tried the same experiment, with contradictory results, this point, perhaps, cannot yet be looked on as satisfactorily settled. These experiments of Pellat are what suggested to Chauveau that it might be the evaporation of water from the ground that caused the daily variation of atmospheric potential.—*Pellat, C. R.*, 128, 169, 1899.

Electromotive Force of the Clark Cell.—A new absolute determination of the electromotive force of the Clark cell has been made by Professor H. S. Carhart and Dr. K. E. Guthe at the University of Michigan. The Clark cell is a cell made up in a very careful and particular way with pure chemicals, and it is used as a practical laboratory standard of electromotive force. It has zinc and mercury electrodes, immersed in a solution of zinc sulphate. The determination referred to was a sequel to the work of Patterson and Guthe in making an absolute determination of the ampère, treated in 1898 YEAR BOOK. In the previous work an electro-dynamometer was constructed, by means of which the absolute value of an electric current could be measured. Ohm's law gives the relation between current, electromotive force, and resistance as

$$\text{Current} = \frac{\text{Electromotive force}}{\text{Resistance}},$$

so that an electromotive force at the extremities of a wire of known resistance can be measured if we can measure the current which is produced by the electromotive force. The experimenters used the electro-dynamometer to measure their currents, and they compared their resistances with two standard 1-ohm coils made by Wolff, of Berlin, and compared at the Reichanstalt. Two Clark cells were made in accordance with the specifications legalized by act of Congress in 1894. They were of the H-form, as modified by Kahle. The electromotive force of a Clark cell at 15° C.

is 1.4333 volts. This value depends on the value of the ampère as found by Patterson and Guthe. One of these cells was afterward compared with those at the Reichenstalt, at Charlottenburg, Germany, and found not to differ more than $\frac{1}{10000}$ from the mean of all the normal Clark cells in the Reichenstalt. Messrs. Glazebrook and Skinner, using a different value for the electrochemical equivalent of silver (.001118) and a different method of using the silver voltameter, found in 1892 the value, 1.4342 volts at 15° C. This value would, however, become 1.4332 if allowance were made for the difference in the electrochemical equivalent of silver and the difference in the method of using the silver voltameter. The difference in the use of the silver voltameter depends on the fact that, according to Kahle, the silver equivalent for a solution neutralized with silver oxide is $\frac{1}{1000}$ higher than for one not neutralized.—*Phys. Rev.*, 9, 288, 1899.

ASTROPHYSICS.

Pole Star a Triple System.—W. W. Campbell, working at the Lick Observatory with the Mills spectrograph, has discovered that the pole star, α *Ursæ Minoris*, has a variable velocity in the line of sight. Measurements of the velocity of a star in the line of sight are made by observing in the spectrum of the star whether or not there is a displacement of those spectral lines which come from known substances, and therefore have a known wave length—that is, a definite known position in the spectrum. These determinations are made by Döpler's principle, according to which if a luminous body is approaching the eye of the observer, the waves of light reach the eye more frequently, and as a consequence the wave length is shorter than it would be if the luminous body were at rest. On the other hand, if the luminous body is receding from the observer, the waves are longer. This change in the wave length can be detected only with the spectroscope, of course. In the case of sound a similar phenomenon is observed, and this is plainly noticeable to the ear. If one is in a rapidly moving train, it will be noticed that the sound of a bell on a locomotive approaching from the opposite direction has its pitch considerably lowered at the instant of passing, when it ceases to approach the ear and begins to move away. Campbell's observations were made during August, 1899, and show that Polaris has a velocity in the line of sight toward the earth varying from 8.6 kilometres per second to 14.6 kilometres per second. This gives a range of 6 kilometres per second. The period of the change is about 3 days 23 hours. Some previous observations made in 1896 did not happen to show a sufficient variation to make the variable velocity apparent. The observations happened to be taken at intervals apart, which were multiples of the period of the variation, as shown in 1899. The velocity found at that time, however, was about 9.6 kilometres per second. Campbell, therefore, thinks that there is another disturbing force, and instead of Polaris being a binary system, as the 1899 observations alone give evidence of, that it is really at least a triple system.

Atmosphere of Venus.—H. N. Russell has made some observations at Princeton, N. J., which throw some light on the nature of the atmosphere of the planet Venus. When Venus, which is nearer to the sun than the earth is, reaches a position where it is nearly on the straight line joining the sun and earth, it has, of course, an appearance similar to that of the new moon. It shows a very thin crescent. If Venus had no atmosphere, it would be easy to calculate how much of her illuminated surface we ought to be able to see in any given position of the planet with reference to the sun. But the effect of an atmosphere which refracts the light entering it is to increase a little, not only the amount of surface which is illuminated by the sun, but also the amount of surface which is visible. The effect of these two causes is to make the cusps of the crescent extend around farther than they otherwise would. By measuring them an idea can, therefore, apparently be obtained of the amount of refraction in the atmosphere of Venus, and thus of the density of the atmosphere and its height. Regarded in this way, the atmosphere should be twice as dense as that of the earth. But Russell shows that if the atmosphere is perfectly transparent and is as dense as this, the appearance of the rim of light when Venus is still nearer to the sun, and the cusps meet, ought to be very different. It ought to be 2000 times as bright as it really is. Any fog or mist in the atmosphere would lessen this, but a hazy atmosphere of itself would tend to extend the cusps without considering any refraction. Russell shows that if we consider the effect of both refraction and of haze, we have no satisfactory evidence that the atmosphere of Venus is more than one-third as dense as that of the earth.—*Astroph. J.*, 9, 284, 1899.

PHYSIOLOGICAL SOCIETY, AMERICAN, organized in 1887, in 1899 had 73 members; meets annually in December. President, R. H. Chittenden, Ph.D.; secretary, Frederic S. Lee, Ph.D., Columbia University, New York City. The society publishes the *American Journal of Physiology*.

PICKING, HENRY F., rear-admiral, U.S.N., died September 8, 1899. He was born in Somerset County, Penn., in January, 1840. Appointed to the navy when seventeen years of age, he served at the academy in Annapolis from 1857 to 1861, and in July of the latter year was appointed acting master. A year later he was made a lieutenant. During the Civil War he was in the blockading service; among the engagements he witnessed were the sinking of the privateer *Petrel*, the fight with the Confederate ram *Merrimac*, and a number of skirmishes with the batteries on Sullivan's Island. After the war his promotions were as follows: Lieutenant-commander, July, 1866; commander, January, 1875; captain, August, 1889; commodore, November, 1898; rear-admiral, March 3, 1899. On the 25th of that month he was ordered to the command of the navy yard at Boston.

PICQUART, GEORGES, one of the leading witnesses for Dreyfus at the second court-martial, was born at Strasburg in 1854. After receiving his education at St. Cyr and at the general staff school, he served with the Zouaves in Algeria, and then entered the infantry. In 1880 he became captain, and in 1883 was appointed to the war office staff. From 1885 till 1888 he served in Tonquin, where he gained a decoration, and, returning to France, became professor at the military school. In 1893 he was again appointed to the war office, and in 1895 was placed at the head of the intelligence department. In 1896 he was made lieutenant-colonel, and began his investigations upon the Dreyfus case. This ultimately led to his being sent in disgrace to Tunis in 1897, but he was sent for during 1897-98 to take part in the legal proceedings. His evidence was of great importance; but in February, 1898, he was prosecuted for revealing war office secrets. Colonel Picquart was released after a long imprisonment, and was one of Dreyfus's most important witnesses during the trial at Rennes. See FRANCE (paragraphs on History).

PIERCE, HENRY NILES, D.D., LL.D., Protestant Episcopal bishop of the diocese of Arkansas, died at Fayetteville in that State, September 5, 1899. He was born at Pawtucket, R. I., October 19, 1820; was graduated at Brown University in 1842, and six years later took deacon's orders in the Episcopal Church. The following year he was ordained to the priesthood, and until 1852 was engaged in missionary work in Washington County, Tex. During the next two years he had a regular charge at Matagorda, Tex.; he then became rector of Trinity Church, New Orleans; subsequently he held the following charges: St. Paul's, Rahway, N. J., 1855-57; St. John's, Mobile, Ala., 1857-68; St. Paul's, Springfield, Ill., 1868-70. In the last-named year he was consecrated bishop of Arkansas and Indian Territory, and in 1871, upon the erection of Arkansas into a diocese, he was made its diocesan, still retaining control of the Indian Territory mission. Besides several volumes of sermons and addresses, Bishop Pierce wrote *The Agnostic, and Other Poems*.

PIERPONT, FRANCIS H., ex-governor of Virginia, died in Pittsburg, Penn., March 24, 1899, in his eighty-fifth year. He was born in Monongalia County, Va. (now West Virginia). In boyhood he was able to get only little schooling, but he later succeeded in entering college. He taught school, studied law, and finally, having been admitted to the bar, settled in Fairmont, Marion County. He rose to prominence, and at the outbreak of the war declared himself loyal to the Union. From June, 1861, to June, 1863, he was governor of Virginia at Wheeling; from the latter date to May, 1865, at Alexandria; and from May, 1865, to January, 1868, at Richmond. After the war he rendered valuable services in the reorganization of Virginia and the formation of the new State of West Virginia.

PILLSBURY, CHARLES ALFRED, the well-known miller, died September 17, 1899, at Minneapolis, Minn. He founded in 1872 the firm of Charles A. Pillsbury and Company, which built the largest flour mills in the world. The plant was sold in 1889 to an English syndicate, which also bought other mills, organizing the Pillsbury-Washburn Flour Mills Company, of which Mr. Pillsbury became president. He was also president of the Minneapolis and Northern Elevator Company, owning elevators through the northwestern grain region. Mr. Pillsbury was born in New Hampshire, 1842, and was graduated at Dartmouth. In 1872 the Pillsbury firm was

founded, and thereafter were built the many fine buildings and improved machinery of the present plant. Improvement in the crushing and disintegration of the wheat brought about by the introduction of steam rollers, made a cheaper and greatly improved quality of flour, and from the monopoly of the patent for some years Mr. Pillsbury reaped great profit. Outside of the milling and elevator business, Mr. Pillsbury served, 1877-87, as a Minnesota State senator, representing the Republican party.

PINGREE, HAZEN S., governor of Michigan, was prominent in 1899 through his continued efforts to bring about the municipal ownership of street railways in Detroit. (See MICHIGAN, paragraph Detroit Street Railways.) He was born at Denmark, Me., August 30, 1840. In youth he worked on his father's farm, in a cotton factory at Saco, and in a shoe factory at Hopkinton, Mass. On August 1, 1862, he entered the Union service as a private in the First Massachusetts Heavy Artillery, with which he remained until August 15, 1865, except for about five months in 1864, when he was a prisoner of war. After being mustered out he went to Detroit and worked in a shoe factory until 1866, when with a partner he established a small factory, which has become one of the largest shoe-manufacturing enterprises in the West. As mayor of Detroit, to which position he was elected four times, serving from 1889 to 1896, he became widely known for establishing potato gardens on vacant city lots, cultivated by the otherwise unemployed, and for his hostility to street railway and other combinations. He was elected governor in 1896, as a Republican, and was re-elected in 1898.

PIPE LINES. See IRRIGATION and WATER-WORKS.

PLAGUE. At the commencement of the year 1899 the scourge that has devastated India since the autumn of 1896, and China and Persia for nearly as long a period, and Japan for a shorter time, was reported to be progressing with rapid strides. In localities where the disease had apparently subsided a recrudescence occurred. In the Bombay Presidency, India, for the week ending January 13, 1899, there were 2593 cases of the disorder registered, with 2045 deaths. Throughout the entire Presidency 360 villages were infected at this date; and up to this time, from the commencement of the epidemic in September, 1896, there had been, in the Bombay Presidency alone, 214,197 cases, with 169,240 deaths. In midsummer there was reported in Poona, India, an alarming condition. During the two days, July 29 and 30, 360 cases occurred, and 317 deaths were reported. At this time the disease was reported at Bangalore, also at Bushire, Persia. Early in August it appeared at Alexandria, Egypt, where a large proportion of the cases were fatal. In Hong Kong, at this time, there seemed to be a decrease, the figures reported in August being about 30 cases a week, against 100 a week a fortnight previous. Mauritius reported 52 cases of the plague, with a mortality of 37 in August. In Marseilles at this juncture about 2 new cases a week were reported. In September the reports from Poona showed an increased mortality, reaching 1000 a week from all causes, plague being responsible for nearly all of these. The disease had also reappeared in Hyderabad, in Scinde, in a very virulent form. In Bombay there were from 60 to 80 new cases a week, in Calcutta from 30 to 40 a week. During the year ending September 1 the following had been the figures in Mysore province alone: Bangalore City, 3377 cases, with 2787 deaths; the cantonment, 4040 cases and 3330 deaths; the district, 5347 cases and 4746 deaths; Mysore City, 2759 cases and 2238 deaths; the district, 956 cases and 704 deaths; the Kodar district and gold fields, 2303 cases and 1823 deaths. Other places brought the total for the Mysore district up to 19,840 cases and 16,320 deaths. For the first week in November the record was bad. In India the total deaths for this week reached 6727, of which Bombay Presidency contributed 5812. In the Nizam's dominions 592 deaths were reported. Tidings from Saran in Bengal bring intelligence of a large number of deaths there. Six cases were found in Hoshiarpur, Punjab. Lord Curzon, Viceroy of India, made a personal inspection of the plague hospitals and segregation camps in Poona, during November. His enthusiastic advocacy of inoculation with plague serum as a preventive, and the example set by himself and his party (all of whom were inoculated before leaving Simla) were of great value in preventing panic and encouraging proper measures for protection.

The first case of plague to reach England in 1899 was in the person of a man on board of the steamer *Golconda*, from Calcutta via Ceylon and Marseilles, who suffered from a mild attack of the scourge, and was put ashore at Plymouth. He had been infected through clothing brought aboard by a convalescent from the disease. On October 14 the *Peninsular*, of the P. and O. Steamship Company, brought to Plymouth a coal trimmer suffering from plague which was contracted at Bombay, and appeared sixteen days later, when the steamer reached Marseilles. Several cases of the disease were seen at Naples and Palermo in August, three or four ending fatally. In August, Drs. Mendoza and Vincente were sent from Spain to Oporto, Portugal, to study the plague there. Surgeon Fairfax Irwin, of the United States

Marine Hospital Service, was also ordered to Oporto for the same purpose. It is said that this city was infected by a steamer loaded with rice from India. A commission was appointed by the French government to investigate the epidemic of the plague in Portugal, including Dr. Albert Calmette, Director of the Pasteur Institute at Lille, and Dr. Salimbeni, preparateur in the laboratory of Dr. Roux, Pasteur Institute, Paris. The Portuguese government authorized the distribution of the anti-plague serum of the Pasteur Institute. Spain, Italy, and Turkey sent in requests for this serum, and it was supplied from Paris. A request from the Boers was declined, as the reserve supply in the Pasteur Institute had become nearly exhausted. It is now generally recognized that antiplague serum is of undoubted efficacy as a prophylactic, though less certain as a curative.

The plague reached New York harbor on November 18, on board the steamer *J. W. Taylor* from Santos, Brazil. The steamer left Santos October 24, the man was taken ill November 1, and died November 5. The captain and the cook were both suffering with the disease when the quarantine authorities boarded the vessel, and were removed to the fever hospital in the lower bay. The ship was thoroughly and repeatedly fumigated. The 24,000 bags of coffee which formed the cargo of the *Taylor* were taken out upon lighters and exposed to the air for eight days. While the health officer of the port, Dr. Doty, and Health Commissioner Jenkins, formerly health officer, agreed that the cargo could be landed with perfect safety to the city after the precautions named, the other commissioners of health thought otherwise and for some weeks the fate of \$600,000 worth of coffee was uncertain. After Boston offered to take the cargo it was deemed safe to land it in New York City, and finally it was put ashore. As a special precaution to allay public fear, as well as to increase the safeguards now surrounding the public health of the city, Dr. Doty issued in November the following statement: "Therewith all vessels arriving from Santos, whether there is infectious disease among the crew or not, will be subjected to the same precautions. The cargo will be fumigated in the hold and then discharged into lighters and held in the open air for eight days from the time of removal. The vessel, after discharge of cargo, will be kept under the supervision of the health officer and loaded in the stream before sailing." No case of the disease appeared in any part of New York City.

In December the fell disease appeared in Honolulu, Hawaiian Islands. Two deaths occurred from this cause on December 12, and 2 cases were reported in Honolulu on December 20. The infection is thought to have been brought from Japan on a Norwegian steamer. A slight doubt exists as to the genuineness of the disease in Honolulu.

Dr. Yersin thus describes a typical case of plague: The disease is ushered in with a chill followed by a high temperature (39° to 41°C). Dizziness and staggering gait follow, with headache and lassitude. Injection of the conjunctivæ, rapid breathing, frequent pulse, vomiting, and constipation supervene. The bubo appears in the groin, armpit or neck during the first hours of the disease. It is always painful to the touch. The second day the temperature remains elevated, the respiration anxious and the pulse more frequent. At this time the bubo is as large as a pigeon's egg, and the patient begins to be delirious. The third day the pulse reaches 140 in frequency, the patient is suffering agony and the bubo is the size of a hen's egg. Death usually occurs on the fourth day, the proximate cause being paralysis of the respiratory centre.

The pathological controversy between Drs. Kitasato and Yersin has been ended by the acceptance by the former of the theory of Yersin that the plague bacilli are found only in the lymphatics. Kitasato's earlier experiments were made upon patients in the latter stages of the disease or dead patients, at a time when putrefaction of the blood had set in, and the Kitasato bacilli were found in the blood-vessels. Hence his conclusion that the pest-bacillus must have its origin in the blood-vessels. Kitasato's recent examinations in Kobe led him to conclude that the pest-bacilli propagate in the lymphatic vessels, next cause putrefaction of the blood, followed by fever, prostration, and lung inflammation, the Kitasato bacilli being present in the blood-vessels only in the last stages. He agrees that the Yersin bacillus is the true cause of plague. See INSECTS AND THE PROPAGATION OF DISEASE.

PLANETOIDS. See ASTRONOMICAL PROGRESS.

PLANT. HENRY BRADLEY, founder of the well-known Plant system of railways and steamships, died in New York, June 23, 1899. He was born in Branford, Conn., October 27, 1819, and was educated privately and in the public schools. In 1837 he entered the services of the New Haven Steamboat Company, and later was placed in charge of the express business on the New York and New Haven steamboats, and on the New York and New Haven Railroad. Having subsequently entered the employ of the Adams Express Company, he was appointed in the fall of 1854 superintendent of the Southern Division, with headquarters at Augusta, Ga. He held this position

until 1861, when he organized the Southern Express Company, and became its president, which he continued to be until the time of his death. During the war he rendered invaluable services to the Confederates by his energy in effecting transportation. After the war the Southern Express did much toward re-establishing the cotton industry, by affording means for the transportation of the cotton to the factories. Still later, Plant in becoming connected with a large system of railroads contributed largely to the industrial growth of the South. To him also was due the opening up of Florida as a winter resort. The steamship lines that came under Plant's control are a line between Tampa and Key West, the Canada, Atlantic, and Plant Steamship Company, Limited (between Boston and Halifax), and the North Atlantic line of steamers. At the time of his death Plant was a trustee of the Metropolitan Trust Company, a director of the Key West Commercial Company, a trustee of the American Surety Company, and president of the following: The Lake Alfred Company, the Alabama Midland Railway Company, the Brunswick and Western Railroad Company, the Savannah, Florida and Western Railroad Company, the Charleston and Savannah Railway Company, the Tampa and Thonotosassa Railroad Company, and the Silver Springs, Ocala and Gulf Railroad Company. Plant never entered politics. It will be remembered that, as an evidence of the appreciation of him in the South, Monday, October 28, was designated Plant System Day at the Atlanta Exposition of 1895, where Plant had erected a building for an exhibit of his system of railways and steamships.

PLATINUM. The production of platinum for the last two years was, 1897, 150 ounces; value, \$900; 1898, 225 ounces, \$3375. Trinity and Shasta Counties in California still continue to be the sources of supply.

J. M. Davison has discovered the existence of both platinum and iridium in the meteoric irons from Coahuila and Toluca.

PLAYFAIR, Sir ROBERT LAMBERT, died February 18, 1899. He was born at St. Andrews, Scotland, March 21, 1828; was educated at St. Andrews University, and in 1846 entered the Madras Royal Artillery; appointed consul-general in Algeria in 1867, and in 1885 his consular powers were extended over Tunis. He wrote: *Fishes of Zanzibar*; *History of Arabia Felix*, 1859; *Travels in the Footsteps of Bruce in Algeria and Tunis*, 1877; *The Scourge of Christendom*, 1884; *Bibliography of the Barbary States—Algeria, Cyrenaica, Morocco*, 1888 *et seq.*; (Murray's) *Handbook to the Mediterranean*, 1892, and *Handbook to Algeria and Tunis*, 1895.

PNEUMONIA. See SERUM THERAPY.

POLE STAR. See ASTRONOMICAL PROGRESS AND PHYSICS.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF, in Philadelphia, was founded in 1889. President, Edmund J. James, University of Chicago; secretary, L. S. Rowe, University of Pennsylvania. It issues the *Annals*, a bi-monthly publication.

POLO was introduced into England in 1872 by British cavalry officers, who learned the game in India, where it has been played in some form for many years. The game has recently become very popular in the United States. There were in 1899 over a score of prominent clubs, formed wholly or in part for the pursuit of the game, and several hundred players registered in active play. Polo, which may be described as hockey on horseback, has a sufficient spice of danger to attract the stronger class of sportsmen. It is an expensive game also, involving stables of well-bred ponies and carefully laid-out grounds. One of the most notable polo events of 1899 was the opening of the new courses laid out by George J. Gould at Lakewood, N. J. In 1899 the height of ponies allowable for match plays was raised from 14.1 hands to 14.2 hands. The tournaments held throughout the United States are under the auspices of the Polo Association, with headquarters at No. 15 Church Street, New York City. The grand annual championships for the Astor Gold Cup have been held in the past at Prospect Park, New York City, being won by the Myopia (Mass.) Hunt Club in 1895, the Rockaway (Long Island, N. Y.) Club in 1896, and the Meadow Brook (Long Island) Club in 1897 and 1898. In 1899 there was no tournament, owing to the death of Mr. Vanderbilt. Nearly all the clubs held important tournaments in various parts of the country, the meets of all kinds in 1899 being over 75. On the Pacific coast a North California team defeated a South California team by 9 goals to 1. Among leading Eastern teams in 1899 were those of the Westchester (Newport) Club, made up, during most of the season, of J. M. and Lawrence Waterbury, John E. Cowdin, and Foxhall Keene; the Meadow Brook four, W. C. Eustis, C. C. Baldwin, H. P. Whitney, and Benjamin Nicoll; the Myopia team, H. P. Gardner, R. L. Agassiz, R. G. Shaw, 2d, and H. H. Holmes,

and the Lakewood organization, including such players as George J. Gould, H. L. Herbert, chairman of the Polo Association and the "father of polo"; P. F. Collier, the well-known master of fox-hounds, and others. Among the noticeable younger players are C. R. Snowden, George W. Kendrick, 3d, Charles Wheeler, and George McFadden, of the Devon (Penn.) Club, who won the Valentine, Alden, Morrell, and Cedarhurst challenge cups in the first half of the season, against all comers. For the junior players cups are offered by Mr. Gould, and the Juvenile Polo Cup, W. H. Hazard donor, to be played for annually. The junior players are becoming more numerous, and promise to develop many strong players for the future. Four teams played at Rockaway, Long Island, for the Juvenile Cup. Team No. 1, made up of René La Montagne, Jr., Louis Neilson, and Halstead Vanderpoel, beat Team No. 4 in the finals by $5\frac{3}{4}$ goals to $2\frac{1}{2}$, after defeating No. 2 by 6 to 4. Team 4 had beaten Team 3 by $4\frac{1}{4}$ to 4. Polo is not so well known at large as it should be, and the above review is not a complete record. Some of the statistics are from *Outing*. The following are the principal polo organizations: Buffalo Country Club, N. Y.; Country Club of Westchester, N. Y.; Dedham Polo Club, Mass.; Devon Polo Club, Penn.; Jacksonville Polo Club, Fla.; Lakewood Polo Club, N. J.; Meadow Brook Club, N. Y.; Morris County Country Club, N. J.; Myopia Hunt Club, Mass.; Onwensia Club, Ill.; Philadelphia Country Club, Penn.; Point Judith Country Club, R. I.; Rockaway Hunting Club, Long Island, N. Y.; Somerset County Polo Club, N. J.; Southampton Polo Club, Long Island, N. Y.; St. Louis Country Club, Mo.; Staten Island Polo Club, N. Y.; The Brookline Country Club, Mass.; Westchester Polo Club, Newport, R. I.; Washington Polo Club, D. C.; Saratoga Polo Club, N. Y., and Aiken Polo Club, S. C. Also the Atlantic City Country Club, N. J., with polo grounds laid out late in 1899. It is expected that a number of prominent American polo players will compete at Paris in 1900. They may also visit England and endeavor to recapture the Challenge Cup, won at Newport, R. I., in 1886, by the Hurlingham Club, of London.

POLO, WATER. See SWIMMING.

PONAPÉ. See CAROLINE ISLANDS.

POND, GEORGE EDWARD, editorial writer on the staff of the *New York Sun*, died at Spring Lake, N. J., September 22, 1899. He was born in Boston, Mass., March 11, 1837; was graduated at Harvard in 1858 and at the Harvard Law School in 1860. After practising law for two years, he entered the Union service as a first lieutenant, and in 1864 resigned to become associate editor of the *New York Army and Navy Journal*. From 1868 to 1870 he was a member of the editorial staff of the *New York Times*, and then was editor-in-chief of the *Philadelphia Record* from 1870 until 1877, when that paper became the property of William M. Singerly. Returning to New York, Pond resumed his position with the *Army and Navy Journal*, and at the same time was associated with the editorial staff of the *Galaxy Magazine*. With the latter he remained for ten years, and wrote the well-known *Driftwood Essays* over the pen name Philip Quilibet. Later he accepted an editorial position on the *Sun*, which he retained to the time of his death. He wrote *The Shenandoah Valley* in 1864, and in collaboration with William Swinton, *Twelve Decisive Battles*. He was a member of the Authors' Club.

PONISI, MILE, at one time a well-known actress, died at Washington, February 19, 1899. She was best remembered as a successful actress of old-woman parts, and played particularly long and well in the old comedies. She first appeared in New York in 1850 as Lady Teazle. In the seventies she became noted for her impersonation of Mrs. Hardcastle in *She Stoops to Conquer*. Beginning in 1871, she played for many years with the old Wallack stock company, New York. At the later Wallack's, on the present theatre site, she was conspicuous in most of the old comedy revivals. Ponisi was born in England about 1819, and had lived a retired life for ten years or more.

POOL. The world's championship at continuous pool, held in 1898 by J. R. Keogh, Scranton, Penn., was captured at Chicago, April 10-12, 1899, in a match between Keogh and Alfred De Oro, New York. The championship conditions are: 600 balls, 200 each night. The totals were: De Oro, 600; Keogh, 515. In a subsequent match for the championship, held in New York, November 30 to December 2, De Oro won, by the same score, over F. J. Dayton, of Omaha, Neb., whose total was 479.

POPE, CHARLES R., died July 2, 1899. He was first known in this country as an actor in Shakespearean plays, playing with Booth, the elder Salvini, and others; about 1874 he abandoned the stage to become a manager of various theatrical enterprises, particularly in New Orleans and St. Louis. In the latter city he built Pope's Theatre, which was one of the well-known playhouses of the West until replaced by a new theatre in 1895. He retired from business in 1887, afterward

serving as consul at Toronto under President Harrison. He was sixty-seven years old, and was born in Germany.

PORTO RICO. See PUERTO RICO.

PORTRAIT GALLERY, NATIONAL (British), established in 1856, is in a building in St. Martin's Place, London, which was first opened in 1896, as the gift of W. H. Alexander to the British nation. There are over 1200 portraits and busts in the gallery. It is open to visitors, free, on Mondays, Wednesdays, and Fridays. Secretary, Mr. Lionel Cust, F.S.A.

PORTUGAL, a European kingdom, situated on the western coast of the Iberian peninsula, bounded on the east by Spain and on the west by the Atlantic Ocean. The area, including the Azores and the island of Madeira, is 36,038 square miles, and the population in 1890 (the latest available statistics), 5,082,257. The chief towns are Lisbon (population, 301,206) and Oporto (population, 138,860). The state religion is the Roman Catholic, while other religions are tolerated. The number of emigrants to the United States in the fiscal year 1898-99 from Portugal, including Cape Verde and the Azores, was 2054, showing an increase of 337 over the previous year. Education is not general, the number of illiterates being very large, in 1890, 79 per cent. The revenue, according to the budget of 1899, is 52,373,581 milreis, coming largely from direct taxes, and the expenditures, 53,919,296 milreis, of which the greatest item is the consolidated debt, next coming the civil list and the cortes. All men of 21 years are obliged to serve in the army, which, according to the reorganization of 1899, on a peace footing consists of 30,000 men, and on a war footing of about 150,000 men. The Portuguese navy amounts to very little, but has a few good vessels. In 1899 the *Donna Amelia*, a cruiser of 1660 tons, was launched at Lisbon. Another new vessel is the *Admistor*. Three vessels building in 1899 were the *Don Carlos I.*, 4100 tons, with a speed of 20 knots, and 2 15-knot cruisers, the *Sao Gabriel* and *Sao Rafael*, of 1800 tons each. The chief productions are maize, rye, wheat, and, the most important, wine. There are large productions also of olive oil, figs, oranges, potatoes, etc. The most important mineral productions are copper and sulphur ore, lead, antimony, and manganese also being found. The exports are chiefly agricultural, wine being by far the most important. The value of exports to the United States for the year 1899 was \$3,774,642, and that of the imports from the United States was \$5,113,524; the total importations for consumption were valued in 1897 at \$43,600,016, and the total exports at \$29,504,810. The unit of currency is the milreis, which has a value of \$1.08. The colonies of Portugal comprise Goa, on the Malabar coast; Damão, on the coast, 100 miles north of Bombay; and Diu, a small island west of Damão (the production is principally salt); Macao, at the mouth of the Canton River, China; a part of the island Timor, in the Malay peninsula; the Cape Verde Islands, with 1480 square miles and 114,130 inhabitants; Portuguese Guinea, on the coast of Senegambia (4440 square miles; population, 820,000); the islands of St. Thomé and Principe in the Gulf of Guinea; Angola, on the west coast of Africa (484,800 square miles; population, 4,119,000); and Portuguese East Africa (301,000 square miles; population, 3,120,000). The government is a constitutional monarchy, under the King, Carlos I.

History, 1899.—The bubonic plague was brought to Oporto in July, as was supposed, by means of merchandise received from Bombay. In October nearly 140 cases and 44 deaths had been reported. The ignorance of the populace led them to the belief that the physicians were causing the disease, and the work of the latter was thereby much impeded. Efforts to confine the disease within the city were ineffectual. A reciprocity convention between the United States and Portugal was proclaimed in 1899, which provided for a reduction of duties on wines, brandies, and paintings coming to the United States, and a minimum rate on all flour, except wheat flour, agricultural machinery, tar and pitch, etc., going to Portugal.

PORTUGUESE GUINEA, on the western coast of Africa, is a small colony entirely surrounded by French possessions on the land side, the colony of French Guinea to the south and Senegal to the north merging to enclose it on the rear. Portuguese Guinea has an area of about 4440 square miles. It includes the adjacent archipelago of Bijagoz, with the island of Bolama, on which the capital town, Bolama, is situated. The chief port, Bissau, lies upon the northern part of the coast. The population is about 820,000. The chief products for export are rubber, wax, oil seeds, ivory, and hides. In 1898-99 the estimated revenue of the colony was 72,280 milreis, and the expenditure was 180,854 milreis.

POTATOES. The following table, published by the department of agriculture, division of statistics, shows the acreage, production, and value of potatoes in the United States in 1890:

States and Territories.	Acreage.	Average Yield per Acre.	Production.	Average Farm Price per Bushel Dec. 1.	Farm Value Dec 1.
	<i>Acres.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Cents.</i>	<i>Dollars.</i>

POULETT, Sixth Earl, **WILLIAM HENRY POULETT**, died January 22, 1899. He was born in London, September 22, 1827, and was educated at the Royal Military College at Sandhurst, being graduated in 1842. He served in India from 1852 to 1857, engaging in 1853 in the expedition from Peshawar to Boroe Valley. He succeeded his uncle, the fifth Earl, to the title in 1864. Subsequent to his service in the army much of his time was passed in hunting and other sports. At the time of his death the right of succession to the title was in dispute between the Earl's son by his third wife and the Viscount Hinten, a son of his first wife, but whose paternity the Earl disclaimed.

PRESBYTERIAN CHURCH IN ENGLAND in 1899 had 314 organized congregations and 16 preaching stations, 328 ministers, and accommodation for 162,000 communicants. It has 20 ordained and 12 medical missionaries, 3 missionary teachers, and 25 women missionaries. The Westminster College was opened in Cambridge in October, 1899. General secretary, Rev. J. Thoburn McGaw, D.D., 7 East India Avenue, Leadenhall Street, E. C., London, England.

PRESBYTERIAN CHURCH IN THE UNITED STATES (NORTH). During 1899 Presbyterian churches in certain quarters are said to have experienced some depression in spiritual matters, which also was manifest in other denominations. Although debt was removed from the home and foreign mission boards, it was felt that active measures must be taken for the spiritual uplifting of the church. The last general assembly adopted the following deliverances on Fundamental Doctrine: "The truthfulness of the Scriptures, the freedom from liability to error of our Lord Jesus Christ, the personal establishment by Christ of the Lord's Supper, and the justification of sinners by imputing to them the merits of Jesus Christ received by faith alone." These deliverances are considered to be a firm basis of agreement

of all the different bodies of the church. A careful statistical inquiry into the numerical relation between ministers and churches showed that there was a lack of ministers. "The Presbyterian and Reformed churches in all countries had in 1899, 26,467 ministers, 136,509 elders, 4,842,534 communicants, and 3,473,764 Sabbath-school scholars." The Presbyterian Church in the United States (North), in 1899 had 7175 ministers, 7386 churches, and 961,334 communicants. There are twelve divisions of the Presbyterian Church in the United States. Besides the Northern church, above mentioned, there are the Presbyterian in the United States (South), the Cumberland Presbyterian, the Cumberland Presbyterian (colored), the Welsh Calvinistic, the United Presbyterian, the Associate Church of North America, the Associate Reformed Synod of the South, the Reformed Presbyterian in the United States (Synod), the Reformed Presbyterian in North America (General Synod), the Reformed Presbyterian (Covenanted), and the Reformed Presbyterian in the United States and Canada. The latest report of the United States Commissioner of Education shows that the Presbyterian bodies have 53 institutions of learning, with 457 professors, 4352 students, and endowment funds aggregating \$5,085,053.

PRESBYTERIAN CHURCH IN THE UNITED STATES (SOUTH) reports, for 1899, a ministerial body of 1471, with 2919 churches and 221,022 communicants. No great spiritual movement took place in the church during the year, but a call for \$200,000 for foreign missions was made as a twentieth century offering. The Southwestern Presbyterian University, at Clarksville, Tenn., received a gift of \$100,000, and a chapel was given to the Union Theological Seminary at Richmond, Va. Buildings and grounds in Austin, Tex., have been donated for a theological seminary.

PRESS CLUBS, INTERNATIONAL LEAGUE OF, founded in 1890, had in 1899 a membership of 4000. President, Colonel J. M. Carter, Jr., Baltimore; secretary, C. Frank Reed, Boston Press Club, Boston, Mass.

PREVENTION OF CRUELTY TO ANIMALS, AMERICAN SOCIETY FOR THE, incorporated in 1866, and supported chiefly by voluntary contributions, maintains an extensive humane work in New York City. The report of the society for the year 1899 shows 417 arrests and prosecutions, 3756 animals suspended from labor, 3240 horses, mules, and other large animals disabled past recovery and humanely destroyed, 85,895 small animals destroyed; 493 disabled horses and other large animals removed from the streets in ambulances, and 57,958 cases investigated. The society distributes humane literature and conducts courses of illustrated lectures in schools and before gatherings of livery men, wagon-drivers, and others. The efforts of the society have also during the year 1899 been directed to the protection of animals in Cuba, Puerto Rico, Hawaii, and the Philippines. President, John P. Haines; superintendent, Charles H. Hankinson. Headquarters, Madison Avenue and Twenty-sixth Street, New York City.

PREVENTION OF CRUELTY TO ANIMALS, THE MASSACHUSETTS SOCIETY FOR, incorporated in 1868, with same purposes as the above, has organized over 41,200 "bands of mercy" for the protection of harmless animals, and publishes *Our Dumb Animals*. President, George T. Angell, 19 Milk Street, Boston, Mass.

PREVENTION OF CRUELTY TO CHILDREN, NEW YORK SOCIETY FOR THE, founded in 1874, the parent of many similar societies in the United States. The twenty-fifth annual report of the society (for the year 1899) shows that since the foundation of the society 129,675 complaints were received, 50,800 cases were prosecuted, 47,455 convictions were secured, and 83,986 children were rescued. In the year 1899, the convictions numbered 2913, and 5637 children were rescued. Headquarters, 297 Fourth Avenue, New York City. President, Elbridge T. Gerry; secretary and superintendent, E. Fellows Jenkins.

PRICE, Major Sir ROSE LAMBERT, English soldier and writer, died April 17, 1899. He was born July 26, 1837; was educated at Grosvenor College, Bath. He entered the army and served with rank of lieutenant on the East African coast, for the suppression of slavery; he then served in India during the Mutiny; in 1857 was a member of the storming party at the capture of Canton; was wounded in the capture of the Pei Ho forts; participated in the taking of Tangku and the Taku forts; and was present at the surrender of Peking, where he was honored with a medal and three clasps. He wrote *The Two Americas* and *A Summer on the Rockies*, 1898.

PRIMITIVE METHODISTS, or RANTERS, founded in 1810, have three conferences, 65 ministers, 72 churches, 6470 members, and property worth \$433,300. The headquarters are at Fall River, in which part of Massachusetts the denomination is chiefly located.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, with a gross area of 2000 square miles; capital, Charlottetown.

Agriculture.—In the calendar year 1898 the yield of wheat was 596,761 bushels; oats, 2,922,552; barley, 147,880; buckwheat, 84,460; potatoes, 7,071,308; turnips, 2,005,453; grass and clover seed, 12,417; pease, 4735; corn, 2651; and beans, 2495. Live stock comprised 30,000 horses, 14,060 colts and fillies, 55,017 milch cows, 55,014 other cattle, 176,800 sheep, and 51,100 swine.

Fisheries.—The value of all fishery catch in the calendar year 1897 (the last officially reported) was \$954,949, a decrease in a year of \$21,177, and the lowest since 1899. The principal catches were lobsters, \$493,336; herring, \$116,144; oysters, \$83,660; cod, \$82,083; hake, \$33,115; mackerel, \$31,570, and smelts, \$29,927. Exports of all fisheries in 1898 amounted to \$510,298, an increase in a year of \$16,017, and the capital investment in all fisheries, \$386,156.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise aggregated in value \$486,681, almost wholly for home consumption; exports, domestic and foreign, \$1,389,674, an increase in a year of \$75,067; duty collected, \$136,705. Navigation was facilitated by 39 light-stations, 66 light-houses, and 5 warning apparatus. The registered merchant marine of the province comprised 21 steamers of 4043 gross tonnage, and 157 sailing vessels of 11,936 tonnage.

Banks.—On January 1, 1899, there were 6 chartered banks and branch banks in the province; 9 post-office savings banks, with 1356 depositors, and \$308,046; and a government savings bank, with 5361 depositors, and \$1,843,961 deposits.

Railways and Post-offices.—The Prince Edward Island Railway, one of the two railways built and owned by the Dominion government, extends the entire length of the island, 154½ miles, and, including branches, had a total length in 1898 of 211 miles. Its total earnings in the year were \$158,951; total expenses, \$231,419; deficit, \$72,468; government expenditure for all purposes, \$248,961, and paid-up capital, \$3,768,107. At the end of 1898 there were 409 post-offices in the province, in which were posted during the year 1,350,000 letters and 198,000 postal-cards, and 17 money-order offices, which issued 9903 orders.

Education.—Reports for the school year of 1898 showed 581 school districts, 408 schools, 581 teachers, 21,852 enrolled pupils, 13,377 pupils in average daily attendance, and total expenditures of \$163,033, of which \$129,818 was from the government, and \$33,215 from the school board.

Finances.—The revenue of the province in the year ending December 31, 1898, was \$276,183; expenditure, \$301,700; gross debt, \$468,757; Dominion government debt allowance, \$181,953; other assets and net debt for the year, not reported. Charlottetown had a net debt of \$141,500, and total assessment of \$2,652,193.

Population.—Local estimates in 1898 gave Charlottetown, 12,500, and Summerside, 2500. The Indian population of the province was 314. There was one school for Indian youth, with an enrolment of 32 pupils. The Indians cultivated 256 acres of land, and received \$9160 from their various industries.

PRINCETON UNIVERSITY, at Princeton, N. J., is now in its one hundred and fifty-third year. Among its new buildings are two dormitories, the Albert B. Dod Hall and the David Brown Hall, both gifts of Mrs. David Brown, of Princeton, recently erected. Another handsome building lately finished is Alexander Hall, the gift of Mrs. Charles B. Alexander, to be used for commencement exercises and all academic gatherings. The Isabella McCosh Infirmary has been completed and is now open. A building to be used for indoor tennis, and for occasional entertainments, has been erected by contributions from the undergraduates and their friends; a large and complete library building and a new dormitory, called Blair Hall, in honor of its donor, Hon. John I. Blair, have been recently finished. A new dormitory, to be called Stafford Little Hall, in honor of its donor, Hon. H. S. Little, of the class of 1844, is now being erected. Mr. Little also gave to the university the sum of \$10,000 for the establishment of a lectureship on public affairs, the Hon. Grover Cleveland, LL.D., being the lecturer. The university has 106 endowed scholarships for the benefit of students in the Academic Department, one of which may be assigned to a student in the School of Science. At the commencement, June, 1899, degrees were conferred in course upon 2 Doctors of Philosophy, 1 Doctor of Science, 34 Masters of Arts, 127 Bachelors of Arts, 4 Electrical Engineers, 49 Bachelors of Science, and 9 Civil Engineers. For Statistics, see **UNIVERSITIES AND COLLEGES**.

PRISON ASSOCIATION OF NEW YORK, organized in 1846 to ameliorate the condition of prisoners, to improve prison discipline, and for the support and encouragement of reformed convicts; inspects all State, county, and city penal institutions annually, and reports to the legislature. During the last year the society registered 756 discharged prisoners, provided 651 with steady work, and furnished 5800 books to libraries of county jails and penitentiaries. President, Charlton T. Lewis; corresponding secretary, W. M. F. Round, 135 East Fifteenth Street, New York City.

PRODIGY, AN ARITHMETICAL. See GRIFFITH, ARTHUR F.

PROTECTIVE TARIFF LEAGUE, AMERICAN, organized in 1895. In 1899 it had 967 members. Secretary, Wilbur F. Wakeman, 135 East Twenty-third Street, New York City. The general meeting for 1900 is on January 18, at New York City.

PROTESTANT EPISCOPAL CHURCH. The event arousing most popular interest during 1899 was the ordination of Dr. Charles A. Briggs (*q. v.*) by Bishop Potter, of New York. This act aroused not a little bitter opposition on the part of a number of clergymen, who subsequently tried to induce the convention of New York to censure the bishop and the standing committee of the diocese. The admission of Dr. Briggs was followed by the resignation of Dr. De Costa, a noted Episcopalian clergyman. The next triennial general convention will be held in 1901. The latest report of the United States commissioner of education shows that the Protestant Episcopal Church has 5 institutions of higher education, with 60 professors, 503 students, and endowment funds aggregating \$1,645,467. The Protestant Episcopal Church reports 59 dioceses, 17 missionary districts, 84 bishops, 4734 priests and deacons, 6519 parishes and missions, 699,582 communicants, and contributions amounting to \$13,878,380.

PRUSSIA. THE KINGDOM OF, is the largest political division of Germany. Its area is 134,603 square miles, or over 64 per cent. of the country, and its population, according to recent estimates, is 35,000,000, or 66 per cent. of the inhabitants of Germany. A large proportion of the population is engaged in agriculture and mining, and the trade and industries of Prussia are of great importance. Prussia contains Berlin, the capital of the empire, with a population of 1,677,304. Among the cities are Breslau, Cologne, Frankfurt, Magdeburg, Hanover, and other well-known towns. There are ten celebrated universities in Prussia. The kingdom is represented in the German *Bundsrath* by 17 members, and in the *Reichstag* by 236 deputies. The king is the German emperor. Local government is vested in the king and the *Landtag*, consisting of a house of lords and a chamber of deputies. The principal minerals are coal, of which Prussia produces over 84,000,000 tons annually, or 90 per cent. of the total German output; zinc, of which Prussia yields about one-half of the world's production; copper, and lead. Other statistics may be found in the article GERMANY.

PSEUDO-INFLUENZA. During 1899 there have been many cases reported of disease whose clinical symptoms resemble those of epidemic influenza (*la grippe*). Bacteriological examination of sputa in each case has resulted in the discovery of the absence of Pfeiffer's bacillus, which is the cause of influenza, and the presence, in most cases, of the streptococcus bacillus. Many of these cases prove to be cases of pneumonia, and in a number of these beside the streptococci are found diplococci. The deduction has been that there are morbid agents which are capable of producing a condition resembling influenza besides the bacillus of Pfeiffer. Von Jaksch has had special studies made of all the cases of pneumonia at his clinic in Vienna since the appearance of the plague in that city. In November and December of last year diplococci were found in the sputa of these cases; during February and March, 1899, or about the time the pseudo-influenza was prevalent, several streptococcus pneumonias were observed. In all these cases the streptococci were highly virulent.

PSYCHICAL RESEARCH, the investigation of those alleged mental and physical manifestations ordinarily ignored in the laboratories of experimental psychology (*q. v.*), and by alienists, such as apparitions, thought-transference, hypnotism, clairvoyance, "haunted" houses, dreams, coincidences, and allied phenomena. Most of the research in these fields has been done by the Society for Psychical Research, founded in England in 1882 (president for 1899, Sir William Crookes, F.R.S., membership, 924), and its American branch (secretary and treasurer, Dr. Richard Hodgson, membership, 1899, 502). A most substantial article by Miss Johnson, of Newnham College, Cambridge, England, on *Coincidences*, was published during the year. Perhaps the most interesting investigation by the society in the year 1899 was a continuation of the research into the trance phenomena of the well-known medium, Mrs. Piper. Professor J. H. Hyslop, vice-president and secretary of the New York section of the American branch of the society, is making a detailed report of his inquiries into the trance phenomena of this medium, to be published in 1900. In illustration of the correct identification of personality in these trance "messages," Professor Hyslop also carried out in 1899 an interesting and valuable research as to what circumstances are sufficient to compel the recognition of another personality when this latter is manifested solely through verbal messages expressed either by letter or telegraph, and representing incidents in the common life of communicator and receiver.

Given, therefore, the automatic writing or speech of an entranced medium, the question naturally arises, before one can believe or not in the reality of spirits, whether the "communications" are of such a nature that they can reasonably be thought to represent the characteristics and experiences of a certain specific personality. The independent reality of this person or personality is a separate problem. Professor Hyslop thought to demonstrate the possibility of recognizing these trance

personalities by showing that it would be easy for one living individual to recognize another solely by means of verbal communications having the trivial and incoherent style of messages received through Mrs. Piper. He performed the following experiment:

The person who was to represent the supposed spirit selected a number of incidents common to the life of the receiver, starting from the most general and proceeding to the most specific. These were written out, some of them in the incoherent style of trance communications, and presented or telegraphed, one at a time, to the receiver, who was to guess as soon as possible the identity of the other. This guess was easily and correctly made in the majority of the cases and the results are held by Professor Hyslop to show that the identification of personality can be established on perhaps a hundredfold less evidence than is presented in the Piper records. It may be mentioned as an illustration of the experiments referred to that one was performed with the communicator in New York City and the receiver at a distance of one hundred miles from that city. This was arranged in such a way that the receiver had not the slightest suggestion of whence the messages came, these having been sent to a third person. The identity of the communicator was correctly guessed at the end of the seventh out of twenty messages, each consisting of ten or fifteen words representing about fifteen or twenty incidents of a more or less general or specific character, arranged in an order of increasing definiteness. Professor Hyslop considers that the results of this successful guessing show how few are the incidents necessary to enable one person to recognize the identity of another with surety. This is considered as strengthening the Piper case by demonstrating both that a positive and correct identification of personality after a few messages is possible, and that incoherences, grammatical and mental, of the trance messages are not an argument against the spirit hypothesis.

PSYCHICAL RESEARCH, THE SOCIETY FOR. See **PSYCHICAL RESEARCH.**

PSYCHOLOGICAL ASSOCIATION, AMERICAN, founded in 1892, had a membership, 1899, of 128. The eighth annual meeting was held at Yale University, New Haven, Conn., December 27-29, 1899. The president for 1900 is Professor Joseph Jastrow, of the University of Wisconsin; secretary and treasurer, Livingston Farrand, Columbia University. The association consists of two sections, an experimental section and a philosophical section. In the experimental section at the last meeting new psychological instruments were exhibited, and papers were read and discussions were held on the following subjects: *Volition as a Scientific Datum*, by Professor E. F. Buchner, of New York University; *The Criterion of Sensation*, by Professor G. S. Fullerton, of the University of Pennsylvania; *Moral Perceptions of School Children*, by W. S. Monroe, of the State Normal School, Westfield, Mass.; *Psychology and Social Practice*, by Professor John Dewey, of the University of Chicago; *Individual Tests of School Children*, by E. A. Kirkpatrick, of Fitchburg Normal School, Mass.; *A New Arithmetical Prodigy and His Methods*, by Professors E. H. Lindley and W. L. Bryan, of Indiana University (see GRIFFITH, ARTHUR F.); *Researches in Experimental Phonetics*, by Dr. E. W. Scripture, of the Yale psychological laboratory; *Elements of a Psychological Theory of Music*, by Dr. Max Meyer; *On Relations of Time and Space in Vision*, by Professor Cattell, of Columbia (see **PSYCHOLOGY, EXPERIMENTAL**); *Conditions Affecting the Judgment of the Direction of Lines*, by Professor E. B. Delabarre, of Brown University (see **PSYCHOLOGY, EXPERIMENTAL**).

PSYCHOLOGY. The science of the mind and of mental manifestation in all their possible modes of expression. Psychology has in the last twenty years become more of a natural science and less of a theory by the application of the natural science methods of research to the old theoretical problems of mind. This method is followed out in that branch of psychology at one time known as psycho-physics, but now generally called experimental psychology. (For the world's progress during 1899 in this line see the article **PSYCHOLOGY, EXPERIMENTAL**.) The scope of psychology has gradually widened so as to embrace not only the adult, human, normal mind, but every possible deviation therefrom. An "animal psychology" investigates the apparent mental life of various animate things (cp. Kline, *Methods of Animal Psychology*, *Am. Jour. Psy.*, 10, 256, and, for example, Small, *The Psychic Development of the Young White Rat*, *ib.*, 11, 80). The experimental psychologists do not stop with the higher orders of animals, but have even investigated mind in some of the lowest forms of animal life (cp. Jennings, *The Psychology of a Protozoan*, *Am. Jour. Psy.*, 10, 503). A child psychology has swept over the United States, and has been taken up in various countries of Europe, both by workers in the laboratories and by child study associations, whose membership, consisting largely of teachers, prosecute these researches in the schools, with results that make for improvement in methods of primary and secondary education. An

important contribution to child psychology is made by Dr. Arthur MacDonald, specialist in the United States Bureau of Education, in his article *Experimental Study of Children* in the report of the commissioner of education for 1897-98 (published in 1899. See Vol. I., pp. 989-1204, and Vol. II., pp. 1281-1390. See also Carman, *Pain and Strength Measurements of 1507 School Children*, *Am. Jour. Psy.*, 10, 392; and Colegrove, *Individual Memories*, *ib.*, 10, 228). Great progress is being made year by year in the field of abnormal psychology. Problems in this field are not only those relating to the various forms and degrees of insanity, but also the forms of mentality studied by the societies for psychical research (*q. v.*). A considerable literature is appearing, too, upon the psychology of sex, chiefly abnormal, in Germany, Italy, and England. It is thus seen that the old limitations of psychology are breaking down, and that our knowledge of the mental processes of the normal human adult is being supplemented by extensive study of the abnormal, the animal, and the adolescent. Specialization in the narrower field of normal human adult psychology has gone to the greatest extremes, so that we have not only researches in the senses of sight and hearing (see the *American Journal of Psychology*, the *Psychological Review*, *Zeitschrift für Psychologie*, and several other psychological periodicals), but researches upon smell (Zwaardemaker, *Tast- en Smaakgevaarwordingen bij het Ruiken*, touch and taste sensations in smell, *Nederlandsche Tijdschrift voor Geneeskunde*, 1, 4, 1899), upon touch, the muscular sense, the time sense, and upon taste. W. Sternberg, in an article, *Geschmack und Chemismus* (taste and chemical action), in Vol. XX. of the *Zeitschrift*, above mentioned, finds that the only tastes, strictly speaking, are sweet and bitter, but that all the other so-called tastes are compounds of taste and touch. Bitter tastes produce hunger, and sweet tastes cause thirst. The molecules of sweet substances are very similar to those of bitter substances. This fact explains why the sensations are so often closely associated, and proves that the organ of taste is extremely delicate. The study of the psychology of reading is being carried to an elaborate refinement (see **PSYCHOLOGY, EXPERIMENTAL; PSYCHOLOGY OF READING**), and more attention is paid yearly to the investigation of problems connected with the influence of mind upon body, as is seen in the various forms of suggestion (*q. v.*)—namely, hypnotism, psycho-therapeutics, and various other forms of faith cure, mind cure, etc. See **CHRISTIAN SCIENCE**.

Psychology in Europe.—The work of the laboratories of experimental psychology in Europe was divided in lines of the closest specialization, as follows: In the only laboratory in England connected with a university—namely, that of the university at Cambridge, the director, Dr. W. H. R. Rivers, reported the completion and publication of researches upon the development of the senses of the natives of Torres Strait (between Australia and Papua), including work upon their reaction time, musical capacity, intuition of time, mental fatigue, and effects of practice. These researches were undertaken as part of the work of the Cambridge anthropological expedition to Torres Strait. At the meeting of the British Association Dr. Rivers reported that the natives show considerable variability in temperament, and are not particularly susceptible to suggestion. He tested 150 natives of Torres Strait and Kiwai for color blindness, and found no case. The color names of the islanders were investigated. They were found to have definite names for red, less definite for yellow and green, while for blue they had to borrow names from English. A corresponding bluntness of vision for the violet end of the spectrum was observed. The results of numerous investigations into their ability to draw and write showed the natives to have a surprising accuracy in mirror writing. Their estimation of time was found to be unexpectedly exact. Indications of mental fatigue were shown by them, also the improvement due to practice. In hearing they were below the average Europeans, and in acuteness of sense of smell not above; but they had at once a greater power of discrimination in the sense of touch and a smaller sensibility to pain. In Germany the director of the psychological laboratory at Kiel, Professor G. Martius, published researches on the perception of light and the duration of visual impressions; Professor Benno Erdmann, in Bonn, continued his investigations upon the recognition of letters and words. (See **PSYCHOLOGY OF READING**.) In Freiburg Dr. Jonas Cohn published *Gefühlston und Sättigung der Farben* (The Relation of Affective States of Consciousness to the Saturation of Color). In the psychophysical laboratory at Copenhagen, Denmark, Professor Alfred Lehmann has directed studies in the determination of the perception of differences of color, particularly purple; the perception of difference, similarity, and identity; and plethysmographic researches with the insane; and has himself experimented upon the determination of the mechanical equivalent of psychic energy, and published in German *Die Körperlichen Äusserungen psychischer Zustände*, Leipsic, 1899.

Psychological Literature.—Notable psychological works on special topics which have appeared in Europe in 1899 are: Z. Oppenheimer, *Physiologie des Gefühls* (The Physiology of Feeling), Heidelberg; Groos, *Die Spiele der Menschen* (The

Play of Man), Jena; Von Krafft-Ebing, *Psychiatrie und Neuropathologie*, Leipsic; O. Sommer, *Lehrbuch der psychopathologischen Untersuchungsmethoden* (Methods of Research in Psychopathology), Berlin; Fuchs, *Therapie der Anormalen Vita Sexualis bei Männern*, Stuttgart; Friedrich, *Hamlet und seine Gemüthskrankheit* (The Madness of Hamlet), Heidelberg; Von Bechterew, *Suggestion und ihre Sociale Bedeutung* (The Significance of Suggestion for Society), Leipsic; Hering, *Zur Theorie der Nerventhätigkeit* (Theory of Nerve Action), Leipsic; Romer, *Psychiatrie und Seelsorger* (Psychiatry and Religion), Berlin; P. F. Thomas, *L'Éducation des Sentiments*, Paris; A. Binet (ed.), *L'Année Psychologique*, Paris; Gyl, *L'Être Subconscient*, Paris; Lalande, *La Dissolution*, Paris; Duprat, *L'Instabilité Mentale*, Paris. One of the most notable psychological publications of the year is the French *Year Book of Psychology*, mentioned above. The fifth volume (902 pages, Paris, 1899) contains seventeen original contributions, reviews, and digests of much of the periodical and other literature of the year and a classified bibliography of 2558 titles by Professor H. C. Warren, of Princeton University. Two works in Italian are especially worthy of mention—namely, Sanctis de' Sanctis, *I Sogni* (Dreams), Turin; and Villa, *La Psicologia Contemporanea* (Contemporary Psychology), Turin. The work of de' Sanctis on dreams contains a treatment of the dreams of children, adults, old persons, neuropathics, of the mentally deranged, of delinquents, and of animals. It is found that women dream more frequently and more vividly than men, and remember their dreams better. Imbeciles and epilepts are infrequent dreamers, while paranoiacs and hysterics are constant dreamers. Of the delinquent class examined by de' Sanctis, less than 25 per cent. were dreamers. He finds also that the daily emotions of the normal human adults influence their dreams in about 60 per cent. of the cases. In English have appeared during 1899: G. F. Stout, *A Manual of Psychology*, London; Hugo Münsterberg, *Psychology and Life*, Boston; William James, *Talks to Teachers on Psychology*, New York; H. M. Stanley, *Psychology for Beginners*, Chicago; R. H. Hutton, *Aspects of Religious and Scientific Thought*; F. W. Bain, *Realization of the Possible*; A. W. Benn, *Philosophy of Greece*; Schofield, *The Unconscious Mind* (all London, 1899).

PSYCHOLOGY, EXPERIMENTAL. In the United States and Canada there were over twenty laboratories where research work was being done, the most important being those connected with the universities of Harvard, Yale, Princeton, Cornell, Columbia, Clark, Brown, and those of Pennsylvania, Chicago, California, Iowa, Wisconsin. Two methods in experimental psychology have led to different fields of investigation. The one method requires a laboratory and its many instruments, while the other is introspective, and requires only the writing materials necessary for recording the facts observed. Topics investigated in this manner are those of imagination and memory. An interesting and curious use of the introspective method was made by a German investigator in the subject of the sensations of being hypnotized. (See *Zeitschrift für Hypnotismus*, 1899.) Following is a brief account of some of the experimental work done in several of the more noted universities of the United States:

Brown University.—Professor E. B. Delabarre, of Brown University, reported in 1899 before the American Psychological Association results of certain ingenious experiments on visual perception as manifested in the judgment of the direction of lines. He discovered that one's judgment of the verticality of a line is influenced by a number of hitherto neglected factors, chief of which are the so-called attention fixation and the eye fixation. When the eye is directed to one small point in the field of vision it has generally been taken for granted that the eye remains motionless just as long as the attention remains fixed upon the same point. Professor Delabarre finds, however, that there is a slight motion of the eye, of which the observer is unaware. The eye and the attention are normally looking at different points, and even if the attention is held for some time upon one point, the eye shifts constantly, playing about the point of attention. "Normally the deviation between the two fixation points, that of the eye and that of attention, is large and constantly variable. Practice in steady fixation may diminish but not remove it, and may or may not make us conscious of its existence." This play of the eye about the point of attention is considered to be necessary, in order that the attention may be kept upon one point and yet allow some slight change in the whole retinal field, whereby the retina is less exhausted. Professor Delabarre demonstrated the actual motion of the eye by means of a microscope. He got his subject to look as steadily as possible at one point while a microscope was directed upon certain small blood vessels on the surface of his eyeball. An infinitesimal eye motion could thus be readily detected; and it was found that there is a continual motion of the eye, of which, however, the subject has no consciousness. This is certain to influence the judgment of the verticality of lines, because when the eye is fixed upon a point a short distance to the left of the centre of a vertical line and the attention upon the line, the ends of the line seem to be inclined slightly toward the point, while if the

point fixated by the eye is to the left of the lower end of the line, the whole upper part of the line seems to be slightly inclined toward the left. The same thing is true *vice versa*. Other factors in the judgment of the direction of lines are (2) the irradiation of the upper and lower ends of the line; (3) after-images (*q. v.*) of the line; (4) fatigue or degree of attention or distraction; (5) whether the right eye or the left or both be used; (6) expectant attention; (7) a tendency of the line to waver when looked at for any great length of time; (8) the presence of bright spots in the field of vision; and—a very important factor—(9) the ordinarily unconscious muscle strains of the head and the eye, which strains may be produced by several of the factors mentioned above. Thus, if a bright spot be introduced within the field of vision, it will attract the eye and arouse a strain of resistance. This strain will result in influencing the judgment of the vertical in the direction of the spot. The factors which influence the judgment of vertical lines will also affect that of any other lines, and other judgments of space as well as judgments of direction. The application of these researches is primarily in the explanation of certain geometrical illusions, and secondarily in the deduction of certain underlying and as yet ill-understood principles of art.

Columbia University.—From the laboratory of psychology of Columbia University were published in 1899 five researches of importance. These were: *The Emotion of Joy*, by George V. N. Dearborn, M.D.; *The Influence of the Weather on Conduct*, by Edwin G. Dexter; *Inhibition*, by B. B. Breese; *After-Images (q. v.)*, by Shepherd I. Franz; and *The Accuracy of Voluntary Movement*, by R. S. Woodworth. The laboratory was increased by the addition of nine rooms. The new rooms are to be used as research rooms in the field of vision. Unpublished original research carried on or completed during the year were those of Professor Cattell and Mr. Gerrard. Professor Cattell's researches were upon the relations of time and space in vision. He experimented with a visual stimulus, consisting of white, black, and colored surfaces moving rapidly behind a screen through a slit, in which they became visible for a short time. As the slit in the screen was very narrow and the colored surface about an inch square, the exposure was of so short a duration that the eye could not move. Thus, the effect of eye movement was eliminated. The stimulus was first one color and then another, thus making for the retina a time sequence of impressions, a sensation of red and after it a sensation of green in exactly the same place in the field of vision. As the eye cannot move, the same parts of the retina must be affected successively. When the same parts of the retina are affected by the two or more colors of a color-mixer the result is a uniform gray. The color-mixer is an apparatus consisting of a circular disc with green, red, etc., colored sectors, which is set in rapid motion, producing what is termed fusion or the melting of the two or more colors into another different color from either of the others. When a red stimulus follows a green in the instrument of Professor Cattell the result is not a uniform gray, but a patch of green color seems to be beside a patch of red, sometimes above or below, sometimes at one side or the other, and sometimes seeming to overlap one another. This fact is considered by Professor Cattell to illustrate a fundamental principle of visual perception, that from successive stimulations in time a perception of space results either intuitively or by gradual education. Professor Cattell takes an opposite view to that which the students of the psychology of reading propose, who say that when the eye moves from point to point on the line in reading a printed page it perceives nothing at all while actually in motion. He holds, on the contrary, that there are many perceptions made by the moving eye, pointing out that there is no fusion of retinal images observable in the ordinary perceptions of life where the eye moves, and that there is fusion where the object moves and the eye remains stationary. These two circumstances where fusion of images does and does not take place are, he considers, as the retinal conditions are quite analogous, a proof that fusion and clear perception are the work of the brain rather than of the eye, or, in psychological language, are of central rather than of retinal origin. Mr. Gerrard has carried out extensive researches in the emotional expression in literature. He caused a number of subjects to indicate while they read certain works of literature of various styles, such as *Hamlet*, *Rip Van Winkle*, *Heimat*, and others, at what points their emotional changes took place. He then analyzed these works into the different elements of dramatic moment, paragraph, sentence, clause, verb, noun, adverb, and adjective. Comparing the emotions experienced in reading these pieces of literature with the differing proportion of the elements above mentioned, he finds that the elements change with the emotion, and that their changes indicate almost exactly the emotion expressed; and has discovered a general rule respecting the use and value of each of the literary elements as found in all kinds of literature. He is thus enabled to assign a relative emotional value to each of the elements, and can so account for the weakness or strength of any literary work. During 1899 Mr. Gerrard also extended his research so as to include the emotional elements in music. In Dr. Dearborn's monograph on the emotion of

joy the results of experiments extending over several years are given. He finds that an emotion in proportion to its pleasantness is accompanied by an expansive tendency of the extensor muscles; he finds five components of the period of emotion—namely, psycho-physical excitement, various feelings, heightened consciousness of the relation between the object of the emotion and the subject agent, a pleasant or unpleasant tone of consciousness, and sometimes an increased self-reference. Dr. Franz's work on after-images has been noticed in a separate article under that title. Dr. Breese experimented upon inhibition in what is called retinal rivalry in the following manner: By means of a stereoscope he put before the right eye a figure (b), and before the left a figure (a). When both eyes are open the

phenomenon called retinal rivalry takes place. One sees not a figure like (c), but first (a) and then (b) and then (a) again, and so on indefinitely, the changes taking place at an interval of about five seconds. He found, however, that he and a number of other persons experimented on by him could increase the length of time that (a) or (b) was seen by fixing the attention on it, but the number of changes seemed to increase. It was observed that the eyes moved slightly in the direction of the lines of the figure which at that time occupied the attention; but the elimination of this eye movement decreased the ability to look steadily either at one or the other figure. If, on the other hand, an effort was made to follow with the eye the lines of either figure, it was possible to hold that figure longer. A like result was obtained by counting the lines. When other figures were used, those which induced the greatest eye movement remained longest in consciousness. If all the muscles on the right side of the body were voluntarily contracted, the figure on the right was seen longer. The after-images also were found to exhibit the same rivalry. Dr. Breese found that "when both figures were of the same color the rivalry between the two sets of lines was not affected, and that this retinal rivalry occurred not only between two eyes, but that different stimuli falling upon the same area of the retina of one eye produced the phenomena of rivalry. By these experiments it was shown that inhibition may be voluntary or that, of two sensations, we can inhibit the one by paying attention to the other. Other experiments were devised by Dr. Breese to ascertain the effect of different kinds of inhibition upon various states of consciousness. Thus, having observed that when persons endeavored to memorize a series of numbers or letters they tend to repeat them aloud, he caused his subjects first to hold their breath while trying to memorize, and second to repeat something incongruous with what they were trying to remember. In both of these cases he found that the memory consciousness was inhibited or overcome by the contradictory motor impulse. Dr. Breese considers these experiments strongly to corroborate the theory that consciousness is dependent equally upon its motor and upon its sensory factors—in other words, that every thought tends to express itself in an action, and the suppression of the physical action limits and restrains the mental activity. Professor Cattell is co-editor (with Professor J. Mark Baldwin, of Princeton) of the *Psychological Review*, and is the responsible editor of *Science*.

Cornell University.—The equipment of the psychological laboratory of Cornell has been largely increased, a special grant of funds having been made by the university. The collection of apparatus for experimentation in the senses of smell and taste is considered to be one of the best in the world. Several new and very extensive sets of apparatus for touch and hearing were, during 1899, added to the room

devoted to registration by the graphic method—a dynamometer, two ergographs, two pneumographs, an automatograph, a laryngograph, a sphymograph, two plethysmographs, a tri-dimensional analyzer, a new pattern continuous paper kymograph, and several student kymographs. The borderland between conscious perception and the subconscious was the subject of one series of experiments at Cornell in the sense of hearing. When a sensation is so faint as hardly to be perceptible the effect is not a uniform but an intermittent perception, a perception which appears and disappears. Thus, as one looks at a very distant and almost invisible object, it is seen for a time, and then is lost. Mr. Cook, experimenting on hearing, found that when an almost imperceptible musical tone was produced, the hearer's attention directed to it could bring it into consciousness only periodically. It was heard only about every five seconds. Dr. I. M. Bentley published in 1899 the results of an elaborate series of experiments made by himself with the aid of a number of subjects as to the nature of the memory image. The memory image is the visual or other imagination which one has, with the additional qualification that it pertains to an actual experience, and is referred to the past. It is to be distinguished from the visual after-image, since this is supposed to be the gradual fading away of the effects of stimulation of the retina of the eye. The problem investigated had chiefly to do with the "qualitative fidelity" of the memory image—that is, not the individual capacity for retaining for a longer or a shorter time a given sight in his memory, but this ability to call up in his mind the quality of the sensation. The time, intensity, and quality chosen for experiment were three shades of gray so close as to be hardly distinguishable. By means of an apparatus devised for the purpose, he exposed to the subject's view a shade of gray made up of 60 per cent. white and 40 per cent. black, and produced by what is known in the psychological laboratory as a Marbe adjustable color mixer. This instrument consists of a disc which can be rotated rapidly, and so adjusted that the colors can be changed while in motion. When the disc is made up of sectors of all the colors of the spectrum, and the rate is rapid enough, the result is a uniform gray. If the rate is very slow a flickering of the different colors takes place. The same gray can be made by mixing a white sector and a black sector. The latter is the method used by Dr. Bentley. By dividing the circle of the disc into 100 equal portions, the proportions of the white and black sectors can be expressed in percentage. The proportion of white and black can be changed, thus making grays of different shades while the disc is rotating. The three shades of gray used in the experiment differed by a sector of only 5°, so that the shade first shown, called *A*, was lighter by 5° of arc than one of the others, *B*, and darker by 5° of arc than the other, *C*. After shade *A* was shown, there was a period of 5 seconds, and then either *B* or *C* was shown, and the subject judged whether the second appearance was lighter or darker. Sometimes it was judged to be the same. A curious and interesting law was observed in Dr. Bentley's 600 experiments. These experiments were carried on partly by diffused daylight of good intensity, where naturally the whole of the retina was acted upon, not only by the color mixer, but by the other objects in the room within the field of vision; and they were partly carried on in a dark-room, in which case the disc of the mixer was the only object which acted upon the retina. The result of this difference of conditions of the experiment was that in the daylight, the memory image by means of which the subject compared the first shade with the second, seemed to grow lighter and in the dark room the image grew darker, so that by daylight the second shade was thought to be darker, and in the dark, lighter than the first. Publications coming from the Cornell psychological laboratory in 1899 were the second edition of Professor Titchener's *Primer of Psychology*, and the fifth edition of his *Outlines of Psychology*. He published also *Zur Kritik der Wundt'schen Gefühlslehre* (Review of Wundt's Theory of the Emotions) in the *Zeitschrift für Psychologie*, and *The Postulates of a Structural Psychology*, published in the *Philosophical Review*. Professor Titchener is the American editor of *Mind*.

Indiana University.—Two researches of great interest were reported during 1899 from this university by Professor William L. Bryan. Mental and physical tests were made into the conditions of the rapidity and accomplishments of the arithmetical prodigy, Arthur F. Griffith (*q. v.*), and a valuable research was published by Professor Bryan and Superintendent Noble Harter, of the public schools of Warsaw, Ind., on the subject of the acquirement of the telegraphic language. They recorded for periods of 40 and 28 weeks, respectively, the number of (1) letters not making words, (2) words not making sentences, and (3) words making sentences which their subjects, two students of telegraphy, could send or receive in one minute. To these records were added answers by expert telegraphers to the following questions: (1) To what is attention mainly directed at different stages of the progress? (2) How far can one "copy behind" in different stages of his progress? This question was framed in technical telegraphic terms to find out how much could be remembered at any given time, or how great was the span of consciousness

for the receiving of messages. (3) What happens when you have to receive the disconnected words of a strange code, or list of figures, such as bank clearings or the like? It should be here stated that in the American Morse system of telegraphing there are required, on an average, nearly 24 clicks for each word. This gives some slight insight into the difficulty of carrying many letters or words in the memory, particularly when it is remembered that in receiving a message the operator goes by the sound of the clicks of his instrument. It was found in response to question (1) that the operator can do no more when learning than to follow the letters successively, write them down, and look for the sense afterward. Later he can receive by paying attention to the words, and not listening so carefully to the letters. It should be borne in mind that in telegraphic messages only the shortest possible abbreviations for words are used, and that it would be impossible to spare the time necessary to spell every word completely. From the answers to question (2) it was learned that a good operator, in writing down a message, can be about six words behind the clicking of the instrument, and that an expert prefers to be as much as ten or twelve words behind. Question (3) elicited the fact that in the case of disconnected figures and code words, all operators endeavored to take them down as fast as they are given. The results of this detailed study of the telegraphic language, and the nature of the progress in learning it, are interpreted by Professor Bryan as showing that there is in every one a hierarchy of habits. In other words, one habit must be acquired in the learning of any subject before the next can be developed. This is shown equally well in children learning to read, and blind persons learning to read from raised letters. A striking difference is shown, too, between the progress of learning to send and of learning to receive a message. It is found that the ability to send a message progresses much more rapidly than the capacity for receiving, and sooner reaches the maximum, as that is soon limited by the physical conditions of moving the hand. The sender's ability also continues to improve at an approximately uniform rate. The capacity to receive, on the other hand, improves for about eight or ten weeks at a uniform rate, and then for about the same period of time there seems to be no improvement. This first progress and apparent halt is thought to be the time necessary to attain the habit of listening to the letter and word clicks. After that has become a sufficiently organized habit of the physical and mental system, the progress in learning to listen to whole clauses and sentences in telegraphic messages before writing them down becomes very rapid, and leads finally to mastery, and, in the case of a few operators, to the highest expertness. Professor Bryan points out that this interrupted progress is characteristic of nearly all mental acquirements, mentioning as instances the subjects of English composition, chemistry, music, mathematics, and the learning of chess and other games. The recognition of this is of evident value in education, as it will, in some respects, account for a very discouraging slowness and incapacity shown by nearly all students at certain points in their study of all branches of learning. The instructor should not regard this perfectly normal phenomenon as due either to any defect in method of instruction at that particular point or to laziness or a lack of interest on the part of the students, but rather to the fundamental nature of the formation of habit.

The University of Chicago.—The results of a number of experiments on the relations between certain organic processes and consciousness were published in 1899 (*Psychological Review*, Vol. VI., p. 32) by J. R. Angell director of the psychological laboratory. Plethysmographic records were taken in the shape of capillary pulse tracings, and the respiration was graphically recorded for short periods of time, during which either the subject was left to himself, and described the various thoughts and emotions occurring during the interval; or the subject was given some mental task to perform, such as an arithmetical operation. The results of these experiments show a general and uniform relation between the rate and depth of respiration, the pulse rate and the blood pressure, and the emotions and the sensations and the purely mental processes, including memory, reasoning, and undirected reverie. The results show that even in cases of similar psychical content the respiration and circulation vary greatly from time to time in accordance with the fluctuations of the attention; but that the general tendency of sensation is to make smaller the blood vessels in all parts of the body except the brain, and to send to the latter an increased amount of blood; and at the same time to accelerate the heart beat and the rate of respiration. The blood rushes to the brain, too, when some mental work is going on, whether memory or reasoning. Furthermore, emotions produce vaso-constrictions, or a lessening of the calibre of blood vessels, and a consequent afflux of blood to the brain. While the purely psychological processes mentioned call more blood than usual to the brain, it is not to be supposed that the reverse is necessarily true—namely, that when blood is sent to the brain in larger quantities (as may be done by doses of amyl nitrite), a corresponding mental activity results, as many investigations have proved the contrary. Thought affects the blood pressure, but blood pressure alone does not cause mental activity.

University of Iowa.—From the University of Iowa Professor C. E. Seashore publishes psychological statistics on the visual perceptions of interrupted linear distances, the material-weight illusion, the localization of sound in the median plane, hearing ability and discrimination, and sensibility for musical pitch; and on motor ability, reaction time, rhythm, and time sense. Dr. Seashore finds that there is a strong tendency to think that the source of any sound which comes from any point in the median plane is situated in front of the hearer and above his ears. In his experiments upon rhythm he finds that when a person is told to make a series of motions, the rhythm into which he naturally falls has the same time interval as the pulse, a multiple of the pulse rate, or sometimes that of the respiration. Dr. Seashore has made a valuable contribution to science in the shape of his new audiometer, an apparatus with which to produce sounds the intensity of which can be accurately measured. This has never been successfully accomplished before. It is found necessary in all experiments upon sensation to have an objective stimulus which can be accurately estimated physically before an attempt can be made to measure the discriminative power of the various senses. In the case of the sense of touch an impress is made upon the skin; either directly by a weight, or by a plunger attached to a spring, the pressure of which can be measured in ounces or grams. In the case of the senses of sight or hearing there has never been an altogether satisfactory means of measuring the real physical force of the so-called stimulus. Dr. Seashore has constructed an instrument which can vary with mathematical exactitude the intensity of the sound. It is made by sending to the receiver of a telephone the electrical energy generated by one, two, three, or more loops of the secondary coil of an induction coil. "The complete apparatus consists of an induction coil, a battery, a galvanometer, a resistance coil, switches, and a telephone receiver, all except the receiver being built into one compact and portable piece." The ordinary sound conveyed by the receiver to the ear of the subject is a click, but the switches are so arranged that the continuous tone of an electrically actuated tuning-fork may be reproduced with greater or less intensity in the telephone receiver. It has been pointed out that Seashore's audiometer will be of use not only in the psychological laboratory, but in aurists' offices, and in the school-room, where the hearing of pupils is to be tested.

University of Toronto.—From the psychological laboratory of this university were published two researches during 1899, one on the psychology of time, in which it is shown that Webers law holds good for the subjective estimation of time; and another on the time relations of poetical metres. In the latter research the experimenters, measured by means of a chronograph, the length in 100ths of a second the syllables in various poetical metres. They found the relation of the iambus and the trochee came very near being one of identity; but that the dactyl and anapest, besides being actually of longer duration than the other two metres, had each an order of syllable lengths peculiar to itself. It has been generally supposed that the anapestic rhythm might be regarded as a dactylic rhythm preceded by two unaccented syllables, and they have in all works on prosody been represented by a long and two equal short marks, thus dactyl — — —, anapest — — —. It is here shown that both metres are made up of a long, a shorter, and a shortest syllable, the dactylic having them in this order, but the anapestic having them in the reverse order. The relative lengths of the two short syllables being in the anapest in the order shortest, short, followed by the long, and in the dactyl the long followed by the short and then the shortest. This is of interest as affording a solution of the question whether there is an intrinsic difference between the dactyl and the anapest.

PSYCHOLOGY OF READING. Chiefly owing to its practical application in every-day life, the study of the mental and physical processes involved in reading is one of the most important branches of experimental psychology, and shows that the ability to read, which is expected of every one not illiterate, is physiologically and psychologically a complicated affair. This is true whether one reads silently or aloud. The thorough investigation of this subject will in the end prove of vast importance to philosophy in its elucidation of the processes of verbal thought. The latest and most important work on this subject is the 360-page volume, entitled *Psychologische Untersuchungen über das Lesen* (Researches in the Psychology of Reading), by Professor Benno Erdmann, of the University of Bonn, Germany, one of the foremost philosophical thinkers of the day, and his pupil, Professor Raymond Dodge, now of Wesleyan University, Middletown, Conn. The results of their investigation, partly corroborating and partly supplementing the previously discovered facts mentioned in the 1898 YEAR BOOK, may be summed up as follows: When reading, the eye moves from one point to another in the line, resting an instant on each point. During the short times while the eye is actually in motion, it is impossible to distinguish a single letter; consequently all the reading is done during the interval that the eye is looking at one point. This jerky motion of the eye fatigues the eye-muscles when carried on too long, and is a source of weakness

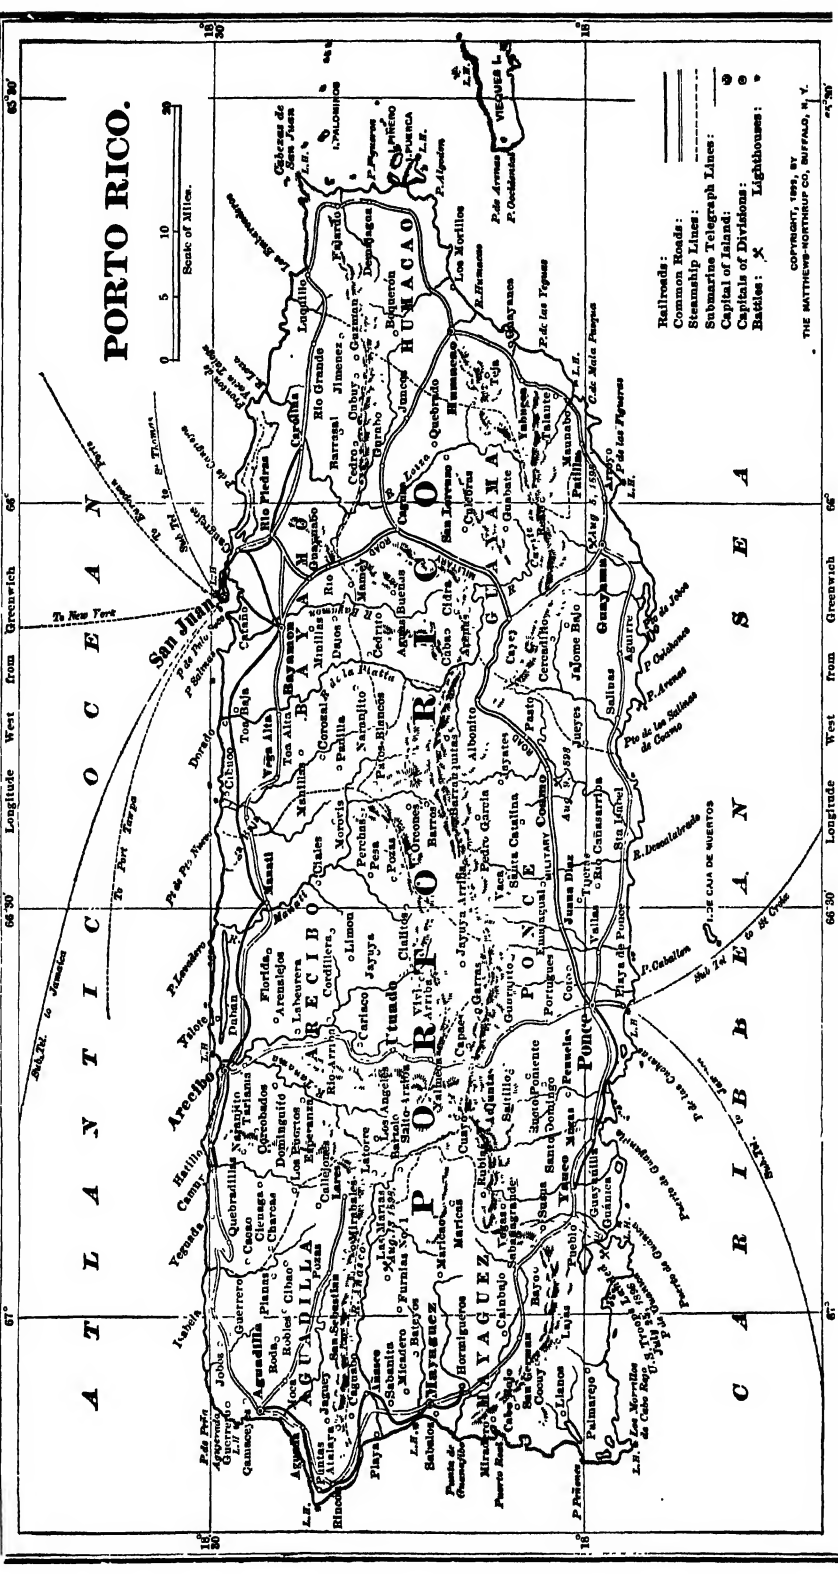

to the eyes. In words of medium length, the eye is generally looking at the middle letter and at the upper half of the word. In long words, the eye looks at the first half rather than at the second. In the case of easy, familiar prose, it was found that while reading a line about three and a quarter inches long, containing 47 letters, one observer moved his eyes on an average five times, and in reading a line four and three-quarter inches long, having 63 letters, another observer moved his eyes 7 times. The number of eye-jerks varies in lines of the same length, according to the length of the words and their position in the line, but this variation is so slight as to be almost negligible. It is thus seen that the eye in reading ordinary prose takes in about 9 letters at a time. An interesting comparison is made between the number of these eye-jerks in reading for the sense of the passage and reading for the spelling, as in proof-reading. In the latter, it is found that the average scope of the eye is only about 4 letters, instead of 9. A careful estimate of two factors in the eye movement in reading was made—namely, (1) the rate of movement from one stop to another, in going from left to right, and (2) the length of each stop. It was found that one observer's eyes, moving 5.6 times to each line, covered an angular distance each time of nearly 4°, and that the time occupied in movement was about .11 seconds, and in stopping about 2 seconds. The rate of movement naturally varies very slightly whether the text is familiar or unfamiliar, but if the text is unfamiliar the stops are of greater duration. It is noticeable, too, that the time occupied in stopping is more than ten times as long as that taken up in moving. The investigation of certain points connected with the perception of individual words must be noticed. In the first place, a table of figures given by Erdmann and Dodge shows that the time it takes to perceive a suddenly displayed illuminated surface and make a signal to that effect is .222 second. This is what is known as a simple reaction. It takes .434 second, or nearly twice as long, to call the name of a letter instantaneously shown. It would seem that to name a word of 4 letters would take 4 times as long again, but this is not the case. To perceive a 4-letter word was found by these experimenters to take .430 second. Moreover, an 8-letter word was perceived and named in .449 second, a 12-letter word in .543 second, and a word of 16 letters in .509 second. So that if it takes four-tenths of a second to name a single letter, it takes only a little over five-tenths to call the name of a word containing 16 letters. An extremely ingenious manner of finding what point in any word is actually looked at, technically called the "point of fixation," must be mentioned. It is a familiar fact that the eye retains a strong impression for some time after the cause of the impression has been removed. Fix the eyes upon a red circle for a minute, and then look at a small point in the centre of a white surface, and a green circle will be seen, which subsequently changes color a number of times and finally disappears. A red cross will produce a green cross in the same way. This second image is called the *after-image* (*q. v.*). A peculiarity of the after-image is that it moves with the eyes, possibly because a certain part of the retina was temporarily overworked, and so always remains in the same relative position in the field of vision. Messrs. Erdmann and Dodge made a very curious and clever use of the after-image in their experiments, in order to find in what parts of the line the point of fixation fell in reading. So before reading a line they looked steadily for a short time at a red spot the size of a capital letter, and then read on in the ordinary way. The small green after-image was observed to rest now on one and now on another letter of the text. These letters were marked with a pencil, or identified in some other way, and thus were shown to be the points of fixation in question, or the parts of the words directly looked at. It was found that this point generally fell in the middle of a word, and never between two words, but sometimes between two letters of the same word. It was furthermore ascertained that the word is taken in as a whole and not by spelling it out letter by letter. It was found that words could be correctly read, in a large percentage of cases, when they were so far from the eye that the individual letters were just indistinguishable, showing that, in some way, the mind helps the eye to see what is, as it were, physically invisible. It was found also that as long as the eye was kept directed to one letter, only about a half a dozen letters to the left of it and about the same number to the right could be distinguished. This is a valuable indication of the extreme narrowness of human vision while the eye is at rest, and helps the uninitiated to realize that his sight takes in, fully, only about 4° of the 360° of the circle, or of the 120°, more or less, which is the ordinary compass of one eye for the detection of moving objects.

PUERTO RICO, or more commonly spelled Porto Rico, a West Indian island, acquired in 1898 by the United States as a result of the war with Spain, has an area of 3608 square miles, with a coast line of 360 miles and a population of about 850,000. At the close of the year 1899 the preliminary estimate of the population was 957,679. The mountains form the greater portion, about nine-tenths, of the area, the lowlands being around the coast of the island. The greatest altitude is 3790 feet, which is reached by the western summit of El Yunque in the Sierra Luquillo, the eastern summit being almost the same height. According to a report of the United States Insular Commission, dated June 9, 1899, the people are "most loyal in their devotion to their new country, and are solicitous to be regarded as a part of the United States." There are numerous well-to-do and intelligent people, but there is a great deal of poverty among the lower classes, yet before the great and disastrous hurricane of August 8, 1899, there was no actual starvation. The religion was that of the Roman Catholic Church, the only church edifice of any other denomination being the Protestant Episcopal Church at Ponce. The priests, formerly paid by the Spanish government, are now obliged to get their subsistence from the contributions of their congregations. Education was in a very backward state, due to the neglect of the Spanish authorities. In 1898 there were 554 schools in Puerto Rico, 510 public and 44 private, with an enrolment of 27,936. At the same time there were 125,695 children of school age, leaving 97,759 children without school privileges. Eighty-seven per cent. of the white population and eighty-six per cent. of the colored population are said to be illiterate. In January, 1899, General John Eaton, who was, from 1870 to 1886, United States commissioner of education, undertook the task of reorganizing the educational system of the island. The government in 1899 was entirely in the hands of the military governor, but important steps had already been taken both toward a free education for the people and toward a new form of government better adapted to their nature. The currency is made up of Puerto Rican silver and the paper currency of the Spanish bank of San Juan. The Puerto Rican dollar or peso was valued on January 20, 1899, at \$0.60. The municipal governments were in 1899 managed on the same bases as under Spanish régime. The climate is equable, there being but a slight annual variation in temperature. The annual rainfall varies from 120 inches in the northeast corner of the island to about 40 in the southwest. The communication and transportation on the island is by means of the railway extending from Carolina, about 14 miles east of San Juan, to the capital, and thence west along the coast to Camny, the total mileage being 137. There are 170 miles of railway under construction. The agricultural products of the island include vegetables of all kinds and Indian corn, besides the more important coffee, sugar, and tobacco.

The Great Hurricane of 1899.—All that might be said of the fertility of Puerto Rico and its prosperous outlook in the early months of the year would have to be contradicted after the terrible hurricane which visited the island on August 8, 1899, wrecking many of the coffee and sugar plantations, and rendering thousands homeless and destitute. The official report of Brigadier-General George W. Davis, dated December 15, 1899, says:

"As respects the number of persons who on August 8 lost all, or about all, but their lives, the original estimate was close to the truth—that is to say, the numbers of the class referred to aggregate about a quarter of a million. Nor was the extent overstated to which they were victims. In one particular, however, it was understated. These poor peones were left without the material (palm leaves) with which to rebuild their huts, for the tornado decapitated every palm tree in its path. Fortunately, the climate is mild, and the suffering from a lack of shelter was light. It was only the sick who really suffered, for they had no protection from the summer rains. Medical service was deficient and medicines unobtainable at first. There are no hospitals and could be none save those that the board of charities improvised. The destruction to roads was rather more than I reported, above \$100,000 of insular revenues having been already spent in repairs, and as much more will be required to reconstruct and rebuild. Some important bridges must wait until next year. Tobacco suffered very little, but the loss of the Cuban market had already disarranged planting, and as the crop had been harvested, there was no growing crop to injure; but the tobacco laborers suffered to the same extent in loss of huts, provision crops, etc., as all other peones. Sugar-cane was greatly injured by overflows and sedimentation, but was benefited—that is, fertilized—by the same for future crops. There was extensive injury to sugar mills, some of which, being old and obsolete, will never be rebuilt."

The following is an estimate made by General Davis as to the probable yield of coffee, sugar, and tobacco for 1899-1900:

Staple.	Estimated Value for Export, 1899-1900.	Actual Average Export, 1893-97.	Reduction.
Coffee.....	\$300,000	\$3,080,409	\$5,480,409
Sugar and molasses.....	2,100,000	2,408,963	303,963
Tobacco.....	450,485	450,485
Total.....	\$3,150,485	\$3,939,857	\$5,794,872

The Insular Commission.—The report of the insular commission, sent by the President to Puerto Rico to investigate the civil affairs of the island, was submitted May 27, 1899. The commission was composed of General Robert P. Kennedy, Judge H. G. Curtis, and Major C. W. Watkins. They submitted with the report a number of recommendations for improvements in the various administrations of the island, of which the following is a summary: 1. That all Spanish laws and royal decrees be abolished in favor of the common law of the United States. 2. That a new system of taxation be introduced. 3. That a school system with a majority of American teachers be inaugurated. 4. That a number of judicial courts be instituted on the American plan, the official language to be English in the federal and supreme courts and Spanish in the inferior courts. 5. That church and state be completely separated. 6. That in order to prevent the concubinage so prevalent on the island, where formerly fees of priests made marriage impossible for poor persons, so-called common-law marriages be recognized, all marriages be recorded, and, further, that divorces be decreed for good cause, as allowable in the United States. 7. That the president make "such modifications in the tariff schedules between the United States and Puerto Rico as he may deem wise, pending the action of Congress in fixing the full status of the island province." 8. That a new and complete census be made. The United States Geological Survey has issued a report on the mineral resources of Puerto Rico by Hill. See **COLONIES** and **UNITED STATES**.

PUTNAM, HERBERT, librarian of Congress, was appointed to that position on March 13, 1899, to succeed John Russell Young, who died on the 17th of the preceding January. Mr. Putnam is the son of the late George P. Putnam, publisher, and was born in New York City, September 20, 1861. After his graduation at Harvard in 1883 he took a partial course at the Columbia Law School, and two years later was admitted to the bar in Minneapolis, Minn. He soon became librarian of the Minneapolis Athenæum, and later was instrumental in founding the Minneapolis Public Library, which is known as one of the most progressive libraries in the country. In December, 1891, he resigned as librarian in Minneapolis, and removed to Boston to practise law, where he was engaged in legal work until 1895, when he became librarian of the Boston Public Library. This is one of the largest and most efficient libraries in the United States. In 1898 Mr. Putnam was president of the American Library Association. The best authorities regard him as a most capable librarian. He has published various articles in professional journals and other magazines.

PYRITE. The chief use of pyrite continued to be for the manufacture of sulphuric acid and sulphur. The yield for the last two years was: 1898, 193,304 long tons, valued at \$593,801; 1897, 143,201 long tons, valued at \$391,541. About 70 per cent. of the production came from Virginia, 22 per cent. from Massachusetts; the balance from California, Colorado, New York, North Carolina, Ohio, and Tennessee. The imports of pyrite containing less than 3.5 per cent. of copper amounted to 252,773 long tons, valued at \$717,813. That with over 3.5 per cent. copper is treated as copper ore. This production was 761,754 long tons.

QUARITCH, BERNARD, a well-known London art dealer and book-seller, died December 17, 1899. He had a wide reputation among bibliophiles, and was undoubtedly one of the greatest dealers in rare and old books, the modern market for which was largely made by him. He was born in Germany in 1818, and went to London for permanent residence in 1845.

QUARLES, JOSEPH VERY, United States senator from Wisconsin, was elected, as a Republican, by the legislature, to succeed Senator John L. Mitchell, Democrat, January 31, 1899. Born December 16, 1843, at Kenosha, Wis., he was graduated at the high school there, and in 1862 entered the University of Michigan, but soon left to join the Thirty-ninth Wisconsin Volunteers, becoming first lieutenant of Company C. After being mustered out he re-entered the university at Ann Arbor, being graduated in 1866, and two years later was admitted to the bar. Subsequently

1

4

he served in both houses of the Wisconsin legislature, and then, having settled in Racine, practised law there until 1888, when he removed to Milwaukee. His term in the Senate will expire March 3, 1905.

QUAY, MATTHEW STANLEY, United States senator from Pennsylvania, was born in Dillsburg, Penn., September 30, 1833. He graduated at Jefferson College in 1850, and in 1854 was admitted to the bar. He was lieutenant in the Tenth Pennsylvania Reserves, and colonel of the One Hundred and Thirty-fourth Pennsylvania Volunteers during 1861-65; was a member of the legislature in 1865-67; secretary of State for Pennsylvania in 1872-78 and 1879-82, and recorder of Philadelphia in 1878-79. In 1885 he became State treasurer, and since that year has been a member of the Republican national committee, of which he was chairman in 1888. In 1896 he was a member of the executive committee. From 1887 till 1899 he was United States senator. In the latter year Mr. Quay was indicted for conspiring to use for his personal profit State funds deposited in the People's Bank of Philadelphia. He was brought to trial on April 10, 1899, at Philadelphia, and on April 21 the jury rendered a verdict of not guilty. Governor Stone immediately appointed him to the vacant United States senatorship, which the legislature had been unable to fill. Charges of unconstitutionality were raised, and the Senate referred the matter to a committee, but no decision had been reached at the close of the year.

QUEBEC, a province of the Dominion of Canada, with an area, as increased by act of Parliament, of 347,350 square miles, exclusive of the Gulf of St. Lawrence and the territorial seas. Capital, Quebec.

Mineralogy.—Iron ore shows a fluctuating production, but no marked increase. The output in the calendar year 1897 was 22,436 tons, somewhat less than that of 1892, and only 3191 tons in excess of the average of intervening years. Gold-mining made a notable rally, with an output valued at \$6089 in 1898, against \$900 in 1897, and \$3000 in 1896. High water-mark was reached in 1881, \$56,661, and the largest production since was in 1894, \$29,196. In copper there was a production that gave for export 541,401 pounds. Salt yielded 1100 bushels in 1897, with no report for 1898; and silver, 80,475 ounces, valued at \$48,116 in 1897, with no report for 1898. The output of phosphates shows a steady decline, with 3469 tons in 1895, 528 in 1896, 21 in 1897, and 165 in 1898, the highest recorded production being in 1890, 26,521 tons. Mining laws of the province are liberal, but the industry lacks official encouragement, modern appliances, and capital.

Fisheries.—The value of all fishery catch in the calendar year 1897 (the last officially reported) was \$1,737,011, a decrease in a year of \$288,753, and the lowest value since 1890. The principal catch was cod, \$667,202; lobsters, \$207,710, and herring, \$196,530. Exports of all fisheries in 1898 amounted to \$485,135; the distribution of fry was 6,435,000, and the capital investment in all fisheries, \$583,403.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise aggregated in value \$62,550,471, the largest of all the provinces, and the highest recorded in Quebec; exports, domestic and foreign, \$73,327,220, an increase in a year of \$13,052,084; duty collected, \$8,386,122. Navigation was facilitated by 118 light-stations, 159 light-houses, 8 light-ships, and 4 fog-alarms. The registered merchant marine of the province comprised 322 steamers, of 75,349 gross tonnage, and 1056 sailing vessels, of 69,108 tons.

Banks.—On January 1, 1899, there were 117 chartered banks and bank branches in the province, and during 1898 the exchanges at the clearing house in Montreal amounted to \$731,264,677, an increase in a year of \$130,079,677. There were also 140 post-office savings banks, with 19,578 depositors and \$5,450,746 deposits.

Railways and Telegraph.—On June 30, 1898, the total length of railways in operation was 3315 miles, the second largest provincial mileage in the Dominion, and the total grants to roads constructed and under construction then amounted to \$21,053,992. Government telegraphs had a total of 808½ miles of land lines, and 44 miles of cables, with 54 offices.

Post-offices.—At the end of 1898 there were 1698 post-offices in the province, in which were posted during the year 31,125,000 letters and 4,950,000 postal-cards, and 371 money-order offices, which issued 136,090 orders.

Education.—Reports for the school year 1897-98 showed municipal schools, 5544; independent, 354; elementary, 5167; superior, 731; schools of arts and manufactures, 7, and agricultural and dairy schools, 4—total, 5898. Of all schools, 4998 were Roman Catholic and 979 Protestant; Roman Catholic enrolment in Roman Catholic schools, 273,755; in Protestant schools, 2705; Protestant enrolment in Roman Catholic schools, 1404; in Protestant schools, 35,930. Pupils and students in all schools aggregated 314,731; teachers, 10,493. Total expenditures were \$1,730,396, of which the government appropriated \$304,410. Roman Catholic schools included 2 universities, 19 classical colleges, 127 academies, and 3 schools for deaf-mutes and the blind; and Protestant schools, 2 universities, 3 university colleges, 26 academies, and a

charitable school. Of both classes there were 534 model schools. At the end of 1899 there were 119 periodicals, of which 16 were dailies and 71 weeklies.

Finance.—The revenue of the province in the year ending June 30, 1898, was \$4,176,140; expenditure, \$4,415,370; gross debt, \$35,450,548; Dominion government debt allowance, \$2,549,214; Dominion government railway subsidies, \$2,394,000; other assets, excluding public buildings, \$8,902,855—total assets, \$13,846,069; net debt, \$21,604,479.

Population.—Local estimates in 1898-99 gave Montreal 250,000; Hull, 12,371; Sherbrooke, 10,470; St. Hyacinthe, 10,044; Ste. Cunegonde, 9943; Valleyfield, 8010; Westmount, 6953; St. Johns, 5000. The Indian population of the province in 1898 was 10,677. There were 17 schools for Indian youth, which had an enrolment of 748, and average attendance, 342. The Indians cultivated over 9000 acres of land, had 2438 head of live stock, and received \$105,541 from their various industries.

QUEENSLAND is a British Colony in northeastern Australia. It has an area of 668,252 square miles, with a seaboard of 2250 miles, and it had an estimated population in 1899 of 499,000. The capital is Brisbane, which, including an area with a radius of 5 miles, had an estimated population in 1899 of 107,840. This city is situated on the Brisbane River, 9 miles from the mouth and about 40 miles from the entrance to Moreton Bay, into which the river empties. The river has a depth of 20 feet, which is soon to be increased by government engineers. Other important ports of Queensland are: Rockhampton, population, 19,650; Townsville, 16,500; and Maryborough, 14,000.

Production and Commerce.—About 97 per cent. of the colony consists of land still possessed by the crown, and about one-half the total area is natural forest. Government lands are being gradually disposed of by direct sale on the instalment plan and by leases, with or without the right of purchase. Stock raising and agriculture are the principal occupations, and there is also considerable mining done. Maize is the principal grain crop, and wheat, oats, and barley flourish in certain parts. The amount of wheat and sugar produced is rapidly increasing. The live stock at the beginning of 1899 included 17,552,608 sheep, 5,571,292 cattle, and numbers of horses and swine. In 1897 the number of cattle and sheep decreased greatly, the latter by nearly 2,000,000, and this decrease, though in lessening degree, continued up to 1899. The decrease was due to the prolonged droughts which have prevailed throughout Australia. (See NEW SOUTH WALES.) Among minerals are gold, coal, tin, silver, copper, opal, and lead, named in the order of importance. Owing to the small number of large streams, water is obtained through Artesian wells, of which there were in 1898, 344, averaging nearly 1300 feet in depth. The greatest depth is 4010 feet, at Winton. There were 44 bores in progress in 1898, averaging over 1900 feet in depth. The commerce of Queensland for 1898 amounted to £10,856,127 for exports and £6,007,127 for imports. Most of the trade is with Great Britain and her colonies. As to imports from foreign countries, exclusive of Great Britain, the United States sends over half. Her principal article of purchase in Queensland is wool. The value of wool exported to all countries in 1898 was £3,009,462; gold, £2,830,553; sugar, £1,329,876; meat, £941,308; live stock, £808,818; other exports being timber, animal products, pearl, tortoise shell and other sea products, silver, and tin. Large quantities of imports and exports pass through Victoria, the chief imports being various manufactures, spirits, chemicals, oils, grains, and flour. Queensland is being brought into closer communication with the United States by a line of steamships between New York and Brisbane. There is a line of mail steamships between Queensland ports and Great Britain. In 1898 the registered shipping of Queensland amounted to 95 steam vessels, with a tonnage of 13,810, and 143 sailing vessels, with a tonnage of 9994. The former are engaged mostly in the coasting trade and the latter in trade with the Pacific islands. The entire tonnage of vessels entering and clearing in 1898 was 602,006 (615 vessels) and 596,313 (598 vessels), respectively.

Government, etc.—The executive authority is vested in a governor (Lord Lamington since 1895), who is commander-in-chief of the troops, and vice-admiral; the legislative authority is a bicameral parliament, consisting of a legislative council, whose members are appointed by the crown for life, and a legislative assembly, whose members are elected by popular vote. The colonial expenditure in 1898 was £3,802,795, and the revenue was £3,891,767. The public debt in 1898 was £33,598,414. In the same year there were 2742 miles of railway open, owned by the colonial government. Lines start from each of the principal ports—namely, Brisbane, Maryborough, Bundaberg, Rockhampton, and Townsville—and run into the interior. Further communication is by means of bullock drays and upon the rivers, none of which, however, is navigable for more than 50 miles from its mouth. In 1898 there were 18,565 miles of telegraph lines. As to education, there were 843 state schools, with 1904 teachers and an average attendance of 58,296 children; 181 private schools had an attendance of 11,044

History, 1899.—The elections held in 1899 gave such support to the government as to make it possible for the assembly to pass in June the bill consenting to the federation scheme for the Australian colonies. This matter is fully discussed in the article Australian Federation (*q. v.*). In common with the other Australian colonies, Queensland made an offer of troops to the imperial government for service in the South African war, and in October the offer was definitely accepted, and a force of 250 mounted infantry was despatched to the seat of war. There was some opposition made to this offer on the part of the Labor party in Queensland. The cabinet resigned in November, owing to its inability to carry out certain policies, that relating to the construction of new railways being passed by a bare majority. As in each of the other colonies supporting the federation movement, the government lost the support of many who had stood by it until the Enabling bill was passed, and who then returned to their former parties. On November 28 Mr. Dawson undertook to form a new cabinet.

QUESNAY DE BEAUREPAIRE, JULES, French magistrate and author, who was concerned in the Dreyfus case, was born in Saumur, France, July 2, 1838. He entered law, and on the fall of the empire volunteered his services, and took part in the defence of Paris. In 1877 he was defeated for parliament by the Duc de la Rochefoucauld, upon which he again engaged in the practice of law. In 1881 he was made attorney-general at Rennes, and in 1883 became advocate-general in Paris. As attorney-general in 1889 he became conspicuous in prosecuting General Boulanger and M. Rochefort before the senate, when they were condemned to imprisonment for life. The papers supporting the Boulangist cause attacked him so unwarrantably that he brought suits for damages. In 1892 he was made president of the Court of Cassation, but resigned in January, 1899, because of the partiality the judges evidenced in the Dreyfus investigation. M. Quesnay de Beaurepaire has written novels under the pen name of Jules de Glouvet, among which are *Le Forestier*, 1880; *Le Berger*, 1882; *L'Idéal*, 1883; *La Famille Bourgeoise*, 1883; *Le Père*, 1886; and *Marie Fougère*, 1889. His *Histoire du Vieux Temps*, extracts from his uncle's papers, 1865, passed into its third edition in 1890. M. Quesnay de Beaurepaire is a commander of the Legion of Honor.

QUICKSILVER. California continues to supply all of the domestic ore. The production from this State amounted in 1898 to 31,092 flasks. The celebrated New Almaden mines continue to be an important source of supply, and it is interesting to note that the ore, which is now being worked at a profit, contains but 1 per cent. of metallic mercury.

QUINCY, JOSIAH, Democratic mayor of Boston from 1895 to 1899, was born in that city in 1859. He is the grandson of Josiah Quincy, who was mayor of Boston in 1845. After receiving an academic education, he studied law and was admitted to the bar, but he never practised. He served in the Massachusetts legislature, was chairman of the Democratic State convention, was assistant secretary of State in 1893, and was elected mayor of Boston in 1895, and re-elected in 1897. He has established and promoted many reforms and benefited the city to such a degree that he is considered one of the foremost men in municipal affairs in the country. He was not renominated in 1899, and was succeeded as mayor by Mr. Thomas N. Hart (Rep.).

RABIES. The following table gives the results of the antirabic treatment at the Institute Pasteur, Paris.

Year.	Cases.	Deaths.	Per Cent.	Year.	Cases.	Deaths.	Per Cent.
1896-97.....	2,671	25	.94	1898-99.....	1,468	6	.36

RACHMANINOFF, SERGEI VASSELIEVITCH, Russian composer, born in 1873 at Novgorod, studied at the Moscow Conservatory under Arensky and Siloti, and obtained the first gold medal at the age of seventeen. His works include a piano concerto, a fantasia for the piano, a trio in D minor for piano, violin, and 'cello, with harmonium obligato, and a prelude for the piano in C-sharp minor. He appeared

in London at the Philharmonic, April 19, 1899. Although so young, he is regarded as one of the most important of the living Russian composers.

RAOQUETS, or RACKETTS, a game resembling court-tennis, but simpler, played in a paved court, surrounded by four walls. Racquets has become popular in this country among a growing number of players. One of the first and most notable organizations which have taken it up is the New York Racquet and Tennis Club. In 1899 the Racquet and Tennis Club at Tuxedo, N. Y., was formed, and a club-house built, which is said to contain courts rivalling the best of those abroad. One of the officers and the coach of the game at Tuxedo is Eustace H. Miles, of Cambridge University, the noted amateur British racquet and court-tennis player. The United States amateur racquet championship tournament for singles was held at New York in February, 1899, and was won by Quincy A. Shaw, Jr., of Boston, who defeated H. H. Hunnewell, of Boston, in the finals. Shaw and Hunnewell played together in the championship doubles, held at Philadelphia during the same month, and beat M. S. Paton and Clarence H. Mackay, of New York, in the finals. Early in the year Mackay defeated the Canadian racquet champion Rolland. Later Shaw played Rolland for the Canadian championship of 1899, and lost.

RAILWAY ASSOCIATION, AMERICAN, organized in 1886, in 1899 had a membership of 257 railway companies, operating 171,718 miles of line; it holds two meetings annually. Secretary, W. F. Allen, 24 Park Place, New York City.

RAILWAYS. In railway construction, maintenance, and operation the year 1899 was a remarkable one in many important respects. This assertion is true of all departments of railway operation and of all sections of the country, and it lends unusual interest to a review of the year's railway business. For the purpose of this review the subject will be considered under the following headings: (1) Accidents; (2) cars; (3) construction; (4) fast runs; (5) foreign railways; (6) grade crossings; (7) locomotives; (8) road-bed and track; (9) shops; (10) signaling; (11) traffic; (12) train weights.

Accidents.—According to the figures of the interstate commerce commission for the year ending June 30, 1898, which are the latest accident statistics available for the whole United States, the aggregate number of persons killed in railway accidents was 6859, and the number injured was 40,882. The number of passengers killed was 221, and the number injured was 2945, all other fatalities being among the employees of the railways. The figures of 1899 will show no material diminution or increase from those given above.

Cars.—Returns from all the contracting car builders in the United States for 1899 show that during the year 123,893 cars of all kinds were built. These figures do not include cars built by the railways themselves or small cars for plantation work and similar special duty. Of this total, 117,982 were freight cars, 1201 were passenger cars, and 4710 were street cars; 1904 freight cars, 104 passenger, and 296 street cars were for export. Of the freight cars, 10,500 were steel cars. Combinations of car-building concerns have been a notable feature of the year; 13 companies have consolidated under the name of the Southern Car and Foundry Company, the Wagner Palace Car Company was absorbed by the Pullman Palace Car Company, and the two largest concerns manufacturing steel cars have combined under the name of the Pressed Steel Car Company. Perhaps the most striking feature of the year's car construction was the vastly increased output of steel cars. In 1898 the number of steel cars built was 2700, or about one-fourth the number built in 1899. These cars were mostly 50-ton and 40-ton coal and ore cars of the hopper bottom and gondola types. In addition to the increase in the number of cars built entirely of steel, there has been a notable increase in the construction of cars with steel under-frames and timber upper parts. There was also a substantial increase in the use of steel bolsters and truck parts where formerly wood was employed. Steel castings have to some extent replaced cast iron in trucks and other parts. The principal advantages argued in favor of steel cars of 40 and 50 tons capacity are their great capacity in proportion to their weight and their superior strength and durability over wooden cars. These qualities suggest that the chief field of usefulness for such cars will be in coal and ore service, and it is mostly for this class of traffic that they have been built in the past. For general service, cars with steel under-frames and wooden upper parts possess in many respects superior advantages to all steel construction.

The equipment of freight cars in the United States with automatic couplers and train brakes made substantial progress during 1899. The time now set by the Interstate Commerce Commission when all cars shall be equipped with these safety appliances according to the federal law is June 30, 1900. Considerable trouble has been had within a year or two from the breakage and improper operation of automatic couplers, owing to poor material and faulty construction and design, and at

its convention in June, 1899, the Master Car Builders' Association adopted rules and specifications for the manufacture, application, and operation of such couplers, with the view of remedying this trouble. The question of adopting automatic couplers of the American pattern on English railways came up for consideration during the year. It does not seem likely, however, that such couplers will find much favor abroad as long as the standards of car construction there remain as they are at present.

Construction.—The total mileage of railways in the United States on January 1, 1899, was 184,894 miles. During the 12 months of 1899 there were built 4500 miles of new line, which brings this total up to 189,394 miles. The bulk of the new construction was in the States west of the Mississippi River; over 75 per cent. of it was built by existing railways. Iowa heads the list of States in the amount of new railways built with 582 miles. Following Iowa come Minnesota, with 369 miles, and Arkansas, with 269 miles. The States of New Hampshire, Rhode Island, Delaware, Nevada, and South Dakota added no new line to their existing mileage during the year. According to the best available figures, about 500 miles of new railway were built in Canada during the year, and about 300 miles were built in Mexico. The 4500 miles of railway built in the United States in 1899 is the largest year's construction since 1890, when 5670 miles were built.

In connection with new construction it is important to notice that it was somewhat handicapped by the high price of iron and steel and the inability in some cases of the mills to supply orders. (See IRON AND STEEL.) As an illustration of these facts the accompanying table is of particular interest. These figures are based upon actual ruling prices of material and labor during the two years.

Table Showing Approximate Cost of Railroad Track Per Mile in December, 1898, and December, 1899, Exclusive of Grading, Culverts, Bridges, etc.

	WEIGHT OF RAIL.					
	56 Pounds.		70 Pounds.		90 Pounds.	
	1898	1899	1898.	1899	1898	1899.
Rails.....	\$1,760 00	\$3,040 00	\$2,200 00	\$3,650 00	\$2,828 00	\$4,950 00
Spikes, $\frac{5}{16}$ ins. \times 9-16-in.	90 00	180 00	99 00	198 00	90 00	198 00
Angle plates.....	118.27	271.04	168.98	387 20	190.08	435.60
Bolts, nuts, washers and braces....	55 50	98 00	77 40	141 00	82 40	146 00
Ties.....	1,320 00	1,990 00	1,500 00	2,250 00	1,500 00	2,250 00
Track laying, including construction train	500 00	575 00	600 00	690 00	600 00	690 00
Ballast.....	300 00	360 00	900 00	1,050 00	1,500 00	1,800 00
Total.	\$4,143.77	\$6,544.04	\$5,545.36	\$8,566.20	\$6,799.48	\$10,469.60

Fast Runs.—Numerous fast runs for short distances have been made by regular and special railway trains during the year, the speed of over 100 miles per hour having been developed over portions of some of these runs. Among the fast long runs recorded the following are fairly representative: Chicago, Burlington and Quincy Railroad, fast mail, 502 miles in 10 hours 29 minutes, $46\frac{1}{2}$ miles per hour; fast mail, New York to San Francisco, in 97 hours 55 minutes, or an average speed of 37.2 miles per hour; Terre Haute and Indianapolis Railroad 235 $\frac{3}{4}$ miles in 263 minutes; or an average speed of 53.76 miles per hour; Lake Shore and Michigan Southern Railway, 183 miles at an average speed of 57.8 miles per hour.

Foreign Railways.—A notable number of important foreign railway enterprises developed during 1899. Russia's railway budget for 1899 proposed the expenditure of \$51,000,000, a large part of which was devoted to new construction. Not including 1590 miles of railway in Finland, there were 26,797 miles of railway in operation in Russia in 1898, with 7000 miles of new line projected and under construction on January 1, 1899. The most important of the Russian railways is the Trans-Siberian Railway, which, when completed, will be the longest continuous railway line ever built. The longest continuous line on the North American continent is the Canadian Pacific Railway. Its main line from Montreal to Victoria is 2090 miles in length. The located line of the Siberian railway, from Chelyabinsk to Vladivostock is 4776 miles and the branch through Manchuria to Port Arthur will be 1273 miles, so that the system will commence before any feeders are built, with 6000 miles of line. The Siberian Railway is, like all Russian roads, of 5 feet gauge. It is constructed after the manner of American western railways, single-tracked, gravel-ballasted, with

Howe truss bridges over the smaller waterways, and steel bridges across the large rivers. In the country east of the Ural Mountains the rivers are deep, full-flowing streams, the alluvial bottoms of which necessitate large spans, and make it desirable to have as few bridge piers as possible. Floating ice is in the rivers for about seven months of the year. The bridge at the Ishim has openings amounting to 700 feet, that at the Tobal 1400 feet, that at the Irtysh 2100 feet, and the bridge over the Yenisei has a total length of almost 3000 feet. Lake Baikal is traversed by a steam ferry for a distance of some 40 miles. Forty bridges, each over 200 feet long, cross the tributaries of the Obi River between Omsk and Irkutsk. The Amur at Khabarovka is crossed by a steel bridge some 5000 feet in length. The total length of water crossings between Chelyabinsk and Vladivostock is given at 30.1 miles, exclusive of the 40 miles of ferry.

In Africa actual construction has been confined to short extensions of existing railways, of which there were 10,866 miles in operation at the end of 1898. Numerous railways are, however, projected and surveyed by the various governments which control African territory. The most important individual line is the much-talked-of "Cape to Cairo" combined railway and waterway line, which from Capetown to Alexandria is about 6000 miles long, of which about 5000 miles are railway. No material progress has been made toward carrying out the actual construction of this line. See "CAPE TO CAIRO" RAILWAY, and for account of Chinese railways see CHINESE EMPIRE.

In Japan, according to the last report of the Japanese Railway Bureau, there are 768 miles of state railway and 2652 miles of private railway, or a total of 3420 miles of railway of all classes. The building of private lines began in 1883-84, with 63 miles, and in 1898-99 the state and private lines in operation and under construction, or chartered, aggregated 5810 miles. In March, 1899, there were 58 incorporated railway companies, with a total paid-up capital of 238,775,000 yen, or \$118,909,950. Besides these, 26 new companies have been formed under provisional charters, with a total capital of 43,535,000 yen and a mileage of 809 miles. Of the 58 companies mentioned 42 are actually doing business, though only five of these companies operate more than 100 miles of road. These five larger companies operate 857, 315, 276, 207 and 147 miles of line, the Nippon Company heading the list. The average cost of construction per mile for state and private lines is given as follows in United States money:

Fiscal Year.	Lines.		Average.
	State.	Private.	
1897-98	\$34,789	\$24,887	\$27,127
1898-99	39,356	28,444	30,879

This increase in cost is the result of the general advance in the price of materials and labor. The total rolling-stock of the state and private lines in March, 1899, included 1103 locomotives, 3811 passenger cars, 14,088 freight cars. The most notable new construction now in progress is the extension of the state railway lines in the island of Yezo, which aggregates 598 miles, of which about 96 miles were completed in February, 1899. The Japanese government also proposes to rebuild the original Chinese railway line in Formosa, and to extend it, the work comprising in all about 200 miles of line, much of which is difficult construction. The construction will be carried on gradually.

One of the most important railway schemes now under way in South America is the extension of the Ferrocarril del Sur, of Ecuador, east and north from its present terminus at Puente de Chimbo to the city of Quito, about 231 miles. The surveys for this line have been completed, using 4 per cent. maximum grades and 20 per cent. maximum curves. The route will be mountainous, but as the line is narrow gauge, 3.28 feet, the work will not be heavy. At one part of its length the line will overcome an elevation of 8000 feet in 65 miles. The road is being built by American capital and American engineers.

In some respects the most interesting piece of railway construction of the year is the White Pass and Yukon Railway, built into the Klondike gold fields. This line is located to extend from Skagway, Alaska, to Fort Selkirk, Canada, 380 miles, and 41 miles from Skagway to Lake Bennett have been completed. From Skagway the line extends to Boulder, 5 miles with a 1 per cent. grade, but beyond this there is an almost continuous grade of 3.7 to 3.9 per cent. to the summit at White Pass, 20 miles from Skagway, the summit elevation being 2885 feet. A level stretch and some grades of 1 per cent. and 2 per cent. bring the line to Log Cabin, 32 miles, beyond which the line descends by a long grade of 3 per cent. to Lake Bennett. From Boulder to White Pass very heavy work was encountered, involving a large amount of rock excavation. In many places the slope of the mountain side along which the road ran was so steep that the men had to be secured by ropes while drilling the holes

for blasting away the rock. The road is 3 feet gauge, and is laid with 50-pound rails. It cost to construct \$60,000 per mile, and the capital was supplied by Americans. The construction of the road will be continued.

Grade Crossings.—The abolition of grade crossings of streets and railway tracks has been carried on actively in several cities during 1899. The railways entering the city of Chicago had up to the end of the year completed or commenced work involving the elevation of 60 miles of main line railway and 273 miles of track, and abolishing 416 crossings at grade. The total cost of this work had required the expenditure by the railways of over \$10,000,000. Other cities where considerable work has been done in abolishing grade crossings are Buffalo, Philadelphia, and Boston. The tendency is quite general in all cities throughout the eastern section of the country to require grade-crossing improvements, and the prosecution of this work is likely to form a considerable item in the expenditures of railway companies as time goes on.

Locomotives.—The increase in the size and weight of locomotives which has characterized the work of the last few years was continued during 1899. Since 1891 the average weight of American locomotives has increased 50 per cent. Late in 1899 the Lake Shore and Michigan Southern Railway and the Illinois Central Railroad put into operation, respectively, the largest ten-wheel passenger locomotive and the largest freight locomotive ever built. The weight and principal dimensions of these two engines compared with those of other heavy engines of corresponding classes are shown in the accompanying tables. A study of the locomotive dimensions and weights in the United States, given in these tables, in connection with the 80,000 pound and 100,000 pound cars and 2000-ton train loads, mentioned in preceding and succeeding paragraphs, shows very clearly the great train weights hauled on American railways at the present time:

During 1899 the contracting locomotive shops of America built 2473 locomotives, as compared with 1875 built in 1898. This is the largest number of locomotives ever built by these shops in a single year. The number of locomotives exported in 1899 by American builders was 514 as compared with 554 exported in 1898. The 554 locomotives built in 1898 were exported to over 30 foreign countries, and those sent abroad in 1899 were probably as widely distributed. Many of the locomotives exported in this last year have gone to England, France, and other European countries that are themselves extensive builders. In minor details of locomotive design and construction the year has shown steady advance. High boiler pressures of 200 to 210 pounds have been more commonly adopted, the size of boilers in relation to diameter of cylinders has continued to increase, more generous grate areas were adopted, cast-steel frames have been more largely used, piston valves were employed to an increasing extent, compound engines have continued to grow in favor and nickel steel has been extensively experimented with for boilers, stay bolts, and other parts.

Road-Bed and Track.—Constantly increasing attention is being directed toward securing greater solidity and durability in railway permanent way and track construction. At the present time about one-sixth of the total cost of operating railways in the United States is expended on the care and maintenance of track, exclusive of bridges, culverts, fences, etc. In the year ending June 30, 1898, the railways of the United States expended \$81,360,000 in repairs to roadway, exclusive of \$10,662,000 for rail removals, and \$24,770,000 for tie removals. To reduce these figures by a more lasting construction is being made the subject of much thought by railway maintenance-of-way engineers throughout the country. Perhaps the most striking and radical proposition to secure this end is the proposed substitution of a solid concrete foundation, to which the rails are fastened directly. No attempts have been made to use such a construction, but the favorable discussion which it has met with from prominent railway engineers makes it one of the possibilities of the future. Sprinkling the ballast with oil to prevent flying dust has been practised to an increasing extent during the year. The oil used is a residuum of crude petroleum, having a high fire test, low gravity, and faint smell. The sprinkling is done with a tank car, fitted and operated like an ordinary street sprinkler. The first application requires about 2000 gallons per mile, after which 500 to 600 gallons per mile per year will suffice to keep the ballast dustless. Increasing attention has been given to the preservation of wood ties by preservatives. The preservatives most commonly employed are creosote (dead oil of coal tar) and chloride of zinc, which are forced into the pores of the wood until the tie is thoroughly impregnated. The use of steel ties has continued to increase in Europe and other foreign countries, but is making little if any progress in America. In rails, rail fastenings, rail joints, switches, frogs, etc., very little that is new developed during 1899. Iron is being quite extensively used as a substitute for wood in track signs, fencing, etc. In handling material, such as rails, ballast, etc., the principal progress has been in the increasing use of mechanical means, such as ballast unloaders, track pile-drivers, rail-sawing machines, etc., mounted on cars so as to be transported from place to place, where work is being

done. Two railways, the Canadian Pacific and the Northern Pacific, have done a considerable amount of work in filling in trestles by the hydraulic method. In this method a stream of water is brought in pipes to the work, where it is thrown through nozzles in powerful jets against some adjacent hillside, and thus washes down the earth which is carried away with the water by a flume discharging under the trestle being filled in. Where the conditions are suitable for the operation of this method it has proved very efficient.

Shops.—In railway shop practice the year has shown a continuation of the tendency of recent years toward better designing and construction of shop buildings. Central power stations supplying electrical power to shop motors operating single tools or groups of tools are being adopted, and in the shops power-hoisting and conveying devices are being used more and more. In car shops a change is being slowly introduced because of the increasing use of steel cars requiring entirely different tools and labor than are used in repairing wooden cars.

Signalling.—Substantial progress was made during 1899 in railway, block, and interlocking signalling in the United States. Green lights are now pretty generally used instead of white for the clear signal. The color for distant signals is unsettled in actual practice. One prominent railway uses red for danger, green for clear, and yellow for caution. Various improvements have been made to secure better and more durable construction of signalling apparatus. The one field in which there is an increasing demand for better signalling arrangements is on electric railways, and very little advance has been made in this class of signalling.

Traffic.—During 1899 railways were pushed to their utmost to handle the business offered them, and earnings showed a steady increase throughout the year. All sections of the country participated in the improved conditions, but the trunk lines carrying cereals to the seaboard, and particularly the lines handling coal and ore, enjoyed the greatest increase in business. As a whole rates were fairly well maintained, but they were low. Passenger business as well as freight showed a decided improvement during 1899 over the preceding twelve months.

Train Weights.—A notable feature of railway operations in 1899 has been the continued increase in the weight of the heaviest trains hauled. The record is now held by the Baltimore and Ohio Railroad, which in May hauled a train of 50 cars, containing 98,000 pounds of coal each, or 4,900,000 pounds total net load, from Cumberland to Brunswick, Md., 100 miles. The total gross weight of this train was 6,843,700 pounds. The Illinois Central Railroad has recently installed equipment for handling regular net loads of 2000 tons; the Pittsburg, Bessemer and Lake Erie Railroad has hauled during the year average train loads of 1644 tons net or 2137 gross behind the tender; the New York Central and Hudson Railroad's new equipment is planned to handle regular trainloads of 2400 tons net. The handling of these enormous loads has been made possible by the great increase in the size of cars and locomotives, and it has resulted in reducing rates on bulk freights to a very low figure. It is estimated by competent authorities that a rate of .1 cent per ton mile for handling such freight is a possibility of the near future. See BRIDGES and TUNNELS.

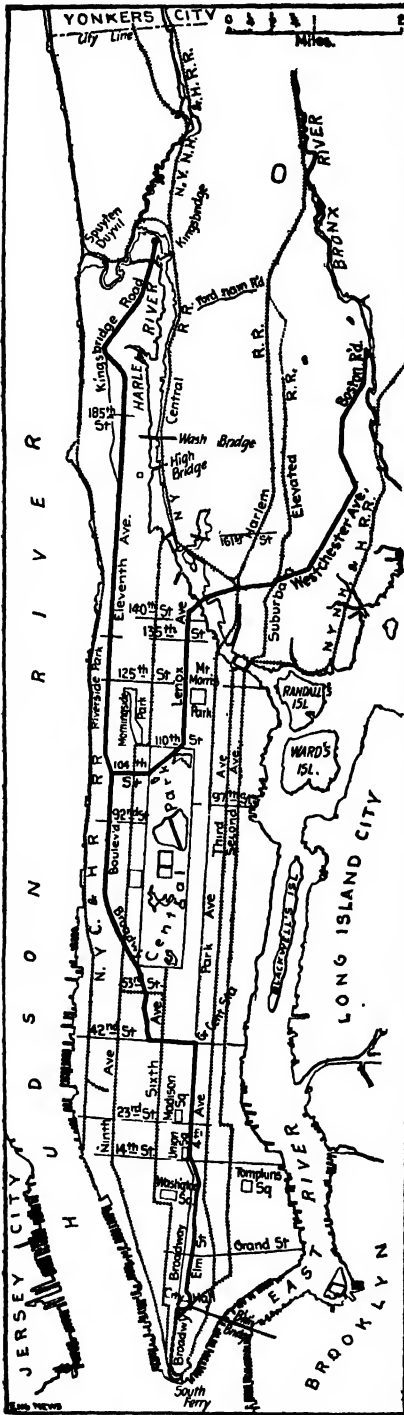

RAILWAY SURGEONS, AMERICAN ACADEMY OF, founded in 1894, had in 1899 a membership of 151; publishes annual *Transactions*. The general meeting for 1900 is to be in St. Paul, Minn., September 5 and 6. President, Dr. C. A. Wheaton, St. Paul, Minn.; secretary, Dr. T. B. Lacey, Council Bluffs, Ia.

RANDOLPH-MACON SYSTEM OF COLLEGES AND ACADEMIES consists of Randolph-Macon College, at Ashland, Va., opened in 1832, and the Randolph-Macon Academies, opened one at Bedford City, Va., in 1890, another at Front Royal, Va., in 1892, for men, and the following for women: Randolph-Macon Woman's College, at Lynchburg, Va., opened 1893, and the Randolph-Macon Institute, at Danville, Va., opened 1897. The system has endowments of about \$750,000, and received in 1899 gifts of money amounting to \$41,000. In 1899 there were in the system 59 officers of instruction and administration and 630 students. The library had 17,000 bound volumes. Chancellor, William W. Smith, A.M., LL.D.

RANNEY, AMBROSE ARNOLD, ex-member of Congress, died March 5, 1899. He was born at Townshend, Vt., April 16, 1821; was graduated at Dartmouth in 1844, and in 1848 was admitted to the bar, after which he practised in Boston. He was there city solicitor in 1855-56, and in 1857, 1863, and 1864 served in lower house of the Massachusetts legislature. From 1881 to 1887 he was a Republican member of Congress.

RAPID TRANSIT. The rapid transportation of passengers in large cities is usually accomplished either by surface street railway lines, now generally operated by electric power; or by elevated railway lines, operated by steam or electric power; or by underground lines, through subways or tunnels, operated in all recent construction by electric power. See ELECTRIC STREET RAILWAYS.

Elevated Railways.—New York City was the first American city to build elevated railways on an extensive scale, and there are now about 66 miles of elevated railway in operation in the boroughs of Manhattan, Brooklyn, and the Bronx. The city of Chicago has about 40 miles of elevated railway in operation, and the city of Boston has 7 miles in process of construction. All of the Chicago lines are now operated by electric power, and the new Boston line will use the same method of propulsion for its trains. In the city of New York steam locomotives are still used on the greater proportion of the elevated lines, but all of them are either in the process of being changed to electric power or have completed arrangements for making the change at an early date. A portion of the New York Rapid Transit Railway will be elevated structure. (See paragraph Underground Railways below.) In Liverpool, England, there is an elevated railway 6.4 miles long, double tracked, operated by electricity. This was the first elevated railway built to operate by electric power. These are the only elevated railways of much importance now in operation in the world. The most recent elevated railways to be constructed are the Northwestern Elevated in Chicago, 7 miles long, and the new Boston elevated line, 7 miles long. Both of these roads follow practically the same lines structurally. The supporting columns are placed on the curb lines, and are connected at their tops by a deep-plate girder extending transversely across the street. Longitudinally, these cross girders are connected by two pairs of plate girders, each pair of girders carrying one track. This construction is in its general features the standard modern construction for elevated railways over public streets. Compared with the original construction of elevated railways in New York it is more simple and substantial, and follows more nearly present engineering practice in structural steel design, details and construction. Elevated railways when operated by electricity take the power in all cases from a third rail. Both the Northwestern Elevated and the Boston Elevated railways belong to the construction of 1899.

MAP SHOWING ROUTE OF NEW YORK UNDERGROUND RAPID-TRANSIT RAILWAY. (From *Engineering News*.)

Underground Railways.—Underground rapid transit railways were under construction in 1899 in London and Paris, and plans were finally completed and bids asked during the same year for the construction and operation of the New York Rapid Transit Underground Railway lengthwise of Manhattan Island. The lines under construction in London were the Central London, and a road two

miles long from Baker Street Station to Waterloo Station, crossing under the Thames River. This last line, like the Central London, will be operated by electric power. The Paris underground lines were fully described in the *YEAR BOOK* for 1898.

The New York Rapid Transit Underground Railway, as planned for present construction, starts from a loop which encircles the triangular area occupied by the City Hall Park and the post-office. Within this loop the tunnel construction will be two storied, but where the main line leaves the loop all four tracks will come to the same level and continue side by side thereafter, except at the points which will be noted as the description proceeds. Proceeding from the loop, the four-track line passes under Centre and Elm Streets, and a few blocks of private property, and reaches Fourth Avenue at about Ninth Street. From this point, Fourth Avenue and Park Avenue are the routes pursued until Forty-second Street is reached, when the line turns west along Forty-second Street, which it follows to Broadway. Broadway and the Boulevard (now renamed Broadway) are then followed until Ninety-seventh Street is reached, when the four-track line is separated into two double-track lines. The four-track line, between the post-office and Ninety-seventh Street, will be known as the main line. In this portion the two inside tracks will be used by express trains, stopping only at comparatively long distances, and the outside tracks will be used by local trains, stopping at stations about $\frac{1}{4}$ mile apart. At about Ninety-sixth Street, on the main line, suitable crossovers will be provided, so as to permit trains to pass at will between the northbound local and express tracks, and also between the southbound local and express tracks. At a suitable point north of these crossovers the outside tracks will rise so as to permit the inside tracks, on reaching One Hundred and Third Street, to curve to the right and pass under the right-hand outside track. The inside and the outside tracks then take separate routes north as double-track lines. The inside tracks, which run to the right at One Hundred and Second Street, continue east and north to Bronx Park, passing under a portion of Central Park and under the Harlem River in the route. This branch will be known as the East Side Line. The outside tracks turn slightly to the left from the point of separation, and then continue along a route generally parallel to the North River, through Spuyten Duyvil to about Two Hundred and Thirtieth Street. This branch will be known as the West Side Line. At one point between One Hundred and Twenty-third and One Hundred and Thirty-fifth Streets, the West Side Line will rise to the surface and pass over a depression, on elevated structure or viaduct, and for a considerable distance both this and the East Side Line will be pure elevated railway construction. This elevated construction and viaduct, the tunnels under the Harlem River, under Central Park, and under the present Fourth Avenue tunnel, the post-office loop, and the Ninety-sixth Street crossovers call for special modifications of construction. Except at these points the construction will conform closely to a single standard construction adapted to four-track and two-track lines. This construction consists of a concrete floor upon which is erected a framework of steel columns and roof-beams carrying side-walls, and a roof of concrete.

READING, PSYCHOLOGY OF. See *PSYCHOLOGY OF READING*.

RED CROSS SOCIETY, THE AMERICAN NATIONAL, incorporated 1881, and reincorporated 1893, to furnish relief in war, famine, pestilence, floods, or other great calamity; in time of war acts under protection of the provisions of the Geneva treaty. This society rendered valuable services in the Spanish-American War in 1898, and in the Anglo-Boer War in 1899. President, Clara Barton; general secretary, Walter P. Phillips; headquarters, Washington, D. C.

REED, THOMAS BRACKETT, announced his retirement from political life on April 20, 1899. Elected to every Congress from the Forty-fifth to the Fifty-sixth inclusive, he served in all but the last. As speaker of the Fifty-first, Fifty-fourth, and Fifty-fifth Congresses, Mr. Reed established a reputation for arbitrary ruling, which though often disagreeable to various members of the House seemed, nevertheless, to make for better and more efficient legislation. Had he not resigned his seat there is little doubt that he would have been speaker of the Fifty-sixth Congress. Unlike many other politicians and statesmen, he made little money out of public office, and his resignation was due, it was said, to the fact that he felt constrained to secure a larger income for the sake of his family. He changed his residence from Portland, Me., to New York City, where he entered a law firm and began a lucrative practice. His successor as speaker of the House is Mr. David B. Henderson, of Iowa. Mr. Reed was born in Portland, October 18, 1839. Being graduated from Bowdoin in 1860, and admitted to the bar in 1865, he began the practice of law in his native city. Beginning in 1868, he served successively in the lower and upper houses of the Maine legislature, was attorney-general of the State, city solicitor of Portland, and in 1877 first represented the first Maine district in Congress. In 1896 he was a prominent candidate for the Republican Presidential nomination. By both friend

and foe in politics he has been recognized as one of the foremost contemporary American statesmen. He does not agree with the "expansion" policy of the McKinley administration.

REES, Sir JOSIAH, chief justice, and judge of the vice-admiralty court of Bermuda, died November 4, 1899. He was born in 1821 in London, was educated at University College in that city, and became a barrister in the Middle Temple in 1851. After a successful career in English courts, he was appointed in 1878 to the position held by him at the time of his death. He was knighted in 1891.

REFORMED CHURCH IN AMERICA (DUTCH) reports a year of quiet progress. The general synod met at Catskill, N. Y., in June, 1899, and filled two vacancies in the faculty of the Theological Seminary at New Brunswick, N. J., caused by the death of Dr. D. D. Demarest, and the resignation of Dr. J. G. Lansing. This church has 86 missionaries in China, India, Japan, and Arabia, with 42 churches, 4458 communicants, 6 hospitals and dispensaries, the work being carried on at an expense of \$134,672. The Dutch Reformed Church in 1899 had 724 ministers, 619 churches, and 109,361 communicants. The latest report of the United States commissioner of education shows that the Reformed Church has 8 institutions of learning, with 98 professors, 708 students, and endowment funds aggregating \$1,407,830.

REFORMED CHURCH IN THE UNITED STATES (GERMAN). The important event of the year 1899 in this body, was the meeting of the general synod on May 23, at Tiffin, O., where \$40,000 was appropriated for foreign missions. Successful home mission work is carried on among the Hungarians and Bohemians in the United States. Three new missionaries were sent to Japan and China. *The History of the Reformed Church in the United States* was published during the year. This body reports for the year, 1049 ministers, 1677 congregations, and 240,130 communicants.

REFORMED EPISCOPAL CHURCH in the United States in 1899 had 7 bishops, 103 ministers, 104 churches, and about 9000 communicants. The fifteenth general council will be held in Baltimore, Md., June 6, 1900. The bishops are: Charles Edward Cheney, Chicago, Ill.; William R. Nicholson, Philadelphia, Penn.; Edward Cridge, Victoria, British Columbia; Samuel Fallows, Chicago, Ill.; P. F. Stevens, Orangeburg, S. C.; James A. Lalane, Baltimore, Md., and Edward Wilson, Metuchen, N. J.

REFORMED PRESBYTERIANS. The General Synod reports for 1899, 44 ministers, 50 churches, and 5000 members. The synod of India reports 113 ministers, 124 churches, and 9875 members. The denomination carries on missionary work in India, Syria, Asia Minor, Cyprus, and China, and has mission schools for freedmen in Selma, Ala., for indians at Fort Sill, Okla., for Chinese in Oakland, Cal., and for Jews in Philadelphia and Cincinnati.

REPUBLICAN LEAGUE OF THE UNITED STATES, NATIONAL, organized in 1887 for the recruiting of the Republican party. Yearly conventions are held. President, George Stone; secretary, D. H. Stine, Newport, Ky. Headquarters, Auditorium Hotel, Chicago, Ill.

REUNION ISLAND, a French possession, lies in the Indian Ocean about 420 miles east of Madagascar. Its area is 965 square miles, and its estimated population is 171,713, made up principally of natives of British India, Madagascar, and Africa, and a few hundred Chinese. It is represented in France by a senator and two deputies. The trade of Reunion is quite important, the exports in 1896 being 18,100,000 francs, of which 96 per cent. went to France, and the imports 19,189,637 francs, of which 55 per cent. came from France. In 1897 French imports into Reunion amounted to 19,477,945 francs, and she received exports from Reunion valued at 20,678,910 francs. The principal products are sugar, coffee, cacao, vanilla, and spices. The principal port is Pointe-des Galets, which is connected with St. Benoit and St. Pierre by a railway 78 miles in length. In 1899 Ranavalo, the former queen of Madagascar, who had been exiled to Reunion, was sent to Algiers, since authorities believed the island to be too near her former home. A pension of 25,000 francs is granted to her by the French government.

REUTER, PAUL JULIUS VON, Baron of the Duchy of Saxe-Coburg and Gotha, died at Nice, February 25, 1899. He was known throughout the civilized world as the founder of Reuter's Telegram Company, the most important European organization for the collection and dissemination of news. He was born at Cassel, Germany, July 21, 1821. He became connected with a banking house in Göttingen, and in 1847 entered a book business in Berlin. From the time of its introduction into Europe he sought to utilize the electric telegraph system for the transmission of news, and

in 1849, upon the completion of the line from Berlin to Aix-la-Chapelle, he established in the latter place the first central bureau for the collection and dissemination of telegraphic news. As other lines were completed his system developed and increased in efficiency. The telegraphic cable between Calais and Dover was laid in 1851, and thereupon Reuter transferred his central agency to London, becoming himself a naturalized British subject. As soon as possible he established agencies throughout the civilized world, with the result that the British press excelled all other publications in the prompt setting forth of important events connected with politics, commerce, science, etc. The agency supplied news indiscriminately to the various papers; this fact was an important factor in the development of the penny press. In order to secure patronage in other countries, and thus adjust more equitably the expenses of the company, Reuter established branch agencies in the countries of Europe, in North and South America, India, Egypt, China, and the West Indies. The prompt and efficient service of the agencies during the American Civil War and the Franco-Prussian War won for the company general confidence, which, it is said, it has since maintained. In 1865 the business was converted into a limited liability company; Reuter continued as manager until 1878, when he resigned, but retained his place in the board of directors. The company is affiliated with the Associated Press in America. The title of baron was conferred upon him in 1871. The next year he attracted attention through a concession granted him by the Shah of Persia, by the terms of which he was given the exclusive privilege of constructing railroads, utilizing the natural resources of the country, including the exploitation of mines and forests, and collecting the customs for a percentage.

REYNOLDS, JOSEPH JONES, brevet major-general, U.S.A., retired, born at Flemingsburg, Ky., January 4, 1822, died in Washington, D. C., February 26, 1899. Appointed to the Military Academy at West Point from Indiana, he was graduated in 1843. He was stationed at various military posts, taught from 1846 to 1855 at West Point, and was professor of mechanics and engineering at Washington University, St. Louis. After the outbreak of the Civil War he entered the Union volunteer service as colonel of the Tenth Indiana, was rapidly promoted, and in 1862 became a major-general, U.S.V. He served in West Virginia, and in 1863 was chief of staff of the Army of the Cumberland. He was engaged in the battles at Hooker's Gap, Chickamauga, and Chattanooga. From January to June, 1864, he commanded the defences of New Orleans, and was there given command of the Nineteenth Army corps. In the same year, from October to December, he was over the forces from Memphis to the mouth of the Mississippi. He had command of the Department of Arkansas. He assisted in organizing forces for the capture of Mobile, Fort Gaines, and Fort Morgan. In 1866 he was mustered out of the volunteer service and was appointed colonel in the regular army. In the following year he was brevetted brigadier-general, U.S.A., for gallant and meritorious services at Chickamauga, and major-general, U.S.A., for similar work at Missionary Ridge. In June of this year (1877) he was retired.

RHODE ISLAND, a New England State, has an area of 1250 square miles. The capitals are Providence and Newport.

Mineralogy.—Granite quarrying continued to show declining results through the greater part of 1898; but toward the close of the year a marked change for the better took place, giving much brighter prospects than usual for 1899. In 1898 the value of the output fell to \$320,242, a decline in a year of \$309,322. The uses of the stone were: Sold in the rough, \$43,505; dressed for building purposes, \$40,987; dressed for monumental work, \$204,739; and cut into paving-blocks, \$19,510. In limestone also there was a heavy fall, the output being valued at \$10,215 only, the smallest production in many years. The total amount was burned into lime.

Manufactures.—Rhode Island is included in the internal revenue collection district of Connecticut, and the principal details of its taxable manufactures are combined with those of that State. The collections for the State separately aggregated \$1,116,234. There were 69 cigar factories, which had an output in the calendar year 1898 of 4,898,365 cigars, and 3 fruit distilleries in operation, which produced 794 gallons of grape brandy. Rhode Island produced all the oleomargarine manufactured in the district, a total in the fiscal year 1898-99 of 7,912,571 pounds, of which 2,283,455 pounds was for export account. In January, 1899, a long-rumored deal, whereby the syndicate, headed by Joseph Leiter, of Chicago, became the owner of the Rhode Island Locomotive Works in Providence, was effected. It was understood that the works would be operated by the International Air Power Company, composed of American and British capitalists; that the manufacture of steam locomotives and steam-engines would be continued; that the Greene-Wheelock engine plant would be returned to Providence from Worcester; and that the company, in addition, would manufacture compressed-air locomotives, carriages and coupés,

trucks, truck bodies, and compressed-air machinery for use in the United States and Europe.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise in the customs districts of Bristol and Warren, Providence (\$860,392), and Newport, aggregated in value \$877,840; exports, all at Providence, \$2974, making the total foreign trade of the year \$880,814, an increase in a year of \$194,030, chiefly in imports.

Banks.—On October 31, 1899, there were 56 national banks in operation and 8 in liquidation. The active capital aggregated \$17,740,200; circulation, \$7,415,950; deposits, \$26,100,142; and reserve, \$7,516,286. The State banks, November 17, 1898, numbered 6, and had capital, \$916,675; deposits, \$765,225; resources, \$1,892,767; and undivided profits, \$144,774; loan and trust companies, 8, with capital, \$2,852,262; deposits, \$23,214,799; and resources, \$28,571,031; and mutual savings banks, 35, with depositors, 140,815; deposits, \$70,589,065; resources, \$74,156,559; and surplus, \$3,545,495.

Education.—The school census of 1898 showed a total enumeration of 79,299. At the close of the school year 1897-98 the public school enrolment was 65,384, and the average daily attendance, 47,370. There were 1852 teachers, 525 buildings used as school-houses, and public school property valued at \$4,579,334. The revenue was \$1,485,604; expenditure, \$1,717,492, of which \$989,267 was for teachers' salaries. There were 16 public high schools, with 155 secondary teachers and 3149 secondary students; 13 private secondary schools, with 116 teachers, 762 secondary students, and 612 elementary pupils; and 1 public normal school, with 19 teachers and 218 students in all departments. Normal training was also given in 1 college and 1 private secondary school. Brown University reported 1 fellowship, 100 scholarships, 72 professors and instructors, 860 students, 100,000 volumes in the library, valued at \$220,000; \$340,000 invested in scientific apparatus, \$1,177,967 in grounds and buildings, and \$807,481 in productive funds; \$131,752 in total income, and \$13,800 in benefactions. The vacancy in the presidency of the university was filled June 3, 1899, by the election of the Rev. William H. P. Faunce, D.D., of New York, who formally assumed his duties on September 20. In 1899 there were 62 periodicals, of which 14 were dailies, 33 weeklies, and 10 monthlies.

Railways.—There was no new railway construction either in 1898 or 1899, and the present total mileage is 223.03, according to the reports adopted for this volume, or 479, as claimed locally.

Finances.—The assessed valuations for 1898 were: Real estate, \$308,967,317; personal property, \$81,945,263—total, \$390,912,580; tax rate, \$1.80 per \$1000. The total funded debt, January 1, 1899, was \$2,300,000; sinking funds, \$255,089—net debt, \$2,044,911. The sinking fund receives \$50,000 annually, and invests its receipts from all sources in bonds and notes of the cities, towns, and districts of the State. Providence had an assessed valuation in 1899 of \$188,501,780, and net debt of \$13,882,404; and Newport, valuation, \$38,121,300, and net debt, \$639,850.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 418,000.

Legislation.—It was enacted that commercial foodstuffs shall be labelled as to quantity and quality. A State commission is to be appointed by the governor to protect birds and prosecute those molesting them. Kidnapping was made a felony. It was provided that juvenile offenders must be kept separate from adults. Primary elections and caucuses are regulated; every political party shall elect a State committee. Insurance companies must pay a tax of 2½ per cent. on gross incomes received on property insured within the State.

Elections.—A Republican governor and a Republican legislature were elected on April 5, 1899, and on May 30 Governor Elisha Dyer was inaugurated for a third term. Governor Dyer received 24,308 votes; the Democratic candidate, Mr. Greene, 14,602 votes; Mr. Herrick (Soc. Lab.), 2941; and Mr. Peckham (Pro.), 1279 votes. The whole vote cast was 43,130, and Governor Dyer's plurality, 9706. A proposed revision of the constitution of Rhode Island was submitted to the people on June 20, and rejected by a vote of 11,549 to 4714.

State Officers and National Representatives.—Governor, Elisha Dyer; lieutenant-governor, William Gregory; secretary of state, Charles P. Bennett; attorney-general, W. B. Tanner; general treasurer, Walter A. Read; adjutant-general, F. M. Sackett; auditor, Charles C. Grey; superintendent of education, T. B. Stockwell. Supreme Court: Chief justice, Charles Matteson; associate justices, John H. Stiness, Pardon E. Tillinghast, George A. Wilbur, Horatio Rogers, W. W. Douglas, Edward C. Dubois; clerk, B. S. Blaisdell. The State legislature consists of 90 Republicans, 19 Democrats, and 1 Prohibitionist. Senators, George P. Wetmore, from Newport; and Nelson W. Aldrich, from Providence—both Republicans. Representatives, Melville Bull, from Newport; and Adin B. Capron, from Smithfield—both Republicans.

RHODES, CECIL, South African capitalist, was born July 5, 1853. He was educated at Oriel College, Oxford, and for a time studied law at the Inner Temple, London. Left by his brother in charge of the diamond mines at Kimberley, South Africa, Mr. Rhodes acquired a large fortune. He turned his attention to politics, and entered the Cape Parliament for West Barkly. About this time he refused General Gordon's offer to accompany the proposed expedition to Khartoum, and accepted the post of treasurer-general in the Scanlan cabinet in South Africa. Soon he became concerned in difficulties with the Boers regarding Bechuanaland, and checkmated Kruger's advance upon that portion of South Africa. He then formed the De Beers Consolidated Mines, and in 1886, when gold was discovered in the Transvaal, organized the company known as the Gold Fields of South Africa. Fearing that the Boer republic would overrun territory which he hoped to see under British rule, he formed the British South Africa Company, and succeeded in obtaining a charter. Of this company he was chairman until 1896. When Kruger sent agents to Matabeleland, Cecil Rhodes arranged a mission to Lobengula, which resulted in the Moffat treaty of 1888. He secured interests in the South African Lake Company and brought the De Beers Company and the British South Africa Company together, obtaining a royal charter for the area of a million square miles, comprising Rhodesia (Mashonaland and Matabeleland), Bechuanaland, and British Central Africa. Dr. Jameson undertook his mission to Matabeleland about this time. In 1890 Mr. Rhodes became prime minister of Cape Colony, remaining until 1896, when he resigned on account of the Jameson raid into the Transvaal. When a second revolt of the Matabele occurred, and a general massacre of the white settlers was contemplated, Mr. Rhodes took command of a body of men at Salisbury and defeated the Matabele at Givelo. In 1896 he went to meet the native chiefs alone and unarmed, and they surrendered. In 1897 he visited England, where he received an ovation, and returned in the same year to South Africa. He went to Buluwayo with Earl Grey to negotiate with the native chiefs relative to stopping the fighting in Mashonaland. In 1897 he was returned to Parliament for both Barkly West and Namaqualand, but chose to sit for his old constituency. In 1899 he visited England to secure government charter for the railway he proposes between Buluwayo and Lake Tanganyika; but a greater scheme is that of a proposed railway from Cape Town to Cairo. (See "CAPE TO CAIRO" RAILWAY.) In March he went to Egypt to confer with Lord Kitchener regarding this project. Oxford conferred upon him the degree of D.C.L. in June, 1899. He went to Kimberley when the war with the Transvaal broke out in October, 1899, and raised and equipped a town guard of 400 men at a cost of £15,000. He predicted that he would be in London in June, 1900. Mr. Rhodes appears to be one of the most successful English financiers and capitalists. The aim of his life may be said to be British territorial expansion. He frequently sweeps his hand over the map of Africa from the Cape to the Zambesi, saying: "That's my dream—all English!" At the close of 1899 he was among the besieged English in Kimberley.

RHODESIA is a name for a large tract of territory, comprising some 750,000 square miles, administered by the British South Africa Company. The river Zambesi flows eastward through the territory, dividing it into Northern Rhodesia and Southern Rhodesia. The former includes the whole of British Central Africa, a section of which, fronting on Lake Nyassa, has been formed into a protectorate under imperial control. Southern Rhodesia includes what was formerly known as British South Africa, and embraces the two provinces known as Mashonaland and Matabeleland, lying roughly between the Zambesi and Limpopo rivers, and in addition, that part of the Bechuanaland protectorate not annexed to Cape Colony in 1895. North of the Zambesi the country is not greatly developed, but to the south the company has introduced many improvements and largely reclaimed the country, which was an unexplored region up to within quite recent years. Within the company's domain have been built about 2500 miles of public road, nearly 2700 miles of telegraph lines, and many miles of telephone wire. Much of the country lies on a high plateau, and is suitable for agriculture and grazing, the climate being mild in the elevated portions. European and sub-tropical plants are said to thrive there, among those which it is claimed would repay expensive cultivation being tobacco, India-rubber, indigo, and cotton. There are extensive forests of hard timber, and foreign fruit and other trees have been imported. Sheep and goats have also been brought into the country. There are extensive gold reefs, and other minerals of importance are found. Coal, silver, copper, iron, tin, plumbago, and other ore deposits have been located, but gold is the only mineral which has been extensively worked. The latter metal has been mined mostly along the lines of ancient workings. These are said to be none other than the ancient mines of Ophir, from which King Solomon obtained supplies. The modern discovery of gold in Rhodesia is of very recent date. The first crushing was reported in September, 1898. By the end of August, 1899, the amount of gold obtained was 63,500 ounces, worth £224,951, obtained

from 115,924 tons of quartz. Rhodesia has a number of important railways. The Rhodesia or Bechuanaland road runs southward from Bulawayo to Kimberley, in Cape Colony, and thence to Cape Town, 1360 miles distant. This is a section of the projected "Cape to Cairo" railway. It was being connected in 1899 with Salisbury, 280 miles, while a northern extension to Gwelo was begun in May. A second road is the Mashonaland railway, which connects Salisbury with Beira, a port of Portuguese East Africa, 380 miles. The extension of this road from the coast reached Salisbury in May, 1899. This road is being widened to the general "Cape to Cairo" gauge. A railroad and telegraph line has been constructed between Salisbury and Umtali, and will run thence to the western shore and northwestern end of Lake Nyassa and to Lake Tanganyika. Bulawayo, in Matabeleland, is the principal commercial centre of Rhodesia. It is situated 4400 feet above the sea, and has an estimated white population of 7500. The population of the whole territory is unknown, but is placed at from 1,000,000 to 2,000,000. Of the whites said to be in Rhodesia, all but a few hundred live south of the Zambesi. The capital, Salisbury, in Mashonaland, has a given white population of 2000. All imports up to 1899 have come by way of the railroad from Cape Town, 1300 miles distant, but the Beira-Salisbury road will henceforth offer a comparatively short route to the seaboard. It was decided in 1898 to increase the capital stock of the South Africa Company from £3,500,000 to £5,000,000. The revenue of the company is derived mainly from mining, trading, and professional licenses, stand holdings, and postal and telegraph services.

The company administers Rhodesia, but the country north of the Zambesi is policed by imperial forces, and the eastern portion of British Central Africa is a definite imperial protectorate. In 1899 the administration of Northern Rhodesia by the company, under the African Order in Council, was placed under the provisions of the Northeastern Rhodesia and Northwestern Rhodesia Orders in Council. In Southern Rhodesia the company administers the country under the Southern Rhodesia Order in Council. In time Rhodesia will become a protectorate under direct imperial control.

History, 1899.—The principal matter of interest in 1899 was that of railway building. Mr. Rhodes visited Berlin during the year for the purpose of interviewing the German Emperor and his ministers on the right of way of the "Cape to Cairo" railway across German East Africa. No definite agreement was reached, but permission was given for the proposed continental telegraph line to cross German territory. (See EAST AFRICA, GERMAN.) Later in the year an agreement was made with the German government regarding the construction of railroads westward from Rhodesia to the coast of German Southwest Africa (*q. v.*). An effort was made to induce the British government to guarantee the interest on capital which it was proposed to raise for the extension of the Bechuanaland Railway north of Bulawayo. On the failure of these negotiations the British South Africa Company agreed to guarantee the capital of £3,000,000, which the railroad company decided to raise, and the statement was made that it will now be possible to complete the remaining 750 miles of railroad to the boundary of German East Africa, making a completed southern section of the "Cape to Cairo" road over 2100 miles long. The northern section already runs southward from the Mediterranean about 1100 miles, leaving to be constructed when the above extension is built about 2250 miles. Early in the war some fighting took place in Rhodesian territory, at Rhodes Drift, in which the British were forced back. The British troops were not pressed, and soon after moved south of the border line, where subsequent battles were confined. In 1899 the company for the first time imposed customs duties on certain articles of import, the estimated revenue from which for 1899 is estimated at £60,000. Trial by jury was instituted in Southern Rhodesia.

RICE CULTURE. See IRRIGATION.

RICHARDSON, JOHN PETER, ex-governor of South Carolina, died at Columbia, July 6, 1899. His family has been prominent in the State for several generations, and from it came four South Carolina governors. John Peter Richardson was the son of the governor of the same name, and was born in Clarendon County in 1831. After his graduation at South Carolina College he engaged in planting, entered politics, and was sent to the legislature. He left the legislature in 1862, and joined the Confederate Army, serving to the close of the war on the staff of General James Cantey. He subsequently re-entered politics, and in 1878 was elected to the legislature. He was elected State treasurer in 1880, 1882, and 1884, and in 1886 and 1888 was elected to the governor's chair. His duties, both as treasurer and as executive, were performed with faithfulness and ability. Governor Richardson was opposed to the Tillman movement of 1890, and upon its success was practically forced into retirement.

RISTIC, JOWAN, Servian statesman, died September 4, 1899. He was born at

CECIL J. RHODES.

Kragoujewatz in 1831; studied in Heidelberg, Berlin, and Paris, and in 1854 entered the service of the Servian state, and soon was given a position in the ministry of the interior. In 1858 he was made secretary of the embassy sent to Constantinople by Obrenovitch III., and he acted as the Servian envoy to the Porte in 1860, when he negotiated for the surrender of the Servian fortresses. In 1863 he became minister of foreign affairs, and two years later minister-president. During the minority of Prince Milan, from 1868 to 1872, Ristic was a member of the council of regency. He was superseded as president of the ministry by Marinowitch, but in May, 1876, after he had allied himself with the panslavic party, he was again called to that position, and also became minister of foreign affairs. In the strenuous days of the war with Turkey, and at the Berlin congress, in which he represented his native country, Ristic directed Servian politics with such skill that the state not only attained its independence, but increased its territorial extent. But when, encouraged by his success to plans of further conquest, he antagonized Austria, that government, by a threatening note, in October, 1880, forced his dismissal. Thereafter he was leader of the liberal party friendly to Russia, and from July, 1887, to the following January, he was again at the head of a liberal-radical ministry. He acted as first member of the regency from King Milan's abdication, in 1889, until the young King Alexander I. assumed control in 1893. Among the writings of Ristic is a work on the foreign relations of Servia from 1848 to 1858, entitled *Spoljasni ornosaji Srbije*, and published in 1887; in German he wrote: *Kurze Charakteristik des geistigen und sitthlichen Zustandes von Serbien*, 1851; *Die neuere Litteratur der Serben*, 1852.

ROADS. See PAVEMENTS AND ROADS.

ROBERTS, BRIGHAM HENRY, a Mormon, was in November, 1898, elected to the Fifty-sixth Congress from Utah. He was born at Warrington, Lancashire, England, March 13, 1857; came to the United States in 1866, and settled in Utah, where he received his education, being graduated from the normal department of Deseret (now Utah) University in 1878. He has three wives, taken before President Woodruff, of the Mormon Church, abolished polygamy in 1890. Mr. Roberts has been chiefly engaged in editorial work and other writing, but has travelled extensively in the United States and the British Isles. He was a member of the Utah constitutional convention in 1895, and in the same year was an unsuccessful candidate for Congress. At the roll-call of the Fifty-sixth Congress, on December 4, 1899, Mr. Roberts answered to his name, but opposition on account of his polygamous relations was made to his admission as a member of the House. A public petition that he be not allowed to take his seat had been made, signed, it was said, by 7,000,000 persons, and consisting of 28 rolls, each 2 feet in diameter. On the motion of Mr. Robert W. Taylor, of Ohio, that the question of admission be submitted to a special committee of 9, appointed by the speaker and empowered to take testimony, the speaker requested Mr. Roberts to step aside, which he did without, however, waiving his rights in the matter. The Taylor resolution came up for discussion the next day, and Mr. Roberts spoke strongly in his own behalf; the resolution was finally carried by a vote of 302 to 30. The final disposition of the case had not been reached at the close of the year. Mr. Roberts has written: *The Life of John Taylor*, the third president of the Mormon Church; *Outlines of Ecclesiastical History*; *The Gospel; A New Witness of God*. See MORMONISM.

ROBERTS, Lieutenant FREDERICK H.S., the only son and heir of General Lord Roberts, of Kandahar and Waterford, died in December, 1899, from wounds received in the engagement at the Tugela River, South Africa. The despatch to America, announcing the appointment of General Roberts to supreme command in South Africa, also brought the news of the death of his son. Lieutenant Roberts was born at Simla, India, in 1872. He was educated at Eton, and at the Royal Military College at Sandhurst. Though scarcely twenty-seven, he had seen service in four campaigns, and had won two mentions for gallant conduct on the battle-field. In the battle of Friday, December 15, in which he was mortally wounded, his gallantry led to his recommendation for the Victoria Cross.

ROBERTS OF KANDAHAR AND WATERFORD, First Baron, Sir FREDERICK SLEIGH ROBERTS, commander-in-chief of the British forces in South Africa, was appointed to that position December 17, 1899, to supersede General Sir Redvers Henry Buller, whose forces two days before had suffered a serious reverse at Chieveley, on the Tugela River. General Roberts has had an active and most creditable career, and has won for himself a number of honorary titles, including Knight of the Order of St. Patrick, Knight of the Grand Cross of the Bath, Knight of the Grand Cross of the Star of India, Knight of the Grand Cross of the Indian Empire, and the Victoria Cross. In 1892 he was raised to the peerage. All of his promotions in the army have been "for merit." Excepting Lord Wolseley, the commander-in-chief, Lord Roberts is regarded as the foremost general in the British army. General

Lord Kitchener, the Sirdar of the Egyptian army, was appointed his chief of staff. At the time of his appointment General Roberts was commander-in-chief of the British forces in Ireland. He sailed for South Africa from Southampton, England, on December 23, 1899, and met General Kitchener at Gibraltar. General Roberts is the son of General Sir Abraham Roberts, and was born at Cawnpore, India, September 30, 1832. He was educated at Eton, Sandhurst, and Addiscombe, and when nineteen years old entered the army as a second lieutenant in the Bengal Artillery. His promotions have been as follows: Lieutenant, June, 1857; captain, November, 1860; brevet major, November, 1860; brevet lieutenant-colonel, August, 1868; brevet colonel, January, 1875; major-general, December, 1878; lieutenant-general, July, 1883; general, November, 1890; field-marshal, May, 1895. General Roberts served throughout the Indian Mutiny. He participated in the siege and capture of Delhi (being wounded July 14, 1857); the engagements at Bulandshahr Agra, Aligarh, Bantharra, and Kanaug; the expedition for the relief of Lucknow, and the siege of that city; the battles of Cawnpore and Khudaganj; the taking of Fategarh, Mianganj, Laloo, Umbeyla, and Malka. He was with the Abyssinian expedition of 1867-68, and the Lushai expedition of 1871-72, being present at the capture of the Kholel villages, and the attack along the Murtlang range. From November, 1878, to September, 1879, he commanded the Kuram Field Force; among his engagements at this time were Peiwar Kotal, and Sapari Pass. Relinquishing this command, he took command of the Kabul Field Force, retaining it until the following April; this expedition saw the battle of Charasia, the capture of Kabul, and the engagements before Sherpur. In these engagements in Afghanistan the British were successful, though, it is said, they were sometimes outnumbered six to one, and even twelve to one. In August, 1880, General Roberts led his force through a mountainous country, inhabited by hostile people, from Kabul to Kandahar, a distance of 300 miles, in twenty days, crushing Ayoob Khan at the end of the march. From 1881 to 1885 he was in command of the army at Madras, and from the latter year to 1895 commander-in-chief for India, being in 1886 in command of the army in Burmah. On October 1, 1895, he was appointed to the command of the forces in Ireland. General Roberts is honored not alone for his fighting record; he "fortified the frontier of Hindustan with a chain of fortresses from end to end; he made both the British and native troops far more effective than ever before; he obtained better rations for the men, and he secured better equipments." His services have been recognized not only by promotions and titles, but he has received many medals and clasps, and the formal thanks of the government of India and of both houses of Parliament. He has written *The Rise of Wellington*, 1895, and *Forty-one Years in India*, 1897.

ROBERTS, Sir WILLIAM, M.D., F.R.S., a London physician, was born at Anglesea, in March, 1830; died, April 16, 1899. Having taken his degree (B.A.) at University College, London, he began his medical practice in Manchester, 1854. He subsequently occupied the chair of medicine in Owens College, Victoria University, and in 1889 removed to London. He was knighted in 1885. Among his publications are: *On the Chemistry and Therapeutics of Gout and Uric-Acid Gravel*; *A Practical Treatise on Urinary and Renal Disorders*; collected articles on *Dietetics and Digestion*.

ROBINSON, Rev. CHARLES SEYMOUR, D.D., Presbyterian clergyman, died at his home in New York City, February 1, 1899. He was born at Bennington, Vt., March 31, 1829. At twenty years of age he was graduated from William's College; he then taught school, but soon entered Union Theological Seminary, where he remained for a year, and then went to Princeton Seminary, completing his theological course there in 1855. From this time to 1860 he had a pastorate in Troy, N. Y. In the latter year he accepted a call to succeed Dr. Cox in the First Presbyterian Church, of Brooklyn, and remained there until 1868, when he took charge of the American Chapel in Paris. This was simply a preaching station, but under Dr. Robinson's influence it developed into a regular church organization. On account of the Franco-Prussian War he left Paris in 1870, and became pastor of the Madison Avenue Presbyterian Church in New York. In the summer of the following year he re-organized in Paris the work he had been forced to leave. From the Madison Avenue Church Dr. Robinson went to the Thirteenth Street Presbyterian Church, which charge he retained until 1887. After this time he did but little regular preaching or pastoral work. In all his charges, it is said, he showed great liberality, and when pastor of the Thirteenth Street Church he accepted no salary, on account of the financial weakness of the church. He is very widely known as a compiler of hymnals. His first hymn-book, *Songs for the Church*, appeared in 1862; following this were *Psalms and Hymns*, *Laudes Domini*, *Spiritual Songs*, and *Songs for the Sanctuary*. Of the last-named volume, it is said that more than 500,000 copies of

LORD ROBERTS.

the octavo edition were sold. Among his own writings are: *Church Work; Memorial Pulpit; Short Studies in the New Testament; The Pharaohs of the Exodus*, etc.

ROENTGEN RAYS. A writer in the *Medical and Surgical Review of Reviews* states that it has been computed that 1 person in every 800 is blind to the X-rays—that is, when looking through the fluoroscope is unable to see the objects clearly seen by the ordinary observer. During 1899 the field of the radiograph has been much enlarged. The X-ray is used in corroborating or correcting medical diagnosis with more frequency. The size and position of the heart can be more accurately learned from a radiograph than by percussion of the chest. Commencing consolidation from pulmonary tuberculosis is detected by an X-ray picture when detection is impossible by the physical signs. The presence of abnormal density of the lung in early or convalescing pneumonia can be determined readily by the radiograph, as well as in la grippe. Effusion in the pleural cavity, an emphysematous condition of the lung, hydrothorax, pneumothorax, thoracic aneurism, a new growth, were all easily detected and accurately bounded in skiagraphs. In many cases, the errors of percussion, as corrected by skiagraphs, were corroborated at post-mortem examinations. The X-rays have been used with success as a therapeutic agent in treating lupus by C. T. Holland, of London, as well as by Philip M. Jones, of San Francisco. Holland reported, in 1899, 3 cases so treated, with recovery in two cases and great improvement in the third. Jones reported two cases, one cured and the other improving rapidly under treatment. The method has been used in Germany with great success. See HEART, WOUNDS OF THE.

ROMAN CATHOLIC CHURCH. The only exception to the generally peaceful progress of the Roman Catholic Church in the United States during 1899 has been the trouble concerning the appointment of a German priest over a parish in East St. Louis. The parishioners rebelled against it, and were excommunicated, but by an order from Rome were received again into the church, and a priest of Irish extraction was appointed. Much indignation was caused among Catholics by the reported looting of the churches in Luzon. In 1899 there were in the Roman Catholic Church in the United States 11,119 priests, 11,571 churches, and 8,421,301 communicants. The latest report of the United States commissioner of education shows the Roman Catholics to have 60 institutions of higher education, with 608 professors, 5243 students, and endowment funds aggregating \$996,000. The Roman Catholic hierarchy in the United States consists of the apostolic delegation—Sebastian Martinelli, archbishop of Ephesus, Papal Delegate, Washington, D. C.; Rev. Donatus Sbordetti, auditor, Washington, D. C.; Rev. F. Z. Rooker, secretary, Washington, D. C., and 14 archbishops and 72 bishops. Four bishoprics were vacant in 1899. (For the College of Cardinals, see CARDINAL.) The total number of Roman Catholics in the world is estimated to be 240,000,000. It was announced that in Rome the year 1900 would be celebrated with great solemnity as a "Holy Year," or year of "Universal Jubilee."

ROOSEVELT, THEODORE, governor of New York, was born in New York, October 27, 1858, and graduated at Harvard in 1880. In 1882-84 he was a Republican member of the New York legislature, and in 1886 an unsuccessful candidate for mayor of New York. In 1889 President Harrison appointed him a national civil service commissioner. In 1895 he became a police commissioner of New York, and in 1897 assistant secretary of the United States Navy. He resigned the latter post to organize, with Colonel Leonard E. Wood, the First United States Cavalry Volunteer Regiment, called "Roosevelt's Rough Riders," consisting largely of recruits from the Western plains. He distinguished himself in the campaign before Santiago de Cuba, and was made colonel. In 1898 he was elected governor of New York. His books include: *The Naval War of 1812*, 1882; *Hunting Trips of a Ranchman*, 1885; *Life of Thomas H. Benton*, 1887; *Life of Governor Morris*, 1888; *Essays on Practical Politics*, 1888; *Ranch Life and the Hunting Trail*, 1888; *The Winning of the West*, 4 vols., 1889-96; *The Wilderness Hunter*, 1893; *American Ideals and Other Essays*, 1897; and *History of New York City*, 1891.

Governor Roosevelt, who was formerly colonel of the First Volunteer United States Cavalry, met his troopers at Las Vegas, N. M., on June 24, 1899, where they had gathered for their first annual reunion. Every troop in the organization was represented. Governor Roosevelt was elected honorary president of the regiment. Lieutenant-Colonel Brodie was president; Major W. H. H. Llewellyn, first vice-president; Lieutenant David Goodrich, second vice-president; and Lieutenant W. E. Dame, secretary and treasurer. On the following day Governor Roosevelt reviewed the regiment, and was presented with a gold medal by the people of New Mexico, who bestowed a sabre upon Lieutenant-Colonel Brodie. For some account of Governor Roosevelt's administration, see NEW YORK.

ROOT, ELIHU, a prominent New York lawyer, was chosen to succeed General

Russell A. Alger as secretary of war, and took the oath of office on August 1, 1899. Mr. Root is the son of Dr. Oren Root, for many years professor of mathematics in Hamilton College, and was born at Clinton, N. Y., February 15, 1845. After graduation at Hamilton in 1864 as valedictorian of his class, he taught for a year at the Rome (N. Y.) Academy, and then entered the University Law School in New York. Here he was admitted to the bar in 1867, and began practice. His first important case was the suit of the People *vs.* Ingersoll, "in which he successfully contended against Charles O'Connor's theory that the State, instead of the county, was the proper party to sue for money alleged to have been taken from the county." Mr. Root was counsel for the executors in the Hoyt and Havemeyer will cases, for the late Judge Henry Hilton in the Stewart will cases, and for the contestants in the Hammersley will case; he has had a considerable amount of experience as a corporation counsel. Beginning early in his career, he has taken an active part in politics, though he has made little effort to get office. He has been an opponent of undue machine power, and "early realized that pecuniary independence was necessary to personal independence in politics." In 1879 he was nominated as a Republican for judge of the Court of Common Pleas, but was defeated. He later became a leader in the Republican organization in his assembly district, and in 1886-87 was chairman of the Republican county committee. The only public office he ever held before becoming secretary of war was that of United States district-attorney for the southern district of New York, to which he was appointed by President Arthur in 1883. He served two years. In 1894 he was chairman of the judiciary committee of the State constitutional convention. He is a member of the New York Bar Association, has been president of the Republican Club, and in 1898 succeeded General Horace Porter as president of the Union League Club, to which position he was re-elected in the beginning of 1899.

Secretary Alger tendered his resignation on July 19, to take effect August 1. The President offered the portfolio to Mr. Root, who accepted on July 22. Notwithstanding the fact that Mr. Root is a civilian, that he was personally acquainted with very few army officers, that he had little knowledge of Washington official life or of military affairs in general, or of the functions and current work of the twelve bureaus of the War Department, yet so great was the public belief in his ability and integrity that the appointment met with general approval. The position was a difficult one to fill. Whatever may be said for General Alger's management of the War Department, the public, and in particular the friends of the administration, rejoiced to see him superseded by Mr. Root. The new secretary in a short time succeeded in making himself familiar with the workings of the department. He has managed the military affairs of the country in a highly creditable manner.

ROPES, JOHN CODMAN, author and lawyer, died October 28, 1899, at the age of sixty-three years. The definition of Mr. Ropes as "a precise writer and able historian" does not overestimate his abilities or fully sum up his services to students of warfare. His death deprived the world of letters of an eminent representative, but among students of the art of war his loss will be particularly felt. He left an unfinished work, *The Story of the Civil War*, the monumental character of which was shown by the first two volumes which had already appeared. It was announced some time after the writer's death that manuscript of the remaining two parts of the subject had been found to be in such shape as to promise the completion and publication of the entire series. The importance of this work lies in the fact that it gives to the public a most elaborate production concerning the military achievements of his own countrymen by a writer who had attained world-wide fame as the critic of a foreign war. In *The Campaign of Waterloo* he became an authority in England and France, and it has been said by conservative critics that as an expounder of the strategic problems of the period covered by this book, Mr. Ropes had few equals. Distinction in this country was first gained by his work among the archives of the Massachusetts Historical Society. Mr. Ropes was born in St. Petersburg, Russia, but of American parentage. He was graduated from Harvard in 1857 and from the Harvard Law School in 1861. Mr. Ropes achieved fame through a pursuit which he may originally have entered into as a side issue. He had taken up the profession of law after leaving the university and continued its practice up to the time of his death. He was granted an LL.D. from Harvard in 1897. Much of his life was passed in Boston, where he was a member of the American Historical and the Massachusetts Historical societies and of the Military Historical Society of Massachusetts. His more important books include *The Army Under Pope*; *The Story of the Civil War*; *The First Napoleon*; *The Campaign of Waterloo*; *Atlas of Waterloo*.

ROSE, SOCIETY OF THE. See **RUSKIN SOCIETY.**

ROSS, JONATHAN, LL.D. United States senator from Vermont, was appointed to

this position, as a Republican, by Governor Edward C. Smith, on January 11, 1899, to succeed Justin S. Morrill, who died on the 28th of the preceding month. Born at Waterford, Vt., April 30, 1826, he worked on a farm until he was twenty-one, teaching for a number of years in the winter time. He managed to prepare for college at St. Johnsbury Academy, and was graduated at Dartmouth in 1851; being admitted to the bar five years later, he practised his profession in St. Johnsbury until 1870. In 1862-63 he was State attorney for Caledonia County, from 1865 to 1867 a member of the legislature in the lower House, in 1869 a member of the last council of censors, and from 1866 to 1870 a member of the State Board of Education. In the latter year he was elected to the Supreme Court of Vermont, and in 1890 became chief justice. This position he held until he accepted the senatorship on January 11, when he tendered his resignation. His term will expire March 3, 1903.

ROUGH RIDERS' ASSOCIATION, formed in 1898 by the members of the First Regiment, United States Volunteer Cavalry. President, Lieutenant-Colonel Alexander O. Brodie; secretary-treasurer, Lieutenant J. D. Carter. See ROOSEVELT, THEODORE (second paragraph).

ROUMANIA, THE KINGDOM OF, a Balkan state, lying between Russia and Bulgaria, has an estimated area of 48,307 square miles and an estimated population in 1893 of 5,800,000. It includes the divisions Wallachia, Moldavia, and Dobruja. It formerly included only the first two, which were autonomous Turkish provinces. These were united in 1861. In 1877 they became independent, at which time there was added to them Dobruja, to the north, which was obtained from Russia as compensation for certain territory given up to her. In 1881 the country became a kingdom under the present ruler, Carol I. There is a senate of 120 members, elected for 8 years, and a chamber of deputies of 183 members, elected for 4 years. Dobruja does not have the right to elect senators and deputies, but in common with the other two divisions of the kingdom has a form of local government. The capital of Roumania is Bucharest, with a population recently estimated at about 250,000. The prevailing religion is Greek Orthodox, the number of adherents being estimated at from 4,500,000 to 5,000,000. Education is backward. Seventy per cent. of the population is engaged in agricultural pursuits. The soil is very rich, but in the summer there occur severe droughts, while the winters are equally extreme. The produce is mainly cereals, beans and peas, vines and fruits, and the country is rich in forests. The live-stock industry is important, and large numbers of cattle, sheep, and horses are raised. Salt and petroleum are the only minerals obtained, though others are said to exist. In 1897 the imports amounted to 355,782,000 lei (the leu being equivalent to 1 franc, or \$0.193), and the exports, 224,180,000 lei. The imports are chiefly European manufactures. In 1898 Roumania had 1800 miles of state railway, while communication is further afforded by the Danube River. An international commission exercises control of Danube navigation, with its seat at Galatz in Roumania, and collects the shipping and other dues. Roumania is represented in the superintendence of this branch of navigation, and in addition the state conducts a commercial navigation service on the Danube and Black Sea. Roumania has an army of about 46,000 on a peace footing, or 158,000 on a war footing, besides a militia. There is a navy of 12 vessels.

The parliamentary session opened November 13, 1898. In the course of the message from the crown mention was made of the King's visit to the Russian court in July, 1898, in the following language: "On the occasion of the visit which I paid to the Emperor of Russia his majesty gave me numerous proofs of a real friendship. The reception which was offered was as sympathetic as it was brilliant, and in the course of my travels in Russia I saw with especial satisfaction that the recollection of the brotherhood in arms, which was consecrated on the battle-fields of Bulgaria, remains intact." As to the programme of parliamentary work, the message stated that the main work of the session would be devoted especially to the formation of projects of law which had already been discussed in the previous session and to the consideration of the general budget. It was also said that since the treaties of commerce with foreign countries would expire soon, it was desirable to take the appropriate measures for establishing the economic affairs of the country on a sound basis. Another feature of the message was the announcement of a project of law dealing with professional education, which should provide the young with a practical training corresponding to the economic necessities of the country. The most important bills were passed by the parliament without difficulty. The law on the subject of professional education occasioned some sharp debates, but had no more serious consequence than the resignation of the minister of agriculture, commerce, and industry, who was opposed to the transfer of the professional schools to the jurisdiction of the minister of public instruction. However, an anonymous work appeared at Budapest, pretending to explain the accession of Stourdzsa to power as a result of an agreement with Baron Banffy, the former prime minister of Hungary.

This agreement was said to be injurious to the cause of the Roumanians who were under Magyar leadership. Although little faith was placed in the statements in this book by impartial persons, the publication gave a pretext to the opposition which started a campaign against Stourdza as a traitor to the Roumanians. In reality this campaign was merely a political move against the Liberal party. Interpellations followed, and the opposition spread to the streets, where it expressed itself in open-air meetings and processions. Finally a riot broke out in Bucharest on April 9, and on the following day Stourdza handed in his resignation, which was accepted. The prevailing opinion was that the government had been intimidated by the demonstration, but as a matter of fact the change of front was due probably to the weakness of the Liberal organization, which had undergone some serious defections. On the 23d, after long negotiations, a new ministry, in part Conservative, was organized under the presidency of M. Georges Cantacuzene, who had succeeded to the head of the party on the death of M. Catargi. The other members were as follows: Finance, General Mano; war, General Jacques Lahovary; justice, Discesco; public instruction, Take Jonesco; domains, Fleva; foreign affairs, John Lahovary; public works, Istrati.

Early in the year 1899 a Socialist agitation arose in favor of a measure for land purchase on easy terms. Upon the defeat of this bill in the upper house the peasantry in the district between the Danube and the Olt rivers rose in revolt. On February 4 they defeated two regiments of infantry near Krayova, but quiet was finally restored.

ROWING. Boat-racing in oared-shells is rapidly becoming as popular in America as it has been for years in England, and the annual intercollegiate regattas are among the notable events of the athletic year. One of the features of 1899 has been the further development of college rowing, both as to the number of men actively interested and the quality of their form. At Harvard and Yale the inauguration of a system of club and interclub rowing, and class races, brought out a large number of crews, and greatly stimulated general interest and practice. The year saw also an increase in the number and character of contests, both preceding and including the annual regattas on the Hudson and the Thames. Races of the second-class were especially numerous for their kind. On May 30, at Cayuga Lake, the Cornell second 'Varsity defeated the Pennsylvania second 'Varsity in a two-mile eight-oared race, in 11:26½. This race is to be an annual spring contest. At Annapolis there occurred two-mile eight-oared races between the United States Naval Academy crew and the following university crews: Columbia, May 13, who won by 1½ lengths in 12:06; Pennsylvania, May 20, who won in 11:13 (and her freshman crew won a 1½-mile race in 7 minutes); and Yale, May 27, who won in 10:28. A noteworthy event among races of a third-class, representing interclub and class races, was the annual single-sculling contest for the Francis diamond medal at Cornell. This was won by Mr. Francis, who, in June, stroked the freshman boat at Poughkeepsie, and whose father, Charles S. Francis, of Troy, is the donor of the medal. The elder Francis, in the intercollegiate regatta at Saratoga Lake, in 1876, established the present intercollegiate two-miles single-sculling record of 13:42¾.

These races, together with the major intercollegiate regattas of the summer, made the season of 1899 the most active and successful in the history of college boating. On the Hudson, June 26-27, Pennsylvania won the 'Varsity Challenge Cup for the second time, in an eight-oared race of 4 miles. The times were: Pennsylvania, 20:04; Wisconsin, 20:05½; Cornell, 20:13; Columbia, 20:20. Four-oared 'Varsity race, 2 miles: Pennsylvania, 11:12; Cornell, second. Freshman eight-oared race, 2 miles: Cornell, 9:55; Columbia, 10:00; Pennsylvania, 10:10. The sensational contest between Wisconsin, who led almost to the finish-line, and Pennsylvania, and the bad defeat of Cornell, were features of the principal 'Varsity race. The introduction of a four-oared race into an intercollegiate regatta of this character was the revival of a custom which had not been observed for some years. This event was introduced also in the Harvard-Yale race. The stewards of the Intercollegiate Association decided toward the close of the year to increase still further the scope of the races by introducing in 1900 pair-oared and single-sculling contests, provided three entries in each could be secured by May 15, 1900. It was also decided to invite the participation of as many other colleges as might find it possible to equip crews. At the close of the year the colleges announcing their intention of entering one or more events were as follows: Columbia, Cornell, Georgetown, Pennsylvania, Syracuse, and Wisconsin, the latter with at least three crews. Georgetown and Syracuse are new entrants into college athletics. The University of California signified its intention of sending a crew for the 1901 regatta. The 1900 regatta promises the nearest approach to an American Henley yet made. On the Thames, June 29, occurred the annual Harvard-Yale dual races. The feature of the 1899 regatta was the emphatic success of Harvard in the entire list of events. The official time of the Harvard-Yale races follows: 'Varsity eight-oared, 4 miles: Harvard, 20:52½; Yale, 21:13. 'Varsity four-oared, 2 miles: Harvard, 10:51; Yale, second.

Freshman eight-oared, 2 miles: Harvard, 9:33½; Yale, second. The races for 1900 will include the same events as in 1899.

Amateur rowing outside the colleges, though not so widely advertised, and neither so expensive, nor on the whole so highly developed, has a large number of devotees, especially in the East, where there are many fine boat-houses. Among the various regattas in that section there were held in 1899 the following: Harlem Regatta, Schuylkill Navy, Passaic River Association, Long Island Association, Hoboken Association, New England Association, Middle States Association, Metropolitan Association, People's Regatta, and National Association of Amateur Oarsmen. The last named held its twenty-seventh annual regatta at Boston, July 28 and 29, over a 1½-mile course.

In England, the Oxford-Cambridge race, March 25, over the regular 4¼-mile course, was won by Cambridge for the first time in ten years. The winner's time was 21:04, the race being won by 3 to 4 lengths. At the Henley Regatta, in July, B. Hunting Howell, an American student at Cambridge, won, for the second time, the Diamond Sculls, which in 1897 had been captured by Ten Eyck, of the United States. Howell's time was 8:38, and one of his opponents was Bright, of Toronto.

ROYAL ACADEMY, LONDON (Burlington House, Piccadilly), founded by George III., in 1768, for the maintenance of a free school of art, and the holding of annual exhibitions. In 1899 there were 40 royal academicians and 27 associates. The academicians and dates of their election were: Edwin Austin Abbey, 1898; George Aitchison, 1898; Sir Lawrence Alma-Tadema, 1879; Henry Haugh Armistead, 1879; George Henry Boughton, 1896; Thomas Brock, 1891; Thomas Sidney Cooper, 1867; Ernest Crofts, 1896; Henry William Banks Davis, 1877; Francis Bernard Dicksee, 1891; Luke Fildes, 1887; Edward Onslow Ford, 1895; Alfred Gilbert, 1893; Frederick Goodall, 1863; Andrew Carrick Gow, 1891; Peter Graham, 1881; Edward John Gregory, 1898; Hubert Herkomer, 1890; James Clarke Hook, 1860; Thomas Graham Jackson, 1896; Benjamin Williams Leader, 1898; George Dunlop Leslie, 1876; John Seymour Lucas, 1898; John MacWhirter, 1893; William Quilter Orchardson, 1877; Walter William Oules, 1881; Sir Edward John Poynter, 1876; Valentine C. Prinsep, 1894; Sir William Blake Richmond, K.C.B., 1895; Briton Rivière, 1881; James Sant, 1869; John Singer Sargent, 1897; Richard Norman Shaw, 1877; Marcus Stone, 1887; William H. Thornycroft, 1888; Alfred Waterhouse, 1885; John William Waterhouse, 1895; Henry Tanworth Wells, 1870; Henry Woods, 1893; William Frederick Yeames, 1878. President, Sir E. J. Poynter; secretary, Frederick A. Eaton.

ROYAL ACADEMY OF SCIENCES, BERLIN (AKADEMIE DER WISSENSCHAFTEN), founded in 1700, has 54 regular and 20 honorary and corresponding members. It publishes the *Monatsberichte*, and the two series of classical works, the *Corpus Inscriptionum Græcarum*, and the *Corpus Inscriptionum Latinarum*. Offices, Universitätsstrasse 8, Berlin.

ROYAL ARCH MASONS, the seventh degree in Masonry, reported for 1899 44 grand chapters, each representing a State or Territory (except Pennsylvania and Virginia), and 2235 subordinate chapters, with a total membership of 177,628. There are, besides, 18 subordinate chapters in the Territories of the United States, the Sandwich Islands, Chile, and the Chinese Empire, which are under the immediate jurisdiction of the General Grand Chapter. General grand high priest, Reuben C. Lemmon, Toledo, O.; general grand secretary, Christopher G. Fox, Buffalo, N. Y.

ROYAL ASIATIC SOCIETY OF GREAT BRITAIN AND IRELAND, founded in 1823 for the study of Asiatic arts, sciences, and literature, had in 1896 a membership of 523. There are branch societies in Bombay, Madras, Ceylon, the Straits Settlements, Japan, and China. The society has a library of 12,000 volumes, and publishes the *Journal*. President, Lord Reay, G.C.S.I.; secretary, Miss C. Hughes.

ROYAL ASTRONOMICAL SOCIETY (Burlington House, W., London), founded in 1820, has 680 members, publishes *Monthly Notices and Memoirs*. President, G. H. Darwin; foreign secretary, Sir William Huggins, K.C.B.

ROYAL SOCIETY, the well-known British scientific association, was organized in 1660, and incorporated by Charles II. in 1662. It has a library of 50,000 volumes, and headquarters in Burlington House, Piccadilly, London. Among the fellows (F.R.S.) elected in 1899 are: Professor Alfred C. Haddon, Professor C. Lloyd Morgan, F.G.S., and Lord Curzon, of Kedleston. President, Lord Lister; secretary, Sir Michael Foster, K.C.B., M.D. See ZOOLOGICAL SOCIETIES.

RUMSEY, ALMARIC, professor of Indian jurisprudence at King's College, London, died April 8, 1899. He was born in London, December 31, 1825; was educated at Rugby and Oxford. In 1857 he was admitted to the bar, Lincoln's Inn, and later practised in Indian Appeals at the Privy Council. He was a magazine contributor,

and from 1863 to the time of his death was on the staff of the *Athenæum*. Among his publications are: *A Chart of Moohummudan Inheritance*, 1866; *A Chart of Hindu Inheritance*, 1868; *The Moohummudan Law of Inheritance, and Rights and Relations Affecting It*, 1880.

RUSKIN SOCIETY OF LONDON (Society of the Rose), organized in 1881 for the purpose of studying the works of John Ruskin. Secretary, J. P. Smart, Jr., 5 Mount View Road, Crouch Hill, London, N., England.

RUSPOLL, Prince di, a former mayor of Rome and senator in the Italian parliament, died November 29, 1899. He was born in 1838, of the third branch of the family which bears the title of Princes of Poggio-Suasa. He fought for the unification of Italy, and returned to Rome in 1871 with the rank of captain. He was elected an alderman of Rome, a senator for seven consecutive terms, and mayor of Rome. His wife was the daughter of J. D. B. Curtis, of Boston, Mass.

RUSSELL, WILLIAM AUGUSTUS, ex-congressman from Massachusetts, died in Boston, January 10, 1899. He was born at Wells River, Vt., April 22, 1831; was educated at the academy in Franklin, N. H., and at a private school in Lowell. In 1853 he formed with his father a partnership in paper manufacturing at Lawrence, Mass.; his paper interests greatly developed, and mills were established in other towns, the principal ones being at Lawrence and at Bellow's Falls, Vt. In 1869 he instituted a new department of industry in this country by establishing a wood pulp mill at Franklin, N. H. Mr. Russell was elected as a Republican to the Massachusetts legislature in 1868, and in the same year served as a delegate to the National Republican Convention in Cincinnati. He represented the seventh Massachusetts district in the Forty-sixth, Forty-seventh, and Forty-eighth Congresses.

RUSSIA (EMPIRE OF ALL THE RUSSIAS) comprises northern Europe and all of northern Asia, has a total area of 8,660,394 square miles, of which 2,095,616 square miles are in Europe. The total population of European Russia in 1897 was 106,191,795, with a density of 51 per square mile, and that of the Asiatic dominions was 22,697,469, being only 4 to the square mile. The grand total of population of the whole Russian Empire is placed at 128,932,173, which gives 15 to the square mile. The chief cities in European Russia are St. Petersburg, with a population (1897) of 1,267,023; Moscow, 988,614; Warsaw, 638,209; Odessa, 405,041; Lodz, 315,209; Riga, 282,943, and Kieff, with 247,432. There are 9 other cities with a population of over 100,000, 30 others with over 50,000, and 27 others with over 30,000 population. In Asiatic Russia Tiflis, in the Caucasus, has 160,645; Tashkent, in Turkestan, has 156,414; Baku, in the Caucasus, 112,253, and there are 20 cities with a population between 30,000 and 100,000.

Emigration.—In the fiscal year, ending June 30, 1899, the number of persons emigrating from Russia and Finland to the United States was 60,982, which shows an increase of 31,154 over the preceding year. The increase of Russian emigration to the United States for this year was greater than any other increase reported, the next largest being that of Austria-Hungary. The number of Russians coming to this country was 1747, of Finns 6079, and of Hebrews, from the Russian Empire, 24,275. The opening of the Trans-Siberian Railway as far as Irkutsk in 1899 continued to give some impetus to the migration from Russia to Siberia. In the 17 years, ending January 1, 1899, the persons migrating to Siberia from European Russia numbered 1,117,715. In 1898 the number reached nearly 200,000.

A report of United States Commercial Agent Richard T. Greener, dated Vladivostock, November 19, 1899, shows that the Russian migration to the Amur and Khabarovsk regions of eastern Siberia has been considerable, but that numbers of migrants fail to reach these sections for various reasons, chief of which are the prospects of receiving better pay as laborers on the Trans-Siberian Railway, and the unfavorable reports concerning eastern Siberia, circulated by persons returning to Russia. The Khrestianin settlements in the Amur territory numbered, in 1897, families, 6593, with 44,943 persons. There were 79 grain elevators. The Amur territory is considered to be in all respects desirable for agriculturists, except for the ravages of the cattle pestilence. Settlers of the lowest peasant class receive pecuniary aid from the government.

Government.—An absolute hereditary monarchy, the entire executive, legislative, and judicial function being lodged in the Emperor. He is limited in his rulings only by certain precedents, such as the decree of Emperor Paul in 1796, concerning the succession to the throne, and that of Peter I., requiring the Emperor, his consort and princes of the blood royal to be members of the Greek Orthodox Church. The four imperial councils are the *Council of the State*, which has superintendence of finance, legislation, and civil and church administration; the *Ruling Senate*, which has judicial and executive functions; the *Holy Synod*, which controls ecclesiastical matters; and the *Committee of Ministers*, consisting of 12 ministers, of the imperial house and domains, of foreign affairs, of war, of public instruction, etc.

European Russia is divided into 68 governments (including Poland and Finland), and Asiatic Russia has 5 general governments. Finland (*q. v.*) retained in 1899 some vestiges of the constitution of 1772, but these have been virtually rendered inoperative.

Religion and Education.—The Græco-Russian or Orthodox-Catholic Church is the national church. It is independent of, but has connections with, the patriarchates of Alexandria, Antioch, Constantinople, and Jerusalem. The latest estimates place the number of Orthodox Greek Catholics in Russia at 75,000,000. The number of persons of other creeds is estimated as follows: Roman Catholics, 8,300,000; Jews, 3,000,000; Protestants, 2,950,000; Mohammedans, 2,600,000; United Church and Armenians, 55,000, and Pagans, 26,000. The statistics of education in the Russian Empire are not complete. The *Statesman's Year Book* for 1899 gives the number of universities as 9, with 923 instructors and 16,326 students; other higher institutions, 44, with about 9000 students. These figures do not include Finland, which has 1 university, at Helsingfors, with 2062 students in 1897. The number of elementary schools in 1896 was 78,724, with 113,984 teachers and 2,948,274 male and 831,544 female pupils; total, 3,779,818. Of the 265,000 men, more or less, which annually enter the Russian army, about 70 per cent., according to the latest obtainable figures, are illiterate. See AGRICULTURE (paragraph Agricultural Teaching.)

Currency.—By the coinage law of July 7, 1899, the currency question in Russia was settled by the adoption of gold as standard of value, and the unit of currency a rouble containing 0.7742 grams of pure gold, worth 51.4566 cents in United States gold. Silver is to be used only in fractional currency; state credit notes are to be exchanged at par with gold; silver coins are not to be accepted as metallic bank reserve; and the coinage of silver is not to exceed 400,000,000 roubles. The total amount coined up to January 1, 1900, was 220,000,000 roubles, and there were but 165,000,000 roubles in circulation. In 1899 there were in circulation 662.3 million roubles in gold coin, 143.3 million roubles in silver coin, and 555 million roubles in notes. The state bank was able, in spite of the adoption of the gold standard, immediately to redeem all circulating notes, and, in December, 1899, the circulation of notes was 518 million roubles, and there were 112 millions in the state bank. The ratio of reserve to outstanding notes was 16.7 to 10.

Finances.—The following table shows the budget for the year 1900. The total national debt in 1898 was 6,341,880,893 paper roubles, showing a decrease of some 400 million roubles from that of the year 1897. The imperial budget for 1900:

	Roubles.
Ordinary receipts.....	1,593,745,680
Extraordinary receipts.....	3,000,000
Imperial revenues.....	160,641,423
Total.....	1,757,387,103
Ordinary expenditures.....	1,564,441,679
Extraordinary expenditures.....	192,945,424
Total.....	1,757,387,103
Ordinary expenditures:	
Interest on loans.....	274,726,164
Higher governmental.....	3,007,995
Holy Synod.....	23,559,685
Imperial house.....	12,899,514
Foreign affairs.....	5,267,735
War.....	324,343,686
Navy.....	86,628,015
Finances.....	288,489,304

Interior.....	85,938,484
Public instruction.....	33,180,829
Public works.....	322,287,968
Justice.....	46,515,736
Sources of Revenue:	
Direct taxes.....	120,365,517
Customs.....	84,802,850
Indirect taxes.....	641,142,309
Regalian rights.....	173,687,800
State domains.....	422,748,423
Redemption of servitude.....	77,717,000
Payment for imperial bonds.....	66,941,018

Army.—Military duty is obligatory for all males over 21 years with certain exceptions, which include clergymen, teachers, and physicians. In European Russia they are required to serve upon attaining majority 5 years nominally, actually about 4 years in the active army, then 13 years in the reserve, and 5 years in the Zapas, or second reserve. In Asiatic Russia and in Caucasia the terms of military service are 7 years active and 6 reserve, and 3 years active and 15 reserve, respectively. The peace footing of the army was estimated in 1899 at 36,000 officers and 860,000 men—total, 896,000. This is made up as follows: Infantry, 563,000 men; cavalry, 119,000 men; artillery, 115,000 men; engineers, 24,000 men; and administration, 39,000. The army on a war footing was estimated at about 3,500,000 men.

Navy.—The Russian navy, according to a United States Navy Department publication, dated 1899, was, as reported in July, 1898, made up of 12 battle-ships, and 6 building; 10 armored cruisers, and 1 building; 3 protected cruisers, and 3 building; 3 unprotected cruisers, 15 coast-defence ships, and 1 building; 17 torpedo vessels, 1 torpedo-boat destroyer, and 28 building; 114 torpedo boats and 5 ships for special purposes. There were laid down in 1899, 4 battle-ships, 1 protected cruiser, 4 torpedo-boat destroyers, 2 torpedo boats, and 1 coast-defence ship. There were under construction during the year 9 battle-ships, 13 cruisers, 42 torpedo-boat destroyers, 16 torpedo boats, a torpedo-supply vessel, and a mining transport. There were launched in 1899, 4 cruisers, 3 torpedo-boat destroyers, and 1 transport. Russia is now in line with other powers in the pursuit of a definite naval programme. It is said to be the intention of the Czar that for every new British war-ship a Russian one of equal power shall be laid down.

Railways.—On January 1, 1899, there were over 29,000 miles of railway in Europe and Asia, of which the state owned 17,743 and private companies, 9711; state railways of Finland, 1616. Of the total length, only 5385 miles were double-track lines. The railway mileage of Russia is much less in proportion to the area and population than that of other European nations.

On April 28, 1899, the representatives of the Russian and British governments signed an agreement with regard to the interests of the two nations in railways in China. Russia agreed to seek no railway concessions in the basin of the Yang-tse, and to make no interference in the promotion of British railway interests there. In return for this Great Britain agreed to make no effort to extend railways in any part north of the great wall of China, and not to oppose Russian railway interests there.

The Trans-Siberian Railway.—One of the most extraordinary railroads in the world is that constructed across Siberia by the Russian government. An account of the engineering feats accomplished in building this road is given in the article on Railways (*q. v.*). The railway extended in 1899 from Ufa, in the Ural Mountains, to Irkutsk, on Lake Baikal, and the proposed extension when completed will go from that point to Khabarovka, on the Amur River. From the last-named place a line of railway has already been built to Vladivostok, on the Japan Sea. An all-rail route will, on the completion of the portion indicated above, be available from St. Petersburg and other Russian cities to the Pacific Ocean. The total length of the trans-Siberian line is 4950 miles.

Other new railway projects are: (1) The trans-Caspian road, which will when completed join Russia with the western portion of the Chinese Empire, and (2) the line to connect the preceding line with the Indian Ocean. The former will reach that part of the Chinese Empire known as East Turkestan, which, though not a thickly populated country, has for Russia a great strategic importance. To quote from the summary of *Commerce and Finance* (April, 1899): "Stretching eastwardly from Andijan, West Turkestan, the terminus of the line now being completed, lies a comparatively level section, through which caravan routes have for centuries extended, connecting China with Europe across this arid district. Along this caravan route the Chinese Government now maintains a telegraph line from Peking to the very point at which the new Russian line will terminate, while railway lines are already projected westward from Peking over a considerable portion of that distance. While it is scarcely to be expected that the eastward extension of the trans-Caspian system will result in an all-rail line to the Pacific for many years, it will, at least, touch the caravan route through which the inhabitants of that sparsely populated region obtain their supplies, and suggests the possibility, if not the probability, of a Russo-Chinese intercontinental and international line paralleling the trans-Siberian at such distance to the south as to render it practically non-competitive, the difficulties of such an enormous undertaking being no greater now than those which confronted the Russians a decade ago, when they planned the trans-Siberian railroad."

The line connecting the trans-Caspian line with the Indian Ocean is to run from Askhabad, in the southwestern part of Turkestan, about 200 miles from the Caspian Sea, to a port on the Persian Gulf, Bender Abbas, the control of which was recently

secured by the Russian government. From Bender Abbas communication could be maintained by sea with the oriental trade centres, which would be a profitable outlet for Russian products. The construction of this line is opposed by some Russian publicists, who have pointed out that it would give great facilities for British trade in Central Asia. In 1899 the Russian government sent engineers to survey the country between Orenburg and Tashkent for the construction of a line of railway connecting these two places. It will cross the Kirghiz Steppe and will join the trans-Caspian railway between Samarkand and Andijan.

Russian Waterways.—The total length of rivers, lakes, and canals in Russia, exclusive of Finland, was in 1896, 68,459 miles. The navigable waterways are as follows: (1) Suitable for floating rafts, 15,977 miles; (2) navigable down-stream, 7475 miles; (3) navigable up and down-stream, 23,079 miles—total, 46,531 miles. Of this, only 14,030 miles are navigable for steamers. There are canal systems uniting the Baltic and Caspian basins, the Baltic and White Sea basins, and the Baltic and Black Sea basins. The number of river craft in 1896 was 2500 steamers, of 211,000 tons, and 17,000 other vessels, of 8,640,000 tons.

Industry and Commerce.—The agricultural products of the Russian Empire include corn, wheat, rye, millet, flax, hemp, beet sugar, tobacco, and cotton. Russia produces four-fifths of all the flax used in the world; hemp is produced in great quantities, and raw cotton is becoming a staple of much importance in Russian Turkestan, while silk is produced in trans-Caucasia and Turkestan. About one-third of European Russia is forest land, much of which is protected by imperial decree from being cut. The principal manufactures are articles of food, textiles, paper, iron and steel, machinery, chemicals, leather, china, glass.

The United States deputy Consul-General Heydecker in St. Petersburg reports that in 1899 there were 1,212,972 acres under cultivation in the beet-growing governments of European Russia, showing an increase of 129,972 acres over 1898. The following statistics are from the United States Consular Reports: The sugar produced in Russia during the year 1898-99 amounted to 1,800,000,000 pounds, of which the home consumption was 1,188,000,000 pounds; 108,000,000 pounds were for reserve, and the export amounted to 504,000,000 pounds.

American cotton is sold in Russia, but the greater part comes by way of England, the direct lines being with Philadelphia, New York, Savannah, and New Orleans. The average price of American cotton in Moscow from May to October, 1898, was \$4.43 per pood of 36 English pounds.

The imports from the United States to Russia were valued in 1899 at \$10,029,793. The exports from Russia to the United States in the fiscal year ending January 30, 1899, were: From the Baltic, \$2,830,223 in value; from the Black Sea, \$1,710,161 in value, making a total value of \$4,540,384.

Postal and Telegraph Systems.—In 1896 the internal postal service carried 302,500,308 letters and postal-cards, 16,858,164 letters with money, and 110,037,929 periodicals and packages. The number of miles of telegraph lines was in 1895 about 78,400, with 157,400 miles of wire and 4623 stations.

Change in Russian Calendar.—The government decided in 1899 to discard the Julian calendar, which has been a source of confusion, particularly in international communications, and to adopt the Gregorian calendar. This will mean the addition of thirteen days to the present Russian dates. An astronomical commission has in hand the details of the change, and it is expected that it will be completed in 1901.

History, 1899.—In spite of the Czar's recommendation for disarmament, the estimates for army and navy were increased in 1899. Russia's policy of extending her influence in the direction of countries that were hampered by war or in other respects was seen in the extension of Russian railway interests toward the Persian Gulf, the key to the Indian Ocean and the British sphere of influence in the Orient. Some account of the Russification of Finland will be found in the article Finland (*q. v.*). Commercial and industrial development was marked by the subsidizing of steamers sailing from the Black Sea to Great Britain and the Pacific Ocean, and in the latter case the payment by the Russian government of tolls incurred by vessels passing through the Suez Canal. The development of Siberia was carried out both by means of the great trans-Siberian railway, and was supplemented by the appointment in May, 1899, of a commission to consider the abolition of the system of transportation of criminals and political offenders to Siberia. It was stated that, as Siberia is receiving more and more honest immigrants, the sending of criminals there has become injurious, and that at the same time, owing to the improved condition of the country, the transportation to Siberia has lost something of its penal character. A municipal commission was formed to substitute punishment by courts for transportation, to abolish or limit administering transportation by peasant boards, to improve the condition of Siberian convicts, and, in short, to reorganize the system of transportation and penal establishments.

On July 10, 1899, the Czarevitch Grand Duke George, brother of the Czar, died

at Abbas Touman, in the Caucasus, and the Czar's second brother, Michael Alexandrovitch, became Czarevitch. In the spring the demonstration of students unfriendly toward the administration resulted in the arrest of a large number of students and the closing of almost all the colleges and universities in the empire; the students generally were, however, pardoned in July. Famine and failure of crops, followed by outbreak of scurvy and the bubonic plague, were in the governments of Kazan and Astrakhan, and the Caspian districts of the Caucasus.

A new port on the Arctic Ocean was opened in 1899 near the Catherine Harbor, the extreme northern point of Russia's possessions, and situated not far from the maritime industries of the Mourman coast. There is sufficient depth of water to admit the largest steam vessels. The Consular Report of October, 1899, thus describes the new port: "The city will be called 'Alexandrovsk,' in honor of the late Emperor, at whose request S. I. Witte, minister of Finance, visited the northern coast of Russia in 1894. The minister reported that the location of a city at a point where a good harbor could be found was necessary to the development of the Mourman region. Kola, the principal commercial town of that region, is on a narrow, shallow gulf, about 40 miles from the Mourman coast. It is inaccessible to ordinary vessels, and thus forces the trade of northern Russia to seek such Norwegian ports as Vardey, Hammerfest, etc. The Gulf Stream keeps it from freezing during the winter. In 1896 the Emperor ordered this harbor improved and a city laid out, which has been carried out under the supervision of the minister of finance and the governor of Archangel, at the small cost of \$250,000, inside of five years from the time the improvement was first suggested. Work was begun only three years ago. The new port of Alexandrovsk will soon become an important centre for the industries of northern Russia, as it is capable of enormous development."

For an account of the new Russian ice-breaking boat, which arrived at Cronstadt, March 5, 1899, see ARCTIC EXPLORATION.

RUSSIAN LITERATURE. All things considered, the past year must be accounted a good one in Russian literature, for the list includes a fair proportion of the best known writers, and a number of works of real merit; yet these are in some danger of being unjustly overshadowed by the magnitude of the two principal literary events: the publication of Tolstoy's *Resurrection*, and the celebration of the centenary of the birth of Pushkin, the national poet. In this connection it is interesting to note that a sumptuous memorial volume was prepared, in honor of Pushkin, to which all the important writers in Russia were asked to contribute. The request met with a cordial response, excepting in the case of Tolstoy, who made the characteristic answer that he never could bring himself to write to order.

History.—Among the recent historical works, the first place must be given to the elaborate work of N. K. Shilder, *The Emperor Alexander I.*, which has been brought to a conclusion with the fourth volume. This is something more than an ordinary history, being rather a psychological monograph, in which the author has concentrated his attention upon the personality of the Czar; and the resulting analysis is full of scientific as well as artistic merit. Among other things minutely investigated in this work is the curious legend connected with the death of Alexander. There was a rumor current among the common people that he did not die, but became a hermit; and they identified him with a Siberian hermit, called Feodor Kuzmich, who expired at Tomsk in 1864, at about the age of ninety. *Imperial Sports of the Czars Mikhail Feodorovich and Alexei Mikhailovich in Russia* is the title of an historical sketch by N. Kutepov, which contains some interesting details of the life of the earlier Russian rulers; while M. Diakonov, best known as author of *The Dominion of the Muscovite Emperors*, finds this year an equally congenial theme in his comprehensive study entitled *Sketches of the History of the Village Population in the Muscovite Empire*. Among other monographs which deserve a passing word are *The Insurrection of Pugachev in Siberia*, by A. Dmitriev-Mamonov, a work based upon original documents and personal investigations, and *The Protopope Arvakum*, by A. Borozdin, which not only throws fresh light upon the great Russian setcary, who, after a long series of frauds, ended his life at the stake, but gives a vivid picture of intellectual life in Russia in the seventeenth century.

Literary Criticism.—Among the volumes bearing upon the history of literature, one of the most important is the work of a young scholar, N. Kotliarevski, the title of which may best be rendered, *Disgust with the World (Weltschmerz) at the End of the Past and Beginning of the Present Century*. Starting from Rousseau, Heine, and Schiller, the author studies at considerable length the growing pessimism of the French romanticists during the period of the empire, and then passes on to Byron, whom he considers the best exponent of this type of pessimism. In analyzing the literature of the present time, he defines it on the contrary as a renaissance of optimism. An important and voluminous work is a four-volume *History of Russian Literature*, by A. Pypin, the three volumes published covering the ground from the earliest times to Lomonosov inclusive; and of equal importance is the vast biblio-

graphical work of S. Vengerov, *Russian Books, with Biographical Data About the Authors and Translators*, which is still in course of publication. An interesting contribution to the history of the Russian theatre is a volume by Shliapkin, *Natalia Alexeyevna and the Theatre of Her Time*. The work is based upon a curious manuscript discovered by the author dating from some time before 1721, and throwing considerable light on the beginnings of the Russian theatre, as it furnishes pieces from the repertoire of the Czarevna Natalia Alexeyevna, of which up to this time only the names were known. A valuable storehouse of learning is embodied in the recently published edition of the works of N. S. Tikhonravov, in six volumes. In the first volume the essays on old Russian literature are included, among others, a well-known essay on "Apocryphal Books in Old Russia;" in the second and third volumes are the essays on the literature of the seventeenth, eighteenth, and nineteenth centuries, including estimates of Lomonosov, Fonvizin, and Novikov. Lastly, it should be mentioned that the poet and critic, Merezhkovski, has issued a new edition of his enjoyable book, entitled *Eternal Fellow-Travelers*, containing studies of Pushkin, Montaigne, and Ibsen.

Fiction.—In Russia the novel holds an exceptionally high place, since it offers a convenient medium through which many of the nation's best thinkers can develop problems of social, ethical, or political import, which if presented in a more direct form would incur the ban of Russian censorship. This season it is doubly important, since the list includes the first part of Tolstoy's new novel, which is not merely the Russian novel of the year, but has excited a widespread interest in Europe and America. The story of how *Resurrection* was written forms a curious chapter in literary history. Some years ago Tolstoy wrote a novelette of this title, in which he told the story of a man of wealth and position who, one day finding in court a woman whom he had many years before seduced and afterward abandoned, and learning that she is on trial under a criminal indictment, suddenly has the conviction borne in upon him that he himself is the real cause of the poor creature's degradation; so that in expiation of his sin he marries her and follows her into exile in Siberia. The story as then written had about the dimensions of *The Kreutzer Sonata*, and, like the latter volume, undertook to point out much which the author looks upon as immoral and unchristian in the ordinary fashion of regarding love. The manuscript was laid aside, and might never have seen the light again had it not been for the interest which Tolstoy took last year in the curious religious sect of the Dhoukhoborts, whom the Russian government was trying to force to abandon their traditions and to conform with the laws of the empire. In order to aid in defraying the expenses of transplanting this sect to Canada, Tolstoy volunteered to donate a story, the proceeds of which should all go to this cause; and arrangements were accordingly made for the simultaneous publication of *Resurrection* in Russia, France, Germany, England, and the United States. Tolstoy's literary methods, however, are peculiar, and when he undertakes to revise his work, his revision is not only thorough but radical. This partly explains how it happened that in the course of revision *Resurrection* grew from a short story to a novel of no less extent than *Anna Karenina*, and of a literary importance perhaps even greater. The subject is no longer merely his hero's expiation which Tolstoy relates; it is his entire life, the life of a man whom exterior influences have turned aside from the path which nature intended him to pursue, and who from the day that he becomes aware of this has no peace until he recovers his lost way. There is no question that he has made of it a great novel, or more properly speaking, two great novels, since it has undergone one last alteration. The book should have been completed in October, 1899; nothing remained but to write a short epilogue, depicting the arrival of the two central characters in Siberia, redeemed through love and repentance. But in writing this epilogue, Tolstoy perceived that in the moral resurrection of his hero and heroine there would be material for a sequel, which will in all probability be neither shorter nor less important than the present volume.

But it would not be fair to let *Resurrection* quite cast in the shade a number of other excellent novels which are also the product of 1899. The well-known writer Boborykin, who is more French than Russian in his literary methods, has issued two volumes, a big novel, *Where Can We Go?* and a short story, *At Home*, which has attracted considerable attention, and has been compared to some of the writings of the Swedish novelist, August Strindberg, on account of its prevailing tone of misogyny. Another notable novel is Yasinski's new volume, *The Rebellion of the Cockroaches*, which displays with a vigorous touch some little-known sides of Russian life, and which draws a striking parallel between the lives of the Russian peasant and of the cockroach. It is noteworthy, both for the merciless realism and for the gloomy originality of the conception. Other volumes deserving enumeration are *The Gods Who Have Risen Again*, by Merezhkovski, which has run as a serial in the *Nachalo* (The Beginning); three recent novels, by Madame V. Mikulich, *The Cherry Tree*, *Flashes of Lightning*, and *Mimochka*; and the collected short stories of Maxim

Gorki, who has a rare talent for depicting the world of vagabonds and heterodox people.

RUTHERFORD, WILLIAM, M.D., F.R.S., professor of physiology in Edinburgh University, died February 21, 1899, in his sixty-first year. He was the author of *Outlines of Practical Histology*, and of many physiological papers that have appeared in scientific magazines. He occupied the chair of physiology at Edinburgh from 1874 to the time of his death.

RYE. The following table, published by the Department of Agriculture, division of statistics, shows the acreage, production, and value of rye in the United States in 1899:

States and Territories.	Acreage.	Average Yield Per Acre.	Production.	Average Farm Price Dec. 1.	Farm Value, Dec. 1.

RYLAND, Rev. ROBERT, D.D., one of the oldest clergymen and educators in the United States, died at Lexington, Ky., April 23, 1899. He was born in 1805. For twenty-eight years he was president of Richmond (Va.) College, during much of which time he was pastor of a colored Baptist church in Richmond. This was the largest African church in the world, having nearly 3000 members, nearly all of whom were Virginia slaves. During his later years Dr. Ryland devoted his time in the interest of various churches and educational institutions in Kentucky and Tennessee.

ST. ANDREW, BROTHERHOOD OF, a Protestant Episcopal religious society of men founded in Chicago in 1883, the object being to "spread Christ's Kingdom among men." Their organ is *Saint Andrew's Cross*, published in New York. The society had in 1899 a membership of 13,000 in 1220 chapters in various parts of the United States, and in Canada 180 chapters and 2000 members. Similar societies have been organized in the Scottish Episcopal Church, and in England and Australia. President, James L. Houghteling; secretary, John W. Wood, 281 Fourth Avenue, New York City.

ST. CHRISTOPHER, or **ST. KITTS**, with Nevis and Anguilla, constitutes a presidency of the British crown colony of the Leeward Islands (*q. v.*). The combined area is 150 square miles, and the total population (1891), 47,662. The figures for the separate islands are as follows: St. Kitts, 65 square miles, population, 30,870; Nevis, 50 square miles, population, 13,087; Anguilla, 35 square miles, population, 3699. The capital is Basseterre (population about 10,000); the chief town of Nevis is Charlestown (population, 838). The leading products of the two latter islands are

sugar and rum, and of Anguilla, garden stock and salt. The aggregate entrances and clearances in foreign shipping for St. Kitts and Nevis in 1897 amounted to 491,629 tons. The following statistics are for 1898: Imports, £122,968; exports, £138,222; revenue, £40,430; expenditure, £44,659. The public debt in 1899 was £74,450.

ST. LUCIA, the largest island of the British crown colony of the Windward Islands (*q. v.*), has an area of 233 square miles and a population (1898) of 47,976. The white inhabitants are chiefly French creoles, who are Roman Catholics. The capital is Port Castries (population, 8000), a naval station and coaling depot. The chief products are sugar, cacao, rum, logwood, spices, tobacco. The sugar export in 1898 amounted to 8,403,750 pounds. The central factory system of sugar-growing has been instituted in the island. In 1897 the aggregate entrances and clearances in the foreign trade were 1,780,560 tons. The following figures are for 1898: Imports, £271,995; exports, £166,508; revenue, £67,628; expenditure, £60,975; public debt, £189,580.

ST. PIERRE and MIQUELON, the largest of two groups of small islands near the coast of Newfoundland, belonging to France. The area of the St. Pierre group is 10 square miles, and the population 5700; of the Miquelon group, 83 square miles, with 550 inhabitants. The chief town is St. Pierre. The dependency is administered by a governor, a council general, and municipal councils. Advantages are offered for primary and secondary instruction. For 1898 the local budget was 500,710 francs (the franc being worth \$0.193), and the expenditure of France in the budget of 1899, 290,791 francs. The principal industry is cod-fishing, carried on chiefly in French vessels. Exports to France in 1897 amounted to 26,954,415 francs and the imports from France 7,527,491 francs. The foreign tonnage entering at St. Pierre in 1895 amounted to 47,868 tons, carried in 1544 vessels. The French and local tonnage entering aggregated 1986 vessels of 116,774 tons.

ST. VINCENT, an island of the British crown colony of the Windward Islands (*q. v.*), has an area of 132 square miles, and a population of about 42,000. The government is directed by an administrator and a legislative council. The capital is Kingstown, with a population of over 4500. Fisheries constitute one of the chief occupations of the inhabitants. The leading agricultural products include sugar, rum, molasses, arrowroot, cacao, coffee, spices. In 1897 the sugar export amounted to £25,592; arrowroot, £21,859. In 1899 a free grant of £25,000 was made St. Vincent, and under the Colonial Loans Act £50,000 were advanced to further industrial development. The following statistics are for 1897: Total exports, £68,935; total imports, £70,824; revenue, £25,396; expenditure, £26,520. The aggregate entrances and clearances in foreign shipping in 1897 amounted to 248,877 tons.

ST. VINCENT DE PAUL, SISTERS OF CHARITY OF (Filles de la Charité), founded in Paris, in 1633, by St. Vincent de Paul and Mlle. Louise le Gras. The mother-general resides in Paris. The mother-house in the United States is at St. Joseph's Academy, Emmittsburg, Md. There were 1639 sisters of this order in the United States in 1899. The duties of the sisters are: Teaching in academies and parochial schools; caring for abandoned infants; the education and care of orphan children; training them to usefulness and independence when grown up; and the care of the insane, the sick, lepers, etc.

ST. VINCENT DE PAUL, SOCIETY OF, a benevolent Roman Catholic society for the relief of the poor in large cities, was organized in 1835, and incorporated in 1872. The latest report of the society shows annual receipts amounted to \$180,537, and expenditures, in relief of all kinds, \$184,341. There was an increase in number of conferences, and a slight decrease in membership. Number of members, 6361. The general headquarters are in Paris. The local bodies, called particular councils, are in all countries of the world. The headquarters of the superior council of New York are at 2 Lafayette Place, Borough of Manhattan.

SALISBURY, LADY GEORGINA, wife of the Marquis of Salisbury, prime minister of England, died in London, November 20, 1899. Lady Salisbury was the daughter of the late Sir Edward Hall Alderson, a baron of the exchequer, and a famous lawyer and judge. The marriage of the premier, then Lord Robert Cecil, to Miss Alderson took place in 1857. Lady Salisbury is said to have been well fitted as the wife of the man who finally became England's prime minister, and she is commonly believed to have played no small part in the political history of the latter half of this century, wielding an influence through her husband both in the councils of the Conservative party and of the nation. Lady Salisbury was a member of the Royal Order of Victoria and Albert, and Lady of the Imperial Order of the Crown of India. Lord and Lady Salisbury had eight children, of whom one daughter has died.

SALT. The production of salt in the United States in 1898 shows the remarkable output of 17,612,634 barrels, which was 1,600,000 greater than in 1897, and

2,000,000 more than in 1896. The increased output was accompanied by an increase in price. Among new developments which are to be noted are the opening up of several new mines in Louisiana, all of them in the Avery Island region. In one drill-hole, sunk in Jefferson Island, the drill encountered salt at the depth of 260 feet, and passed on through over 1800 feet of salt without reaching the bottom of the deposit. In point of thickness this exceeds the enormous Prussian salt beds. The salt exported from the United States in 1898 amounted to \$4751, and went to Central America, Mexico, the Hawaiian Islands, Japan, Asiatic Russia, and Canada. Salt valued at \$13,953 was imported from Canada and European countries. The Russian salt industry is rapidly assuming large proportions. There are important deposits of rock salt in the Crimea, and also in the Caucasus, as well as at several other localities; salt lakes also occur.

SALVADOR, the smallest republic of Central America, lies to the south and west of Honduras, and borders the Pacific Ocean. The capital is San Salvador.

Area and Population.—The country comprises 14 departments, the total estimated area of which is 7225 square miles, and the population, according to the last official estimate, 803,534. Salvador is far more densely inhabited than any other country of Central America. Only about 20,000 of the inhabitants are pure whites, the rest being Indians or mestizos. The population of the capital is about 25,000; the other important towns are: Santa Ana, population 15,000; Sonsonate and San Miguel, each 10,000; Ahuachapam and San Vicente, each 8000.

Government and Education.—By the constitution the executive authority is vested in a president, who is elected for a term of four years, and is assisted by a cabinet of four members, controlling the following departments: The interior and government; foreign affairs, worship, justice and instruction; finance, fomento and beneficence; and war and marine. The president is Señor Tomás Regalado, who, in November, 1898, led a successful insurrection, causing the dissolution of the newly formed Greater Republic of Central America, and made himself the chief executive. The legislative power devolves upon a congress of 70 representatives, elected by popular vote for terms of one year. Of the representatives 42 are proprietors. Besides local magistrates and inferior courts, there is a Supreme Court of Justice. There is a national militia of 18,000 men and a regular army reported to number about 4000. Salvador has practically no navy. Education is gratuitous and nominally compulsory. There are about 600 primary schools with about 30,000 pupils, 18 schools for more advanced work with an enrolment of about 1200, and a national university with nearly 200 students pursuing courses in science, engineering, laws, or medicine. Thirteen periodicals are published in Salvador.

Finance.—The largest items of revenue are import duties and imposts on brandy; the chief expenditures are for the departments of finance, war, interior, and public works. The estimated revenue and expenditure for 1896 were 10,174,000 pesos and 9,745,000 pesos respectively. In 1896 the foreign debt was \$1,236,980, and the internal debt about \$3,488,000. On October 1, 1899, the value of the silver peso in United States gold was \$0.436.

Industries and Commerce.—The industry first in importance is agriculture, mining ranking second. The chief products include coffee, tobacco, indigo, sugar, and balsam. The chief metals found are gold, silver, copper, mercury, and iron. Coffee is the leading export, with indigo and tobacco next in importance. The chief imports are cotton goods, alcoholic liquors, iron goods, flour, and silks. The foreign trade is carried on principally with the United States, Great Britain, Germany, and France. The imports in 1896 amounted to 3,347,718 pesos, and the exports to 7,485,384 pesos.

Communications.—The roads of Salvador are far superior to those of most of the Latin-American countries; there are in all over 2000 miles of good roadway. The port of Acajutla is connected by rail with Santa Ana, Santa Tecla, and Ateos; also Armenia is connected with Ceiba, and Santa Tecla with San Salvador. Other railways are under construction, one of which will extend from the port Union, in the extreme southeast, northwest to San Salvador, a distance of 124 miles. In 1896 there were 1724 miles of telegraph lines, with 121 offices.

History.—A revolutionary conspiracy in Salvador was discovered and frustrated in July, 1899, and on the 15th of the month the government declared martial law in the department of San Salvador pending an investigation. There was no disorder or interruption of business. Another revolutionary movement developed late in the fall, General Toledo attempting to invade the republic. Despatches bearing date of December 4 announced that the government forces had met the insurgents near the frontier and repelled them with loss. On October 11, 1899, the president formed a new cabinet with Señor Reuben Rivera as minister of the interior and foreign affairs.

SALVATION ARMY, organized in 1865 by the Rev. William Booth, for the purpose of spreading the gospel among the masses. The history of this movement in the United States during 1899 is marked by the incorporation of the Salvation Army

under the laws of the State of New York. This body maintains various forms of social relief, such as nightly accommodation for 16,000 persons, farm colonies, etc., and there are many benevolent forms of organization for the benefit of the members of the army. They have an annual income of about \$1,000,000, and claim from 35,000 to 50,000 conversions annually. The commander-in-chief of the Salvation Army is Rev. William Booth, with headquarters at 101 Queen Victoria Street, London, E. C.; for the United States the commander is Mr. Booth-Tucker, with headquarters at 120 West Fourteenth Street, New York City. There were in the United States in 1899, 2689 officers, 753 corps, and about 40,000 members; 21 slum posts, 14 rescue homes, 75 food and shelter depots which give 27,000 meals monthly, 5 working-women's hotels, 7 wood and coal yards, 5 farms, and 2 children's homes. In Great Britain there are 4306 officers and 1338 corps, and in Australia 1527 officers and 831 corps. The organization is found in almost all the countries of the world. See **VOLUNTEERS OF AMERICA.**

SAMOA **ISLANDS**, or **NAVIGATORS' ISLANDS**, lie in the Pacific Ocean, about 2000 miles south and 300 miles west of the Hawaiian Islands, on the trade route between the Philippines and the proposed Nicaraguan Canal. There are about a dozen islands in the group, two of which are said to be uninhabited, but three only are important—namely, Savaii, Upolu, containing the town of Apia; and Tutuila, in which is the fine harbor of Pago-Pago. The total area is about 1700 square miles. The population, according to an estimate given in 1899, is 36,000, of which one-sixth is in Tutuila, which became United States territory in 1899. The number of whites in the islands is about 400, half of whom are British. There are about 120 Germans, 30 Americans, and 25 Frenchmen. Most of the islands are of volcanic origin. The soil is very fertile and the climate is moist. It is of interest to note the reported fact that there is no native fauna, excepting a species of bat. In recent years swine, cattle, and horses have been imported. The principal crops are cocoanuts, copra, cotton, sugar, and coffee.

Commerce and Communications.—In 1897, the latest year for which full statistics are obtainable, the imports were \$329,630, of which Germany contributed \$83,562; the United States, \$53,415; Great Britain, \$13,322; and New Zealand and New South Wales, \$157,695. The remainder came from various Pacific islands. It is said that a large percentage of goods, not so credited, are of American origin. For instance, most of the kerosene comes from Sydney, though it is practically all of American production. The astonishing statement is made by the United States consul-general at Apia that, owing to the high rates of transportation from San Francisco, it is cheaper to ship goods from the Atlantic seaboard to Sydney, and thus to Samoa, than to Samoa direct. The exports in 1897 were \$239,198, including principally cocoanuts, and copra, or dried coconut. The exports of the latter were over 10,690,000 pounds. Exports went mostly to Europe, Australia, and the United States. There was once a quite active copra trade with the United States, but high rates and the devastating wars in Samoa have lessened the industry. There is coming about a revival of interest in the production of tropical fruits, which are far more suitable for cultivation than rice, tea, sugar, and cotton, it is said, and a number of important coconut plantations have recently been laid out. Vanilla, bananas, and pineapples are also grown with success. Samoa is connected by regular steam lines with New Zealand, Sydney, in Australia, and San Francisco. By the Berlin treaty the standard of exchange was made United States coinage. Values are mostly reckoned by that standard, but the principal money in circulation consists of British coins.

HISTORY.

The history of Samoa in 1899 was very important. In order to explain the events of the year it is necessary to sketch briefly some phases of the recent history of the archipelago.

The Act of Berlin.—Down to the establishment of international control by the Act of Berlin in 1889, a sort of feudal system prevailed in the islands, the power being divided among native chiefs. For many years a sort of headship was exercised by a prominent family named Malietoa. There was naturally a temptation for Europeans to interfere in the interest of their respective governments, and there developed a spirit of rivalry among the Americans, English, and Germans. The treaty of 1878, granting to the United States the port of Pago-Pago on the island Tutuila, was followed by concessions to the German and the English governments. In 1881 Malietoa Laupepa was chosen king with the consent of the powers. A war followed between him and the rival candidate, Tamasese, and resulted in the overthrow of Malietoa, who was transported in a German war-vessel to the Cameroons. Tamasese now became king. But the election of a new king, Mataafa, in 1888, led to further troubles, and finally Prince Bismarck called a conference at Berlin to come to an agreement upon Samoan affairs. As a result of this conference the convention, known as the Act of Berlin, or Act of Samoa, was signed in June, 1890, and the

régime which it established lasted until the autumn of 1899. This placed the islands under the joint control of Great Britain, Germany, and the United States, but formally acknowledged the independence of the native state and the government of the king. It provided that the natives should choose their king and form of government according to their laws and customs, that Malietoa Laupepa should be restored to the throne, and that his successors should be chosen according to Samoan laws and customs. It established a Supreme Court whose chief justice was to be chosen by the three powers. His judgment was without appeal, but he could be dismissed at any time upon demand of any two of the powers. He had political as well as judicial powers, since his jurisdiction extended over disputes in connection with royal elections or questions of prerogative. Another feature of the new government was the establishment of the municipality of Apia, under a ministerial council of six members elected by the taxpayers, and a president designated by the three powers. The decisions of the council were subject to the approval of the three consuls, or, if they failed to agree, of the chief justice. It was also provided that the act should remain in force so long as it was not modified by the unanimous consent of the three powers.

The Question of Succession.—The jealousy of the powers, combined with the rivalry between the native claimants to the throne, led to much confusion. Malietoa Laupepa died in 1898, and according to the Act of Berlin his successor was to be chosen by the natives according to the laws and customs of the country. But it was hard to determine what were the laws and customs of a country like Samoa. Of the two candidates for the throne Malietoa Tanu was the favorite of the Anglo-Americans, and Mataafa was supported by the Germans. The Anglo-American party was successful, and Malietoa Tanu was chosen king. The Germans charged that Mataafa had been fraudulently excluded. The decision, however, rested with the chief justice, Mr. Chambers, an American, who pronounced in favor of Malietoa Tanu. There followed another petty war, resulting in the defeat of Malietoa, who took refuge on board an English vessel. Early in 1899 the consuls recognized that the Mataafa party, favored by the Germans, was *de facto* in possession, and established a provisional government with a German at its head, but soon afterward the Anglo-Americans opposed the action of this government in closing the Supreme Court of the Anglo-Americans. On March 11, 1899, Rear-Admiral Kautz, who had been sent to Samoa on board the *Philadelphia*, issued a proclamation, after an agreement with the consuls, dissolving the provisional government and ordering the partisans of Mataafa to withdraw. The German consul now issued a counter-proclamation declaring this manifesto null and void, and supporting Mataafa. Conflicts now broke out among the natives, and several officers and men of the British and American forces were killed. On April 1, an Anglo-American force fell into an ambush arranged by the partisans of Mataafa, and several of them were killed. There now followed a sharp discussion in the press of the three countries concerned. The English government criticised the action of the German representative, and, on April 14, Herr von Bülow made a speech in the *Reichstag* in which he declared his disapproval of the separate action of the Anglo-Americans, and their overthrow of the provisional government in March. At the same time Germany proposed the sending of a special commission to the island to settle the differences. This commission reported in favor of a government by a single power. In the meanwhile it proclaimed the abolition of royalty, and established a provisional government consisting of the three consuls. Subsequent events rendered their report superfluous, for on November 8, 1899, Germany and Great Britain reached an agreement providing for the partition of the islands.

The Partition.—The principal feature of the Anglo-German convention of November 8, 1899, was that the archipelago should be divided between the United States and Germany, England giving up her rights in return for compensations elsewhere. This was the substance of the arrangement: Germany received the two western groups of the Samoan islands—that is, Savaii and Upolu, with its capital at Apia, while the United States received the western group, Tutuila, with the important harbor of Pago-Pago. This settled the Samoan difficulty. By way of compensation England received from Germany the Tonga Islands, lying to the south of Samoa, including the Vavau and Savage Island groups, and also the islands of Choiseul and Isabelle in the Solomon group. Moreover, she gained certain advantages in Africa. In the interior of German Togoland and the English Gold Coast a new arrangement was made, whereby the neutral zone between the two colonies was divided anew, by far the greater part falling to England. Germany also gave up its extraterritorial rights to Zanzibar, which renunciation was to become effective when the other powers had renounced these rights. In South Africa, however, the German colonies gained some advantages from two conventions entered into, the one with the Trans-continental African Telegraph Company, and the other with the English Company of South Africa, whereby Germany obtained the guarantee that the net-

SAMOAN REBELS MARCHING IN THE MAIN STREET OF APIA

work of railways and telegraph lines should be built in such a manner as to satisfy the interests of her two colonies of East Africa and Southwest Africa.

SAN DOMINGO, or the DOMINICAN REPUBLIC, comprises the eastern and larger, but less populous, portion of the island of Haiti, the western part being the Republic of Haiti. The capital is Santo Domingo.

Area, Population, Education.—The country comprises six provinces and five maritime districts, the total area of which is 18,045 square miles, and the population, according to the official estimate of 1888, 610,000; population of the capital (1892), 14,150, and of Puerto Plata, the principal port, 4500. The inhabitants are chiefly mulattoes, mestizos, and negroes, while whites are comparatively numerous. Spanish is the prevailing language. The state system of education comprises a professional institution, and normal, technical, secondary, and primary schools. The number of the primary schools in 1899 was estimated at 300, with an attendance of 10,000 pupils. Primary education is free and nominally compulsory. About forty newspapers are published in the republic. The state church is the Roman Catholic, but with certain restrictions, other denominational forms are allowed.

Government.—By the constitution of the republic the chief executive authority is vested in a president, chosen by an electoral college for a term of four years, and assisted by a cabinet directing the following departments: Foreign affairs and public works, interior and police, commerce and finance, war and marine, and justice and public instruction. The president is Señor Juan Isidro Jimenez, elected October 20, 1899. The legislative power devolves upon a congress of 22 deputies elected by direct vote. For the administration of the provinces and districts the president appoints governors, who in turn appoint prefects or magistrates for the government of the subdivisions, while in the communes there are municipal boards, chosen by the people. There are local justices, eleven courts of first instance, and a Supreme Court of Justice; the appointments to this court are only for the presidential term. There is a small regular army, a regiment of which is stationed in each of the provincial capitals. The navy amounts to very little, consisting of only three small gunboats.

Finance.—The chief items of revenue are import and export duties. In 1895 the revenue and expenditure in gold amounted to \$1,382,500 and \$1,351,250, respectively; the revenue for 1896 was \$1,545,450 and for 1897, \$1,601,204. A conversion of the foreign debt took place in 1897, according to which the debt was made to comprise two classes of bonds—one for \$13,317,025 gold, at $2\frac{3}{4}$ per cent., and the other for \$7,299,000 gold, at 4 per cent. These bonds are secured chiefly by a lien on the customs duties, the collection of which is controlled by the Santo Domingo Improvement Company, of New York. In June, 1899, the congress enacted a law, to take effect July 1, requiring the payment of import duties to be in United States gold or its equivalent in currency, the American dollar (the official standard of value in San Domingo) being equal to six Dominican paper dollars. In December, 1899, the government was authorized by the congress to withdraw national coin in exchange for United States gold and silver, beginning in March, 1900. For a number of years Dominican finance has not been in a satisfactory condition; this fact was said to be one of the causes of the revolution of 1899.

Industries, Commerce, etc.—Agriculture and forestry are the principal industries; the former, however, is carried on for the most part in a crude and unintelligent manner, and in consequence Dominican products command only low prices in European markets. The cultivation of tobacco, though still the most valuable industry, is said to be declining, while the production of bananas, coffee, cacao, and sugar is on the increase. There are sugar factories in the south and west of the country. Among the minerals found are coal, salt, iron, gold, and copper, but there is practically no attempt at their exploitation.

High customs duties have hitherto retarded commerce. The leading exports are tobacco, coffee, cacao, cabinet woods, sugar, hides and goat-skins, and honey. The exports and imports in 1896 were valued, in United States gold, at \$2,710,362 and \$1,824,750, respectively. The most important exports were as follows: Tobacco, 6,332,148 pounds; sugar, 86,866,240 pounds; cacao, 4,308,820 pounds; coffee, 2,437,400 pounds; mahogany, 264,254 feet; cane honey, 1,777,120 gallons; divi-divi, 1,304,930 pounds. Of the import value, 45 per cent. came from the United States, 12 per cent. from the Danish West Indies, and 11 per cent. from British sources. The foreign trade for 1897 was reported to be about the same as that for 1896. Commercial conditions in 1899 were not prosperous, and the depreciated currency caused not a little distress; near the close of the year, however, it was reported that business was improving. Wagon roads, as in most Latin American countries, are few and in poor condition. The total length of railway open to traffic is 116 miles, but other lines are projected. The telegraph lines aggregate 430 miles.

Assassination of Heurieux.—The assassination of President Ulises Heurieux (q. v.) on the 26th of July, 1899, brought to an end the dominance of one of the most capable statesmen of Latin America and one of the most remarkable negroes

of our time. Though still a young man, he had been president of the republic since 1882; his last term was to expire in February, 1901. Heureaux was a man not only of resolute will, but of no mean intelligence, and he believed that his despotic and often ruthless methods were the best possible means of attaining adequate government for the heterogeneous and unstable population of San Domingo. Although his régime was marked by much high-handedness and many probably unjustifiable executions, and though his financial measures had burdened the country, still he gave to San Domingo a period that was "more free from revolution, more prosperous, better inclined toward outside capital and enterprise, and more disposed toward the ways of modern civilization" than it had enjoyed for very many years. The assassination was due partly to personal and partly to political causes. The assassin was General Ramon Caceres, who later became minister of war under Provisional President Horacio Vasquez, and whose father Heureaux was said to have put to death in 1884. Caceres shot and instantly killed the president as the latter was starting home from Moca, in the northern part of the island, where he had been to dispel some symptoms of discontent. Caceres was not apprehended, but two accomplices were arrested and shot on August 2. On August 1 it was announced that the vice-president, General Wenceslas Figueroa, the constitutional successor to the presidency, had assumed the office of chief executive, and formed a cabinet.

The Jimenez Revolution.—In June, 1898, Juan Isidro Jimenez, whose father at one time had been President of San Domingo, started a conspiracy against the Heureaux government and attempted a filibustering expedition, which met with failure. Having landed at Monte Cristi, San Domingo, he received no assistance, but effected his escape, though many of his party lost their lives. He then went to Cuba, where he kept up his conspiracy, and in April, 1899, issued a bitter manifesto against President Heureaux. Almost immediately upon the killing of the president in July a strong insurgent movement in favor of Jimenez became evident; by the 7th of August five generals had declared for Jimenez, and by the 12th, 1200 insurgents had crossed the border from Haiti and defeated the government troops. Besides the personal ambition of Jimenez, the causes of the insurrection were said to be race feeling against negro domination—Heureaux being a negro—and dissatisfaction with the financial policies that had been in force. The northern part of the island was made the base of operations; various towns, including La Vega, Moca, and Macoris, surrendered without resistance, and though Santiago and a few other places were "taken by storm," there was little real fighting, the only serious conflicts being at Dejabon and Monte Cristi, where the insurgents were finally victorious. At the outbreak of the disturbances the United States government sent the cruiser *New Orleans* and the gunboat *Machias* to the port of Santo Domingo for the protection of American interests.

While the insurgents were gaining ground Jimenez attempted to direct the revolution from his position in Cuba; and then, having started for San Domingo, he was arrested about the middle of August by the United States authorities. In a few days, however, he was released by Governor-General Brooke, and on the 20th, without arms or recruits, sailed from Cienfuegos for San Domingo, which he reached at Puerto Plata on September 5, after stopping at Caimanera, Cuba. In the meantime, the revolution had been pushed almost to a successful conclusion. The insurgents were gaining steadily in strength and popularity, and on August 28 won a battle; on the 31st President Figueroa resigned, and a citizens' committee of safety undertook to preserve order in the capital. Probably more effective, however, than the committee was the presence of the United States war-ships in the harbor. Jimenez was greeted warmly at Puerto Plata, and later was received with enthusiasm in other cities. Pending a constitutional election, the successful revolutionists chose as provisional president General Horacio Vasquez, who made the revolution complete on September 5 by entering the capital and taking control of the government. Ramon Caceres was his minister of war. Arrangements were made for the election of delegates composing the electoral college, who nominate the president and vice-president, and though the date set was earlier than that which the constitution provides, no objections were made, and on October 20, 1899, Jimenez was regularly elected president. It was thought that the reforms he promised, if carried out, would greatly benefit the republic, but his position was difficult and the financial conditions serious. The public debt is large and the paper currency unstable and depreciated, the ratio sometimes falling as low as 50 to 1.

SANFORD, W. E., a Conservative senator in the Dominion Parliament, was drowned near Muskoka, Ontario, July 10, 1899. He was born in New York City in 1838; went to Hamilton, Ontario, when six years of age; after receiving a school education he returned to New York, where he entered the employ of a publishing house. He went again to Canada, began business for himself, founded with Senator MacInnes a great wholesale clothing house, and subsequently became interested in railroads and other financial enterprises. In 1887 he entered the Dominion senate.

Mr. Sanford was a liberal contributor to various charities; he founded the Sanford Mission among the Chinese on the Pacific coast and the convalescent hospital at Hamilton.

SANITATION. A vigorous appeal for an improvement in passenger-car sanitation was made by Dr. J. N. Hurty, of the Indiana State board of health, at the meeting of the Master Car and Locomotive Painters' Association, held in September, 1899. He attacked the prevailing mode of ornamenting passenger coaches with carvings, scrolls, panels, and work that catches and holds bacilli-laden dust, and enunciated, as the first principle toward securing better car sanitation, plainness of interior. Next he placed equable warming and good ventilation, and, third, freedom from smoke and dust. He also advocated substituting frequently changed linen covers for plush upholstery. Regarding spitting in cars, he claimed that from 2 per cent. to 5 per cent. of the samples of saliva voided in public places is found, on bacteriological examination, to contain disease germs, such as the germs of pneumonia, tuberculosis, catarrh, epidemic influenza, etc.

The urgent necessity of thorough disinfection in the sick room, whether the case in hand be one of contagious disease or not, has received attention frequently during 1899 by writers in many medical journals. Where there is a possibility of the spread of germs, cracks must be stopped, and ventilation into the house from the sick-room must be prevented. Isolation of a patient should be at the top of the house or in an extension, where ventilation by means of the outer air can be secured, and free access to sunlight can be arranged, rather than aerial disinfection attempted by means of chemicals burned or evaporated in the room. Excretions should be burned or thoroughly treated with germicides for at least two hours. Formaldehyde has been found efficacious as a disinfectant, because of its certain action, absence of unpleasant odor in dilution, absence of staining or injuring fabrics, and cheapness. See GARBAGE; SEWAGE PURIFICATION; WATER PURIFICATION.

Sanitary Legislation.—The most notable sanitary legislation of the year was that providing for State sewerage commissions in Connecticut and New Jersey. The Connecticut commission has little more than advisory powers, but its general purpose is to aid the municipalities of the State in settling troublesome questions relating to sewage disposal and purification. The New Jersey commission has statutory power to pass on all plans for new sewage disposal works, to collect information regarding the sewerage systems of the State, and to make a general study of sewage purification, employing such engineering and other assistance as may be necessary. Unfortunately, not a dollar was appropriated to meet the bills it might incur, or even to pay the salaries of its members. The governor allowed it a small sum out of the State contingency fund for office rent and sundry expenses.

SARCEY, FRANCISQUE, French dramatic critic, died May 15, 1899. He was born at Dourdan, October 8, 1828, and was educated at the Paris Normal School. For some years he taught school, but having trouble with the school authorities on account of some articles which he wrote for the press, he gave up his work, and went to Paris, where he contributed to the newspapers. He wrote for the *Figaro* and the *Revue Européenne*; in 1859 became the dramatic critic for the *Opinion Nationale*, and in 1867 for the *Temps*. From 1871 to 1884 he contributed largely to the *XIX. Siècle*. His writings became very popular, and in certain departments of dramatic criticism he was regarded as an authority. One of his most successful books was *Histoire du Siècle de Paris*, 1871. Among his other works were: *Le Nouveau Seigneur du Village*, 1862; *Le Mot et la Chose*, 1862; *Etienne Moret*, 1875; *Le Piano de Jeanne*, 1876; *Comédiens et Comédiennes*, 1878-84; *Gare à Vos Yeux*, 1884; *Souvenirs de Jeunesse*, 1884; and *Souvenirs d'Âge Mûr*, 1892.

SARTORI, LOUIS C., commodore, United States Navy, retired, died in Philadelphia, January 11, 1899. He was born in New Jersey in 1812, and at the age of seventeen was appointed to the navy. In 1831-33 he served on ships of the Brazilian station. He was commissioned lieutenant in September, 1841; served on the schooner *Stromboli* during the Mexican war and saw the capture of Tabasco. Early in April, 1861, he was promoted to the rank of commander, and during the war commanded successively the *Ohio*, at Boston; the *Florida*, North Atlantic Squadron; the *Portsmouth*, West Gulf Squadron; and the *Monongahela* and *Oneida* before Mobile. In September, 1866, he was made captain, and in December, 1873, being then in command of the navy yard at Mare Island, Cal., was raised to the rank of commodore. The following year he was retired.

SATURN, A NEW SATELLITE OF. See ASTRONOMICAL PROGRESS.

SAUNDERS, ALVIN, former governor of Nebraska, died November 1, 1899. He was appointed governor of the Territory of Nebraska by President Lincoln a few days after the latter's inauguration, and held that office until the admission of Nebraska to statehood in 1867. During this period Governor Saunders worked ac-

tively for the passage of the bill authorizing the construction of the Union Pacific Railroad. In 1867 he was elected a member of the United States Senate from Nebraska. Mr. Saunders's interests had not been confined to the State of Nebraska. In 1846 he was elected a member of the constitutional convention under which the State of Iowa was admitted into the Union. In 1854 he was elected to the Iowa senate and again in 1858. He was a delegate to the Republican national convention of 1860, and took an active part in the nomination of Abraham Lincoln. He also made a canvass of Iowa in Mr. Lincoln's interest. He was born on July 12, 1817, near Flemingsburg, Ky.

SAVAGE, THOMAS, lawyer, died at his home in Maplewood, Mass., January 31, 1899. He was born at Bradford, N. H., January 18, 1852; was graduated from Dartmouth College in 1874. President Grant appointed him United States district attorney for the southern district of Florida. Having resigned this position, he practised law in Boston, and became a member of the firm of Allen, Long, Hemenway, and Savage. He remained in the firm for several years; Mr. John D. Long, the present secretary of the navy, was one of the members. At the time of his death Mr. Savage was first lieutenant of the Ancient and Honorable Artillery Company, of Boston, and was prominent in several secret orders.

SAWYER, THOMAS JEFFERSON, D.D., LL.D., Universalist clergyman and teacher, died July 24, 1899. He was born at Reading, Vt., January 9, 1804; was graduated at Middlebury College in 1829, and from 1830 to 1845 was a Universalist pastor in New York City. During this time—from 1831 to 1845—he was editor of the *Christian Messenger*. In the latter year he became principal of the Liberal Institute at Clinton, N. Y., where he also taught classes in theology, remaining until 1852, when he resumed pastoral work in New York, continuing in this until 1861. In 1863-66 he was editor of the *Christian Ambassador*. When Tufts College was founded by the Universalists in 1855, Dr. Sawyer was offered its presidency, but he declined the honor; when, however, the Tufts Divinity School was opened in 1869 he became its head, and with it was thereafter connected, though during the last twelve years of his life he was unable to perform his work on account of old age and failure of eyesight. Besides declining to accept the presidency of Tufts, he refused to accept that of St. Lawrence University, Canton, N. Y., and of Lombard University, Galesburg, Ill. Dr. Sawyer has been accounted one of the greatest men in the Universalist Church. It fell upon him to gain a hearing for beliefs that at the time were regarded not only as revolutionary, but as infidel and abhorrent. "He was, literally, a pioneer, not only in proclaiming what was then a strange dogma, but in laying the foundation of an effective religious organization." And to his task he brought qualities of scholarship, culture, and controversial powers that were of a high degree. The Universalist Historical Society, which was founded at his suggestion in 1834, and of which he was secretary and librarian, collected largely through him a unique library of over three thousand volumes relating to Universalism; these books now form a part of the library at Tufts College. Among Dr. Sawyer's writings are: *Discussion of the Doctrine of Universal Salvation*; *Endless Punishment in the Very Words of its Advocates*; *Who is God—the Son or the Father?*

SCARLET FEVER. Search has been continued during 1899 with considerable zeal for the micro-organism which bacteriologists suppose causes scarlet fever, but it has evaded detection. Many have supposed that one of the pus bacilli, the streptococcus, which has been found in the throat and oftentimes in the blood of scarlet-fever patients, is the causative factor. But Frosch and Kolle positively affirm that the course of scarlet fever, as an infectious disease, cannot be brought into accord with the biology of streptococcus and the course of streptococcus infections. However, Dr. William J. Class, of Chicago, claimed in March to have discovered the diplococcus, which he considers the cause, during his investigations for the Board of Health of that city.

In April Dr. J. H. McCollom, of the isolation wards of the Boston City Hospital, published a study of 1000 cases of scarlet fever. He finds that Boston for seven years, 1892 to 1898 inclusive, "has had a higher death-rate from scarlet fever than Brooklyn, New York, Philadelphia, or St. Louis in every year save 1895, when New York's rate was slightly higher. In 1893 Boston also had more deaths per 10,000 of the living than Liverpool, Glasgow, London, Berlin, or Paris; in 1894 it was second to Liverpool, in 1895 it dropped below Berlin, Liverpool, and Glasgow, and in 1896 and 1897 was second only to Liverpool. This shows that scarlatina is unusually prevalent in Boston, as compared with most other places. The ratio of deaths is, however, less per 10,000 living than either diphtheria or typhoid fever. The diminution of scarlatina was greatest in 1898, dropping from nearly 3 in 10,000 living to .61. The morbidity per 10,000 has varied from 62.87 in 1892 to 16.77 in 1898. The added facilities for isolation afforded by the new isolation hospital have decreased in a marked degree both the number of cases reported and the death-rate. The per-

centage of mortality in the 1000 cases treated in the isolation wards, including moribund cases, was 9.8. A summary of these 98 fatal cases shows that scarlet fever uncomplicated caused 56 deaths; bronchopneumonia, 15; diphtheria and scarlet fever combined, 10; diphtheria alone, 9; pneumonia, 4; scarlet fever and erysipelas, 1; tubercular meningitis, 1, and 2 died from various complications."

Dr. MacCollom distinguishes "5 types of the disease. The first or malignant type causes the death of the patient in from 24 to 48 hours, and shows frequent hemorrhages from mucous surfaces, and in places a hemorrhagic eruption. The temperature is very high, the patient, as a rule, unconscious. The second type has a temperature of 102° to 103°, marked throat symptoms, and profuse nasal discharge containing streptococci; the patient is mildly delirious or semi-unconscious; eruption brilliant. The third type has a very high temperature and a brilliant rash; throat symptoms not prominent; no nasal discharge. In the fourth type the eruption is not brilliant and is most marked in the axillary and inguinal regions. Temperature, 99° to 100°. The fifth type has no eruption on the body, temperature little elevated; hands dry and hard; the only sign is the enlargement of the papillas at the tip and edges of the tongue."

Dr. Richard M. Pearce, of Boston, reports very thorough and careful consideration of the bacteriology and of the anatomy of scarlet fever, in the same volume with Dr. MacCollom's résumé. He concludes that as yet no light can be thrown on the causation of the disease; that the only constant gross change is a leyperplasia of the lymphoid tissue in every part of the body; that the anatomical points on which a clinical diagnosis is based are not usually seen after death. He finds the micro-organisms producing secondary inflammations to be streptococci, staphylococci, and pneumococci, in the order named, as regards frequency. See VITAL STATISTICS.

SCHOURER-KESTNER, AUGUSTE, a French chemist and politician, died September 19, 1899. He was prominent as one of the first advocates of the innocence of Captain Alfred Dreyfus, who had been condemned for treason. It was a curious coincidence that Scheurer-Kestner died on the same day that Dreyfus was pardoned. Scheurer-Kestner was born at Mülhausen, February 11, 1833. He studied in Paris, making a specialty of chemistry, and then undertook the management of a factory in Thann, owned by his father-in-law. He became possessed of republican ideas, and in 1865 founded a workingman's co-operative society; in this way he drew upon himself the displeasure of the government, which culminated in 1867, when he was sentenced to imprisonment for four months and was fined 2000 francs. He gained adherents, however, and soon became a man of considerable power in republican politics. In February, 1871, he was elected in Alsace to the National Assembly; here he protested against the peace with Germany. In 1875 he was elected to the senate for life. From 1879 to 1884 he directed the political columns of the Gambetta paper, *La République Française*. He became one of the secretaries of the senate, and later was elected its vice-president, but on account of his position in the Dreyfus affair failed of re-election to the vice-presidency on January 13, 1898. In October, 1897, Scheurer-Kestner publicly stated that he had proofs of the innocence of Dreyfus, and it was probably through him that the efforts of M. Zola were enlisted on the side of the condemned captain. He was president of the Chemical Society of Paris.

SCHÖNBORN, Count FRANZ, cardinal and lord-archbishop of Prague, died in Falkenau, June 25, 1899. He was born January 24, 1844, in Prague. He studied law, and after taking part in the war of 1866 devoted himself to theology, and in 1873 was consecrated to the priesthood. In 1883 he became bishop of Budweis, and in 1885 was raised to the archbishopric of his native city and to the cardinalate in 1889. Cardinal Schönborn was a zealous supporter of Czech interests.

SCHOOL. See HYGIENE.

SCHREINER, W. P., premier of the Cape Colony parliament, was born in Cape Colony and is the son of a German Lutheran clergyman and an English woman. He was educated at the South African College, Cape Town, and Downing College, Cambridge, taking honors at the latter institution in law studies in 1882. Having become a barrister in the Middle Temple, he returned to South Africa and began practice at the Cape. He soon gained a considerable reputation, and when, in 1893, Mr. Cecil Rhodes became premier of the Cape parliament for the second time, Mr. Schreiner was appointed attorney-general. It thus devolved upon him to advise the Cape government when President Kruger, of the Transvaal, in 1895 closed the drifts (fords of the rivers) to all colonial traffic. The opinion he then rendered was that this action of the Transvaal was in opposition to the terms of the London convention, and his view was supported by the Cape ministry and the home government. Strong pressure was thereupon brought to bear on the Transvaal government and war was nearly precipitated. But when in the early part of 1897 Mr. Schreiner appeared before the British South Africa Committee of the House of Commons as a witness in

the investigation that followed upon the Jameson raid, he said that though he still believed that the closing of the drifts was a violation of the London convention, he thought that arbitration would have been a better means of settling the difficulty. In 1896 he was appointed to negotiate with the Orange Free State concerning certain railway and customs duties that had arisen. In politics he is allied with the Afri-cander Bond, and it was on his motion of want of confidence that the ministry of Sir Gordon Sprigg was overthrown, October 11, 1898. Later he became premier. He is a brother of Olive Schreiner (Mrs. Cronwright), the author. After the outbreak of the Boer war in the fall of 1899 Mr. Schreiner notified the Dutch inhabitants of Cape Colony that they would not be asked to bear arms against the allied Dutch republics, but at the same time warned them against lending aid to the enemies of Great Britain. See CAPE COLONY.

SCHRIVER, General EDMUND, died in Washington, D. C., February 10, 1899. He was a native of Pennsylvania; was graduated from the Military Academy at West Point in 1833; served in the Florida Seminole War, and in the Civil War with the Army of the Potomac. He did good service in a number of battles, including Chancellorsville and Gettysburg, rising to the grade of colonel and brevet brigadier-general. He was retired in 1881.

SCHROEDER, FREDERICK A., who died December 1, 1899, was mayor of Brooklyn in 1876-78. Incidents of his administration were the stringing of the first wire of the New York and Brooklyn Bridge, the opening of the Ocean Parkway, and the beginning of the construction of Brooklyn's first elevated railroad. Mr. Schroeder was born in Prussia in 1833, and emigrated in 1848 to this country, where he engaged in the manufacture and, later, the importation of tobacco products. In 1871 he was elected comptroller of Brooklyn. In 1878 he was elected State senator. While at Albany he was instrumental in the enactment of a new charter for Brooklyn, increasing the mayor's powers and replacing single heads of departments for the old triple-headed commissions.

SCHURMAN, JACOB GOULD, A.M., Sc.D., LL.D., president of Cornell University, was appointed by President McKinley chairman of a commission of five members to investigate and report upon conditions in the Philippine islands; the appointment of this commission was announced on January 19, 1899. Mr. Schurman was born at Freetown, Prince Edward Island, May 22, 1854. At the age of thirteen he became a clerk in a general store at Summerside, Prince Edward Island, where he remained for two years, when he entered a village grammar school. In 1870 he won a scholarship at Prince of Wales College, Charlottetown, and three years later entered Acadia College, at Wolfville, Nova Scotia. At this institution in 1875 he won the Gilchrist scholarship in connection with the University of London, where in 1877 he received the degree of master of arts after a course that had been especially brilliant. In 1877-78 he studied in Paris and at the University of Edinburgh, where he took the degree of doctor of science and won the Hibbert travelling fellowship of \$1000 a year for two years. These two years he passed in study at the universities of Heidelberg, Berlin, and Göttingen, and in Italy. It was during this time that he met Mr. Andrew D. White, president of Cornell University, and then United States minister and now ambassador at Berlin; it was through his influence that Mr. Schurman subsequently became connected with the university. In 1880 he returned to Canada and accepted the chair of English literature, political economy, and psychology at Acadia, remaining there until 1882, when he was called to a professorship in Dalhousie College, and there taught English literature and metaphysics until 1886. In this year he became professor of Christian ethics and philosophy at Cornell, and later was made dean of the Sage School of Philosophy. In 1892 Professor Schurman was chosen president of the university, to succeed Dr. Charles Kendall Adams, resigned. He is the senior editor of the *Philosophical Review*. His publications include: *Kantian Ethics; Ethics of Evolution; The Ethical Imports of Darwinism; Belief in God; Agnosticism and Religion*.

The Philippine commissioners, excepting General Otis, sailed for Manila soon after their appointment, and of course the insurrection, which began on February 4, 1899, was in progress on their arrival. The commissioners besides President Schurman were Admiral Dewey, General E. S. Otis, Professor Dean C. Worcester, and Mr. Charles Denby. The commissioner's preliminary report was submitted to President McKinley on November 3, 1899; the document, on its publication, proved to be a fair and deeply impressive argument in favor of the retention of the Philippines.

SCIENCE, CHRISTIAN. See CHRISTIAN SCIENCE.

SCIENCES, IMPERIAL ACADEMY OF (Vienna), founded in 1846, consists of two sections, the philosophical-historical and the mathematical-scientific. Among its publications are *Denkschriften* and *Sitzungsbericht*. Each section of the

academy has 8 honorary foreign members and 30 foreign and 30 Austrian corresponding members. In 1899 there were 18 active members. President, Eduard Suess; general secretary, Professor Viktor von Lang.

SCIENCES, NATIONAL ACADEMY OF, incorporated by the United States Congress in 1863, had 86 members in 1889, and 22 foreign associates. The act of incorporation provided that the academy was to examine and make report upon any scientific matter for which it was to be paid by special appropriation. The annual stated meeting is held in Washington, D. C., beginning the third Tuesday in April. President, Wolcott Gibbs, Newport, R. I.; vice-president, Asaph Hall, Cambridge, Mass.; foreign secretary, Alexander Agassiz, Cambridge, Mass.; home secretary, Ira Remsen, Johns Hopkins University, Baltimore, Md.

SCIENTIFIC EXPEDITIONS. See ZOOLOGICAL STATIONS.

SCOTCH-IRISH SOCIETY OF AMERICA, organized in 1889 by persons of Scottish and Irish descent, of both sexes, for the preservation of the history of the Scotch-Irish race and the development of intelligent patriotism. There are a number of State societies. Honorary secretary, the Rev. J. S. MacIntosh, D.D., 220 Witherspoon Building, Philadelphia, Penn.

SCOTLAND, THE KINGDOM OF, forms the northern part of the island of Great Britain, and has an area of 29,785 square miles, and a population, according to the last British census, of 4,025,647. The largest city is Glasgow, population in 1898, 724,349. Other cities are Edinburgh, 295,628; Dundee, 164,575, and Aberdeen, 140,381. The total town population includes about two-fifths of the inhabitants of the kingdom. Among those engaged in occupations the industrial classes form the large proportion. Though Scotland is naturally a bleak country, the Scotch force of character has made it productive and wealthy. It is largely mountainous and its scenery is famous. Scotland, as a part of the United Kingdom, is represented in the British Parliament at London by 72 members. Of these 16 are Scottish peers in the House of Lords. Home government is provided for by a local government board, whose *ex officio* president is the Secretary for Scotland.

SCOTLAND, CHURCH OF (Established, or Anglican, though Presbyterian in polity), reported for 1899, 1700 ministers, and 648,476 communicants, with 16 synods and 84 presbyteries; has missions in India and Africa. The moderator for 1899 was the Rev. Dr. Pagan Bothwell. The lord high commissioner, representing the Queen, was the Earl of Leven and Melville.

SCOTLAND, FREE CHURCH OF, in 1899 had 16 synods, 75 presbyteries, 1144 ministers, and 404,828 communicants. It carries on missions in India, Africa, Syria, and Arabia. Moderator for 1899, Rev. James Stewart, M.D., D.D., Lovedale, South Africa.

SCOTT, NATHAN BAY, United States senator from West Virginia, was elected, as a Republican, by the legislature to succeed Senator Charles J. Faulkner, Democrat, January 25, 1899. Born in Ohio, December 18, 1842, Mr. Scott was educated in the public schools of Quaker City, Ohio, after which he was for a time clerk in a store. In 1862 he entered the Union army, serving until the end of the war, when he settled at Wheeling, W. Va., which has since been his home. He engaged in glass manufacturing. In 1880 he was president of the city council, and two years later began his service in the State senate, which continued until 1890. In 1886 he was a member of the Republican national committee, and from 1897 to 1899 was commissioner of internal revenue. On February 15, 1899, President McKinley nominated as his successor Mr. George W. Wilson, of Ohio. His term of office in the Senate will expire March 3, 1905.

SCULPTURE. The year 1899 adds little of value to the history of sculpture. The works that attracted most attention were portraits, either colossal or life-size statues and busts, such as Thornycroft's "Oliver Cromwell," E. Onslow Ford's "Queen Victoria," and Falguière's "Balzac," made in place of the unsatisfactory one that Rodin exhibited at the Salon of 1898.

Of the sculpture at the "Old Salon," Boucher's two marble groups, "Evening" and "Antique and Modern," received medals of honor, as did Ernest Dubois's "Pardon," and Émile Boisseau's "Diogenes." Falguière's "Balzac" attracted much attention, and was acceptable. Paul Dubois exhibited a wax group, called "Souvenir;" Antonin Mercié, a statue of "Vestrepain," destined for Toulouse; Frémiet, the colossal statue that the Suez Canal Company intends to place at the entrance to the canal in honor of F. de Lesseps; Gérôme, a statuette of "Frederick II.;" Gardet, a "Lion;" Raoul Larche, a marble group, entitled "Violets;" Henri Allouard, the "Lord's Prayer;" Mlle. Jeanne Itasse, a "Bacchante," and Aimé Octobre, a group called "Remorse." Barrias attracted great attention by his "Nature Revealing Herself," a polychrome marble statue for which the sculptor used Algerian onyxes, and spent many years in study to obtain his results. A noted critic says: "The pliability of

the veil, its coloring, the tone of the garment, which recalls the most marvellous Indian stuffs, and the naive expression of the head, offer the spectacle of an incomparable purity of line and richness of color.

At the "New Salon," Rodin's bronze "Ève" and busts of "Falguière" and "Rochefort" were especially admired. The sculpture at the Royal Academy was of a higher order than usual. Mr. Hamo Thornycroft's colossal "Oliver Cromwell," intended for Westminster Hall, won great praise for the sculptor. Hardly less noticeable were: E. Onslow Ford's surpassingly fine portrait of "Queen Victoria," and a dignified and satisfactory one of "Prince Leopold of Battenberg." His "Sir W. Agnew" was considered a fine example of carving. Other fine examples were C. J. Allen's groups, called "Rescued" and "Love and the Mermaid," in which the sea nymph clasps Cupid's feet with passion; H. C. Fehr's "James Watt," Mr. Longmaid's "Eve," J. W. Rollins's "Water Baby," Mr. J. Drury's "J. Priestley," a memorial of the great chemist for the city square at Leeds; A. C. Lucchesi's "The Myrtle's Altar," G. Simonds's "Song and Dance," a design for a fountain, where three wading birds dance to Ariel's music; C. Dressler's "The Four Winds," Miss L. G. Williams's bust of "A Peri" and "Sappho," Mrs. C. Barker's "Sleep," F. D. Wood's group of "Dante at Ravenna," W. R. Stevens's "Sir Lancelot and the Nestling," W. G. John's "The Elf," T. Brock's recumbent statue of the late "Archbishop of Canterbury," E. L. Dunkley's "Love's Sport," J. M. Swan's "Leopard Running," a statuette in bronze, and G. J. Frampton's "St. George," a gilt and enamelled figure in the style of Italian art in the sixteenth century. Sir Laurence Alma-Tadema presented the Musée des Académiciens, Antwerp, of which he is a member, with a bronze bust of himself, by E. Onslow Ford. The National Gallery acquired a bronze bust of "Prince Charles Edward Stuart," by Edward King, and a marble bust of "Lord Tennyson," by F. J. Williamson. A statue of "Sir John Millais," by J. Brock, was placed before the Tate Gallery, at Millbank; Gérôme's statue to the "Duc d'Aumale," a heroic group in bronze, was unveiled at Chantilly, October 15; Thornycroft's statue to "Oliver Cromwell," so conspicuous in the Academy, was unveiled at Westminster, October 31; a statue of "Velasquez," by Romanos, was unveiled in front of the Prado Museum, Madrid; and Dubois's monument was unveiled in honor of Bossuet, representing the "Aigle de Meaux," and a tablet to William Blake, by Nicholls, was erected at the Central Lambeth Library, Lambeth, of Irish marble, with a relief of bronze, representing Blake's own "Death's Door." Boyle's statue of "Benjamin Franklin" was placed before the post-office in Philadelphia, and Bissell's "President Arthur" in Madison Square, New York. Macmonnies gave a bronze group of a "Lioness and Cubs" for Prospect Park, Brooklyn.

The most significant event in sculpture in America was the erection of the temporary "Dewey Arch," at Madison Square (Fifth Avenue and Twenty-fourth Street, New York). The arch was modelled in plaster, and was 70 by 35 feet. With its quadriga it measured 95 feet in height. It was designed by Charles R. Lamb, of New York. The crowning figure, by J. Q. A. Ward, president of the National Sculpture Society, was a restoration of the "Victory of Samothrace," surrounded by nereids on sea-horses. Eight heroic figures (naval heroes) decorate the entablature. These were the work of Hartley, Lukeman, T. S. Clark, Boyle, George D. Brewster, Partridge, E. C. Potter, and H. K. Bush-Brown. Isidor Konti made the spandrel figures of the North and East Rivers. Four colossal groups against the piers formed the chief ornamentation: "The Call to Arms" was executed by P. Martiny; "The Combat," by Karl Bitter; "The Triumphant Return," by Charles C. Niehaus, and "Peace," by Daniel French. Three sculptors died during the arduous task of completing the work within the short limit of time—Giovanni Turini, Casper Buberl, and Henry Baerer.

Daniel French executed a Dewey medal, the obverse bearing the head of Admiral Dewey, and the reverse a gunner ready for action.

The National Sculpture Society gave to the Metropolitan Museum of Art some bronze reproductions of works by the late Olin L. Warner, and the Boston Museum acquired some of the Marlborough gems. The Peabody Institute of Baltimore offered for the second time its Rinehart scholarship in sculpture, which allows the successful competitor a studio in Rome for four years. Not much sculpture of importance was sold. The highest prices were reached at the sale of the Hoffman collection of antiques in Paris, when a terra-cotta head of Pan realized 3000 francs, a bronze statuette of Bacchus, excavated at Rome in 1880, 20,000 francs, and a fine head of Parian marble, supposed to be of the time of Praxiteles, 11,000 francs. An antique bust of "Alexander the Great," with head and neck of gilt bronze, was bought at the sale of the Bardini collection in London by D. Kelekian, of New York. "Trajan," one of the best portrait busts of Optimus Princeps, migrated from the Villa Barberini, Castel Gandolfo, and the bust of Bindo Altovito, by Benvenuto Cellini, chained to the wall in the reception-room of the Altoviti Palace by order of Pius VII., passed across the Alps, and, perhaps, across the ocean, to an unknown

purchaser. A fine head of the Venus type was exhibited at Sypher's, New York, said to have come from the island of Melos. It was the work of a Grecian or Græco-Roman sculptor. The Department of Greek and Roman Antiquities in the British Museum obtained the marble head of a warrior of considerable value. To the regret of all the world Michael Angelo's famous "Leda" in the Bargello was injured.

SCULPTURE SOCIETY, NATIONAL, founded in 1893, was in 1899 composed of 62 sculptor members, 2 honorary fellows, and 309 lay members. The society aims by exhibitions and committees of advice to promote the interests of sculptors and to give advice, whenever requested, in the matter of selecting designs for statuary. Annual exhibitions are held at 215 West Fifty-seventh Street, New York City. President, J. Q. A. Ward; secretary, Barr Ferree, 7 Warren Street, New York.

SEAL FISHERIES. See ZOOLOGICAL LITERATURE (paragraph Special Treatises).

SEALING. The danger of the complete extinction of the Alaskan seal herd, which was noted in 1898, was even more apparent in 1899. In 1899 only 16,812 skins were taken on the seal islands, although the quota allowed by law was 30,000, while in 1898 there were 18,047 young male seals killed on the islands. The diminution is attributed to the destruction of the females by pelagic sealing. In the report of the secretary of the treasurer, of December, 1899, it was stated that the rookeries showed a continued decline in the herd. Under the provisions of the act of March 3, 1899, the quota of seals allowed by law must not be killed in any other months than June, July, September, and October. In 1899 only one American vessel engaged in pelagic sealing.

SEARCH LIGHT. See FIRE PROTECTION.

SEGANTINI, GIOVANNI, an Italian painter, died September 29, 1899. Born in Arco on the 15th of January, 1858, he passed much of his youth in pastoral pursuits among the mountain villages. When his talent had brought to him some distinction, he came to Milan, where he resided most of his life. He lived, however, for a long time at Albula, in Switzerland, where he entered into the life of the peasantry, receiving an excellent preparation for painting his genre pictures. Among his principal works are those of Swiss life, and pictures of the house and street life of Milan. In 1892 he received the first medal at the Munich art exhibition. His pictures are highly prized in Germany.

SEMMES, THOMAS JENKINS, professor of civil law in the University of Louisiana, and one of the prominent lawyers of the South, died in New Orleans, La., June 23, 1899. He was born in Georgetown, D. C., in 1824; was graduated at Georgetown University, and at the Harvard Law School, where he was a classmate of President Hayes. He practised law in Washington until 1850, when he removed to New Orleans, where he was successful in both law and politics. He was elected to the legislature, was appointed by President Buchanan United States district attorney in 1860, and afterward served in the Confederate senate. His property was confiscated during the war and Semmes was obliged to start anew. He did not, however, re-enter politics. In 1886 he was elected to the presidency of the Bar Association of America. He was a cousin of Captain Raphael Semmes, of the Confederate cruiser *Alabama*.

SENEGAL, a French colony on the coast of West Africa, extends from a point somewhat north of Cape Verde to the British crown colony of Gambia. Its area, together with a definite portion of the settlement of Rivières du Sud, is over 14,700, and the population, 174,000, of whom 135,000 are in Senegal proper. Included in the colony are various protected states, thus extending its frontiers north to Cape Blanco and east and south to French Guinea and French Soudan. With these states the area is 115,800 square miles and the population, 2,000,000. The capital is St. Louis, population about 22,000; another important centre is Dakar, population, 2000. The colony is administered by a governor-general, assisted by a colonial council, and is represented in Paris by a deputy. Over 2500 troops, including natives, are stationed in the colony. The public debt of the colony in 1898 was 517,657 francs; for the same year the local budget amounted to 3,929,367 francs, and the expenditure of France (1899 budget) was 6,106,942 francs.

The leading exports include gums, ground-nuts, rubber, palm nuts and oil, hides, horns, mats, and gold; among the chief imports are tobacco, cutlery, beads, clothing, calicoes. The total imports were estimated at 25,000,000 francs and the exports at 12,000,000.

A railway is open from Dakar to Rufisque and thence northwest to St. Louis, at the mouth of the Senegal; another railway is under construction from Kayes, also on the Senegal, to Bamaku, on the Niger, and in 1899 about one-third of it was open for traffic.

SENFF EXPEDITION. See ZOOLOGICAL STATIONS.

SEPTICÆMIA, PUERPERAL. See SERUM THERAPY.

SEPTIC TANK. See SEWAGE PURIFICATION.

SERUM and SERUM THERAPY. The search for immunity is as old as antiquity. Dr. Nicolas Lambadarios, of the University of Athens, has published a volume on the serum therapy, organotherapy, antirabic, and antileprous treatment of the old Greek physicians. Galen used the flesh of the viper's body as an antivenene. Mithridates fortified himself by taking all the known antidotes, and experimented also upon condemned criminals; finally succeeding in rendering himself immune to snake-bite. For the latter purpose he took the blood of animals which fed on venomous snakes. Attalus, King of Pergamos; Andromachus, Nero's chief physician; and Galen used similar antidotes. Dioscorides advised persons who had been bitten by mad dogs to drink the blood and eat the liver of the animals which had bitten them.

Blood-Serum.—The germicidal action of blood-serum has been tested by Franklin W. White upon cultures of staphylococci, streptococci, typhoid bacilli, and colon bacilli. Blood-serum from 23 healthy persons showed practically no germicidal power over the staphylococcus or streptococcus, but a marked germicidal action on the typhoid bacillus. Blood taken from 10 cachectic people suffering from various diseases also exhibited marked germicidal power over the typhoid and colon bacilli. The blood removed from a number of persons in the death agony or a few hours after death was strongly germicidal against typhoid or colon bacilli. None of it was actively germicidal toward staphylococcus or streptococcus.

Milk-Serum.—Laraboulet, of the Académie de Médecine de Paris, described in July the researches he and Gimbert made regarding milk-serum. It is thus prepared: Fresh cow's milk is coagulated, the whey is filtered off, and the curd dried, pulverized, mixed with chalk, and then soaked 1 to 2 hours in the whey. After filtration and sterilization a little carbolic acid is added as a preservative. He has found that neurasthenia and grave forms of anæmia are rapidly improved by injections of this serum and of arsenic. Encouraging beginnings are reported in cases of pulmonary tuberculosis.

Anthrax and Serum Therapy.—Drs. Abba and Piccardi, of Turin, report the twenty-seventh case of anthrax which has been successfully treated with Professor Sclavo's anti-anthrax serum. The diagnosis was confirmed by inoculations of guinea-pigs with fluid from vesicles appearing around the pustule in the case. After two injections the case went on to recovery after a week's observation.

Diphtheria Antitoxin.—Dr. Herman M. Biggs, of the New York Health Department, reports 3073 cases of diphtheria treated with antitoxin from January, 1895, to January, 1900, with 429 deaths, or an average mortality of 13.9 per cent. If 172 cases of moribunds be omitted, the mortality is 8.8 per cent. The serum was used for the production of immunizing on 5108 persons, of whom 48 had diphtheria. The dose for immunizing is 15 to 20 minims of a high-grade serum. An initial dose of serum for combatting diphtheria is from 2500 to 4000 units. The protection from immunization lasts about 3 or 4 weeks. Of 826 cases of laryngeal diphtheria, 26.5 per cent. were fatal. In the 204 in which intubation was done the mortality was 36 per cent. In New York City there were in 1894, 2874 deaths from true diphtheria as compared with 923 in 1898. In Paris, France, there were treated in the hospitals in 1894, 2355 cases, with a mortality of 35.5 per cent., whereas in 1897 there were 1683 cases, with 15 per cent. deaths. It is calculated that in Chicago, as a result of the antitoxin treatment, there has been a clear gain of 1100 lives in two years past.

Pneumonia and Serum Therapy.—Drs. Eyre and J. W. Washbourn, of Guy's Hospital, London, report the results of an investigation they made in 1899 into the efficacy of the antipneumococcic serum of Dr. Pane. The serum appears to have widely protective powers, and the experimenters anticipate further success in its use. They found that the serum in doses of 1 cubic centimetre possesses for rabbits a considerable protective power against 4 out of 5 strains of pneumococci derived from different sources, having no protective power against 1 strain, obtained from a fatal case of pneumonia. They decided that there are varieties of pneumococcus which at present can be distinguished only by the action of the antipneumococcic serum.

Puerperal Septicæmia.—Antistreptococcal serum reduced the mortality of puerperal septicæmia to 25 per cent. in cases treated by Dr. E. Rosenthal, of Philadelphia. He does not regard the serum as a specific, but believes it has a well-defined value. Repeated injections are necessary. Arthur reports the recovery of a case after 8 injections of 10 cubic centimetres each of streptococcus serum during 9 days.

Swine Plague and Hog Cholera.—The Bureau of Animal Industry of the United States Department of Agriculture issued in 1899 a report on the experiments in 1897 and 1899, with the results of the respective causative micro-organisms of hog cholera and swine plague. In the first year, of 196 animals treated with the mixed

serums, 161 were saved, or 82 per cent., while only 15 per cent. of the 429 control animals not so treated recovered. In 1898, 1727 animals were treated with the serums, and 1304 recovered, or 76.84 per cent., while of 3197 control animals not so treated only 600 survived, or 28.76 per cent. It has been estimated that the State of Iowa alone loses \$15,000,000 annually by the death of hogs from diseases, whose proper treatment, at a very small cost, would save at least \$11,000,000.

Antitubercle Serum.—Dr. Stubbett, physician to the Loomis Sanitarium for tubercular patients at Liberty, N. Y., has employed bovinized antitubercle serum in 82 cases of pulmonary tuberculosis. His figures are as follows: Expectoration improved in 82 per cent. of the cases, appetite improved in 81 per cent., weight increased in 78 per cent., temperature diminished in 49 per cent., disappearance of tubercle bacilli in 13 per cent., apparent immunity obtained in 21 per cent., diminution of the bacilli in 35 per cent., improvement in cough in 79 per cent., general improvement in 78 per cent. In cases of laryngeal tuberculosis, healing of ulceration took place in 50 per cent. when present; arrest of the disease occurred in 46 per cent. of the cases in which ulceration was not present. Stubbett has used anti-streptococcic serum in six cases of tuberculosis with mixed infection. In the first case, the expectoration ceased after one injection for several days. In the second case, cough and expectoration increased after the injection, but subsequently decreased. The third patient, who had a dry cavity at one apex, received four injections, after which the streptococci disappeared. The fifth case received two injections, after which the streptococci disappeared for five months, and then returned. The sixth patient had no streptococci in his sputum for six weeks after the injection.

Calmette's Antivenene.—Arthur Beveridge reports in the *British Medical Journal*, for December, 1899, that a man bitten by a cobra was saved by the use of 10 cubic centimetres of Calmette's antivenene injected hypodermically an hour after the encounter. The wound was excised, and nitric acid was applied. Stimulants were used, and improvement was gradual. In a few hours he was able to walk unaided, though staggering and complaining of weakness. In four days he returned to work. Antivenene is prepared from the blood-serum of animals previously inoculated with snake poison. It was devised by Dr. Albert Calmette, director of the Pasteur Institute at Lille, France. It is stated that Surgeon-General Taylor is taking steps to have a supply of Calmette's antivenene issued to all military hospitals in India.

Yellow Fever Under Serum Treatment.—Very little has been published during 1899 with reference to the use of Sanarelli's antiamarillic serum. A large quantity of the serum was prepared by Dr. Fitzpatrick, bacteriologist of the Health Department of the city of New York, and sent to Vera Cruz for experimental purposes. It was used on one of the two reported cases of yellow fever which came to the port of New York during the year, both being brought on the transport *McClellan* from Santiago; but there was some doubt about the diagnosis in this case. The patient recovered.

Knorr and the Relation of Toxin to Antitoxin.—The relation of antitoxin to toxin has been a problem. Behring and Ehrlich put forth the theory that the action of antitoxin on toxin was a direct neutralization of the one substance by the other. Büchner's theory was that of an indirect physiological antagonism. Angelo Knorr, of Munich, who died in 1899, held that the two entered into a loose combination, whereby the action of the toxin on the body-cells was suspended. He demonstrated this fact by heating neutral mixtures of tetanus poison and antitoxin, and comparing the result with the effect of heat on mixtures of simple serum and tetanus poison. In the first mixture heat had no power to destroy the toxin, while in the case of the control-mixture, in which the serum contained no antitoxin, heat destroyed a part of the tetanus toxin. The union of the two substances cannot be compared with the ordinary chemical combinations. Büchner accepted Knorr's theory. Another interesting fact discovered by Knorr, says the *Philadelphia Medical Journal*, is the following: "When toxin and antitoxin are mixed so that an excess of the former is present, the physiologic action of the surplus does not correspond to its amount—that is to say, 100,000 toxin-units present in excess in a mixture of toxin and antitoxin do not produce proportionate effects. Their effects are only equal to those produced by 20 units acting alone—that is, not in a neutral mixture. Yet, in order to prevent the action of this excess, not 20, but 100,000 antitoxin-units are necessary. Knorr had also found that the less the concentration of the two bodies, the more antitoxin was necessary to neutralize promptly and completely a given quantity of toxin. In one of his last papers he brought forward apparently strong proof against Ehrlich's 'lateral chain' theory of immunity. Ehrlich attributed the formation of antitoxin to the action of the cells attacked by the poison; Knorr, on the other hand, made the unattacked cells the antitoxin producers. Had he lived, there is no telling how near he would have brought us to an understanding of the problems of immunity." See DIPHTHERIA; LEPROSY; PLAGUE; TYPHOID FEVER.

SERVIA, an independent kingdom, formerly tributary to Turkey, is an inland state surrounded by Austria-Hungary on the north, Roumania and Bulgaria on the east, Turkey on the south, and Bosnia on the west. Its area is 19,050 square miles, and its population, according to the census of 1895, 2,314,153. Belgrade is the capital, with a population in 1899 of about 60,000. The trade is fairly good, the imports, which have greatly increased, in 1898 amounting to about \$8,000,000, and the exports about \$11,000,000. The principal exports are animals, animal and dairy products, and fruits, especially prunes, which are sent mainly to Austria-Hungary, Germany, and the United States. The imports consist largely of textile goods, sugar, hardware, etc. The principal occupation is agriculture, but there are a number of carpet-weaving, jewelry, and other industries. The mineral resources, though said to be considerable, are undeveloped. The railway mileage was slightly over 350 in 1896. On the borders of Servia there are about 300 miles of navigable waters in the Danube, Save, and Drina rivers.

The government is vested in the King and the *Skupshchina*, or national legislature. There is a provisional constitution in force pending a new one proposed, whereby the government controls the appointment of one-third of the members of the legislature, while the other two-thirds are elected under a restricted form of open voting, without the use of ballots. In other ways the crown has arbitrary powers, including great power over the press. There are three principal political parties—the Radicals and the Liberals, who look to Russia for support, and the Progressives, who turn to Austria. Russia is supposed to be displeased at the continuance of ex-King Milan as commander-in-chief of the forces of King Alexander, his son, and the departure of the Russian minister from Belgrade in March was attributed to this cause. In July an attempt was made to assassinate Milan by a man named Knezevitch, a Bosnian, who was arrested, and after a trial publicly shot. Knezevitch implicated a number of others in the plot, and many arrests were made, including several prominent Radical leaders, but he made so many conflicting statements that little reliability could be placed upon his word. However, 28 persons were tried, 22 of whom were judged guilty. M. Taushanovitch, a former minister of the interior and of commerce, was sentenced to 20 years' penal servitude, and 8 were condemned to an imprisonment of 9 years. Among these was the Radical leader, Pasitch, who was pardoned by King Alexander. The affair attracted considerable attention in Europe, and although the Servian government alleged that the attempted assassination was part of a conspiracy to overthrow the Obrenovitch dynasty in the interests of the Karageorgevitch pretender, the trial was believed by many to be an unfair one, a recent writer drawing a parallel between it and the Dreyfus court-martial, in respect to the methods of the prosecution. The *Revue Politique et Parlementaire*, of Paris, accused Milan of making the affair an opportunity to avenge himself upon his personal enemies by attempting to implicate them in the plot. It calls the charges against some of these men a tissue of futile and absurd statements, although it sees nothing strange in the action of Milan, whom it brands as a man of no character or conscience. It concludes: "There is no doubt that a Nemesis will come some day under the form of a revolution or the like, provoked by a deep indignation. Milan will then receive the reward of his deeds. If fortune favors him, he will perhaps merely be sent back to the company of those whom he left, in violation of his agreement, and will return and govern Servia in the name of his son. Meanwhile, the presence of this man in Belgrade constitutes a permanent danger to the tranquillity of the Balkan states, where there are already so many causes for trouble."

SERVICE, JAMES, was born in Ayrshire, Scotland, in 1823; died in Melbourne, April 11, 1899. At about twenty years of age he emigrated to Australia, and entered business. He was elected to the legislative assembly for Melbourne in 1857; was minister of lands, 1859-60; represented Malden in the assembly from 1874 to 1881. In the former year he was treasurer of Victoria, and premier in 1880. He was premier again of the coalition government of 1883. Afterward he entered the legislative council (the upper house), of which he was a member at the time of his death.

SEWAGE PURIFICATION. In July, 1899, the city of Paris celebrated the completion of its new sewage farms and other works, designed to divert the remainder of the sewage of the city from the Seine. The two new farms provided in recent years add 7655 acres to the area previously set aside for this purpose, making a total area of 12,340 acres devoted to sewage farming by the city of Paris. Not all of this land has yet been made available for the purpose, but it appears that at least 10,000 acres are in actual use. The various farms—Gennevilliers, Archères, Mery-Pierrelaye, and Carrières-Trill—are located at some distance from the city. The sewage is brought to them through large conduits, and is lifted several times by huge pumps. Berlin has some 20,000 acres (perhaps more) devoted to

sewage farming. London is still partially purifying its sewage by chemical precipitation, and carrying the resulting solids, or sludge, to the ocean in great sludge ships. The volume of sewage is now getting to be so large that more complete purification is desirable, and will soon be imperative. To meet this need, and in hope of simplifying the sludge problem, extensive experiments are being made with filtering the sewage through beds of broken coke. The coarseness of the filtering material permits the beds to be filled and emptied rapidly, thus drawing in air clear to their bottoms, utilizing the whole depth and increasing the rate of filtration over what is possible with intermittent filtration. Bacteria beds and contact beds are terms applied to these filters, and to similar ones recently constructed at other places in England. Thus far such filters have not been put into practical operation on a large scale in the United States, but at the Lawrence Experiment Station of the Massachusetts State Board of Health good results have been attained. Sewage purification by means of intermittent filtration and broad irrigation, or sewage farming, is also a bacterial process, but there is less bacterial activity. The aim of the newer processes is to secure higher rates of treatment, thus economizing in the area required and in the cost of construction. A further aim is to reduce the amount of sludge which accumulates on the surface of the disposal areas, or in the spaces between the filtering material.

The bacteria employed in the processes already mentioned work in the presence of air, and hence are called aerobic. Opposed to this is the septic tank, which is merely a receptacle where sewage is held and allowed to pass through slowly without being subjected to the influences of much light or air. These tanks are designed to utilize the anaerobic bacteria, which work in the absence of air. The septic-tank system is being extended in England, and is now in use in this country at Champaign, Ill., at a golf and polo club near Chicago, and at an insane asylum at Verona, N. J. Contracts for such tanks were let in 1899 at Independence, Mo., and Vancouver, British Columbia, and the system was adopted for Marion, Ia. Experiments with the process have been conducted at the Lawrence Experiment Station. They indicate that the tanks need not be so large as those employed in England, and that they probably need not be covered. The English tanks have been built large enough to store the sewage flow of the whole 24 hours, and have been provided with masonry roofs. It seems sufficient to have the tanks large enough only to give time for a fair amount of sedimentation, since the retained organic matter is supposed to remain in the tank until decomposed by the anaerobic bacteria, after which it passes off in a soluble form. It is then readily acted upon by aerobic bacteria, either upon being discharged into filter beds or water, the latter course being unobjectionable if the water is not used for drinking purposes, and if it is sufficient in volume to provide the requisite amount of dilution. At Manchester, England, it is proposed to transform the chemical precipitation tanks into septic tanks, uncovered, and to pass the septic-tank effluent through so-called contact beds. At Sutton, Surrey, chemical precipitation tanks are being changed into coarse contact beds, from which the sewage goes to and through beds of finer material.

At Providence, R. I., works are nearly completed for the treatment of the sewage by chemical precipitation. This is the largest city in the United States that has attempted to purify its sewage. New York discharges its sewage into the adjacent waters, which have so great a volume that comparatively little offence arises from the practice. Some of the districts recently annexed to New York, however, have purification works. At Boston large sums have been expended to divert the sewage from the old outlets near the built-up portions and discharge it at remote points, in deep water. (Other municipalities have joined in this work, as stated more fully under the article SEWERAGE.) The joint outlets so provided discharge into the harbor and are under the control of the Metropolitan Sewerage Commission. Recently the commission made some very interesting studies to determine the effect of the sewage so discharged upon the waters of the harbor. Buoys were placed at intervals over quite a large area adjacent to the outlets, and visual observations made and samples of water taken for chemical examination at regular intervals. The studies showed that the large volumes of sewage discharged from these outlets were soon dissipated by the effects of tides and currents. Although not commonly classed as sewage purification, disposal by dilution is in many cases the best possible means of getting rid of sewage. The free oxygen of the water and the various lower forms of life which it contains soon change the organic matter of the sewage to harmless compounds, making it available for plants and animals of higher order. Of course, all this presupposes that a given volume of water is not overloaded with sewage, so that offensive deposits and odors result and living organisms are driven away.

One of the most notable examples of disposal by dilution will be provided by the Chicago Drainage Canal, which was nearly ready to be put in operation at the close of 1899. This canal will receive all the sewage of Chicago, dilute it by many times its volume of water and convey it to the Des Plaines River, which in turn connects

with the Illinois and that with the Mississippi. (See CANALS.) The canal is designed on the principle that if the sewage wastes of each inhabitant are discharged into water equal in volume to a flow of 0.2 cubic feet per minute, or 2000 gallons a day, no offensive decomposition or deposits will occur. It was not supposed by those who designed the canal that its use would affect any public water supplies, but St. Louis, some 375 miles below, began to protest last summer that its water-supply would be endangered, and to take steps in the courts and in Congress to prevent the opening of the canal. During the year an exhaustive series of analysis of water from the streams into which the canal will discharge was begun in behalf of the sanitary district of Chicago. This will be continued after the canal is put in operation in order to show what changes follow. A large part of the sewage of Chicago has been sent down through the old Illinois and Michigan Canal, and the rivers to the south, for years past, and more or less of it has gone that way ever since the city had a sewerage system. See SANITATION (paragraph Sanitary Legislation).

SEWERAGE. A complete sewerage system includes means for the collection and disposal of sewage. The latter phase of the subject is treated under Sewage Purification. Under collection, it may be noted that Chicago is preparing to build large intercepting sewers to divert its sewage from the lake to the new drainage canal (which see under CANALS). Baltimore and New Orleans, two of the largest American cities, are still without sewers for the removal of house wastes, but Baltimore has spent large sums of money for sewers (more properly drains) to remove surface water, and New Orleans is improving its old ditches or canals. The latter city has recently voted to construct a thorough sewerage system and enlarge and complete the canals designed for surface and sub-surface drainage. Some years ago the city granted a franchise for sanitary sewers (those removing house wastes) to a private company, but the company went into the hands of a receiver before much work had been done. A suit for the annulment of the franchise was begun by the city some time ago. There are some twenty cities and towns in the United States whose sewerage systems are owned and operated by private companies. Among these are: Atlantic City, Englewood and Long Branch, N. J., Galveston, Tex., and Phoenix, Ariz. In some cases the companies are operating under detailed municipal franchises, which specify the yearly rates to be charged householders for the privilege of using the sewers, and in others a less formal agreement, or a mere permit to occupy the streets, is all that defines the relations between the companies and municipalities. Private ownership of sewers, it hardly needs be said, is not looked upon with favor by engineers, sanitarians, or city officials generally, sewerage facilities being too closely allied to the health and police functions of municipalities.

In some localities local conditions favor joint action on the part of two or more municipalities in the construction and operation of trunk or outlet sewers from the collecting systems to the point of final disposal. Such action was authorized in 1899 by the New Jersey legislature, and in addition an act was passed providing in detail how such a scheme might be carried out for some of the Oranges, a small part of Newark and other and smaller places. In Massachusetts, the Metropolitan Sewerage Commission has completed three large outlet sewers which serve portions of Boston and many towns in the vicinity. Up to October 1, 1899, the following twenty-three cities and towns were included either wholly or in part in the three joint systems under the charge of the commission: Arlington, Belmont, Boston, Brookline, Cambridge, Chelsea, Dedham, Everett, Hyde Park, Lexington, Malden, Medford, Melrose, Milton, Newton, Somerville, Stoneham, Wakefield, Waltham, Watertown, Winchester, Winthrop, and Woburn. In a few instances the towns were not wholly connected with the Metropolitan outlets, but it was estimated that a total of 394,000 inhabitants of a possible 578,000 were so connected, embracing an area of 41.44 miles out of 164.28 miles that will eventually contribute sewage, most of the municipalities already connected being as yet only partially provided with sewers. In all 727 miles of local sewers are connected with the Metropolitan system, and 60,865 buildings are connected with these local sewers. One of the districts served makes use of the outfall portion of the Boston main sewerage system, which to October 1, 1899, had cost the city of Boston about \$6,500,000. To the same date the Commission had expended nearly \$7,000,000 in construction, while \$4,600,000 additional is the estimated cost of its prospective work. The actual mileage of the Metropolitan sewers on the date named was 70, mostly of large size. Several large pumping plants are in use. All the sewage collected is discharged into Boston harbor without treatment, except that that which flows through the old Boston outlet is stored in reservoirs and discharged on the outgoing tide. See SEWAGE PURIFICATION and SEWER GAS.

SEWER GAS, or more properly sewer air, has been studied during the past few years to determine its relation to the spread of zymotic or filth diseases. The following conclusions are drawn from these studies by George Newman in his recent (1899) work, *Bacteria*: Sewer air generally contains fewer micro-organisms than the out-

side air, and the bacteria in sewer air are commonly those of the outside air rather than those in the sewage. "Sewer air neither conducts pathogenic organisms nor stimulates the virulence of such." Notwithstanding these conclusions, sewers should be built so as to prevent the generation or accumulation of putrefactive gases. This can be effected by uniform grades, smooth interiors, and proper ventilation, for sewer air, like any other impure air, may tend to weaken the system, thus making it susceptible to the approach of disease germs from other sources than sewer air.

SEXTON, Colonel JAMES A., commander-in-chief of the Grand Army of the Republic, died in Washington, D. C., February 5, 1899. He was born in Chicago, January 5, 1844. At the outbreak of the Civil War he enlisted and soon rose to the position of first lieutenant and then of captain. He served in Ransom's division of the Army of the Tennessee. He participated in the battles of Columbia, Spring Hill, Duck River, Franklin, and in the campaign before Nashville. In the battles of Nashville and Franklin he was wounded, and at the capture of Mobile suffered a fractured leg. In the latter part of the war he was on the staff of Major-General Smith, commander of the Sixteenth Army Corps. The two years following the war he passed on a plantation near Montgomery, Ala. He went to Chicago in 1867 to engage in business, and founded the firm of J. A. and T. S. Sexton, which was succeeded after the Chicago fire by Cribben, Sexton and Company. In 1889 President Harrison appointed him postmaster of Chicago. He had been a colonel in the Illinois National Guard and a Presidential elector, and in 1898 he was chosen commander of the Grand Army. Besides working in this organization he was actively interested in several other military societies. At the time of his death Colonel Sexton was a member of the commission appointed by President McKinley in the early fall of 1898 to investigate alleged abuses in the War Department.

SHAKERS, a communistic society, called by its members the United Society of Believers in Christ's Second Appearing, originated in England in the eighteenth century, but is now existent only in Massachusetts, New Hampshire, Maine, Connecticut, Ohio, Kentucky, Georgia, and New York. In the last-named State, at Mount Lebanon, is one of their largest settlements. A so-called family was started in White Oak, Ga., in 1809 by Shakers from Ohio. There are 30 families in the society, with from 5 to 100 persons in a family. The total number of Shakers was estimated in 1899 by a member of the Mount Lebanon society as being about 1000.

SHALE. See MINERAL PAINTS.

SHAW, Colonel ALBERT DUANE, commander-in-chief of the Grand Army of the Republic, was elected to that position at the twenty-third annual encampment, held in Philadelphia September 4-8, 1899, to succeed Colonel James A. Sexton, who died in February. Colonel Shaw was born at Lyme, Jefferson County, N. Y., December 27, 1841. He was a student at Union Academy in Belleville when the war broke out in 1861, and in May he enlisted in the Thirty-fifth New York Volunteers. He served as a private and non-commissioned officer until 1863, and then as a recruiting officer at Watertown, N. Y. He made a good record in his regiment and took part in many engagements, including Bull Run, Chantilly, Rappahannock Station, South Mountain, Antietam, and Fredericksburg. After the war Shaw entered St. Lawrence University, at Canton, and was graduated in 1867. In the same year he was appointed colonel of the Thirty-sixth Regiment of the New York National Guard, and was elected to the assembly from Jefferson County. He was United States consul at Toronto from 1868 to 1878, and at Manchester, England, from the latter year to 1886. In 1897 he was elected deputy commander of the Grand Army. Colonel Shaw has been largely interested in the development of electric power at Niagara Falls, and is president of the Canadian Niagara Power Company.

SHELDON, CHARLES M., clergyman and author, was born in Wellesville, N. Y., something over forty-one years ago; he spent his early life on a farm in Dakota, and was educated at Phillips Academy, Andover, Mass., Brown University, and Andover Theological Seminary. In 1886 he went to London and studied there the conditions of the poorer classes. In 1888 he became the pastor of the Central Congregational Church, Topeka, Kan. Publications: *Richard Brice*, 1891; *Robert Hardy's Seven Days*, 1892; *The Twentieth Door* and *The Crucifixion of Philip Strong*, 1893; *John King's Question Class*, 1894; *His Brother's Keeper*, 1895; *Malcolm Kirk*, 1897; *In His Steps, The Redemption of Freetown, One of the Two*, and *The Miracle at Markham*, 1898; *For Christ and the Church*, 1899. Most of these books Mr. Sheldon read from his pulpit, chapter by chapter, in lieu of a regular sermon. Since publication they have had a sale of over three million copies in America, Canada, and England. *In His Steps* is being translated into German, French, Swedish, Norwegian, Spanish, Italian, Armenian, Russian, and some dialects of Central and Western Africa. This book was written from the point of view of the question, "What would Jesus do?"

SHIPBUILDING. The tonnage of ships built during 1899 was large. As usual Great Britain led all other countries in the tonnage of new vessels launched. Of the total tonnage of 1,763,914 tons, the yards on the Clyde and elsewhere in Scotland contributed 536,590 tons, those on the Tyne, 291,293 tons, and those on the Wear, 268,508 tons. The following are some of the other interesting figures of British shipbuilding during the year:

Class.	No. Vessels.	Tonnage.
Steam vessels.....	825	1,666,268
Sailing vessels.....	303	47,065
Total I. H. P. of machinery.....	...	1,597,577 H. P

The largest output of any single British shipyard was that of Harland and Wolff, of Belfast, Ireland, aggregating a tonnage of 82,634 tons. The output of the yards of all other countries for the years 1899 and 1898 was divided as follows:

Country.	1899.		1898.	
	No.	Tons.	No.	Tons.
United States.....	149	288,964	137	216,104
Germany.....	132	179,235	155	173,164
Holland.....	90	70,827	77	43,324
Italy.....	18	67,867	12	24,837
Denmark.....	15	25,007	17	12,448
Norway.....	30	20,261	31	20,206
France.....	8	19,086	11	12,768
Belgium.....	23	9,875	15	8,150
Sweden.....	18	6,354	21	11,024
Austria-Hungary.....	6	1,956	18	11,840
Canada.....	4	825	28	18,842
Spain.....	1	15
Japan.....	3	10,428
China.....	43	2,140
Total.....	493	683,025	569	575,484
Great Britain.....	...	1,763,914	...	1,675,065
Grand Total.....	...	2,447,538	...	2,250,539

Compared with 1898 the total output of vessels built during 1899 showed an increase of about 200,000 tons, of which 108,140 tons was in countries outside of Great Britain. It will be noticed that the United States ranks next to Great Britain in the number and tonnage of ships constructed during the year. Among the particularly notable vessels launched in 1899 were the steam turbine-propelled torpedo-boat destroyer *Viper* of the British Navy, with a speed of 35 knots per hour, and the transatlantic steamer *Oceanic*, the largest vessel now afloat, and having the following principal dimensions: Length over all, 704 feet; extreme breadth, 68 ft. 4½ in.; depth, 49 feet. See NAVAL ENGINEERING.

SHOOTING. Rifle, revolver, and trap events in 1899 were numerous. The Grand Prix du Casino, the most valuable prize known to wing-shots, was won at the international tournament at Monte Carlo in 1899 by M. Moncorg. In the United States the most important event is the Grand American Handicap (25 live birds), which was won at Long Branch, N. J., by Thomas A. Marshall, of Illinois, 29-yards handicap. The entry list was 278. Marshall tied with five others on 25 kills, and won with a kill of 58 straight on the shoot-off. The amateur wing-shooting championship was won by G. S. McAlpin, with 96 kills, at the Carteret Club grounds, Long Island, N. Y. The intercollegiate shoot in May resulted: Pennsylvania 117, Harvard 114, Princeton 107, Yale 103; in November: Harvard 112, Yale 108, Pennsylvania 104, Princeton 102. The first telegraphic intercollegiate shoot occurred in 1899, Harvard defeating Yale 1363 to 1036. In a team shoot Princeton beat Columbia 75 to 73. Five notable individual records were made in 1899, and quoted from the *Clipper Annual* are as follows: Rifle—250 out of 250, Louis Flach, ring target, 25 yards range, New York City, November 4; 2425 points out of 2500, F. C. Ross, German ring target, 100 feet, 22 calibre, New York City, March; revolver—125 out of 125, C. S. Richmond, army revolver, 25 shots at 50 yards, Savannah, Ga., July;

trap shooting—in match, 100 successive kills, J. A. R. Elliott, Kansas City, October; 211 inanimate targets broken straight, unknown angles, C. A. Young, Peoria, Ill., May.

SIAM is an independent kingdom and the chief state of Indo-China. It is bounded on the western side by the province of Burmah, in British India, and on the eastern by the territory of French Indo-China. It borders the Gulf of Siam on the south. The western portion, including the Malay states dependent on Siam, touches also the British protected Malay states of the Straits Settlements. Its territory has been reduced from about 300,000 square miles to about 200,000 square miles, whereby France has added to her Indo-Chinese possessions, and France has a certain amount of jurisdiction over Siamese administration within a limited territory west of the Mekong River, and Great Britain has certain rights over the western dependencies. The central portion of the kingdom, including the basins of the Menam, Petcha Bouri, and Petriou rivers, is recognized as under the complete jurisdiction of Siam. Estimates have placed the population at from 5,000,000 to 12,000,000. The United States Consular Reports placed it in 1898 at about 8,000,000. The present King is Chulalongkorn I., under whose rule the kingdom has prospered and has come to be considered next to Japan in progressiveness and receptiveness to new ideas. A number of Europeans are employed in the service of the state, and several Siamese young men are sent to Europe for their education. Bangkok, the centre of foreign trade and the market for a very populous region, is one of the most interesting cities in the Orient. Recent estimates place the inhabitants at from 600,000 to 800,000, and the population is rapidly increasing. Bangkok has an electric street railway, built mostly from American materials. According to a report in 1899, this railway is crowded all day long, and pays a dividend of 12 per cent. There are also electric lights, telegraphs, telephones, railroads, hotels, libraries, and banks. The latter are said to be excellent. Even the bicycle has found favor, the following account of its recent introduction being given in the *Moniteur Officiel du Commerce*, of Paris, in April, 1899: "Almost simultaneously American and English firms have placed numerous models of their manufactures on the market at Bangkok. At the present time not only is the bicycle met everywhere in the streets of the capital, but it has also penetrated into the interior. Europeans are not the only ones seen on bicycles; the Siamese and even the Chinese, in spite of the inconvenience of their form of dress, have readily adopted this mode of locomotion. The majority of machines now used in Siam are American, English, or German makes; a few French and Belgian are also seen. The demand for American wheels is strong, as they have the reputation of solidity as well as cheapness. Rubber pedals are preferred, as many Siamese and Japanese ride without shoes." Bangkok's trade is facilitated by a good harbor on the river Menam and by regular steamship lines between Hong-Kong and Singapore. In 1898 the imports at this port were \$12,759,542, the items being: Treasure, cotton, silk and piece goods, gunny bags, kerosene, sugar, hardware, machinery, and other iron goods. The exports in 1898 were valued at \$16,988,520, showing the large increase of over \$6,000,000 over the export trade of 1897. The chief item of export is rice; others are teak-wood, sandal and rosewood, pepper, treasure, oxen, hides, and garden products.

The public improvement and development of Siam has practically been brought about during the present decade. Ten years ago there were only 9 miles of streets in Bangkok, communication being had by the canals which traverse the entire city, with a total length of 75 miles in 1899. To-day there are nearly 50 miles of streets, and the old bridges are being replaced with modern steel ones. It is said that the King builds each year out of his funds as a gift to the city one steel bridge, which is opened with ceremony on his birthday. Not only the city but the entire country is traversed with canals, which connect the three great tidal rivers. They serve as highways, and were until ten years ago the only means of communication, excepting byways through the jungle. They are also utilized for irrigating purposes. The company which has for ten years constructed many of these highways and irrigation canals has brought under cultivation a large tract of formerly uninhabited swamp and jungle, which is now occupied by 70,000 people. The King has an extensive canal programme for the development of rich waste lands, and is reported to have already sent to Holland for engineers. The first railroad was opened in 1893, and runs from Bangkok to Paknam, 14 miles. The second was begun in 1892, and was nearly completed in 1899. It is built by the government, of standard gauge, at a cost of nearly \$33,000 gold per mile. It connects Bangkok with Korat, 165 miles. Another road building in 1899 will run from Ban Mayee to Chiangmai, 400 miles. A franchise was granted for a light railway from the Menam to the Nakawn Nayoke River. The King has also a railway programme for the building of lines east and west, aggregating over 500 miles of railway, but a loan may be necessary to carry it through. A line is under consideration in Bangkok to connect that city with the Burmah frontier.

SIBERIA has attracted considerable attention in recent years, owing to the construction of the great continental railway which is being built by the Russian government, and to the development and settlement of the extensive regions which had until recently been considered barren and largely valueless. Siberia stretches from the Ural Mountains to Bering Straits and the Pacific, and from the Arctic Ocean to the borders of the Chinese Empire. Several great rivers enter the Arctic—the Obi River, over 3500 miles long; the Yenisei and Angara, 3200, and the Lena, 2800, while the Amur enters the Pacific after traversing the southern part of the country. While the northern harbors are frozen many months in the year, steamers and tugs operate on the Obi and the Yenisei, and in the south it is possible to grow not only grains, but even fruits. In the summer of 1898 Russian and English steamers appeared at the mouth of the Obi and of the Yenisei, proving it possible to secure open-water communication between western Europe and the Orient. The total area of Siberia is 5,000,000 square miles, with a population of from 5,000,000 to 6,000,000, half of whom represent semi-nomadic tribes.

Agricultural Possibilities.—There has been much speculation in regard to the agricultural possibilities of Siberia, one writer of some note having called it the future wheat chamber of Europe. The cultivable area of Siberia is put down at about 425,000 square miles, or about equal to Iowa, Missouri, Kansas, Nebraska, and the Dakotas. In western Siberia the climate is said to be much like that of western Canada. Southward the climate is said to approach that of Italy, but severe droughts occur. Western Siberia has less favorable climatic conditions than eastern Siberia, but it is richer in forests, and also has a greater amount of live stock. Southward again the cultivable area improves. It may be said that the more desirable sections of Siberia have already been extensively settled. The methods of culture are still primitive, and the live stock, though more numerous in proportion to population than in European Russia, are of inferior grade. The agricultural importance of the country at the present time is, it may be concluded, potential rather than actual.

Minerals and Forests.—There are rich deposits of gold, silver, copper, iron, and lead, besides tin and mercury ores, coal and lignite, graphite, sulphur, naphtha, salts, mica, and precious stones. There are also important mineral and hot springs. The mineral resources are not only rich and varied, but of great extent. The estimated annual output is already over 25,000,000 roubles (1 rouble = \$0.514). This will be very greatly increased upon the introduction of modern mining machinery and improved methods of extraction. The forests are extensive and valuable.

Immigration.—The intention of Russia to develop Siberia led to the abandonment in 1899 of the idea to continue that colony as a penal settlement. Recently a systematic effort at colonization under government direction and assistance has been begun, and hundreds of thousands of Russian peasants have been assigned to lands throughout Siberia. Since 1892 the number of new settlers has steadily increased. During the eighties immigration averaged from 10,000 to 20,000 a year, but in 1896 it reached 200,000, and has maintained that figure each year up to 1899.

Trans-Siberian Railway.—The following may be mentioned among the important benefits accruing from the completion of the great railway which will connect the extreme Orient with the Russian capital and with the European centres, Berlin and Paris. Its greatest importance to Russia is, of course, its strategic character. It will probably become the great mail route and highway of travel between Europe and the East, and a probable competitor of the Suez Canal. It has been pointed out, however, that freight rates will for a long time be much lower by the water route than by rail. Again, the railway is expected to develop mining and agriculture in Russia and Siberia. It will also serve the purposes of industrial expansion, and it will facilitate immigration and materially aid the Russian policy of Siberian colonization. See further the articles **RUSSIA** and **RAILWAYS**.

SIERRA LEONE, a British West African possession, fronts on the Atlantic for about 180 miles, and is separated from the French settlements on the north by the Scarcies River, while Liberia bounds it on the south. The eastern frontier line was settled by an Anglo-French agreement of 1895, by which France gained control of the headwaters of the Niger. This river flows thence into the interior of the continent, and after describing an immense arc enters the ocean in Nigeria. The colony proper is a peninsula, and includes also the island of Sherbro. The area of the protectorate and colony together is variously estimated, but the more reliable authorities place it now at about 30,000 square miles. Estimates regarding the population are unreliable, ranging from 180,000 to 750,000. The most authoritative British manual places the population in 1899 at 250,000, which is the figure accepted by the United States Treasury Department reports. The resident Europeans number a little over 200. Freetown, the capital, with a population estimated in 1899 at 30,000, is one of the chief ports of West Africa. It has an excellent harbor, and is a British naval station of the second class. The trade during the period 1897-98

declined considerably, owing to much fighting between the British and natives, chiefly in the hinterland. The exports include palm oil and kernels, benni seed, kola nuts, India-rubber, ground-nuts, copal, and hides. In 1899 it was reported that the disturbances had largely ceased, and that peace and quiet were being restored. The native insurrection was brought about by a number of causes, the principal one, however, being the resentment of the natives toward the efforts of the British to collect the hut-tax. As the native dwellings are said to be mere mud hovels, the tax should not, in fairness, have been very great; but it has been said that in reality the amount charged was unreasonably large. The revolt which ensued was serious, lasting through the year 1898, and at the end of that time nearly all the huts which the British had proposed to tax are said to have been destroyed. In 1898 the late Sir David Chalmers was sent out as a special commissioner to investigate the causes of trouble. His report was submitted early in 1899, and strongly condemned the policy and administration of Sir Frederick Cardew, the governor of Sierra Leone. However, it was officially reported that fighting had ceased, and that the tax was being satisfactorily collected, and it was decided to continue the strong repressive measures of the governor. The government was therefore ordered to maintain the hut tax, with power to remit it in whole or part when thought necessary. Some concessions were made for policy's sake, the headmen of the towns and village communities being given a special commission for collecting the tax, besides the commission to the principal chief. It was decided that the native police should be retained in the ordinary administration of the protectorate. In 1899 a scientific party was sent to Sierra Leone by the Liverpool School of Tropical Diseases to investigate the causes of malaria. The physicians of the commission reported that the true malarial fever is caused solely by the mosquito, which carries infection from the swamps where it is bred. Should this theory prove true, it will be of immense value to the whole unhealthy coast of western Africa, for the commission reports that the destruction of the mosquito larva in the stagnant stretches and puddles in which it is found may be effected without great difficulty and with a large measure of success. A railway was opened in 1899 from Freetown to Songotown, 32 miles, which will be extended later to Rotofunk and Moyamba. Under the Colonial Loans act of 1899 an imperial loan of £310,000 was made to cover the cost.

SIGNALLING. See RAILWAYS (paragraph Signalling).

SILK MANUFACTURES. The steady growth of silk manufacture in the United States is shown by the following figures: In 1860, 13 per cent. of the silk used was manufactured at home; in 1880, 30 per cent.; in 1890, 55 per cent.; in 1898, 85 per cent.; in 1899, it is believed the tables were completely turned and the 87 per cent. of silk goods which in 1860 was imported, was last year manufactured in this country. Such silk goods as are now imported into the United States are principally fine product, largely from the hand-loom of Lyons, Crefeldt, and Zurich. It is estimated that fully one-third of the world's product of raw silk is handled in the mills of the United States. The raw silk comes from France, Italy, Austria, Spain, China, India, and the Levant; China produces both the largest quantity and best quality. From the days of the earliest Virginia settlers, periodic attempts have been unsuccessfully made to cultivate the silkworm. The industry requires so much time and labor that it will probably never thrive in America. Aside from the raw silk consumed at home in China and Japan, for which no records exist, the world's production of raw silk in 1898 was about 34,000,000 pounds, and for 1899 it is estimated at some 36,000,000 pounds. Our importations of raw and spun silk, mostly raw, have increased from 1,100,000 pounds in 1875 to 10,500,000 pounds for the year ending June 30, 1899, the importations for the latter year being valued at \$32,735,000. China alone produces about half of the raw silk of the world, and Japan and Italy come next. Of the 861 silk factories in the country, when the carefully written article (*New York Sun*, November 19, 1899) from which our figures are being drawn was prepared, New Jersey had 257; New York, 228; and Pennsylvania, 172. But while Pennsylvania stands third in this list, it is leading in the number and extent of new mills, judging from the fact that in 1898 it added 1255 looms out of a total of 2340 required for new equipment, and 37,000 out of 53,000 spindles. More than fifty Pennsylvania cities and towns have silk factories. The activity in this line in Pennsylvania seems to be largely due to low prices of coal, abundant cheap labor, and inducements held out to manufacturers on the part of municipal authorities. During 1899 a new mill was put in operation in Fayetteville, N. C., in which negro labor is to be exclusively employed. It is believed by the projectors that the young people of this race are well adapted to acquire the manual dexterity required in handling silk. The average wages paid silk workers are probably lower than in any other manufacture, this being due to the large amount of

female and child labor employed. According to a table in a recent report on the industry in Pennsylvania, the average wage is \$1.21 a day per male, and 70 cents a day for female labor.

SILVELA, DON FRANCISCO, who became prime minister of Spain on March 4, 1899, is the elder brother of a former minister, Manuel Silvela. He was born about 1845. He studied law under one of the most famous lawyers of Madrid, and was elected a deputy to the Cortes, where he was a Conservative. He served as minister of the interior in the cabinet of Martinez Campos in 1879-80; was minister of justice in the cabinet of Canovas in 1884-86, and minister of the interior again in the cabinet of Canovas in 1890-91. After the death of his brother he became the leader of the young Conservatives with liberal tendencies—a new party. Señor Silvela is a brilliant orator and a writer of ability. He was admitted to the Spanish Academy in 1893. On the resignation of the Sagasta cabinet on March 1, 1899, Señor Silvela succeeded in forming a ministry, and at the general election became prime minister of Spain.

SILVER. The production of silver in 1898, according to the director of the United States Mint, was as follows:

State or Territory.	SILVER.		State or Territory.	SILVER.	
	Fine Ounces.	Coining Value.		Fine Ounces.	Coining Value.
Alabama	100	\$129	Nevada	805,000	\$1,040,808
Alaska	92,400	119,467	New Mexico	425,300	549,883
Arizona	2,240,800	2,904,954	North Carolina	700	905
California	642,300	830,448	Oregon	130,000	168,081
Colorado	22,815,600	29,498,938	South Carolina	300	388
Georgia	500	640	South Dakota	152,300	196,913
Idaho	5,073,900	6,560,065	Tennessee		
Iowa			Texas	473,900	611,426
Maryland			Utah	6,485,900	8,385,810
Michigan	32,400	41,891	Washington	254,400	328,921
Minnesota			Wyoming	100	129
Montana	14,807,200	19,144,668	Total	54,438,000	\$70,384,445

SIMONS, Rev. GEORGE HENRY, died in Brooklyn, N. Y., February 1, 1899. He was born in 1840 on the German island of Amrum in the North Sea. He followed the sea from the age of sixteen until he was twenty-seven, when, becoming converted, he entered a divinity school at Berea, O. He entered the Methodist ministry, and became active in organizing western churches. Later he came to New York City, where he was representative of the German Methodist Church at the Port Mission. From this post he was called to a church in Flatbush; his last charge was the Wyckoff Street Methodist Episcopal Church, Brooklyn. Mr. Simons published several religious works.

SIMPSON, WILLIAM, a member of the Royal Institute of Painters in Water Colors, died August 17, 1899. He was known especially as a war artist and correspondent. Born in Glasgow, October 28, 1823, he was educated in that city and at Perth, and studied art. In 1854-55 he was in the Crimean War as an artist, and on his return to England received the thanks of the Queen for his despatches and sketches. He passed three years sketching in India, saw the Indian mutiny, and visited Kashmir and Thibet. He was in the Abyssinian campaign, 1868; the Franco-Prussian War, 1870, and the war of the Commune in Paris, 1871. In the following year he went to Pekin to report and sketch events connected with the Emperor's marriage, and on his return he witnessed the Modoc Indian War in California. Simpson accompanied the Prince of Wales on the latter's visit to India in 1875-76, the next year he visited Mycenæ and the Troad in order to illustrate the explorations of Dr. Schliemann, and in 1878-79 he witnessed the Afghan War. He had attended the marriage of the late Czar Alexander III. at St. Petersburg, and in 1883 was present at his coronation in Moscow. In 1884-85 he accompanied General Sir Peter Lumsden and the Afghan Boundary Commission to the Afghan frontier in Central Asia. Besides various papers on archaeological and architectural subjects, Simpson published: *The Campaign in the East*, a series of views illustrating the Crimean War, dedicated to the Queen, 1855; *Meeting the Sun, a Journey Round the World*, 1873; *Picturesque People, or Groups from all Quarters of the Globe*, 1876; *Shikar and Tamasha*, commemorative of the visit of the Prince of Wales to India, 1876; *The Buddhist Praying Wheel*, 1896.

SIMSON, MARTIN EDUARD VON, German jurist, was born November 10, 1810; died May 2, 1899. From 1826 to 1829 he studied political science and jurisprudence at Königsberg; having subsequently studied at the universities at Berlin and Bonn and at the Paris Law School, he was made in 1831 a *privat docent* at Königsberg, and in 1836 became a professor in ordinary of Roman law. In 1846 he was appointed to the counsel of the tribunal in Königsberg. Two years later he was elected from this city to the Frankfort national assembly, of which in December, 1848, he became president; his executive duties were performed with great ability. As president he was the head of the delegation that on the 3d of April, 1849, announced to the King of Prussia his selection as German Emperor. The following month he left the national assembly, and in the summer gained prominence in the lower chamber as a speaker for the Constitutional party; in 1850 he was made president. He resumed his academic work in 1852. In 1859 he again entered the Prussian assembly, being its president in 1860-61. He was elected president of the first *Reichstag* of the North German Confederation in 1867, and two years later became president of the Court of Appeals at Frankfort-on-the-Oder. On account of his health he declined a re-election to the *Reichstag* presidency in 1874, and three years later retired from political life. He was appointed, however, the first president of the new imperial chamber at Leipsic in 1879. In March, 1888, Emperor Frederick III. conferred on him the honor (hereditary) of the order of the Black Eagle. Simson retired in 1892. He wrote *Geschichte des Königsberger Obertribunals*.

SKATING as a sport has flourished for many years in America, which has compared favorably with the old world in this branch of athletics. During the last decade the names of Donoghue, Mosier, Reynolds, Johnson, and others have been associated with many new records, the first-named skater having at one time held nearly all the records up to 100 miles, and distanced European skaters in a trip abroad. In Canada, McCulloch, Nilsson, Davidson, Rudd, and others have carried fame for the Dominion. In 1899 the National Skating Association held its races in this country under the metric distances which prevail abroad. These races resulted as follows: 500 metres (546.8 yards), E. A. Thomas, of Newburgh, 59 $\frac{3}{4}$ seconds; 1500 metres (1640.42 yards), E. A. Thomas, 3:06 $\frac{3}{4}$; 5000 metres (5468.1 yards), Charles McClave, New York City, 10:22 $\frac{3}{4}$; 10,000 metres (10,936.11 yards), Charles McClave, 21:36; figure skating, A. J. Keane, New York City, 62 points. In the Canadian Association races James Drury, of Montreal, won the half mile in 1:23, the mile in 2:50, 3 miles in 9:19 $\frac{1}{4}$, and 5 miles in 16:00 $\frac{1}{4}$. Michaelson, of Montreal, won the figure-skating event with 47 points. Abroad, P. Oestlund, of Trondjhem, skated 500 metres in 50 $\frac{1}{2}$ seconds for the world's championship, 1500 metres in 2:45, and 5000 metres in 9:54 $\frac{3}{4}$. J. C. Greve, of Amsterdam, won the 10,000-metre event in 20:36 $\frac{1}{4}$, and G. Hugel, of Vienna, the figure-skating championship, with 341 $\frac{3}{4}$ points.

SMALLPOX and VACCINATION. There were outbreaks of smallpox in a few localities in the United States during 1899, as well as in some of the newly acquired territory. In New Orleans, up to April 20, there had been 179 cases with but 3 deaths, 38 cases remaining under observation at that time. In Ohio, during March and April, an epidemic of considerable severity raged. For the year ending April, 1899, 1429 cases had been reported to the State Board of Health. Of these, 18 were fatal, showing a mortality of 1.26 per cent. Nearly 40 per cent. of the cases occurred in adults. Vaccination proved an almost absolute protection. From January to April 761 new cases were reported, with a mortality of 13, or 1.7 per cent. Cincinnati, Cleveland, and Columbus furnished 616 cases, with 10 deaths. In Illinois an epidemic spread throughout the State in October and November; accurate figures have not been published thus far. Measures were taken early by the United States Army to stamp out the smallpox in Puerto Rico. A vaccine farm was established with an output of 15,000 points a day. About 200 persons per day were vaccinated by each of the native practitioners employed for the purpose, 790,000 persons being vaccinated in three months, at a cost of \$32,000. Late in October it was reported to the government that the threatened epidemic was at an end, and that not a single case of smallpox was then known in the whole island. The anti-vaccinationists are again persistent and confident, in spite of the facts of history. In midsummer they pointed to the fact that smallpox was found among the American troops in the Philippines, stating the occurrence of 151 cases of variola (of which 77 were fatal), and 85 cases of varioloid (of which none were fatal) in a total of 30,000 men who they claim were "all well vaccinated." Inquiry into the facts reveals the truth. When the army was rapidly increased from 25,000 men to 280,000 men, vaccination was not rigidly enforced. In the Philippines, at the outbreak of the disease, a supply of vaccine was procured from San Francisco which proved inert, possibly from the voyage and from heat. A small supply was then procured from Japan, and later a good supply was prepared by the Board of Health in Manila. During the delay the disease made the progress noted. Since 1883 smallpox has

prevailed in some part of the country; yet, although epidemics have occurred near many of the army posts, only 20 cases have occurred (with a fatality of 4) in a mean strength of 25,000 men. The regiment which occupied the Holguin district of Cuba during the stamping out of the epidemic there (from which one in ten of the natives was dying), although constantly exposed to infection, did not report a single case. The statistics of smallpox in Massachusetts have been published in a summary compiled by Dr. S. W. Abbott, of the Massachusetts Board of Health. In the seventeenth and eighteenth centuries epidemics were of frequent occurrence with great mortality. In 1721 nearly 8 per cent. of the entire population of Boston died of smallpox. From 1800 to 1840, vaccination limited the disease so far that not over 20 deaths resulted from smallpox in that time. The relaxing of the vaccination law in 1836 led to a larger death rate in 1839 to 1841, when 232 died from smallpox in Boston. After that date registration laws were enforced furnishing accurate returns for the whole State, and from these we learn that deaths from smallpox from 1842 to 1855 were 1304 in number. No deaths were registered from this cause in 1886 or 1895. The Japanese government has made vaccination compulsory in Japan. All children must be vaccinated before reaching the age of 10 months, must be revaccinated at 6, and again at 12 years of age. No better contrast between the great mortality due to absence of compulsory vaccination laws, and the great protection offered by vaccination, can be shown than that afforded by the figures for Prussia, Holland, and Austria. The statistics show that the control or the eradication of the disease bears an exact proportion to the thoroughness of vaccination and revaccination. The *Melbourne Argus* shows very effectively the conditions in Prussia, Holland, and Austria in the subjoined table:

SMART, JOHN, Scotch landscape painter, died June 1, 1899. He was the son of Robert Campbell Smart, the engraver, and was born in Edinburgh, October 16, 1838. He was educated at the Leith High School, and received his first art education at the school of the Board of Manufactures. He was apprenticed to an engraver in 1853, but as he gave evidence of ability in landscape painting, he became in 1860 a pupil of Horatio McCulloch, R.S.A. He was made an associate of the Royal Scottish Academy in 1871, and was admitted to full membership in 1877. The following year the Royal Scottish Water Color Society was founded, Smart being one of the original members. He devoted himself chiefly to delineations of the highland scenery of Scotland. Among his finest works are "The First of Winter's Snows," exhibited at the Royal Scottish Academy in 1874, and "The Gloom of Glen Ogle," exhibited at the Centennial Exposition, at Philadelphia. His other best-known paintings are: "The Land of Macgregor;" "The Last Rest of the Clansmen;" "Shadow and Shower;" "A Dream of Strathcarn." He published a series of etchings, "The Golf Links of Scotland," and another series entitled "Twenty of the Older Greens."

SMITH COLLEGE, at Northampton, Mass., began its work in 1875. The most important work accomplished by the faculty during the collegiate year ending June 20, 1899, was a thorough revision of the course of study, whereby wider options can be given to candidates in the requirements for admission, and only the one degree of A.B. can be conferred on the completion of the regular academic course. In order to give fair notice to the preparatory schools, however, the new scheme of study will not go into full operation until 1901. The college is a subscriber to the Classical School in Athens and the Classical School at Rome, in both of which schools its alumnae have been represented, two of them having received the first fellowships given by the school at Athens to women students. A new college dwelling-house, called the Tyler House, after Professor William S. Tyler, was completed early in the year at a total cost of \$38,038, and two other houses were purchased, to be called respectively the Haven House and the Wesley House. The chemical laboratory was completed and occupied in February, 1899, the total cost being \$41,587. The \$50,000 promised for Seelye Hall on condition that the trustees would appropriate an equal amount, was duly paid into the college treasury, and the library endowment fund of \$20,000 was completed, and is to be known as the L. Clark Seelye Library Fund. The total gifts to the college during the year were \$128,288, a larger sum than in any previous year of its history. For statistics see UNIVERSITIES AND COLLEGES.

SMITH, WILLIAM HUGH, ex-Governor of Alabama, died in Birmingham, Ala., January 1, 1899. He was born in Georgia in 1826, but in boyhood moved with his father to Randolph County, Ala., which before the Civil War he represented in the legislature. He was a Republican and opposed secession. In 1868 he succeeded Governor Patton, serving two years. Both before his governorship and after he was circuit judge, and in 1881 was appointed by President Garfield district attorney for the northern district of Alabama, in which position he remained until the beginning of Mr. Cleveland's administration in 1885.

SMITHSONIAN INSTITUTION. See ANTHROPOLOGY IN AMERICA.

SOCIALISM. There has been a tendency among Socialists in recent years to modify their theories in some important respects and to assume a more compromising attitude toward other political parties. This tendency has offended some of the more strictly doctrinaire groups. It was especially marked in 1899, occasioning active discussion and divisions among parties. As representatives of this more practical and conciliatory spirit we may mention Herr Vollmar in Germany and M. Millerand in France. The former entered into an alliance with the Catholics of Bavaria and the latter took his seat in the Waldeck-Rousseau cabinet side by side with General de Galliffet, who had distinguished himself by his severity in the suppression of the Commune. The discussion of Millerand's action was carried on not only among the Socialist groups in France, but among the Social Democrats of Germany, Belgium, and Holland, since it involved the important question, How far may the Socialist proletariat interfere in the politics of the bourgeoisie in order to save public liberty, as, for example, in the case of the Dreyfus affair? In other words, to what degree is the idea of the conflict of classes opposed to a partial assumption of governmental power by the Socialist party? Radical leaders, like MM. Guesde and Vaillant in France and Herr Liebknecht in Germany, held in general to the view that the sharing of power with the bourgeoisie was not permissible. As to the Dreyfus affair, they held that it had no revolutionary importance, and that Socialist interference in it was bad policy. Herr Bebel stigmatized it as a mistake and as bringing discord into the party. In France the majority of Socialists seemed to favor the Dreyfusard policy, but many of those who were consulted disapproved of Socialist participation in ministerial power. Along with this change in the attitude of men of affairs there has been an effort on the part of theorists to recast the Socialistic doctrine, and the best illustration of this is to be found in the work of Herr Bernstein, entitled *The Hypotheses*

of *Socialism and the Task of the Social Democracy* (Stuttgart, 1899), which was regarded by some as the most important Socialistic publication since the appearance of Karl Marx's great work, *Das Kapital*. The practical reason for a revision of the strict doctrines of Karl Marx was the need of adherents. By holding aloof from martial measures as likely to defer the revolution, the Socialists would have forfeited the support of the workingman. They have on the contrary interested themselves actively on his behalf, and labor reform has taken its place in their programme. Again, it would hardly do to preach strict Marxism to the agricultural laborer, who would not be likely to favor a party that told him he was on the eve of destruction, and that his little holding was sure to be absorbed under collective ownership. It is natural that these practical necessities should cause a modification of the theories. According to Bernstein, Marxism must be abandoned as a system. He criticised the surplus labor theory, and the idea that the entrepreneur derives his gain by robbing the workingman through a one-sided exploitation of the hours of labor. He objects to Marx's view as to the concentration of industry, and points out that such concentration does not apply to agriculture, and that it does not necessarily mean concentration of fortunes. And as to the prosperity of the working classes under the capitalistic system, Bernstein holds that the working classes are the most prosperous precisely in those countries where capitalism and the use of machinery have been carried to the farthest point. The Social Democracy, says he, is not the product of misery, but of the awakened conscience of a class that is bound to improve its condition. Like other recent writers on Socialism, he emphasizes the need of improving the moral character of the workingman, and advises the abandonment of revolutionary propaganda. He favors trades unions as a good means for carrying on this work of moral education. In other words, he would substitute a spirit of reform for the spirit of revolution, and would advise working classes to seek their emancipation by organizing themselves rather than by expropriating the bourgeoisie.

A Proposed Congress.—Early in the year it was planned to hold a great international Socialistic congress at Paris in 1900, and on March 7, 1899, a manifesto was addressed to all the Socialistic and labor organizations of the world proposing a preparatory conference at Brussels on May 27-28. Admission to this conference was conditioned upon a belief in the following principles: Socialization of the means of production and exchange; international unity of action among workmen; conquest of political power by the proletariat organized as a class. The last-named feature of the programme was condemned by the radicals, who proposed a congress of their own, which should also meet in 1900. They disapproved of what they characterized as a mere political move. Thus the forces of the Socialists were divided as before into the parliamentary and the anti-parliamentary groups. The latter exist in Holland, Spain, and Belgium, as well as in France, but have not the importance of their adversaries, who are willing to adopt practical means for advancing their aims. The anti-parliamentary group generally manifest great confidence in the principle of a general strike. The preparatory conference was held at Brussels at the time appointed. Eleven nations were represented, and France sent the largest number of delegates. It laid down the conditions of admission to the proposed international congress of 1900. These were the same as had prevailed for the international congress of London. While excluding anarchists, the new congress was to include all Socialistic groups which aimed at the substitution of Socialistic ownership and production for capitalistic property and production, and favored parliamentary action as a means to that end; also all labor organizations which recognized the need of political and parliamentary action. The programme for discussion included the following topics: An international *entente*; international labor legislation; the emancipation of labor; the proletariat; the political and economic expropriation of the bourgeoisie; socialization of the means of production; international peace; militarism; suppression of permanent armies; colonial policy; maritime workmen; universal suffrage and direct legislation; communal socialism; conquest of public powers; alliance with the parties of the bourgeoisie; trusts. The subject of a general strike was excluded by a vote of six nations against five. This showed the dividing line between the party of political action and the revolutionary groups.

Germany.—The anti-strike bill mentioned in the last YEAR BOOK as favored by the Emperor in view of certain disorders in the industrial world was still under discussion in 1899. At a congress of German labor organizations, held at Frankfort on May 13 this bill was the subject of the greatest interest. It was vigorously opposed. A book attacking the measure was widely circulated, nearly a million and a half copies being published. (See GERMANY, paragraphs on History.) This measure was characterized by its enemies as an attack on workmen's liberty of association. But the Saxon government aroused more resentment for its alleged infringement of workmen's rights than the government of the empire. This was illustrated in 1899 by the affair of Löptau. A party of carpenters assaulted their employer after a quarrel in regard to the employment of certain workmen overtime. The assailants,

having been arrested, received the maximum penalty. The Socialist newspaper *Vorwärts* started a subscription on behalf of their families, and appealed to public opinion against the severity of the sentence. In the *Reichstag*, a Socialistic deputy, Herr Heine, referred to the condemned as martyrs, and blamed the employer as the aggressor. The most important event in the year's record of German Socialism was the congress of German Socialists, at Hanover, October 8-14, 1899. It brought out very clearly the recent tendencies noted in a preceding paragraph. The great question was whether men like Vollmar, Auer, and David, who favored an opportunist policy, and a modification of the older doctrines, should prevail over the more radical party as represented by Bebel, Liebknecht, Kautsky, and others. After a lively discussion a compromise was reached in a resolution reaffirming the essential principles of Socialism, but making certain concessions to the new spirit, as, for example, the authorization of political alliances with the parties of the bourgeoisie in certain circumstances.

France.—After the suicide of Henry, the French Socialists showed a tendency to unite in their attitude toward the Dreyfus affair. They hailed it as an attack on existing institutions, and therefore likely to weaken the basis of society. But the entry of M. Millerand into the Waldeck-Rousseau cabinet destroyed all hope of union. Out of the 37 deputies in the chamber only 18 voted for the ministry, and the same division showed itself in the country at large. The opponents, led by MM. Guesde and Vaillant, condemned this policy of compromise and stood squarely upon a revolutionary platform. M. Jaurès defended Millerand's course. An attempt was made by the rival Socialist factions to restore harmony, and a new congress was proposed. The *Syndicat Guérard* with its programme for a general strike was conspicuous in 1899, as in the previous year. The attempt at a general strike toward the close of 1898 had failed, and the authors, including the committee of administration and the secretary-general, offered their resignation. At a special meeting of the syndicate on January 20-21, 1899, these resignations were accepted, but the officers were discharged from all blame. The failure of the movement in 1898 did not deter the radical members from renewing their demand for a general strike, and there was much discussion of the subject in 1899. Some suggested that the 1900 exposition would offer an excellent opportunity for such a movement.

Great Britain.—Early in March, 1899, a meeting of English, Belgian, French, and German Socialists was held at London to discuss the question of international peace, and proposed their own programme, in opposition to that of the Czar. International Socialism, according to them, was the only possible basis of international peace, since it alone could bring about the solidarity of the people and the spirit of brotherhood. Indiscriminate attacks were made upon the policy of the various governments. English generals were accused of killing wounded men and mutilating the dead, and classed with the French generals who had conspired against Dreyfus, and Russia's policy in Finland was said to be merely following the example which England had set in India. Capitalism and militarism in all their manifestations were the subjects of much denunciation. See TRADES UNIONS.

SOCIAL SCIENCE ASSOCIATION, AMERICAN, founded in 1865, was incorporated in 1899, and had in the latter year about 1000 members. General meeting for 1900 at Washington, May 7-11. President, Charles Dudley Warner; secretary, Frederick Stanley Root, 129 East Fifteenth Street, New York City.

SOCIALIST TRADE AND LABOR ALLIANCE was organized in 1895 by seceding members of the Knights of Labor. General meeting for 1900, at Pittsburg, Penn., September 17. The alliance publishes *The People*. Secretary, William L. Brower, 23 Duane Street, New York City.

SOCIETY ISLANDS, a group in the Pacific Ocean, constituting one of the French establishments, lie near longitude 170° west and latitude 16° south, and include Tahiti, Moorea, Meetic, and the Tetiaroa Islands. Tahiti, the largest, has an area of 412 square miles, and a population of about 10,300; the area of Moorea is 50 square miles, and the population about 1600. The establishment is administered by a governor, assisted by a council; besides there is a general council elected by popular vote. The principal town is Papeete on Tahiti. For 1898 the local budget was 1,229,625 francs; the revenues do not meet the expenditure, and the appropriation by France, budget of 1899, was 856,080 francs. There are under cultivation in Tahiti and Moorea about 7000 acres. The leading export is mother-of-pearl; other important exports are vanilla, copra, cotton, and oranges. The chief imports include provisions, textiles, wines, sugar, and timber. The imports come largely from the United States, from Great Britain and her colonies, and from France and her colonies. The imports and exports for 1898 were reported to amount to \$577,584 and \$570,490 respectively. In 1897 there entered at the port of Papeete 286 vessels, aggregating 29,585 tons.

SOMALI COAST, a British protectorate extends along the Gulf of Aden from Obok, or the French Somali Coast Protectorate, to Italian Somaliland, and is bounded on the east and south by the latter, and also on the south by Abyssinia. The area is 68,000 square miles. No trustworthy estimate has been made of the population, which is Mohammedan and largely nomadic. The chief town is Berbera, with about 30,000 inhabitants; the population of Zaila is 6000, of Bulhar 5000. The protectorate is administered by a political agent and consul, and up to 1898 was attached to the Aden dependency of the Bombay presidency, but in that year it was placed under the British Foreign Office. The consul-general is Lieutenant-Colonel J. Hayes Sadler. The products and exports are chiefly cattle, hides and skins, ostrich feathers, sheep, and gum. The principal imports are rice, dates, and textiles. It was reported in the fall of 1899 that Mohammed Saleh, an Arab mullah who had been proclaimed Mahdi by the Mussulmans of the hinterland, had incited a Mohammedan uprising, which was thought to be directed against Abyssinia. Indo-British troops were said to have reached the Somali coast and a battle taken place near Berbera.

SOMALILAND, an Italian dependency, extending along the Gulf of Aden and the Indian Ocean from the British Somali Protectorate to British East Africa, and bounded on the west by these two districts and by Abyssinia. This coast strip is 180 miles wide. The estimated area is 100,000 square miles, and population about 400,000. The seat of government is Itala, a newly formed settlement. On November 28, 1899, a convention with the Italian Trading Company, of Benadir, was approved, according to which the administration of both the towns and the hinterland was undertaken by the company.

SONS OF THE AMERICAN REVOLUTION, organized in New York in 1889 and chartered in Connecticut in 1892, had in 1899 a membership of 9090, in 38 State societies, of which those of New York (1100 members), Massachusetts (1300), and Connecticut (1000) are the most important. The officers of the New York, or Empire State, Society are Robert B. Roosevelt, president; secretary, William W. Kenley, 1123 Broadway, New York. The officers of the national society are: President-general, Franklin Murphy, New Jersey; secretary-general, Samuel E. Gross, Chicago, Ill.

SONS OF THE REVOLUTION, a society first organized in New York in 1875, comprising only the male descendants over 21 years old, of a person who was a "military, naval, or marine officer, soldier or sailor, or official in the service of any one of the thirteen original colonies or States," between April 19, 1775, and the same day in 1783. The last triennial meeting was held at Denver, Col., April 19, 1899. The next is to be held in Washington, D. C., April 19, 1902. There are 30 State societies and one in the District of Columbia, with over 7000 members. General president, Ex-Governor John Lee Carroll, Maryland; general secretary, J. M. Montgomery, New York.

SONS OF VETERANS, U. S. A., a society of the lineal descendants of soldiers, sailors, and marines who fought in the Union army in 1861-65. The first camp was organized in Philadelphia, September 20, 1879. There are now about 2000 camps, divided into 29 divisions, each division being under a commander. Each camp has its own officers, the chief officer being a captain. The total membership is about 100,000. The nineteenth annual encampment will be held at Syracuse, N. Y., in September, 1900. Commander-in-chief, A. W. Jones, Youngstown, O.

SONS OF WAR VETERANS, SOCIETY OF THE, is composed of male lineal descendants of those who fought on the Union side in the war of 1861-65. Commander-in-chief, W. F. Langschultz, New York City; adjutant-general, W. F. Kennedy, 110 East Forty-seventh Street, New York City.

SORORIS, the oldest society of women in the United States, founded in 1868, for political, literary, and social aims, had in 1899 a membership of 240. Secretary, Mrs. William Curtis Demorest, 68 East Sixty-sixth Street, New York City.

SOUDAN. See **EGYPT.**

SOUTH AUSTRALIA is a British colony, extending through the central portion of the continent of Australia, from the north to the south coast, is divided into the Northern Territory, added in 1863, and South Australia proper. The total area is 903,690 square miles. The greatest length north and south is 1850 miles and the extreme breadth, 650 miles, with a seaboard on the Indian and the Atlantic Ocean of about 2000 miles. The population, as estimated on December 31, 1898, was about 362,900. The population, as will be seen, is sparse; Adelaide, the capital of the colony, contains with its suburbs about 147,600, or about two-fifths of the inhabitants. At this city are the University of Adelaide, and a public library, museum, and art gallery. The northern territory, containing the town of Palmerston, situated on

a fine harbor, has less than 5000 of the total number of inhabitants in South Australia. The colony is divided also into three natural sections, characterized by climatic conditions. The southern and more settled portion is fertile, and is chiefly adapted to wheat growing; the middle portion is arid, and the northern part of the colony is subject to tropical rains. The climate in the south is said to be one of the best in Australia, and the soil almost matchless, but there is little rainfall. Irrigation, however, is being largely extended, the river Murray being the main source of supply. Although South Australia proper is the more settled portion of the colony, nearly 79 per cent. of its lands are said to be practically unknown and wholly uncultivated. Of the remaining 21 per cent., or about 51,546,880 acres, some 2,604,122 acres were under cultivation in 1898. Ninety per cent. of the cultivated lands was in cereal crops, chiefly wheat. The quantity of wheat produced in the colony in 1898-99 was 8,778,900 bushels. Among important products also are fruit and wine. There were in 1898 about 5,012,620 sheep, and 35,118,644 pounds of wool were exported. Mineral resources have not yet been developed to any great extent, but copper and gold, silver, lead, manganese, bismuth, iron, and coal are found. The exports for 1898 were £6,795,774 and the imports, £6,184,805. The revenue is derived mainly from customs duties, inland revenue, territorial receipts, posts, telegraphs, and railways. The public debt in 1898 was £24,408,535, one-half of which was represented by railways. The latter show an annual profit over working expenses of 3.3 per cent. The total length of government lines in 1898 was 1724 miles. There is a telegraph line 1975 miles in length, crossing the colony from ocean to ocean, between Adelaide and Palmerston, at Port Darwin, which was built by the colony in 1872; the wire is now being duplicated. There are nearly 6000 miles of additional lines. There is universal suffrage in South Australia. The government is administered by a governor, Lord Tennyson being appointed in 1899, and a parliament elected by the people, consisting of a legislative council and a house of assembly. The governor is commander-in-chief of the forces. The premier in 1899 was the Right Hon. C. C. Kingston.

History, 1899.—The Australian colonies do much by means of the government, and South Australia is among the first in this respect. Dr. John A. Cockburn, a former premier and for many years minister of education in this colony, described in an address before the International Commercial Congress in 1899 the sphere of governmental action in South Australia. The formation of homes is encouraged by selling the settler government land on such terms that he can invest most of his capital in the development of his property; efforts are made to settle labor by a system known as workingmen's blocks. Many laborers are demanded at harvest time, but there is very little work for these men during other times in the year. It is the purpose to settle these laborers on blocks of land, on which spare time may be employed during a dearth of employment, the state advancing sums of money for buildings and other improvements. Sometimes these blocks are combined to form village settlements, the workingmen holding their land, irrigation machinery, pumping plant, and means of production in common. There is also a government receiving depot, by the aid of which small fruit growers and the like are enabled to forward their produce for export at a minimum of expense, and to compete with the large dealers. Questions in dispute are, when important, generally referred to the people themselves for decision. Of course, the greatest question throughout Australia in 1899 was that of colonial federation. In South Australia the proposal was approved by a popular vote of 66,000 to 17,000. (For a full discussion of the subject see the article AUSTRALIAN FEDERATION.) Another important question submitted to popular vote was the bill lowering the franchise qualification for the council from £25 to a household franchise. This was passed by the assembly, but thrown out by the council; being then submitted to the people, it was passed. In October troops were offered to the imperial government for service in the South African war. The ministry resigned in November, owing to a want of support, and was succeeded by a cabinet formed by Mr. Solomon.

SOUTH CAROLINA, a southern Atlantic State, with an area of 30,570 square miles. Capital, Columbia.

Mineralogy.—Quarrying yielded a surprising result in 1898, when the output of granite, amounting in value to \$169,518, was an increase over that of the preceding year of \$131,698. There was also an increased production of limestone, the total value being \$34,000, making an aggregate value of \$203,518. The precious metals too indicated a larger activity, the production of gold being 5041 fine ounces, valued at \$104,200; and of silver, 300 fine ounces, coining value, \$388—in all, \$104,588.

Agriculture.—A noteworthy change appears to be taking place in the agricultural interests of this State, involving the supplanting of cotton by other crops, especially tobacco and wheat. In the season ending August 31, 1899, the cotton area was 2,353,213 acres and the production, 1,035,414 bales; and for the season ending August 31, 1900, the estimated area was 2,212,000 acres, and the estimated yield,

165 pounds of lint cotton to the acre. In 1899 the farmers planted tobacco extensively in six large counties in the rich Pee Dee section, and elsewhere many experimental farms were put under tobacco cultivation. Thousands of tobacco barns now dot the State, and in eight or ten towns large warehouses have been built. During August sales took place at these warehouses aggregating several million pounds of the leaf, at prices ranging from 4 to 26 cents per pound. Not only was the annual production about doubled, but the grade of leaf was greatly improved. It was believed that the warehouse sales of tobacco would amount to nearly 20,000,000 pounds for the entire season. The appreciation of wheat has been more sudden than that of tobacco. In 1898 a large acreage was planted in wheat, and while the oat crop failed, the yield of wheat was excellent. This result greatly stimulated planting, and also led to the building of about a score of roller mills in the early part of 1899, which, supplied with improved machinery, were kept rushing during the grinding season. State-grown wheat brought a higher price in the market than outside, and there was a local demand for the entire production. Another notable feature in local agriculture is the decided success of the tea gardens at Pinehurst, a suburb of Summerville, the only enterprise of its kind in the United States. This unique plantation belongs to Dr. Charles U. Shepard, who has devoted ten years to tea culture. In 1892 he had a crop of 56 pounds, in 1898 one of 1200 pounds, and in 1899 the crop was expected to reach nearly 4000 pounds, as the yield to August 18 was 2800 pounds. The plantation contains 800 vigorous plants and 200 young ones.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$284,278. Eight manufactories of tobacco and 11 of cigars had a combined output in the calendar year 1898 of 659,532 cigars, 16,200 cigarettes, 2618 pounds of plug tobacco, and 6882 pounds of smoking. Grain and fruit distilleries in operation numbered 36; the amount of distilled spirits gauged was 219,975 gallons; and the production of fermented liquors, 7022 barrels. In his annual message to the legislature in January, 1900, Governor McSweeney, detailing the development of cotton manufacturing during 1899, declared that in this industry South Carolina leads all of the Southern States, and is second only to Massachusetts in the number of spindles. During the year 11 new mills were organized, representing a combined capital of \$3,275,000, and 16 old mills were remodelled, representing an increase in their capital stock of \$2,429,000. Few mills in the State have a capital of less than \$100,000, the majority have \$200,000, and one building in Columbia has \$1,500,000. All the mills paid good dividends in 1899, and an influential newspaper asserted that the easiest thing to do now in that part of the world was to raise \$500,000 with which to build a cotton mill. Including the one now building, Columbia alone has 6 mills, with \$4,500,000 capital, 6000 looms, and 250,000 spindles; and all but one of them are operated by electricity. The annual consumption of these mills is from 70,000 to 75,000 bales. In Spartanburg County there are 24 mills in operation, with \$5,110,000 capital, 12,454 looms, and 410,632 spindles, and their annual consumption is 220,000 bales. During 1899 the cotton mills of South Carolina consumed nearly one-third of the number of bales used in the factories of the Southern States. See COTTON AND THE COTTON INDUSTRY.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Beaufort and Charleston (\$997,879) aggregated in value \$1,050,004; exports at Beaufort and Charleston (\$8,059,158), \$8,999,292, making the total foreign trade of the year \$10,049,296, a decrease in a year of \$5,196,236, chiefly in exports.

Railways.—The new railway construction in the calendar year 1898 was 16 miles, and in 1899, 162.58 miles, giving the State a total mileage of 2818.03. Railway property was assessed at \$24,658,004 for taxation in 1898, an increase of \$515,663.

Banks.—On October 31, 1899, there were 16 national banks in operation and 6 in liquidation. The active capital aggregated \$1,923,000; circulation, \$662,009; deposits, \$5,533,358; reserve, \$1,541,220; and resources, \$10,375,188. The State banks, June 30, 1899, numbered 5, and had capital, \$251,925; deposits, 362,061; resources, \$799,869; and surplus and profits, \$94,391; and stock savings banks, 2, with capital, \$230,000; depositors, 3565; deposits, \$2,042,337; and resources, \$2,414,656.

Education.—There is no State school census. At the close of the school year 1897-98 the school population was estimated at 200,000 white and 350,000 colored, and the enrolment in the public schools was 125,102 white and 150,787 colored. There were 3076 teachers for white children and 2166 for colored, and the total expenditures were \$754,741, of which \$526,858 was for schools for white children, \$204,383 for those for colored, and \$23,500 for both in common. Public high schools numbered 85, and had 177 secondary teachers, 3312 secondary students, and 3550 elementary pupils; private secondary schools, 34, with 99 teachers, 1474 secondary students, and 2291 elementary pupils; and normal schools, 7 (1 public, 6 private), with 88 teachers and 1938 students in all departments. Normal training was also given in 5 colleges and 1 public and 4 private secondary schools. Nine universities and colleges for men and for both sexes reported 77 scholarships, 92 professors and

instructors, 1069 students, 71,300 volumes in the libraries, valued at \$93,000; \$22,300 invested in scientific apparatus, \$845,000 in grounds and buildings, and \$550,800 in productive funds; \$99,872 in total income, and \$31,514 in benefactions. Nine colleges for women reported 119 professors and instructors, 1423 students, 10,600 volumes in the libraries, \$404,000 invested in grounds and buildings, and \$123,200 in total income. The South Carolina Industrial Home for Negro Boys and Girls, an institution designed to do for colored children what the Tuskegee Normal and Industrial Institute does for grown negroes, was opened at Columbia on November 30, 1899, under the direction of Rev. Richard Carroll, a negro Baptist preacher. In 1899 there were 112 periodicals, of which 8 were dailies, 12 semi-weeklies, 95 weeklies, and 6 monthlies and quarterlies each.

Finances.—The assessed valuations for 1898 were: Real estate, \$100,719,716; personal property, \$47,859,385; and railroad property, \$24,658,004—total, \$173,237,105; tax rate, \$5 per \$1000. The total recognized bonded debt, January 1, 1899, was \$6,844,945, including \$350,208 in old bonds that have never been presented, and are probably destroyed. For many years the State derived considerable revenue from royalty on the phosphate mined in the deposits owned by it, but by 1898 this income fell to \$23,522.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 1,335,000.

Legislation.—The law giving the governor power to appoint police officers to enforce the Dispensary Liquor law was repealed. The use of the impression of the palmetto tree on bottles was prohibited. Officers who receive rebates or commissions are to be punished. Seats must be furnished for female employees, and the wages of discharged employees shall become due immediately. Fire insurance companies that combine to make rates of insurance are to have their licenses revoked. The State Board of Health is to enforce vaccination, and those who interfere or resist are to be punished by fine or imprisonment, "which shall not stand in lieu of vaccination." Corporations for transportation are to obtain charters from the secretary of state instead of by special act of the legislature. Charters of cities and towns may be amended by vote of the electors. Those who trade in sea-island cotton in the seed must have a license. It was made a misdemeanor for a cotton buyer to refuse to receive bales of cotton weighing over 300 pounds because of lightness, after purchasing by sample. Maximum charges were prescribed for handling and selling tobacco by warehousemen. Fertilizers must be inspected by the trustees of the Clenson Agricultural College. Although Governor Ellerbe, in his message at the opening of the general assembly, January 10, referred to the recent serious increase in the number of lynchings in the South, and strongly recommended legislation that should remedy the evil, no laws bearing upon the subject appear to have been passed.

State Officers and National Representatives.—Governor, M. B. McSweeney; lieutenant-governor, R. B. Scarborough; secretary of state, M. R. Cooper; treasurer, W. H. Timmerman; comptroller, D. P. Derham; attorney-general, G. D. Billinger; adjutant-general, J. W. Floyd; superintendent of education, J. J. McMahan. Supreme Court: Chief justice, Henry McIver; justices, Eugene B. Gary, Ira B. Jones, Y. J. Pope; clerk, U. R. Brooks. The State legislature consists of 164 Democrats and 1 Republican. Senators, Benjamin R. Tillman, from Trenton; and John L. McLaurin, from Bennettsville—both Democrats. Representatives, William Elliott, from Beaufort; W. J. Talbert, from Parksville; A. C. Latimer, from Belton; Stan-yarne Wilson, from Spartanburg; D. E. Finley, from Yorkville; James Norton, from Mullins; and J. William Stokes, from Orangeburg—all Democrats.

SOUTH DAKOTA, a northwestern State, with an area of 77,650 square miles. Capital, Pierre.

Mineralogy.—The production of the precious metals in the calendar year 1898 was, gold, 275,723 fine ounces, valued at \$5,699,700; silver, 152,300 fine ounces, coining value, \$196,913—total value, \$5,896,613. According to the annual report of the State inspector of mines, the output of gold in the calendar year 1899 had a value of \$9,136,436. During that year 36 old mines in the Black Hills, which were formerly good producers of both gold and silver, were reopened, a movement growing out of improved business conditions, and the discovery of more economical methods of treating low-grade ores. In Laurence County alone 7 new cyanide plants were erected in the year, and 1,178,000 tons of ore were treated in the plants in the Black Hills and vicinity. Toward the close of the year a number of experienced Colorado mine operators began investigating the phonolite district of the Black Hills region. A number of valuable copper discoveries was made in the mining districts; wolfram ore was mined for the first time in the Hills, and prospecting showed the phonolite belt west of Deadwood to be 16 miles long by 4 miles wide. The American Mining Company began constructing a tunnel at the base of Ragged Top, on the quartz level in the Black Hills, which will be nearly a mile long, and cost approximately \$3,000,-

ooo. This company has laid out a town, named American City, and has planned to bring into use the power of Spearfish River, a short distance from the opening of the projected tunnel, and to create an electric power for all the cities and mining camps in the northern Black Hills. In November a rich streak of sylvanite ore was opened in Carbonate Camp, and the first regular shipment of copper ore from the Black Hills was made from the Blue Lead Mine, six miles east of Hill City. In the previous month a vein of nickel ore was discovered in Deadwood, the first of that metal found in the Black Hills region, and also a deposit of platinum; and an expert examination of the formations of the copper belt at Deadwood showed them to be practically identical with those of the great Butte camp in Montana. Altogether the year of 1899 was one of surprises, unusual activity, general prosperity, and rich promise.

Manufactures.—The two Dakotas are included in the internal revenue collection district of Nebraska, and the principal details of taxable manufactures are combined with those of that State. The collections in South Dakota alone aggregated \$172,707. Seven manufacturers of tobacco and 53 of cigars had a combined output in the calendar year 1898 of 4,767,973 cigars, and a small quantity of smoking tobacco. The State had about 150 creameries, whose production of butter exceeded \$3,000,000 in value.

Banks.—On October 31, 1899, there were 25 national banks in operation and 28 in liquidation. The active capital aggregated \$1,460,000; circulation, \$573,815; deposits, \$5,423,004, and reserve, \$1,838,665. The State and private banks, June 30, 1899, numbered 152, and had capital, \$1,964,530; deposits, \$7,327,356, and resources, \$10,208,324. The exchanges at the United States clearing house at Sioux Falls in the year ending September 30, 1899, aggregated \$6,771,245, an increase of \$1,022,967 in a year.

Railways.—The new railway construction in the calendar year 1898 was 12 miles, giving the State a total mileage of 2813.42. In 1899 the construction was principally confined to short feeders.

Education.—The latest reports on the public schools at time of writing were for 1895-96, when the estimated school population was 473,300 and the enrolment 258,183. For the school year 1897-98 there were reported 29 public high schools, with 68 secondary teachers, 1615 secondary students, and 278 elementary pupils; 7 private secondary schools, with 29 teachers, 370 secondary students, and 524 elementary pupils; 2 public normal schools, with 22 teachers and 593 students in all departments; and 1 private one, with 7 teachers and 120 students. Normal training was also given in 5 colleges. Six universities and colleges for men and for both sexes reported 40 scholarships, 76 professors and instructors, 947 students, 17,857 volumes in the libraries, \$6750 invested in scientific apparatus, \$390,500 in grounds and buildings, and \$82,500 in productive funds, \$62,215 in total income, and \$22,800 in benefactions. Two schools of technology had 24 professors and instructors, 421 students, 6400 volumes in the libraries, \$40,000 invested in scientific apparatus, and \$110,000 in grounds and buildings, and \$69,433 in total income. In 1899 there were 263 periodicals, of which 18 were dailies, 228 weeklies, and 14 monthlies.

Finances.—The assessed valuations for 1899, as equalized, aggregated \$158,722,704, an increase in a year of \$40,142,308, and the highest total in the history of the State. The total debt, January 1, 1899, all bonded, was \$738,300; sinking funds and other assets, \$226,430; net debt, \$511,869. There were also unpaid taxes more than sufficient in amount to pay the entire net debt. In 1898 railway property was assessed at \$9,328,053; other corporation property, \$311,761; and live stock, \$8,684,906.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 405,000.

Legislation.—An elaborate law was enacted regulating the manufacture and sale of food and providing against the adulteration thereof. A State board of embalmers was created to examine, register, and license all persons who embalm the dead, and to regulate the business. Registration of all voters is now required. Initiative and referendum will be applied to the State and to the municipalities, under laws passed in compliance with the constitutional amendment adopted by the people in 1898. At the same election the people voted that the manufacture and sale of liquor should be under exclusive State control, and be conducted by salaried agents of the State. At the general election of 1900 the question of the repeal of this article will be voted on, and also the question whether permanent school funds may be invested in mortgages on farm lands as well as State, county, school, and municipal bonds.

Elections.—In spite of the fact that there were no officers but Supreme Court justices to be elected, the election was the most animated one the State had had for years. The issue was the endorsement of the Republican administration, and on this line the battle was fought, the Republicans carrying the State by majorities approximating 5000.

State Officers and National Representatives.—Governor, Andrew E. Lee; lieutenant-governor, John T. Kean; secretary of State, W. H. Roddle; treasurer, John Schamber; auditor, James D. Reeves; attorney-general, John L. Pyle; superintendent of education, E. E. Collins. Supreme Court: Chief justice, Dighton Corson; justices, Dick Haney and H. G. Fuller; clerk, Miss Jessie Fuller. The State legislature consists of 87 Republicans and 45 Fusionists. Senators, Richard F. Pettigrew (Sil. Rep.), from Sioux Falls; and J. H. Kyle (Ind.), from Aberdeen. Representatives, Charles H. Burke, from Pierre; Robert J. Gamble, from Yankton—both Republicans.

SOUTHWORTH, MRS. EMMA DOROTHY ELIZA NEVITTE, author, was born in Washington, D. C., December 26, 1819, and died there June 30, 1899. She taught in a public school in Washington from 1844 to 1849, and during those years wrote her first story, *The Irish Refugees*; her first novel, *Retribution*, appeared serially in the *National Era*, and several others appeared serially in the *New York Ledger*. She wrote *The Irish Visitor*, *The Hidden Hand*, and 40 others prior to 1872, when a uniform edition of 42 stories was republished. She is said to have written 56 novels in all, dealing largely with Southern life. Among the best known are: *The Fatal Secret*; *Gloria*; *The Trail of the Serpent*; *The Bride's Fate*; *How He Won Her*; *The Mother-in-law*; *The Phantom Wedding*, and *The Hidden Hand*.

SPAIN, a kingdom of Europe, occupying the greater portion of the Iberian peninsula, has an area, including 13 square miles on the coast of Africa, of 197,670 square miles and a population of about 18,000,000. The capital and largest city is Madrid, with a population in 1887 of 470,283. Other cities with a population of over 100,000 are Barcelona, Valencia, Seville, and Malaga. There are 17 cities having a population of over 30,000. The emigration from Spain is largely to Argentina, Brazil, and Uruguay. The latest figures are for 1895, when 166,269 persons emigrated.

Production and Commerce.—Spain is rich in minerals, especially iron, coal, copper, and lead. Mining has been neglected, considering the ore deposits at hand, but increasing interest in this branch of industry is said to have come about during 1897-99. Lack of railroad facilities has been one cause of retarded development, but lack of enterprise is the greatest. The most important agricultural products are wheat and other grains, hemp, flax, subtropical fruits, and products of the vine. It is said that, in spite of the recent war and the heavy taxation, native industries in Spain have not suffered as greatly as was feared. Efforts are being made to increase foreign trade and to find new markets to take the place of the colonies lost in 1898. The Spanish-American republics naturally offer the best inducements for the extension of Spanish trade, and commercial attachés have been appointed for Mexico, Brazil, Uruguay, Argentina, and Chile. Spanish imports into Cuba, Puerto Rico, and the Philippines are estimated to have exceeded \$40,000,000 a year. In respect to home affairs, it may be said that Spain is naturally a self-supporting country and to a large extent independent of foreign foodstuffs, there being quite a large amount of wheat exported in favorable years. In 1898, however, the price of wheat rose, Spanish currency depreciating at the same time, and import duties on wheat were suspended, and the export of cereals forbidden. Various disturbances and bread riots occurred, but the succeeding harvest proved a good one, and export of cereals was again permitted. Wheat imports, however, continued, about 109,000 tons being brought in during the first five months of 1899. The first direct shipment from the United States to Valencia after the war was a cargo of 4000 tons of red winter wheat. The United States consul at the latter port calls attention to the opportunities for Americans in this branch of trade. During March, 19,000 tons were imported, of which 7000 tons were American, 6000 Russian, and 4000 French wheat. In May the Russian imports were somewhat larger than those from the United States. Since the loss of her colonies Spain's sugar factories have been unable to supply the home demand, which amounts to about 100,000 tons of sugar during the year. There is a protective tariff of 102¼ per cent. on foreign sugar imports. Merchants and trades unions have petitioned that this duty be reduced to 50 per cent., and it is stated by our consul at Valencia that, in spite of the opposition of Spanish refiners, the duty will probably be lowered. He mentions this as another opportunity for American trade. Complete trade statistics for 1899 are not available. In 1898 the imports amounted to 525,701,817 pesetas, the principal items being grain, sugar, wine, etc.; raw and manufactured cotton; gold and silver; minerals, glassware, and pottery, and drugs and chemicals. The principal importers were the Spanish colonies, France, and Great Britain, which also took the bulk of the exports. The latter amounted in 1898 to 838,617,599 pesetas, and included grain, sugar, wines, etc.; minerals, glassware, etc.; metals and their manufactures, animals and animal products, etc. In 1899 United States imports into Spain were \$11,528,777, a gain of over a million dollars. Spain exported to this country \$5,341,636, an increase of nearly \$2,000,000.

Army and Navy.—The regular army has a peace footing of 128,559 and a war footing of 183,972. Besides the permanent army, there is an active and a sedentary

reserve. There is also a colonial army, a large portion of which returned to Spain during 1898-99. Spain's navy is now under reconstruction. In 1898, in anticipation of war with the United States, Spain made some effort to modernize some of her older ships, such as the *Numancia*, *Vitoria*, and *Pelayo*. She lost in that war 45 large and small vessels in all (including 12 cruisers), with a total displacement of 48,042 tons. The most important armored vessels of the remaining Spanish fleet are the *Carlos V.*, *Pelayo*, *Numancia*, *Cataluña*, *Cisneros*, and *P. de Asturias*, the first two averaging 9500 tons and the remainder 7000 tons each; there are also 3 partially protected vessels of 5000 tons each and 1 of 1000 tons. Two cruisers were building in 1899—the *Isabel la Católica* and *Reina Regenta*. During the year the *Río de la Plata*, of 1800 tons, was launched.

Finance, etc.—The budget estimates for 1898-99 were 937,930,415 pesetas for revenue and 937,178,134 pesetas for expenditure. In 1898 provision for extraordinary expenditures was made by credits on the Tobacco Company's advance, a loan on guarantee of the Almaden mines, and a tax on traffic, the operations extending to the close of 1904. The public debt at the beginning of 1898 was equivalent to £369,645,700, of which £57,655,000 represented the Cuban debt. The programme of the Silvela ministry in 1899 called for the recognition of the Cuban debt, but it was hinted that the taxation of the holders might be necessary. Seven-eighths of this debt were held in Spain.

HISTORY.

The Treaty of Peace.—The peace treaty between Spain and the United States, signed in Paris on December 10, 1898, was humiliating to the Spanish people, and certain clauses of it were signed under protest by the Spanish commissioners. Differences of opinion arose between the two commissions in their interpretations of the protocol of August 12, 1898, but the Spaniards were forced to acquiesce. They protested in vain against the relinquishment of Spanish sureties in Cuba and Puerto Rico, against the status of such Spaniards as desired to remain in the former island, and against the cession of the Philippines. It was deemed necessary to introduce in the Cortes, which had convened on February 20, a bill for the cession of these islands, and it was passed in the senate by a very narrow majority. The treaty was ratified by the United States Senate by a vote of 57 to 27 on February 6, 1899, and by the Queen Regent of Spain on March 17.

Cabinet Changes.—The government majority in the Cortes had decreased so considerably, as was shown by the vote on the bill for Philippine cession, that on March 1 the Liberal cabinet of Señor Sagasta resigned. The Queen Regent selected Señor F. Silvela, a Conservative, as the new premier, and on the 4th of the month he formed a cabinet, with General C. Polavieja as minister for war, Señor R. Fernandez Villaverde for finance, Señor J. Gomez Imaz for marine, Señor E. Dato for the interior, Señor M. Duran y Bas for justice, Marquis de Pidal for fomento. The ministry for the colonies was abolished, and that of foreign affairs was assumed by the president of the council. The new cabinet was received with marks of sympathy, but there were soon evidences of a want of harmony between Silvela and Polavieja. The policy of the Conservatives was said to have two essential features—regionalism and clericalism. Polavieja attempted to take far-reaching measures for the reorganization of the army and navy and the improvement of coast defences. The expenses that would thus be incurred met the disapproval not only of the public, but of the majority of Polavieja's colleagues in the cabinet. The disagreement led to his replacement on September 30 by General Azcarraga, who had been president of the council for some months succeeding the assassination of Señor Canovas. In October, 1899, another cabinet difficulty arose out of the troubles in Catalonia, a Basque province, that demanded a certain degree of local self-government. When the government refused to grant the demand of Catalonia, that province assumed a revolutionary attitude, and refused to pay the imposts. Serious troubles followed, and on October 27 a state of siege was proclaimed, and the imposts were collected under threats of military coercion. The minister of justice, Señor Duran y Bas, a Catalanian, had strong regionalistic leanings, and the attitude of the rest of the cabinet brought about his resignation on October 23. He was succeeded by Count Torreonaz, director of the Bank of Spain.

The Cortes.—The Cortes began its session on February 20, 1899, and its members were soon involved in a violent discussion of the responsibility for the Spanish-American war. In the chamber the Sagasta government was attacked on the ground that it was the chief author of national disaster. In the senate, on the other hand, it was the military and naval leaders who had taken part in the war that became the objects of the most violent attacks, Count de las Almenas denouncing them in a speech that lasted several days. The leaders themselves demanded on February 27 the nomination of a parliamentary commission to inquire into their conduct, and the senate approved this measure by a vote of 130 to 7. On March 6 the Cortes was

prorogued, the government having decided upon a new election. The elections for the chamber of deputies were held on April 16, and resulted as follows: 243 Ministerialists (of whom 180 were followers of Silvela, 33 of Polavieja, and 30 the ultramontane followers of Pidal), 18 Conservative dissidents, or supporters of the Duke of Tetuan; 86 Liberals, 30 Liberal dissidents, 15 Republicans, 5 supporters of Romero Robledo, and 4 Carlists. On April 30 the senatorial elections resulted as follows: 110 ministerial Conservatives, 50 Liberals, 7 Liberal dissidents, 6 Conservative dissidents, 3 Carlists, 1 Republican, 1 Independent, 1 Integrist. The new Cortes convened on June 2. In the address from the throne on this day it was said that the most urgent and difficult task of the government was the settlement of the financial obligations resulting from the war, in view of which governmental economy was promised. But increased taxes, weighing especially upon the poorer classes, and the proposals of General Polavieja for increased army appropriations caused much popular discontent, which culminated on June 26 in serious demonstrations, started in part by the chamber of commerce. On this day nearly all the shops in Madrid and in various other cities were closed, and some serious disturbances occurred. At Saragossa there was an actual riot, in which several were killed and others wounded, and the city for a time was in a state of siege. Premier Silvela recognized the gravity of the situation, but let it be understood that the government would not give way under threat.

The Sale of the Pacific Archipelagoes.—On February 12 Spain signed a treaty with Germany, transferring to that power the three archipelagoes of the Carolines, the Ladrões, or Mariannes, and the Pelews, the remnants of the Spanish colonial empire in the Pacific. The announcement of the sale was made in the address from the throne to the Spanish Cortes on June 2, when it was said that it was no longer profitable for Spain to keep these relics of her former empire. The terms of the sale were as follows: Germany was to pay Spain an indemnity of 25,000,000 pesetas; to accord the commercial and agricultural interests of the Spanish in the islands the same privileges that were allowed to the German interests; to protect the Spanish religious orders, and to allow Spain to establish a coaling station in each of the three archipelagoes. From the Spanish point of view, the loss of the islands was not serious, since they no longer were of any use to Spain, and might some day call for further sacrifices, in order to defend them. The sum of 25,000,000 pesetas in the existing state of the Spanish finances was, moreover, no slight gain.

Catholic Congress at Burgos.—From August 30 to September 4, 1899, the fifth Catholic congress was in session at Burgos. The character of this congress had a political even more than a religious significance. It was evident that certain members of the congress were supporters of the Carlists, notwithstanding contrary instructions from Rome. To many disinterested observers the interests of peace seemed to require that the Pope's recommendations be followed, but many also who had no sympathy with the tendencies of the Carlist Clericals could not but approve their unwillingness to accept instructions from Rome in political matters. The congress denounced Liberalism, and set forth a programme for Catholic union, looking toward greater powers and privileges for the Catholic clergy, the prohibition of non-Catholic associations, the restriction of religious toleration to the narrowest limits permitted by the constitution, and various other stringent measures favorable to the Church. To carry out their programme the prelates asked the material support of the government. The replies of the Queen Regent and Premier Silvela, however, while friendly in tone, made it clear that they could not go as far as the episcopate desired.

SPANISH-AMERICAN WAR, NATIONAL SOCIETY OF THE, a patriotic society, founded in 1898, eligibility for membership consisting in loyalty to the United States. Honorary president, Clara Barton; honorary vice-presidents, Admiral George Dewey, Mrs. John A. Logan, Rear-Admiral W. S. Schley, and Major-General N. A. Miles; national executive secretary, Hildegard H. Langsdorff, M.D., Carlisle, Penn.

SPIRITUALISTS, those who believe in spiritualism or the independent existence and activity of the soul apart from the body. In America, the National Spiritualists' Association, formed in 1893, with the purpose of organizing the various spiritualist societies in the United States and Canada, comprised in 1899, 16 State associations, 650 local associations, and 52 camp-meeting associations. The membership in these associations is placed at 150,000, while the number of spiritualists in the United States and Canada is said to be ten times that number. There are said to be 1500 professional psychics. There are 82 churches, or auditoriums, and property valued

at \$1,250,000. Ten periodicals are published. Secretary, Mrs. Mary T. Longley, 600 Pennsylvania Avenue, Washington, D. C. The eighth annual convention is to be at Cleveland, O., in October, 1900. In England the London Spiritualist Alliance, Limited, founded 1884, has local organizations in many British cities and towns, and publishes the periodical *Light* at the general offices, 110 St. Martin's Lane, W. C., London. President and editor of *Light*, E. Dawson Rogers.

SPORTS IN THE UNITED STATES. The year 1899 was marked by a general advance in the condition and practice of sports in this country. Progress has been especially notable along the lines of a healthy growth of the amateur spirit in most branches of sport and by the increased attention, both active and passive, which is being given to the subject of recreation by men of affairs as well as by the younger generation. The increasing number of college and athletic club contests is bringing an annually growing number of the latter class under healthful influences, and tennis, wheeling, and golf have been responsible for the more general introduction of women to outdoor life, a class which is gradually taking up many other branches of sport. Besides these influences of athletics on the national life, the year 1899 has afforded some brilliant individual performances in the various branches. These games are described under their proper heads. The subjects treated include athletics, field and track; baseball, boxing, bowling, cricket, croquet, curling, cycling, fencing, football, golf, ice-hockey, ice-yachting, lacrosse, polo, rowing, racquets, shooting, skating, swimming, tennis, water polo, wrestling, and yachting. See also the articles on billiards, pool, chess, and whist. International athletics are described in the following article.

SPORTS, INTERNATIONAL. In the matter of international contests the year 1899 has been an unusually interesting one, having been equalled by no other single season in the number of events contested. The more important of these were British-American, but the Canadian contests of 1899 were also above the average in a number of cases. A brief description of the principal events follows.

Contests with Great Britain.—The most important contests with Great Britain in 1899 include the yacht races for the America's Cup, the dual track and field games between Oxford-Cambridge and Harvard-Yale teams, and the cricket matches played in this country by a team of English experts, captained by the East-Indian Prince Ranjitsinhji, the most noted amateur cricketer of the day. The America's Cup races were marked by evidences of unusually good feeling on both sides, in marked contrast to the races of 1895. For a full account the reader is referred to the article YACHTING. The meeting between the English and American universities took place on July 22 at London. The result was a victory for the Oxford-Cambridge team, which won the meet with 5 firsts and 5 seconds, to 4 firsts and 4 seconds, scored by the Harvard-Yale representatives. The points were made in the following excellent performances, carried off under the most friendly and satisfactory conditions: 100-yards run, 10 seconds, R. J. Quinlan, Harvard; 440-yards run, 49½ seconds, Cambridge; ½-mile run, 1: 57½, Cambridge; 1-mile run, 4: 24, Cambridge; 3-mile run, 15: 24½, Cambridge; 120-yards hurdles, 15½ seconds, F. B. Fox, Harvard; running high jump, 6 feet, A. N. Rice, Harvard; running broad jump, 23 feet, Oxford; throwing 16-pound hammer, 136: 08½, W. A. Boal, Harvard. It was hoped toward the close of 1899 that Oxford and Cambridge might come to America in 1900 to play a return game with a Yale-Harvard team. The third international event of importance, the visit of the all-English cricket team, headed by Prince Ranjitsinhji, resulted in a series of five games played in this country, besides one in Canada. Contests at Philadelphia, September 25 to October 2 and October 7-10, against prominent clubs of Philadelphia, the home of American cricket, resulted in 2 won games and 1 drawn game for the visitors; a game at New York was drawn, and in Canada the Englishmen won. The New York game was a virtual victory for the visitors, with an inning to spare. Among other athletic matters of an international color were the brilliant victories of Clarence Hobart in British and continental tennis, and the second consecutive victory of B. H. Howell, an American student at Cambridge, in the contest for the diamond sculls at Henley.

Contests with Canada.—Contests between Canadian and American athletes and sportsmen are annually becoming more frequent. Among the large number of events fought out in 1899 were yachting, including three different regattas; golf, tennis, cricket, racquets, ice-yachting, curling, and ice-hockey. The Americans won in golf, cricket, tennis, ice-hockey, and the Canada's Cup yacht races. The Canadians won in yachting (two regattas), in ice-yachting, and in curling, and also two events at the annual regatta of the National Rowing Association at Boston. In racquets the honors were divided. In the latter sport Rolland, the champion Canadian racquet player, was defeated by Clarence Mackay, but later in the Canadian championships at Montreal he defeated Quincy Shaw, who had won the American national tournament. In golf, a great victory was scored for the Americans. In

the previous year they had defeated the Canadians at Toronto by a score of 27 to 7. But in 1899, at the Morris Country Club, New Jersey, the Americans won by an aggregate score of 93 won holes to not one for Canada. The annual cricket match with Canada, played at Toronto, August 7 and 8, was one of the closest and most interesting played in years, and was won by the United States (representatives of Harvard, Pennsylvania, and Haverford) by 34 runs. The scores were: United States, 206 and 219; Canada, 222 and 169. In tennis the Americans invaded Canada with their usual success. M. D. Whitman won the Canadian championship. The Gordon medal for curlers was won at Montreal by Canadian players on February 24. A Canadian team won the Walker trophy at St. Paul, January 19.

The most interesting of the yacht races were those for the international inter-lake yacht trophy, the Canada's Cup, which took place at Toronto. On August 22, attended by a large fleet of vessels from all parts of the Great Lakes, the challenging yacht *Genesee*, of the Chicago Yacht Club, defeated the Canadian defender *Beaver*, of the Royal Canadian Yacht Club, over a 21-mile triangular course, the elapsed times being 3.25:09 and 3.26:32. Second race, 9 miles to windward and return, *Genesee*, 5.06:57; *Beaver*, 5.07:36; third, 21-mile triangle, *Genesee*, 3.32:11; *Beaver*, 3.42:58. The Seawanhaka-Corinthian Yacht Club's international trophy for half-raters, won three years before and since retained by the Royal St. Lawrence club, was raced for by these clubs at Montreal, 12-mile course, July 28 to August 3. The American boat *Constance* won the first two races, respectively, in 2.18:28 by 2¼ minutes, and in 2.04:00 by about 1 minute; the next two races were won by the Canadian boat *Glencairn III*, in 2.28:26 by about 3 minutes, and in 2.20:43 by 5½ minutes. In the fifth and deciding race the Seawanhaka club objected to the course as laid out. It was changed, and then the *Constance* grounded. Her protest was not allowed, and the cup remained in Canada. The odd-numbered races were to windward over the course and return, and the even-numbered races were over a triangular course. In February, 1899, the Canadian yacht *Dominion*, which had won the Seawanhaka-Corinthian trophy in 1898, was challenged to a race by the White Bear Yacht Club of St. Paul. The *Dominion* defeated the *Yankee* in three out of four races, and won the special cup offered as a trophy.

STAAL, GEORGES, BARON DE, president of the peace conference at The Hague, is a Russian diplomat about seventy-five years old. The early part of his career was military, and in 1845 he entered the diplomatic service. Thereafter he represented Russia in Turkey, Greece, some of the German states, and finally in Great Britain, his present post, where he has endeavored to foster friendly relations between the rival nations. In May, 1871, he was made minister at Stuttgart. On July 1, 1884, he became ambassador at London. After the death of Nikolai K. von Giers, in January, 1895, he declined an appointment to the portfolio of foreign affairs in the Russian ministry. Baron de Staal represented Russia at the peace conference at The Hague, and on the opening day, May 18, 1899, was elected its president.

STATISTICAL ASSOCIATION, AMERICAN, founded in 1839, had in 1899 a membership of 519. The association holds quarterly meetings in Boston, and publishes quarterly *Transactions*. President, Hon. Carroll D. Wright; secretary, Dr. Davis R. Dewey, 491 Boylston Street, Boston, Mass.

STEEVENS, GEORGE WARRINGTON, author, was born December 10, 1869; he was connected editorially with the *Pall Mall Gazette*, in 1893, and with the *Daily Mail* in 1897. Publications: *Naval Policy and Monologues of the Dead*, 1896; *The Land of the Dollar and With the Conquering Turk*, 1897; *Egypt in 1898 and With Kitchener to Khartum*, 1898; *In India and The Tragedy of Dreyfus*, 1899.

STEINTHAL, HEYMAN, a German philologist and philosopher, died March 14, 1899. He was born at Gröbzig, Anhalt, May 16, 1823. In 1843 he took up the study of philology and philosophy at the University of Berlin; here in 1850 he was appointed lecturer, his subjects being mythology and the science of language. From 1852 to 1855 he pursued a course of philological and literary studies in Paris. In 1863 he became professor of general philology at Berlin, and in 1872 lectured also on Judaism, the philosophy of religion, and the history of religion; thereafter he retained both of these positions. Among his many works are: *Klassifikation der Sprachen*, 1850, which work appeared later with the title, *Characteristik der hauptsächlichsten Typen des Sprachbaues*; *Der Ursprung der Sprache im Zusammenhang mit den letzten Fragen alles Wissens*, 1851; *Die Entwicklung der Schrift*, 1852; *Grammatik, Logik, Psychologie, ihre Prinzipien und ihr Verhältnis zu einander*, 1855; *Geschichte der Sprachwissenschaft bei den Griechen und Römern*, 1863; *Abriss der Sprachwissenschaft*, 1871; *Allgemeine Ethik*, 1885; *Zu Bibel und Religionsphilosophie: Vorträge und Abhandlungen*, 1890. With Lazarus he edited *Zeitschrift für Völkerpsychologie und Sprachwissenschaft*, 1860-90.

STEYN, MARTINUS THEUNIS, president of the Orange Free State, was born at Winburg in that country October 2, 1857. He was educated at Grey College, Bloemfontein; Wevente, Holland; and at the Inner Temple, London, where, on November 17, 1882, he was called to the bar. He practised as an advocate at Bloemfontein from 1883 to 1889, when he was appointed state attorney, and a few months later second puisne judge. In 1893 he was made first puisne judge. Since March 4, 1896, he has been president of the State, and during his administration closer relations have been established with the Transvaal government. In 1897 the two republics formed a defensive alliance, agreeing to stand together in case either should be attacked. At President Steyn's invitation President Kruger and Sir Alfred Milner, high commission of South Africa, conferred at Bloemfontein in May, 1899, with reference to the points at issue between the Transvaal and Great Britain. When negotiations between these two governments came to an end in October, 1899, and war broke out, President Steyn's forces were immediately mobilized and took part in the conflict.

STILLÉ, CHARLES JANEWAY, LL.D., sometime provost of the University of Pennsylvania, died August 11, 1899. He was born in Philadelphia, September 23, 1819, and was educated at Yale, being graduated there in 1839. He studied law, but after his admission to the bar devoted himself to literary pursuits until the Civil War. During the war he served on the United States Sanitary Commission, being a member of the executive committee. In 1866 he was called to the chair of history in the University of Pennsylvania, and two years later was made provost. This position he held until 1880, and was succeeded in the following year by Dr. William Pepper, who died in July, 1898. It was during Dr. Stillé's administration that the university was moved to its present site in West Philadelphia. It is said that largely through his efforts began that growth of the university that was so marked in Dr. Pepper's time. Dr. Stillé was president of the Historical Society of Pennsylvania. He was the brother of Moreton Stillé, author of a treatise on medical jurisprudence, and of Alfred Stillé, professor emeritus of medicine in the University of Pennsylvania. He wrote: *How a Free People Conduct a Long War*, 1862; *Northern Interest and Southern Independence*, 1863; *The Historical Development of American Civilization*, 1863; *Memorial of the Philadelphia Central Fair for the United States Sanitary Commission*; *History of the United States Sanitary Commission*, 1866; *Studies in Mediæval Civilization*; *Studies in Mediæval History*, 1880; *Beaumarchais and the Lost Million*; *General Anthony Wayne and the Pennsylvania Line: Life and Times of John Dickinson*.

STORER, BELLAMY, American lawyer and diplomat, was transferred by President McKinley on April 11, 1899, from the embassy at Brussels to the post of minister to Spain, which had been vacant since the departure from Madrid of Minister General Stewart L. Woodford at the outbreak of the war in 1898. Mr. Storer was born in Cincinnati, O., August 28, 1847. After graduation at Harvard in 1867, he entered the Cincinnati Law School, was graduated in 1869, and, being admitted to the bar, began practice in Cincinnati. He was elected, as a Republican, to the Fifty-second and Fifty-third Congresses, serving from 1891 to 1895. From 1897 to the time of his appointment at Madrid Mr. Storer was minister to Belgium. He was succeeded at Brussels by Mr. Lawrence Townsend.

STRAFFORD, Fourth Earl, Sir HENRY WILLIAM JOHN BYNG, K.C.V.O., C.B., was killed by a train at Potter's Bar, Middlesex, May 16, 1899. He was born August 21, 1831; was educated at Eton. He was page of honor to the Queen, 1840-47, and groom-in-waiting, 1872-74; in 1863 he retired from the lieutenant-colonelcy of the Coldstream Guards. He succeeded to the title upon the death of his elder brother, George Henry Charles, which occurred March 28, 1898, and was succeeded by his younger brother, the Rev. Francis Byng.

STRAITS SETTLEMENTS comprise British territory situated on the west coast of the Malay Peninsula and certain adjacent islands. They include on the mainland Provinces Wellesley and Malacca, and the islands of Penang, or Prince of Wales, Singapore, and the Dindings. Included in the administration are the Cocos or Keeling Islands, and Christmas Island, which lie southwest of Java, exclusive of which the colony has an area of 1475 square miles, and an estimated population in 1899 of 580,563. Besides these there are certain Malay states under British protection. It is one of the most important of the British crown colonies. The city and capital, Singapore, with a population of 185,000, is one of the chief commercial cities of the East, with a good harbor, and is a British military and naval station. In point of shipping it is said to be one of the greatest ports in the world. It is a port of call for trade between Europe, Australia, the Dutch Indies, India, and the East, and the tonnage of foreign clearances in 1898 was 8,287,184, or 9717 vessels. The total tonnage for the whole colony was 12,661,442, the other ports being Penang and Malacca. Nine important lines connect Singapore with Europe and the Far East, the companies being British, German, French, Italian, Austrian, Spanish, and

French. It is announced that an American line will soon connect Singapore with the Philippines. Six regular lines connect Singapore with adjacent states and colonies, and there are coastwise and river lines. There is cable connection with the important oceanic cables. There are no railroads in the colony, though there is a complete system of macadamized roads, and no navigable canals. At Penang there is a street railroad ten miles long. The imports in 1898 were \$248,110,547, principally rice and cotton-piece goods; also opium, fish, coal, tobacco, and petroleum. The exports were \$212,308,029, the chief item being tin, others being spices, gambier, gums, tapioca and sago, rattans, and copra. The articles mentioned include the products and purchases of the colony proper. There is a very large transit trade in many other articles, and this trade will account for the large figures given above. The standard coin is the silver Mexican dollar, and as this was worth about \$0.48 United States currency in 1899 the values given may be reduced about one-half. The estimated share of the United States in this trade in 1898 was \$19,587,640 in exports, and \$2,857,868 in imports, Mexican currency. The principal industry is that in tin, and the tin-smelting works are said to be the largest in the world. It is stated that the yearly consumption of ore, which is mostly native, is nearly 65,000,000 pounds, and the output nearly 45,000,000 pounds of metal. There are other important concerns also, such as the ice manufactory, with a production of 70 British tons daily, and the canning works, which turn out 125,000 cases of preserved pineapples per season.

STRAUSS, JOHANN, son of the prominent musician of the same name, was born in Vienna, October 25, 1825; died there June 3, 1899. After his father's death he took charge of the latter's orchestra, with which he toured, gaining fame, especially through his dance music. Among these pieces may be mentioned *An der schönen blauen Donau, Künstlerleben, Wiener Blut*. He organized an orchestra that played successfully in the principal European cities, and in 1872 he came to America to conduct an orchestra of 1000 performers at the Boston Peace Jubilee. At one time he was music director to the Emperor at Vienna. In that city in October, 1894, the fiftieth anniversary of his debut as a conductor was celebrated. Besides his famous waltzes he was well known for his operettas. Among the latter are: *Indigo*, 1871; *Die Fledermaus*, 1874; *Cagliostro*, 1875; *La Tsigane*, 1877; *Prinz Methusalem*, 1877; *Das Spitzentuch der Königin*, 1881; *Der lustige Krieg*, 1881; *Eine Nacht in Venedig*, 1883; *Der Zigeunerbaron*, 1885; *Simplicius*, 1887; *Ritter Pasman*, 1892. His younger brothers, Josef and Eduard, gained a wide reputation for their compositions in dance music.

STREET CLEANING, or sweeping, is done by hand in 18 cities, by machine in 17 cities, and by both methods in 72 cities, according to figures in *Statistics of Cities*, Bulletin 24, United States Department of Labor, September, 1899. These cities together aggregate 107 of the 140 cities of 30,000 population and upward included in the bulletin. For Covington, Ky., and Tacoma, Wash., it is reported that the streets are flushed, not swept, and for Spokane, Wash., that 33,975 square yards are flushed weekly. At Birmingham and Mobile, Ala., Little Rock, Ark., and Fort Worth, Tex., the bulk of such street cleaning or sweeping as is done appears to be performed by chain gangs. Some of the largest cities in the country did not report the area swept; of those reporting, Baltimore leads with 17,517,000 square yards swept per week, and Kansas City comes next, with 11,200,000 square yards; Pittsburgh, 10,667,000; Chicago, 8,849,000; Boston, 8,660,000; and Milwaukee, 4,883,000.

STREET RAILWAYS. See ELECTRIC STREET RAILWAYS; RAPID TRANSIT.

STRIKES AND LOCKOUTS. The statistics of strikes and lockouts are not available for 1899. The present article deals with some of the statistics published in 1899, but relating to 1897 and 1898, and with some of the important strikes that occurred in the year 1899.

Great Britain.—The Labor Department of the British Board of Trade published its tenth annual report on strikes and lockouts in the United Kingdom, covering the year 1897. This shows a great increase in the number of persons affected by strikes, and in the number of working days lost as compared with 1896, although the actual number of strikes and lockouts was much smaller. In 1897 there were 864 disputes affecting 230,267 persons, and causing an aggregate loss of 10,345,523 working days. The last-named figure was nearly three times as great as the corresponding figure in 1896, and the number of persons affected in 1897 was about 31,000 greater than in the preceding year; 46.2 per cent. of the persons thrown out of work were involved in strikes in regard to wages and 22.9 per cent. in regard to the hours of labor; but the number of working days lost by strikes over the hours of labor was nearly twice as great as those caused by strikes over wages. The statistics show that the advantages gained by the strikes were chiefly on the side of the employers, 44.5 per cent. of the total number of persons were involved in strikes which were settled wholly in the employers' favor, and 21.6 per cent. in those settled wholly in favor of employees. The disputes compromised affected 32.7 per cent. of

the persons involved in strikes. The greatest number of working days lost was in metal, engineering, and ship-building trades, and the next in mining and quarrying. Among the important trade disputes in the United Kingdom during 1899 was one involving the cotton-spinning trades. The operative spinners demanded an increase of 5 per cent. in wages, and threatened to quit work unless the demand was acceded to. The employers at a conference held at Manchester, March 20, agreed to advance wages, and it was estimated that the advance would affect 75,000 workmen. Another dispute arose in the building trades over an attempt of the plasterers to force foremen and superintendents to join their union. The Master-Builders' Association declared a lockout, which went into effect early in March, but a compromise was reached toward the end of May.

France.—The report of the labor bureau of the ministry of commerce for 1898 shows that there were 368 strikes in that year, affecting 1967 establishments, and involving 82,065 strikers. As compared with the preceding year, the figures show an increase in the number of strikes and strikers, but a decrease in the number of establishments affected. A far smaller proportion of the strikes succeeded in 1898 than in 1897. In 1898, 12.91 per cent. succeeded; 39.66 per cent. succeeded partly, and 47.43 per cent. failed. The majority of strikes involved members of trades unions. Three of them affected over 100 establishments each, and 286 involved but one establishment each. In the textile industry occurred the largest number of strikes—104 out of the 368—but the largest number of persons involved were in the building trades—46,438 out of the 82,065 strikers. Of the causes or objects mentioned, increase of wages was the most important, both in respect to the number of strikers involved and in respect to the number of working days lost. The majority of the strikes were of short duration, 242 of them lasting for 7 days or less, but 3 lasted for more than 100 days. As to the effects of conciliation and arbitration, the law of 1892 providing for the settling of trade disputes by these means was applied to 94 out of the 368 strikes. Of these 94, 30 cases were settled by the application of the law and 64 failed after application. A strike occurred in May among the postmen as a protest against the action of the senate in refusing to add the sum of 2,000,000 francs to the postal budget voted by the chamber. Several strikes were caused by the cutting down of wages in certain parts of the country, as a result of the law of 1898 concerning accidents of workmen. A more serious strike than any of these was that of the Creusot iron works, which arose from the suspension of certain workmen for an infringement of the rules. The real causes have been variously stated. According to one account, the strike arose from too much paternalism in the management of the industry. The men complained that the management interfered with their private liberties; that they were spied upon when absent from work, and that a promise of an increase of wages had not been kept. It was also the desire of the workmen to found societies of their own, and obtain from the proprietor of the works a recognition of their union as a body. The strike resulted in an increase of wages and an accession to the workmen's demands on other points, and, what was more important, in the establishment of an organization capable of comprising 10,000 workmen. Another successful strike was that of Montceau-les-Mines on account of certain grievances, one of which was the strict control exercised by the company over the admission of workmen to the mines. The workmen's organization was recognized, the strict system of surveillance was abandoned, and certain other concessions were made. At the close of the year a strike was in progress among the miners in St. Etienne over the question of better pay, shorter hours, and a recognition of the workmen's association.

Denmark.—The greatest strike of the year occurred in Denmark, where the organization of labor has gone so far that it is estimated to include about 4 per cent. of the population as compared with England's 3 per cent. The Danish working classes have not only organized, but have taken an active part in politics. Organized labor was in conflict with organized capital during the entire summer of 1899. A general lockout was declared on May 19, and soon extended to nearly one-half of the organized workmen. The question of wage rate led to this contest, and it comprised all the building industries. For further details see the article DENMARK.

Belgium.—A strike involving some 60,000 workmen occurred among the miners of the Liège and Charleroy region, the cause being a dispute over wages. The danger of violence forced the government to mobilize the troops. The coal industry of Belgium was paralyzed, and coal was imported largely from foreign countries. The general result was that the workmen were obliged to content themselves with the mere promise of increased wages.

United States.—The coal miners' strike at Pana, Ill., which was noticed in the YEAR BOOK for 1898, continued in 1899. The attempts to bring in negro miners led to another riot, and resulted in the killing and wounding of several persons. (For a further account of these disturbances, as well as several other strikes which occurred in Illinois in 1899, see the article ILLINOIS.) A similar difficulty to that at

Pana arose at Mansfield, Sebastian County, Ark., where the union miners struck against the introduction of non-union negro workmen from Kentucky, and where the governor made an attempt to check this importation, but was restrained by the injunction of the federal court. A serious mining strike occurred at Wardner, Ida., where the miners destroyed property to the value of \$250,000, and where the governor was obliged to call on the President for regular troops, the State militia having been largely drawn off to the Philippines. (See IDAHO.) A strike occurred in Colorado over a dispute in regard to the eight-hour law for smelters, the strikers claiming the same wages as had been paid for the longer working day. They went back to work after the law was declared unconstitutional. (See COLORADO.) The strike and boycott of the street railway employees of Cleveland, O., was one of the most important labor conflicts of the year. It arose from the refusal of the company to recognize the union of the employees. The strikers resorted to violence, but finally settled down to the plan of boycotting every one who rode in the street cars or who supported the company even in the most indirect manner. The business men of the city organized a counter-boycott. The strike came to an end in September. See OHIO.

STRUTHERS, Sir JOHN, M.D., LL.D., vice-president of the Royal College of Surgeons, Edinburgh, died February 24, 1899. He was born February 21, 1823; was educated privately and at Edinburgh University. From 1845 to 1863 he was a lecturer on anatomy at Edinburgh, and from the latter year to 1889 was professor of anatomy in Aberdeen University. He was a member of the General Medical Council, 1883-91, and from 1890 to the time of his death was examiner in anatomy at the Royal College of Surgeons, Edinburgh. Among his publications are: *Anatomical and Physiological Observations*, 1854 and 1863; *Memoir on the Anatomy of the Humpback Whale*, 1889; *References to Papers in Anatomy, Human and Comparative*, 1889. He was knighted in 1898.

SUDERMANN. See GERMAN LITERATURE.

SUEZ CANAL, opened in 1869, is 87 miles long, with 21 miles of lakes, and has a depth of 26 feet. The number of vessels annually passing through is now from 3000 to 3500, with a gross tonnage of from 10,000,000 to 12,000,000. British vessels have made up nearly three-fourths, though the number and tonnage of German vessels greatly increased in 1898-99. Few American merchant vessels use the canal. The United States war-ships which passed through in 1898 are said to have paid to the company more than had been paid by this country for all vessels in the previous twenty years. In the first three quarters of 1899 there passed through the canal 2793 vessels, which paid tolls amounting to £2,803,266. At a meeting of the canal company at Paris in November, 1899, the amount of excess dividend to be paid on coupons falling due on January 1, 1900, is said to have been fixed as follows: Ordinary shares, 47.50 francs gross, 43.56 francs net; "actions de jouissance," 35 francs gross, 31.92 francs net; founders' shares, 19.72 francs gross, 18.25 francs net. On November 17, about one week after this meeting, a bronze statue of Ferdinand de Lesseps was unveiled at Port Said.

SUGGESTION, a term used in a technical sense in psychology, though with a very wide application. A suggestion is any sensation or perception which is received by the individual, and leads him to change his mind or actions in accordance with the new idea from without. This usually implies the overcoming of some antagonism on his part, and is connected by some with the force or weakness of the will, a strong will thus asserting itself over a weak will. Suggestion has been shown by several writers in 1899 to be the element common in the various forms of psychotherapeutics—namely, mind cure, faith cure, the cures wrought by Christian Science, by hypnotists, and others; and that suggestibility is a characteristic of the whole human race. The very wide use to which this knowledge can be put will be comprehended when one reflects that suggestion is the basis of all education, that children are particularly suggestible, and that suggestion has as many forms as the objects and circumstances which go to make up the child's environment. Professor E. E. Slosson, of the University of Wyoming, made a very curious experiment in the suggestibility of an audience at a lecture. This occurrence may help to explain how it is possible for an Indian fakir to deceive a large group of people into believing that they see a tree grow from a seed within an incredibly short time while they are gazing at it. He says: "I had prepared a bottle filled with distilled water carefully wrapped in cotton and packed in a box. After some other experiments I stated that I wished to see how rapidly an odor would be diffused through the air, and requested that as soon as any one perceived the odor he should raise his hand. I then unpacked the bottle in the front of the hall, poured the water over the cotton, holding my head away during the operation, and started a stop-watch. While awaiting results I explained that I was quite sure that no one in the audience had ever smelled the chemical compound which I had poured out, and expressed the hope

that, while they might find the odor strong and peculiar, it would not be too disagreeable to any one. In fifteen seconds most of those on the front row had raised their hands, and in forty seconds the 'odor' had spread to the back of the hall, keeping a pretty regular 'wave front' as it passed on. About three-fourths of the audience claimed to perceive the smell, the obstinate minority including more men than the average of the whole. More would probably have succumbed to the suggestion, but at the end of a minute I was obliged to stop the experiment, for some on the front seats were being unpleasantly affected, and were about to leave the room." One writer, H. H. Goddard (*The Effect of Mind Upon Body*, *Am. Jour. Psy.*), after investigating the various forms of mental healing, and being obliged to acknowledge the reality of the diseases and the efficacy of the cures, emphasizes the fact that the mind is thus shown to have an actual effect upon the building up of the tissues of the human body. The proofs of this are (1) from the various testimony of the faith cure, divine healing, mind cure, and Christian Science healers, many of whose statements the writer personally investigated; and (2) from the statements of regularly practising physicians of good standing, both those who use the hypnotic suggestion and those who state that cures have, in the first place, followed the performance of various operations where nothing was done save mere incision—that is, no part could be found diseased, and so none was cut away, but the patient merely sewed up again. In the second place, many cases are on record where physicians, having tried to no purpose every drug known to them, give some entirely powerless substance, such as a bread pill, assuring the patient that it is an exceedingly powerful drug, a heroic remedy, and that it must be taken with the greatest care to avoid an overdose. It is naturally supposed that the imagination of the patient, being thus aroused, helps the mind to effect a cure. Parallel with this is the frequent improvement of the patient from nothing more than the placing of a glass thermometer in his mouth. If he is ignorant, and takes it for a new and potent medicine, he brightens up immediately. The working of suggestion upon the normal adult is the subject of a paper in the *Année Psychologique* (Vol. V., Paris, 1899) by A. Binet. He reviews recent American and Italian contributions to the subject of suggestion, and adds experiments of his own upon primary-school children. As to the suggestions given to persons in a waking state, considered by the Nancy school to be of the same value as those in the sleeping, or properly so-called hypnotic, state, Binet says they form, when given by regular hypnotizers, a part of the hypnotic suggestions. The ordinary suggestibility of waking persons, however, forms one of the most valuable standards with which to measure the individual. Individuals are thus divided into four classes: (1) The automatic, who obey passively without resistance, and are models of blind discipline; (2) the sensitives, who are influenced by an appeal to their emotions; (3) the actives, or strong-willed, who cannot be directly influenced, but only by exciting some antagonism; and (4) the obstinate, who are not amenable to the suggestions of discipline. This last class is supposed to include mostly physical and mental degenerates. All persons are likewise seen to belong either to a class which accepts, or to another which gives suggestion, the latter forming the active and the former the passive members of society. Being a "suggestor," to use the words Binet here coins, or a "suggestible" does not bear any relation to one's intelligence, as we see the positive character in men of affairs, leaders of parties, etc., who do not belong very high in the intellectual scale. Binet defines suggestion as a moral force (*pression*), exerted by one person upon another. Binet's experiments upon school children showed that the youngest were the most suggestible, while upon adults in general those are most suggestible in the sense of obedient who have been in the habit of giving or enforcing the most unquestioning obedience. Investigation of the methods of the prestidigitator shows that in the forcing of cards in card tricks there is not only a sleight of hand on the part of the magician, but the spectator follows a suggestion in taking the card in question. There are seen to be two tendencies in all individuals—first, to do the usual, the customary, to obey the suggestions of one's environment without questioning—in other words, to fall into a rut, to form a regular habit of action, and follow this without reflection or criticism; second, to question and criticise and form a new decision upon the given suggestion, and in most cases to act contrary to it. The first is seen to lead to automatism, or the performing of acts without thought, sometimes without consciousness; and the latter shows the richest individuality, the greater spontaneity and initiative in affairs. It is this distinction in character which makes suggestibility so valuable a criterion in individual psychology. See HYPNOTISM.

SUICIDES. See VITAL STATISTICS.

SULPHUR. The sulphur produced in the United States comes from the native sulphur and also from pyrite, the latter source being one of growing importance. In 1898, curiously enough, in spite of the war, and that sulphur was a contraband

article, the imports of this material from foreign sources shows an increase of 16 per cent. This was due to an increased demand for sulphur, to be used in the manufacture of powder, for which purpose the sulphur contents of pyrite are not so readily available.

According to the United States Geological Survey, the production of sulphur from these sources in the last two years is as follows:

Material.	1897. Long Tons.	1898. Long Tons.
Sulphur (native).		
Domestic.....	2,631	1,071
Imported (crude and refined).....	141,905	164,504
Sulphur contents of pyrite.		
Domestic.....	64,440	87,014
Imported.....	116,796	113,748
Total.....	325,172	366,337

For the sources of pyrite in 1898 see PYRITE. The native source of sulphur continues to be Utah and Nevada, the Louisiana deposit still remaining idle.

SULU. See UNITED STATES (paragraphs on History).

SUMATRA, a dependency of the Netherlands, is the most westerly of the Sunda Islands, lying to the south of the Malay peninsula, and separated therefrom by the Strait of Malacca. It is divided into five districts—West Coast, East Coast, Benkulen, Lampongs, Palembang, and Atjeh, or Acheen—the total estimated area of which is 161,612 square miles, and the estimated population at the close of 1897, 3,209,037. The inhabitants are chiefly Malays, professing Mohammedanism, and in some of the interior districts their tribal strength is sufficiently great to make the Dutch authority merely nominal. The industries are principally agriculture and shipping, and there is considerable trade in cotton, tobacco, maize, and rice. Coal is found; a recent analysis of the Ombilien coal shows the percentage of carbon to be 77.62. The exploitation of petroleum is declining.

SUNDAY-SCHOOL ASSOCIATION, New York State, is interdenominational, and includes 8752 Sunday-schools, 45 of which were organized during the year, with a total membership of 1,402,123. It held its forty-fourth annual convention at Poughkeepsie, N. Y., June 6-8, 1899; 17,295 conversions were reported; \$321,004.22 was contributed during the year for benevolent objects, \$48,358.27 for State and county Sunday-school work. Rev. A. F. Schaffler, D.D., New York, is chairman of the executive committee; Rev. A. H. McKinney, New York, State superintendent of Sunday-school work; Timothy Hough, Syracuse, N. Y., secretary and treasurer.

SUNDAY-SCHOOLS. The latest figures for Sunday-schools in the world are those of 1893, when there were 37,201 Sunday-schools in England and Wales, with 585,457 teachers and 5,976,537 scholars; in the United States, 123,173 Sunday-schools, 1,305,939 teachers, and 9,718,432 scholars; in the world, 224,562 schools, 2,239,728 teachers, and 20,268,933 scholars. These figures do not include the non-evangelical Protestant denominations or the Roman Catholics, who have about 800,000 Sunday-school scholars.

SUNDAY-SCHOOL UNION, AMERICAN, founded originally in 1791 in Philadelphia as the First-Day Society, was organized in 1817 as the Philadelphia Sunday and Adult School Union. Uniting with other societies, it adopted its present name in 1824. Its objects are: "To concentrate efforts of Sabbath-school societies, disseminate useful information, and endeavor to plant a Sunday-school wherever there is a population." This society has distributed over \$9,000,000 worth of religious literature, maintains about 100 permanent missionaries, and has organized over 1300 Sunday-schools a year for 75 years. The seventy-fifth annual meeting was held in Philadelphia in May, 1899. President, Morris K. Jesup; corresponding secretary, John R. Whitney. Headquarters, 1122 Chestnut Street, Philadelphia.

SUPRARENAL EXTRACT. Definite conclusions have been reached in the past twelve months regarding the availability of the extract of suprarenal glands in medicine. Animals from whom the suprarenal capsules have been removed lose flesh, and suffer from impaired nutrition. Abelsons and Brown-Sequard have both shown that the subcutaneous injection of a watery extract of suprarenal causes a marked improvement in the decapsulated animals and lengthens their life. The extract of the suprarenal capsules is a direct stimulant to the heart and blood-vessels, but its effect is very transitory. Abel has isolated the active principle of the suprarenal gland in the form of a powder of a light gray color. The injection into the jugular vein of a few milligrams of the picrate of this principle caused a great rise

of the arterial pressure, which continued for fifteen minutes. The extract has been used locally as a hemostatic, or astringent, in conjunctivitis, glaucoma, iritis, and in swelling of the mucous covering of the turbinates. The solution decomposes very easily.

SUSPENSION BRIDGE. See BRIDGES.

SWALLOW, GEORGE CLINTON, A.M., M.D., LL.D., geologist, died in 1899. He was born at Buckfield, Me., November 9, 1817; was educated at Bowdoin College, being graduated with the class of 1843. In this year he became lecturer on botany at Bowdoin, and five years later took the principalship of the academy at Hampden, Mo. He became State geologist in 1852, and was called to the chair of geology and chemistry in the University of Missouri. It was chiefly through the efforts of Professor Swallow that the agricultural department of the university was established in 1859. In 1870 he was dean and professor of geology in this department. In 1858 he announced his discovery of Permian rocks in Kansas, the first known in America. In 1865 he was State geologist of Kansas. Professor Swallow took an active interest in the development of silver-mining in Montana. He assisted in constructing the first silver mill at Philipsburg and the first silver turnace at Argenta, and was appointed inspector of mines by Governor Preston H. Leslie. At the time of his death his home was at Evanston, Ill.

SWANWICK, Miss ANNA, well-known English translator and writer, died November 2, 1899. Born in Liverpool, June 22, 1813, she was educated at home, but subsequently studied in Berlin, giving her attention particularly to Greek and Hebrew. In England she devoted herself for a time to the higher mathematics. Later in life she took an active interest in the promotion of female education, especially in the classes for women at King's College, Queen's College, and Bedford College. Miss Swanwick also engaged in philanthropic work, and in connection with the education of the working classes for many years gave lectures on English literature and various other subjects. She wrote *Poets, the Interpreters of their Age and Evolution and the Religion of the Future*. Her translations, however, which are chiefly from the German and the Greek, have brought her greater distinction. The German works include: *Selections from the Dramas of Goethe and Schiller*; Schiller's *Maid of Orleans*; Goethe's *Egmont*; his *Tasso*; his *Iphigenia*; and both the first and second parts of *Faust*, with introduction. From the Greek she translated the dramas of *Æschylus*, to which she wrote introductions. Miss Swanwick's *Faust* was probably the most popular English rendering of that drama until the appearance of Bayard Taylor's translation.

SWEDEN, the eastern part of the Scandinavian peninsula, has an area of 172,876 square miles, and a population, estimated on December 31, 1897, of 5,009,632. The only cities with a population of over 30,000 are Stockholm, the capital (population 1897, 288,602), Göteborg (population 1897, 120,552), Malmö (population 1897, 55,500), and Norrköping (population 1897, 38,354). The state religion is that of the Lutheran Protestant Church, other sects being represented in comparatively insignificant numbers, and the Jesuits alone being excluded. The two Swedish universities are at Upsala and Lund. Less than 1 per cent. of the population are unable to read and write. The estimated national revenue and expenditure for the year 1899 were 123,393,000 kronor, the krona being worth \$0.268. The largest items of expenditure were for education and the army, and the largest sources of revenue from customs duties, railways and taxes on spirits. The army is composed of the Vär-fvade or enlisted troops, which must serve two years, the indelta or troops supported by landowners, and the Värnpligtige, which are conscribed annually from men between 21 and 40 years of age. The strength of the army on a peace footing consists of 3728 officers and 33,057 men. The Swedish navy, according to Süssenguth, has 6 second-class battleships, 5 of which are ready for war. The three newest are the *Oden*, *Thor* and *Njord*, of 3400 tons displacement, of the same dimensions as the two new Norwegian armor-clads, though of greater speed. Other vessels are being modernized and armored. The *Dristigheten* was laid down in 1899. The chief agricultural productions are wheat, rye, barley, oats, pulse, and potatoes. The American consul at Stockholm reports that the Swedish crops of wheat, rye, barley, oats, peas, beans, vetches, etc., amounted in 1899 to 101,998,000 bushels, and the potato crop was 33,952,000 bushels. The total weight of all grain and pod crops in 1899 was 2,069,000 metric tons, valued at \$67,616,400 dollars, showing a decrease in metric tons of 247,000. The chief imports are textile manufactures, minerals, mostly coal, and hair and hides; the exports, chiefly timber, live animals and animal food, and minerals. The tonnage of the merchant marine in both domestic and foreign trade was, in 1899, 1008 steam vessels, of 277,492 tons; and 1784 sailing vessels, of 277,582 tons; total—2792 vessels of 555,074 tons. The chief port is Göteborg. In 1897 there were 6350 miles of railway, more than a third of which were owned by the state; and in 1896 there were 8281 miles of telegraph lines, with 25,578 miles of wire, nearly two-

thirds of which were owned by the state. In the same year 64,895 miles of wire and 49,411 instruments constituted the telephone service. The constitution grants executive power to the king, and a legislative function limited by the *Diet*, which has two chambers, one of 150 members (elected for nine years), the other of 230 members (elected by property holders for three years).

History.—For the events of 1899 connected with constitutional question, which has assumed a serious aspect, see the article NORWAY. The political parties in Sweden are the Conservatives, the Radicals, and the Moderates, the latest general election, in 1897, having given the Radicals 79 representatives in the *Storting*, a majority of 44 over the Moderates and Conservatives combined. The Radicals are in favor of the demands of Norway for independent consular service and independent foreign office.

SWEDENBORGIANS (NEW JERUSALEM CHURCH), the followers of Emanuel Swedenborg, who believe that we have Christ's second coming manifested by the revelation of the spiritual or inner sense of the divine word. The Swedenborgians held the seventy-ninth annual convention at Boston, June 3-6, 1899. Reports of associations and societies of the following districts were read, the figures giving the number of church members in 1899: Canada, 222; Illinois, 873; Maine, 155; Maryland, 412; Massachusetts, 1773; Michigan, 108; Minnesota, 84; New York, 611; Ohio, 515; Pacific coast, 436; Pennsylvania, 665; Connecticut, 65; Denver, 33; Louisville, 15; Savannah, 22; Texas, 86; Topeka, 30. Total, 6274. There were 104 ministers and 95 societies. This is not supposed, however, to include all the believers in New Church doctrines, many of whom attend churches of other denominations. The general convention of the New Jerusalem in the United States was incorporated in 1861. The Swedenborgians maintain the New Church School at Waltham, Mass., and Urbana University, Urbana, O. In 1899 there were 87 societies in England and Scotland, and 167 societies in Mexico, South America, Austria, Denmark, France, Germany, Holland, Hungary, Iceland, Italy, Norway, Portugal, Spain, Sweden, Switzerland, Australia, Asia, and Africa.

SWEENEY, JOHN R., hymn writer and musical director, died at his home in Chester, Penn., April 10, 1899, at the age of sixty-two years. He was one of the best known religious song writers in the United States. Among the scores of hymns written by Sweeney are *Beulah Land*, *Calvary*, *Showers of Blessing*, *More About Jesus*, *Little Ones Like Me*. He was a magnetic singing leader, and was much in demand at the great summer religious assemblies at Ocean Grove, Round Lake, and the Thousand Islands. He edited many song books, the royalties on the copyrights of which were said to be large. For many years Sweeney was professor of music at the Pennsylvania Military College at Chester.

SWIMMING AND WATER POLO. Swimming has been since 1888 a recognized department of sports under the Amateur Athletic Union, by whom it has been fostered. The year 1899 was especially full both in swimming contests and in water polo games, which are becoming more popular yearly. At the Amateur Athletic Union championships, held at New York in September, E. C. Schaeffer, of the New York Athletic Club, established three new records, as follows: 100 yards, across the tide, 1:08 $\frac{3}{4}$; 220 yards, across the tide with 1 turn, 2:53 $\frac{3}{4}$; 440 yards, with 3 turns, 6:48 $\frac{3}{4}$. Schaeffer also made 3 other records during the year, as follows: 110 yards, 6 turns with push-offs, still water, 1:17; 220 yards, 13 turns with push-offs, 2:38; 300 yards, 11 turns with push-offs, 4:07. One other Amateur Athletic Union record was made in 1899, H. H. Reeder, Knickerbocker Athletic Club, swimming 200 yards, 7 turns with push-offs, still water, in 2:38 $\frac{3}{4}$. It is important to note the conditions under which races are held. When the contests occur in tanks the swimmer is allowed to push off from the end walls of the bath when making turns, the effect of which is to increase the speed. A short broad tank is generally faster than a long narrow one, owing to the greater amount of back water created in swimming in the latter. When a race is held in open, still water, the distance is covered, unless otherwise stated, without the use of any object from which to push off at the turns. Some remarkable records were made abroad in 1899, especially in England, where swimming enjoys a wide popularity. The most wonderful swimmer in the world to-day is probably J. A. Jarvis, whose performances in 1899 gave him a fresh claim as the natural successor of the noted J. H. Tyres, now a professional. In 1899 Jarvis swam in Amateur Swimming Association and other races with the following reported results: 440 yards, in 5:51 $\frac{3}{4}$, bath; 500 yards, in 6:38, record; 880 yards, in 12:45 $\frac{3}{4}$, record; reported to have done the same in less time; 1000 yards, 25-yard course, in 13:43, record; 1 mile in 25:13 $\frac{3}{4}$, world's record; long-distance amateur championship (5 miles 60 yards), in 1:09:45. Jarvis's rivals in the short distances are J. H. Derbyshire and F. C. V. Lane, the Australian champion, whose native country vies with England for swimming honors. The latter, in 1899, swam 220 yards in 2:38 $\frac{3}{4}$, bath, record, and 300 yards in 3:46 $\frac{3}{4}$, record. He is also

reported to have swam 880 yards in 10:05½, but the statement is not given here as reliable. He won the 440 yards salt-water championship of the year in 6:30½. His time for the 100 yards English championship, bath, is given as 1:00½. One of the aspirations of swimmers is to make 100 yards in one minute in open, still water. Derbyshire, in 1899, swam 150 yards, bath, in 1:38½. The conditions under which the English races were held have not been obtainable in all cases. Cambridge beat Oxford both in swimming and in the annual water polo games.

Water polo in America has come into being as a natural result of the increasing interest in water sports, and in very recent years it has received a great impetus. Teams consist of 5 men, a goal tender and forward, and the ball is of rubber and inflated. In 1899 the Knickerbocker Athletic Club team carried off water polo honors, with the New York Athletic Club team next. Among the colleges the game appeared first at the University of Pennsylvania. In 1899 there were teams also at Harvard, Yale, and Columbia, including also swimming teams proper. Water polo has been well spoken of as a game that brings out all the competitive ability, strength, and gameness in the make-up of the participants. For spectators it is fully as interesting as the game of ice-hockey.

SWINE-PLAGUE. See SERUM THERAPY.

SWITZERLAND, THE REPUBLIC OF, an inland country of Europe having an area of 15,975 square miles, and a population, estimated in June, 1897, to be 3,082,989. The largest towns were, in 1897, Geneva (population 86,535), Basel (population 89,687), Berne (population 49,030), Lausanne (population 40,671), and Zürich (population 151,994). The report of the United States Commissioner-general of Immigration shows that the emigration from Switzerland to the United States in the fiscal year 1898-99 was 1326. Switzerland, being the most mountainous country in Europe, has a very large portion (28.4 per cent.) of unproductive territory. The political division of the country is into 19 entire and 6 half cantons, the most important being Zürich, Berne, Fribourg, St. Gall, and Vaud. The legislative and executive power is vested, by the constitution of 1874, in two houses, the state council of 44 members, 2 elected for each canton and 1 for each half canton for a term of three years; and a national council, made up of 147 delegates, representing the people and elected by the male population, 1 delegate for every 20,000 inhabitants. The president and vice-president of the federal council, the heads of the government, are elected by the two houses annually. The president in 1899 was Edouard Müller, of Berne, and the vice-president, Walter Hauser, of Zürich. The German language is largely spoken in 15 cantons, while French and Italian are spoken in others. The main occupations are agriculture, textiles, building and furniture making. All religious creeds are tolerated, and all sects have liberty of worship except the Jesuits. The people are almost equally divided between Protestantism and Roman Catholicism. Education is obligatory and free. About 1 per cent. of the population is illiterate. There are universities at Basel, Zürich, Berne, Geneva, and Lausanne. In 1897 there were 3331 students, of whom 1526 were foreigners.

The estimated revenue for 1899 was 95,925,000 francs, and the expenditure 98,210,000 francs. The chief source of revenue is the customs (47,000,000 francs), the railways, posts and telegraphs contributing 42,217,400 francs. The public debt in 1898 aggregated 83,891,688 francs, and the net "Federal Fortune" being 77,693,140 francs.

The army, not a standing army in the usual sense of the term, is nominally all citizens of military age. Children of 8 years are given military instruction, which is continued by means of annual exercises and reviews. All male citizens are subject to military duty, the number of such being 527,074 in 1897, of which, however, only about half were organized. Of the organized military there are three divisions, the Elite, or Auszug, the Landwehr, and the Landsturm, the first including men between 20 and 32, the second those from 33 to 44 years of age, and the third those of 17 to 50 years not included, for any reason, in the other two divisions.

The chief imports, which amounted in 1897 to 1,114,442,097 francs, were wheat and flour, silk, cotton, wool, foodstuffs, spirits, tobacco, metals, minerals, animals, timber, machinery, and carriages; and the exports, which amounted in the same year to 747,336,486 francs, consisted largely of silks, cottons, clocks, watches, foodstuffs, tobacco, spirits, cheese, and condensed milk.

The number of miles of railway open in 1897 was 2351, all of which are to come into the possession of the state in 1903. The number of miles of telegraph lines in 1897, owned by the state, was 4410, with 12,823 miles of wire; while the line mileage of private companies was 1204, having 8065 miles of wire.

In 1899 a law was passed introducing compulsory insurance of working people, both against illness and against accident.

SYMONS, General Sir WILLIAM PENN, K.C.B., second in command of the British forces in South Africa, was shot in the fight against the Boers at Glencoe, Natal, October 20, 1899, and died three days later. He was born at Hatt, Cornwall, July

17, 1843. He was educated privately, and at the Royal Military Academy, and in 1863 entered the army as a subaltern in the Twenty-fourth Foot. Promotion came slowly. In 1877-78 he served in the small expedition against the Galekas, a Kaffir tribe. He entered the Zulu War of 1879 as a captain, and after the terrible massacre of Isandlwana, became a major, and received a medal and clasp. It was, however, in the Burmese expedition of 1885-89 that his superiors came to realize his excellent qualities; he showed great talent in the perfection of details and in bringing his men to a high degree of efficiency in musketry and artillery practice. He became a colonel in 1887, and was advanced to the rank of brigadier-general in the Chin field force of the Chin Lushal expedition, 1889-90, and again received a medal and clasp. Symons commanded a brigade in the Waziristan field force, 1894-95, doing brilliant work against the Afghans, and receiving another clasp. In 1897 he commanded the second brigade of the Tochi field force, and in the following year was engaged in suppressing the disorders on the Indian border as commander of the first division of the Tirah expeditionary force. For his services in the latter expedition he was made a Knight Commander of the Bath, and was promoted to the command of the troops in the Sirhind district, India. When in the summer of 1899 the Transvaal situation became strained, General Symons was ordered to proceed to South Africa, and was appointed second in command to Major-General Sir George Stewart White. On October 21 it was announced that Symons was promoted to the rank of major-general for distinguished services in the field.

SYNNOTT, Rev. JOSEPH J., D.D., president of Seton Hall College, South Orange, N. J., died at Montclair, N. J., March 16, 1899. He was born at Great Neck, L. I., February 6, 1863; was graduated at the Roman Catholic College of St. Francis Xavier, New York, in 1882. He then studied at the University of Innsbruck until 1888, receiving the degree D.D. In 1892 he received an honorary M.A. from Yale. He became a member of the faculty of Seton Hall in 1889, and its president in 1897. Dr. Synnott was well known as a linguist, a theologian, and an authority on canon law.

SZELL, KOLOMAN, Hungarian statesman, was premier in the Hungarian ministry formed on February 27, 1899. He was born at Rátót, in Eisenburg, January 8, 1842. After studying at Pesh and Vienna, he was elected in 1867 to the lower house of parliament, where he became a supporter of the patriot, Francis Deak, to many of whose principles he still clings. He has been an active, though not always an especially prominent, member in succeeding parliaments. As minister of finance in 1875, in the first Tisza cabinet, he pursued a policy of great economy and laid the foundation for the restoration of Hungarian finances. On account of the large expense occasioned by the occupation of Bosnia in 1878, he resigned his portfolio and became president of the Hungarian Credit Bank at Pesh. Szell is a member of the Liberal party.

TABOR, HORACE AUSTIN WARNER, once one of the largest land owners in the world, was born at Holland, Vt., November 30, 1830; died in Denver, Col., April 10, 1899. With two partners, in May, 1878, he discovered the "Little Pittsburg" silver mine, which was the basis of his fortune. He subsequently held large grants of mineral and other lands in the Republic of Honduras, and at one time he is said to have owned 175,000 acres of copper land in Texas, and 4,600,000 acres of grazing land in southern Colorado. He built an opera-house in Leadville, and the Tabor Block and Tabor Opera House in Denver; the latter cost nearly a million dollars. He lost his fortune by bad investments, and the panic of 1893; the last of his property was sold in 1897 to satisfy a mortgage. Mr. Tabor was lieutenant-governor of Colorado from 1878 to 1884, and for a month in the latter year served as United States senator. Early in 1898 he was appointed postmaster of Denver, which position he held at the time of his death.

TAIT, LAWSON, M.D., LL.D., one of the foremost authorities on abdominal surgery in England, died June 13, 1899. He was born in Edinburgh, May 1, 1845; was educated at Heriot's Hospital and Edinburgh University. He was house surgeon in the Wakefield Hospital from 1867 to 1870, and in the following year became surgeon in the Hospital for Women at Birmingham, in which city he thereafter resided. From 1875 to 1885 he was a member of the Birmingham town council, and co-operated actively in carrying out the municipal and sanitary improvements inaugurated in that city by Mr. Joseph Chamberlain. Dr. Tait devoted himself to abdominal surgery and the treatment of diseases of women; he improved many of the old methods for operations, and established many new ones; he was held in high regard by physicians and surgeons both in England and America. He wrote a large number of books and papers on his special subjects, and in 1898 published *Diseases of Women and Abdominal Surgery*.

TALIAFERRO, JAMES PIPER, United States senator from Florida, was elected, as a Democrat, by the legislature, April 19, 1899, to succeed Senator Samuel Pasco,

for the term ending March 3, 1905. He was born at Orange Court House, Va., September 30, 1847. After the Civil War, in which he had served as a private in the Confederate Army, he removed to Jacksonville, Fla., his present home, and entered the lumber business. He is now interested in various business enterprises, and is president of the First National Bank of Tampa. For three years he was chairman of the Democratic State executive committee.

TALC. The amount produced in the United States in 1898 was 54,356 short tons, valued at \$411,430.

TALL BUILDINGS. Questions of fire-proofing and fire protection of tall buildings attracted particular attention from engineers and public officials during the year 1899. The new building code of New York City, adopted during the year, contained probably the most comprehensive set of regulations governing fire-protective and fire-proof construction yet enacted by any American city. The principal requirements of these regulations are as follows:

Fire Protection.—All buildings exceeding 85 feet in height must have stand-pipes running from cellar to roof, with siamese connection for fire engines at the curb level, and hose connections on each floor and on the roof. For buildings between 85 feet and 150 feet high stand-pipes must be 4 inches in diameter, with 2½-inch hose connections, and for buildings over 150 feet high this stand-pipe must be 6 inches in diameter. In every such building a steam pump and at least one passenger elevator must be in readiness for the use of the fire department at all times. Where a building extends from street to street, or is L-shaped, so as to have two street fronts, there must be a stand-pipe for each front. All buildings more than two stories high and used for business purposes must have fire-proof shutters for every exterior window above the first floor. Fire escapes must be provided and kept in good working order.

Fire-Proofing.—Every building, to be used as a hotel, lodging-house, school, theatre, jail, police station, hospital, asylum, or institution for the care or treatment of persons, the height of which exceeds 35 feet, and every other building, the height of which exceeds 75 feet, except as otherwise provided, must be built fire-proof. The stairs and staircase landings must be built entirely of brick, stone, Portland cement, concrete, iron, or steel. No woodwork or other inflammable material shall be used in any of the partitions, furrings, or ceilings in any fire-proof buildings, excepting, however, that when the height of the building does not exceed twelve stories or more than 150 feet, the doors and windows and their frames, the trims, the casings, the interior finish when filled solid at the back with fire-proof material, and the floor-boards and sleepers directly thereunder, may be of wood, but the space between the sleepers shall be solidly filled with fire-proof materials and extend up to the underside of the floor-boards. When the height of a fire-proof building exceeds twelve stories, or more than 150 feet, the floor surfaces shall be of stone, cement, rock, asphalt, tiling, or similar incombustible material, or the sleepers and floors may be of wood treated by some process, approved by the Board of Buildings, to render the same fire-proof. All outside window frames and sash shall be of metal, or of wood covered with metal. The inside window frames and sash, doors, trim and other interior finish may be of wood covered with metal, or of wood treated by some process approved by the Board of Buildings to render the same fire-proof. All hall partitions or permanent partitions between rooms in fire-proof buildings shall be built of fire-proof material, and shall not be started on wood sills or on wooden floor-boards, but be built upon the fire-proof construction of the floor and extend to the fire-proof beams filling above. The tops of all doors and window openings in such partitions shall be at least 12 inches below the ceiling line.

Fire-proof floors shall be constructed with wrought-iron or steel floor beams tied together at intervals of not more than eight times the depth of the beam. Between the wrought-iron or steel floor beams shall be placed brick arches springing from the lower flange of the steel beams; or hollow tile arches of hard-burnt clay or porous terra-cotta of uniform density and hardness of burn; or arches of Portland cement concrete, segmental in form, which shall have a rise of not less than 1¾ inches for each foot of span between the beams; or between the said beams may be placed solid or hollow burnt-clay, stone, brick, or concrete slabs in flat or curved shapes, concrete or other fire-proof composition, and any of said materials may be used in combination with wire cloth, expanded metal, wire strands, or wrought-iron or steel bars; but in any such construction and as a precedent condition to the same being used, tests shall be made. These tests shall be made by constructing within inclosure walls a platform consisting of four rolled steel beams, 10 inches deep, weighing each 25 pounds per lineal foot, and placed 4 feet between the centres, and connected by transverse tie-rods, and with a clear span of 14 feet for the two interior beams and with the two outer beams supported on the side walls throughout their length, and with both a filling between the said beams and fire-proof protection of the ex-

A TALL BUILDING IN PROCESS OF CONSTRUCTION.

posed parts of the beams of the system to be tested, constructed as in actual practice, with the quality of material ordinarily used in that system and the ceiling plastered below, as in a finished job. Such filling between the two interior beams shall be loaded with a distributed load of 150 pounds per square foot of its area, and all carried by such filling; the platform so constructed being subjected to the continuous heat of a wood fire below, averaging not less than 1700° Fahr., for not less than four hours, during which time no flame will have passed through the platform, and no part of the load shall have fallen through, and the beams shall have been protected from the heat to the extent that after applying to the underside of the platform at the end of the heat test a stream of water directed against the bottom and discharged through a 1¼-inch nozzle under 60 pounds pressure, for 5 minutes, and after flooding the top of the platform with water under low pressure, and then again applying the stream of water through the nozzle under the 60 pounds pressure to the bottom for 5 minutes, and after a total load of 600 pounds per square feet uniformly distributed over the middle bay shall have been applied and removed, after the platform shall have been cooled, the maximum deflection of the interior beams shall not exceed 2½ inches. Any system failing to meet the requirements of the test of heat, water, and weight prescribed shall be prohibited from use in any building hereafter erected. No filling of any kind which may be injured by frost shall be placed between said floor beams during freezing weather, and if the same is so placed during any winter month, it shall be temporarily covered with suitable material for protection from being frozen. On top of any arch, lintel, or other device which does not extend to and from a horizontal line with the top of the floor beams, cinder concrete or other suitable fire-proof material shall be placed to fill up solidly the space to a level with the top of the floor beams, and shall be carried to the under side of the wood floor boards in case such be used. All fire-proof floor systems shall be of sufficient strength safely to carry the load to be imposed thereon without straining the material in any case beyond its safe working load. The bottom flanges of all wrought-iron or rolled-steel floor and flat roof beams, and all exposed portions of such beams below the abutments of the floor arches, shall be entirely incased with hard-burnt clay, porous terra-cotta, or other fire-proof material allowed to be used for the filling between the beams, to which such incasing material shall be properly secured. The exposed sides and bottom plates or flanges of wrought-iron or rolled-steel girders supporting iron or steel floor beams, or supporting floor arches or floors, shall be entirely incased in the same manner. After the floors are constructed no opening greater than 8 inches square shall be cut through said floors unless properly boxed or framed around with iron. And such openings shall be filled in with fire-proof material after the pipes or conduits are in place. All columns, including the lugs and brackets on same, used in the interior of any fire-proof building, or used to support any fire-proof floor, shall be protected with not less than 2 inches of fire-proof material, securely applied. The extreme outer edge of lugs, brackets, and similar supporting metal may project to within ¾ inch of the surface of the fire-proofing.

These requirements for fire-protection and fire-proofing in tall building construction that are now in force in New York represent in their main features modern American practice in this branch of engineering construction. As indicating the value and efficiency of building stand-pipes, tests made in 1899 by the New York City Fire Department demonstrated that a good fire engine coupled to the curb connective was able to force through the stand-pipe enough water to give an efficient fire stream on the roof of the tallest office buildings of the downtown business district. In England unusual attention was aroused respecting questions of fire-proofing and fire-construction during 1899 chiefly through the efforts of the British Fire Prevention Committee, which has undertaken and partly completed an elaborate series of fire and water tests of various forms of fire-resisting, slow-burning, and ordinary non-fire-proof building construction.

TAMMANY, SOCIETY OF, organized in New York City in 1789, had in 1899 a membership of 11,000. General meeting for 1900, in Tammany Hall, East Fourteenth Street, New York City, April 16. Grand Sachem, Thomas L. Feitner; secretary, Thomas F. Smith, 338 West Twenty-second Street, New York City.

TASMANIA, a large island lying about 80 miles south of Australia, is a British colony. It has an area, including adjacent islands, of about 26,215 square miles, and with Macquerie, 26,385 square miles. Its population was estimated on June 30, 1899, to be about 178,800. The capital, Hobart, has a population, including its suburbs, of about 40,450. Launceston has a population of about 25,000. The principal occupations are agriculture and stock-raising. There are mineral deposits of iron, tin, copper, galena, and coal. There are also valuable forests. The principal exports are minerals, wool, timber, fruit, grain, potatoes, hides and skins, and hops. The imports come mostly from the United Kingdom and Australasia. The United States, though

third on the list, is credited with a comparatively small amount of trade. Her imports are quite considerable, but owing to the fact that most of them are transshipped through colonial importers, especially from Australia, the statistics give no idea of the country of origin. The imports in 1898 were £1,650,018, and the exports were £1,803,369. The public revenue in 1898 was £908,223, and the expenditure, £830,168. The government of the colony is administered by a governor appointed by the crown; a legislative council of 18, chosen for 6 years, and a house of assembly of 37 members, chosen for 3 years. The governor in 1899 was Viscount Gormanston. The premier was the Hon. N. C. Lewis. In 1899 the Federal Enabling bill (for a full account of which see the article AUSTRALIAN FEDERATION) was passed by the legislature, and later approved almost unanimously by a popular vote. In October the minister of lands was forced to resign on a charge of corruption. The government was affected in consequence, and a new cabinet was formed. In the autumn troops were offered to the imperial government and accepted for service in the South African war.

TATE, Sir HENRY, died December 5, 1899. He was known as one of the greatest patrons of art in England. He aimed at the recognition in England of the merits of the modern English schools of painting, and with this idea he acquired a collection of masterpieces. These pictures and the building containing them were presented by him to the people of England; the collection includes many important English pictures, and is known as the Tate Collection and Picture Gallery, Westminster. In recognition of his gift he was created a baronet in 1898. Sir Henry was born in Lancashire in 1819. His fortune was made in the sugar-refining business. Besides his patronage of art he made other important benefactions. The Hahnemann Hospital and the Homœopathic Dispensary in London were built by him, and the library of University College, Liverpool. To the same college he also gave £7000 for scholarships.

TAYLOR, CHARLES FAYETTE, M.D., died at Los Angeles, Cal., January 26, 1899. He was born at Williston, Vt., April 25, 1827; in 1856 was graduated as a physician from the University of Vermont and began practice in New York. He became a prominent specialist in the treatment of deformities and diseases of the bones and joints. He was instrumental in founding the New York Orthopedic Dispensary. Dr. Taylor was a member of several well-known medical societies. His publications include: *Theory and Practice of the Movement Cure*; *Sensation and Pain*; *Infantile Paralysis*; *Spinal Irritation*; *Mechanical Treatment of the Angular Curvature of the Spine*; *Treatment of the Disease of the Hip Joint*.

TAYLOR, S. COLERIDGE, English composer, born in London in 1875, was educated at the Royal College of Music, London, studying composition under professor Stanford, violin under Henry Holmes, and the pianoforte under Mr. Algernon Ashton. His compositions attracted attention at the students' concerts, but his first important work was an *Orchestral Ballade in A Minor*, written for the Gloucester (Three Choirs') Festival of 1898. In 1899 he produced the overture and two parts of a *Hiawatha Trilogy*; *Hiawatha's Wedding-Feast* and *The Death of Minnehaha*. The latter was performed at Hanley, and the overture at Norwich. His *Solemn Prelude* was performed at Worcester in 1899.

TELEBONY. See BIOLOGY (paragraph Hybridization).

TELESCOPES, NEW. See ASTRONOMICAL PROGRESS.

TEMPLE, THOMAS, Conservative member of the Dominion senate, died at Falmouth, Nova Scotia, August 25, 1899. He was born at Bampton, England, November 4, 1818. He was elected to the Canadian house of commons for York, New Brunswick, in 1884, 1887, and 1891, and in 1896 entered the senate.

TENEMENT-HOUSE REFORM. See HYGIENE.

TENNESSEE, a central Southern State of the United States, has an area of 42,050 square miles. The capital is Nashville. Tennessee was admitted to the Union June 1, 1796.

Agriculture.—In the season ending August 31, 1899, the cotton area was 896,722 acres, and the production, 322,820 bales; and for the season ending August 31, 1900, the estimated area was 816,000 acres, and the estimated yield, 166 pounds of lint cotton to the acre. See COTTON and THE COTTON INDUSTRY.

Mineralogy.—According to the annual report of the State Commissioner of Labor for 1898 (issued in 1899), the total number of coal mines in the State is 76, of which 15 were idle during the year. The production was 3,084,748 short tons, valued at about \$2,500,000. Other outputs were, iron ore, 597,777 tons of red and brown hematite; pig-iron, 263,439 tons; copper, 89,721 tons; zinc, 454 tons; manganese ores, 1250 tons; marble, \$316,814; limestone, \$182,402; and phosphate, 272,191 tons. All minerals showed an increased production. In 1899 a New York syndicate acquired the important Ducktown copper property, and expected to begin mining by improved methods in 1900, with the prospect of recovering 12,000,000 pounds annually. Near Columbia

men prospecting for phosphate found a rich deposit of graphite beneath a bed of phosphate 15 feet thick. A Delaware capitalist bought 14,000 acres of coal lands in the Cumberland Mountains, and besides working them for coal will put up 300 solvey coke ovens. Throughout the year the State experienced an unexampled boom in phosphate property, created by the discovery of extensive beds in Maury County. What are said to be the richest phosphate land in the State is in the Mount Pleasant region of Maury County, about 12 miles from the city of Columbia, the rock yielding the blue variety, which brings the highest price in the foreign markets. This industry was most flourishing in Maury, Davidson, Giles, Lewis, and Sumner Counties, and in the former it seemed as if farming had been entirely abandoned. By August 1 more than 10,000 acres of farm lands had changed hands, and many astonishing bargains were reported. The phosphate yields from 5000 to 10,000 tons to the acre, and nets an average of \$3.50 per ton. In the Mount Pleasant district alone, where farming was the rule in 1898, more than 5000 persons were prospecting or working phosphate in 1899.

Manufactures.—During the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$2,173,895. There were 63 manufacturing factories of tobacco, and 62 of cigars, and their output was 5,589,245 cigars, 1,403,067 pounds of plug tobacco, 169,822 pounds of smoking, and 2,111,502 pounds of snuff. Grain and fruit distilleries in operation numbered 158; the amount of fruit brandy produced was 28,550 gallons; spirits rectified, 693,494 gallons; distilled spirits gauged 2,707,500 gallons; and fermented liquors produced, 126,427 barrels.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the delivery ports of Memphis and Nashville aggregated in value \$65,491, showing a steady decrease; exports, none.

Railways.—The new railway construction in the calendar year 1898 was 6 miles, and in 1899, 32.66, giving the State a total mileage of 3102.01.

Banks.—On October 31, 1899, there were 47 national banks in operation and 31 in liquidation. The active capital aggregated \$7,360,000; circulation, \$2,160,933; deposits, \$23,291,255; and reserve, \$7,472,808. The State banks, June 30, 1899, numbered 55, and had capital, \$2,880,329; deposits, \$7,487,316; and resources, \$11,150,477; and stock savings banks, 6, with capital, \$217,500; depositors, 17,678; deposits, \$2,023,686; and resources, \$3,356,448. The exchanges at the United States clearing houses at Memphis, Nashville, and Chattanooga in the year ending September 30, 1899, aggregated \$187,337,528, a net increase of \$1,732,436 in a year.

Education.—The latest common school statistics available at time of writing were for 1895-96, when the school population numbered 720,923, the enrolment being 481,585 and the attendance 338,176. For the school year 1897-98 there were reported 93 public high schools, with 223 secondary teachers, 5357 secondary students, and 4067 elementary pupils; 102 private secondary schools, with 274 teachers, 4899 secondary students, and 7135 elementary pupils; a public normal school, with 28 teachers and 578 students in all departments; and 14 private ones, with 143 teachers and 4244 students. Twenty-four universities and colleges for men and for both sexes reported 18 fellowships, 333 scholarships, 549 professors and instructors, 7139 students, 169,907 volumes in the libraries, valued at \$242,100; \$276,025 invested in scientific apparatus, \$3,414,700 in grounds and buildings, and \$2,406,200 in productive funds, \$455,623 in total income, and \$180,461 in benefactions. Twelve colleges for women reported 180 professors and instructors, 1732 students, 24,878 volumes in the libraries, \$625,500 invested in grounds and buildings, and \$35,000 in productive funds, and \$155,300 in total income. In 1899 there were 300 periodicals, of which 14 were dailies, 229 weeklies, and 39 monthlies.

Finances.—The assessed valuations for 1898 were, acres, \$159,421,612; town lots, \$110,995,934; other property, \$35,698,751—total, \$306,116,297, a decrease in value of \$5,256,432, and the lowest total in more than ten years. The total interest-bearing debt under the new settlement plan, in February, 1899, was \$16,455,200, and the estimated amount of bonds yet to be funded was \$895,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 1,950,000.

Legislation.—Many bills were passed repealing special acts and portions of general acts establishing law, chancery, and criminal courts, which were integral portions of the judicial system of the State. It was also enacted that terms shall be extended as to all cases on trial at the time fixed for the expiration of the term, until such cases are disposed of. All this provoked much public discussion and excitement, and involved the constitutional question whether the legislature has power thus to terminate the functions and emoluments of a judge, constitutionally elected and commissioned, before the expiration of his term. It was claimed that the number of judges was excessive, and that there was a popular demand for retrenchment in judicial expenses, and the legislature claimed to be acting under the power given to it by the constitution to remove judges, for cause, by a concurrent

two-thirds vote of both Houses, which in this case declared that the removals were for economical reasons, and on their face expressly excluded any possible suggestion or inference of personal incompetency, inability, inefficiency, or delinquency. Grave-robbery was made a felony, punishable with imprisonment for not less than two years. Saturday afternoons and the second Friday in May, known as Confederate Decoration Day, were made public holidays. Osteopathy was recognized and regulated. Persons under sixteen years of age cannot marry without written consent of parents or guardians. News agencies are required to sell news to all newspapers and publishers at the same price, thus preventing monopoly in news. Single railroads must not monopolize narrow mountain passes. An elaborate revenue law was passed, which imposes specific occupation and business taxes on nearly every form of business. Uniform text-books, to be selected by a State commission, are required in public schools.

State Officers and National Representatives.—Governor, Benton McMillin; secretary of state, William S. Morgan; treasurer, E. B. Craig; commissioner of agriculture, Thomas Paine; superintendent of public instruction, M. C. Fitzpatrick; comptroller, Theodore F. King; adjutant-general, H. C. Lamb; attorney-general, George W. Pickle. Supreme Court: Chief justice, David L. Snodgrass; associate justices, W. C. Caldwell, John S. Wilkes, W. K. McAllister, W. D. Beard, A. W. McMillin; clerk, James Turney. The State legislature consists of 105 Democrats and 27 Republicans. Senators, Thomas B. Turley, from Memphis; and William B. Bate, from Nashville—both Democrats. Representatives, W. P. Brownlow (Rep.), from Jonesboro; Henry R. Gibson (Rep.), from Knoxville; John A. Moon (Dem.), from Chattanooga; Charles E. Snodgrass (Dem.), from Crossville; J. D. Richardson (Dem.), from Murfreesboro; John W. Gaines (Dem.), from Nashville; Nicholas N. Cox (Dem.), from Franklin; Thetus W. Sims (Dem.), from Linden; Rice A. Pierce (Dem.), from Union City; E. W. Carmack (Dem.), from Memphis.

TENNIS, a modern form of the ancient game of tennis, was introduced into the United States as late as the year 1878, and soon after became one of the national games. One of its best effects was the more general introduction of women to outdoor exercise. Recently golf has taken its place as a popular pastime, but in 1899 a decided revival of interest was shown in tennis, both in private courts and public tournaments. The United States amateur championship was won at the national tournament at Newport, August 15-22, by Malcolm D. Whitman, the champion of 1898. J. Parmley Paret won the singles for all comers, defeating successively M. G. Chase, R. P. Huntington, L. E. Ware, and Dwight F. Davis. The championship doubles were played in two previous tournaments in the East and the West. The winners met at Newport, when D. F. Davis and Holcombe Ward, the Eastern pair, defeated J. A. Allen and H. H. Hackett, the Western champions, and L. E. Ware and G. P. Sheldon, Jr., the 1898 holders of the championship doubles. Tennis critics pointed out as a noticeable feature in the all-around play of the national tournament the consistent, general improvement shown among players of the second and third class. The three leading players of the first class of tennis players in 1899 are officially named as Malcolm D. Whitman, Dwight F. Davis, and William A. Larned. The first ten, as officially ranked in 1899, include, besides these three, J. Parmley Paret, Knight Collins, G. L. Wrenn, Jr., L. E. Ware, Beals C. Wright, Holcombe Ward, and R. P. Huntington, in the order named. R. D. Wrenn did not play in 1899. At the women's championships at Philadelphia, June 20-24, Miss Marion Jones, of San Francisco, won the singles. The championship doubles were won by Miss Myrtle McAleer and Miss J. W. Craven. In the mixed doubles Miss E. J. Rastall and Mr. A. L. Hoskins, Belmont Cricket Club, defeated Miss Craven and Mr. I. P. Gardner, Kenwood Cricket Club. The intercollegiate tennis tournament was held, as usual, at New Haven. The championship was again won by Harvard, Dwight F. Davis taking the singles and Davis and Holcombe Ward the doubles. This tournament is invariably of great interest and it is unfortunate that of the dozen or more colleges which are members of the intercollegiate association, but three organizations enter the tournament annually—namely, Harvard, Princeton, and Yale. This is probably due to the high standard of play that for some time has obtained in these universities, with which the other institutions cannot annually compete. Besides tennis, the older game of court-tennis, played in a covered court, and with more elaborate rules, is coming into favor in this country. It has long been a favorite sport in England. Hand-tennis, or hand-ball, is also played to some extent. See RACQUETS.

TERNINA, MILKA, soprano opera singer, born in Croatia in 1863, studied under Dr. Josef Gansbacher in Vienna, and in 1890 became prima donna in Munich, where she achieved success. She has sung in many of the important Mozart revivals, and is especially admired in the Wagnerian rôles. She has visited America three times, and is now a member of the Grand Opera Company.

TEXAS, a southwestern State of the United States, has an area of 265,780 square miles. The capital is Austin. Texas was admitted to the Union December 29, 1845.

Mineralogy.—During the calendar year 1898 the production of coal exceeded that of the previous year by 47,393 short tons, and was the highest in the history of the State. The total output of 16 mines was 686,734 short tons, valued at \$1,139,763. All the increase was in the bituminous variety, the lignite declining about 20,000 short tons. Iron yielded 9705 long tons, valued at \$3882; pig-iron, 5178 long tons; gold, 14 fine ounces, value \$300; and silver, 472,900 fine ounces, coining value, \$611,426. Quarrying showed an increased production, with granite to the value of \$4685; sandstone, \$77,190; and limestone, \$70,321—total value, \$152,196 against \$90,788 in 1897.

Agriculture.—Almost all these industries received a serious setback by the widespread flood of midsummer. Cotton, however, made a notable advance, keeping the State in first place, and yielding nearly one-third of the entire crop of the country. In the season ending August 31, 1899, the cotton area was 6,991,904 acres, and the production, 3,363,109 gross bales; and for the season ending August 31, 1900, the estimated area was 6,642,000 acres, and estimated production, 185 pounds of lint cotton per acre. See COTTON AND THE COTTON INDUSTRY.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$1,577,833. There were 20 manufacturers of tobacco and 149 of cigars, and the combined output in the calendar year 1898 was 12,999,393 cigars and 49,962 pounds of smoking tobacco. Grain and fruit distilleries in operation numbered 21; the amount of fruit brandy produced was 2158 gallons; spirits rectified, 294,661 gallons; distilled spirits gauged, 597,755 gallons; and fermented liquors produced, 299,861 barrels. In common with all the cotton-growing States, Texas shared in the development of cotton manufacturing during 1899. Several new mills were completed and put into operation, and 25 others were in course of organization.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Brazos de Santiago, Corpus Christi, Galveston (\$2,921,366), Paso del Norte, and Saluria aggregated in value \$6,168,136; exports at Galveston (\$78,476,681) and the other ports, \$92,778,133, an increase in a year of \$1,694,232 in imports and \$13,402,844 in exports. The movement of gold and silver was: Imports, \$9,308,404; exports, \$19,282, a decrease in each. The total foreign trade of the year was \$108,274,955, a net increase of \$11,437,371.

Railways.—The new railway construction in the calendar year 1898 was 180.19 miles, and in 1899, 101.60, giving the State a total mileage of 9759.53. In December, 1899, the State authorities approved the charter of the Union Central Railroad, which, under a capital of \$600,000, is to be constructed from Houston to a point on the Red River, near Paris, with branches to Waco and Palestine, the entire mileage being 560. Approval was also given to a bill for the consolidation of the Missouri, Kansas, and Texas and the Sherman, Shreveport, and Southern lines, on condition that the former builds an extension to San Antonio, and the latter one from Jefferson to the eastern boundary of the State.

Banks.—On October 31, 1899, there were 199 national banks in operation and 79 in liquidation. The active capital aggregated \$19,205,000; circulation, \$5,547,513; deposits, \$44,183,531; and reserve, \$13,791,108. There were also, June 30, 1899, 33 private banks, with capital, \$1,096,587; deposits, \$2,849,701; and resources, \$6,703,455. The exchanges at the United States clearing houses at Galveston, Houston, and Fort Worth in the year ending September 30, 1899, aggregated \$378,729,208, an increase in a year of \$26,800,902.

Education.—The revised school census of 1897 showed a total enumeration of 776,867. At the close of the school year 1896-97, the last for which detailed reports were available at the time of writing, the enrolment in the public schools was 612,140; average daily attendance, 404,372. There were 12,953 teachers, 10,234 buildings used as school-houses, and public school property valued at \$6,081,356. The receipts were \$4,349,834; expenditures, \$4,320,271, of which \$3,723,603 was for teachers' salaries. There were 192 public high schools, with 600 secondary teachers, 11,843 secondary students, and 4835 elementary pupils; 71 private secondary schools, with 287 teachers, 4746 secondary students, and 5777 elementary pupils; 3 public normal schools, with 23 teachers and 892 students in all departments; and 8 private ones, with 63 teachers and 1548 students. Normal training was also given in 6 colleges and 39 public high schools. Sixteen universities and colleges for men and for both sexes reported 7 fellowships, 3 scholarships, 279 professors and instructors, 4577 students, 74,569 volumes in the libraries, valued at \$88,750; \$93,075 invested in scientific apparatus, \$1,959,500 in grounds and buildings, and \$720,716 in productive funds; \$344,183 in total income, and \$83,500 in benefactions. Three colleges for women reported 29 professors and instructors, 452 students, \$120,000 invested

in grounds and buildings, and \$52,778 in total income. In 1899 there were 834 periodicals, of which 69 were dailies, 672 weeklies, and 63 monthlies.

Finances.—The assessed valuations for 1898 were: Real estate, \$575,065,505; personal property, \$279,553,860—total, \$854,619,365; tax rate, \$3.80 per \$1000. The total bonded debt, September 1, 1899, was \$3,989,445, of which \$3,261,200 was held by State funds and \$728,245 by individuals.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 2,985,000.

Legislation.—The legislature of Texas requested Congress to call a convention for proposing amendments to the Constitution of the United States, so that an amendment may be submitted to it providing for the formation of irrigation districts and levying taxes to pay for ditches. Depredators on public lands are to be prosecuted. A State entomologist is to be appointed to take means to destroy insects injuring cotton. A corporation court is established in each city, town, and village, with limited civil and criminal jurisdiction. Selling or giving tobacco to a minor under sixteen years of age was made a misdemeanor. With reference to railroads, a law was passed inflicting a severe penalty on any person giving rebates or drawbacks, charging one shipper more than another, giving unreasonable preference or unjust discrimination. Railroads less than thirty miles long may be leased by other roads for not longer than ten years. General officers must reside in and keep their offices in the State of Texas. The railroad commission was given power to fix emergency rates to prevent interstate rate wars.

A strong anti-trust law was enacted, with heavy penalties, including fine, forfeiture of charter, and inability to recover for any article sold or contract made. It prohibits trusts, pools, monopolies, or interference with competition in articles of commerce, insurance premiums, or the gathering or distribution of news. Whitecapping was defined to be the posting or sending of any anonymous notice or threats to do personal violence, with intent to interfere with the right of any person to occupy any premises, precinct, or county, or to follow any occupation. The penalty is imprisonment for not less than two or more than five years.

State Officers and National Representatives.—Governor, Joseph D. Sayers; lieutenant-governor, J. S. Browning; secretary of state, D. H. Hardy; treasurer, J. W. Robbins; comptroller, R. W. Finley; superintendent of public instruction, J. S. Kendall; commissioner of agriculture, Jefferson Johnson; adjutant-general, Thomas Scurry; commissioner of general land office, Charles Rogan; attorney-general, T. S. Smith. Supreme Court: Chief justice, Reuben R. Gaines; associate justices, Thomas J. Brown, F. A. Williams; clerk, Charles S. Morse. The State legislature consists of 2 Republicans, 148 Democrats, and 9 Populists. Senators, Horace Chilton, from Tyler; and C. A. Culberson, from Dallas—both Democrats. Representatives, Thomas H. Ball, from Huntsville; Samuel B. Cooper, from Beaumont; R. C. de Graffenreid, from Longview; John L. Sheppard, from Texarkana; Joseph W. Bailey, from Gainesville; Robert E. Burke, from Dallas; Robert L. Henry, from Waco; S. W. T. Lanham, from Weatherford; Albert S. Burleson, from Austin; R. B. Hawley (Rep.), from Galveston; Rudolph Kleberg, from Cuero; James L. Sladen, from San Antonio; John H. Stephens, from Vernon—all Democrats, excepting Mr. Hawley.

TEXTILE MILLS. According to the most reliable statistics available, a greater number of new textile mills were built and placed under construction in the United States in 1899 than in any year since 1896. At the rate that new textile mill construction is now progressing this country is becoming the largest producer of cloth in the world. One very notable feature of the new construction is that more mills are being built for the production of the finer kinds of goods than ever before. The following figures, given by the *American Wool and Cotton Reporter*, show the principal features of the new mill construction of 1899 as compared with those of 1898:

Item.	1898.	1899.	Item.	1898.	1899
Cotton mills	152	187	Total Southern mills.....	181	196
Woolen mills.....	30	45	" Northern " 	49	103
Knit goods mills.....	53	40	Total for United States .	290	399
Miscellaneous	26	27			

The year also witnessed very extensive additions to existing mills and particularly the re-equipment of these mills with more modern textile machinery. At the close of the year manufactures of such machinery were being pushed to the limit of their capacity to supply the demand.

THAYER, ELI, was born at Mendon, Mass., June 11, 1819; died in Worcester, Mass., April 15, 1899. After his graduation at Brown University in 1845 he taught for seven years, and in 1853 was elected to the Massachusetts legislature. He is remembered as one of the prominent antislavery agitators, and was the originator of the "Kansas Crusade." By this movement he purposed to send into Kansas a sufficient number of antislavery settlers to insure its becoming a free State. To this end he introduced in his State legislature in 1854 a bill to charter the Massachusetts Emigrant Aid Company; under the auspices of this company the towns of Topeka, Lawrence, Ossawatimie, and Manhattan were settled. In 1856 Thayer began a similar work in Virginia, and in two years had founded the town of Ceredo, with about five hundred settlers from New England. He was elected to Congress as a Republican, and was returned for a second term. At the Kansas quarter-centennial Governor Charles Robinson said in Topeka concerning Thayer and his emigrant company: "Without these settlements Kansas would have been a slave State without a struggle; without the aid society these towns would never have existed, and that society was born of the brain of Eli Thayer."

THEOSOPHICAL SOCIETY. See UNIVERSAL BROTHERHOOD.

THERMOL. A new coal-tar derivative less than a year old is thermol, a definite chemical compound with the formula $C_7H_5NO_2$. It lowers temperature by dissipating heat, and inhibits heat-production by directly controlling the heat-producing centre. It is said to possess a specific action in la grippe, in which disease it causes a rapid fall of temperature and a decided diaphoretic action, causing as well a general activity in the glandular system. It has also been used in typhoid fever.

THIBET, nominally a province of the Chinese Empire, but practically independent in its internal relations, is a country of Central Asia, which hitherto has been very little explored and of which very little is definitely known. The inhabitants, though mild in character, maintain a stubborn opposition to foreign travellers. The country constitutes the high plateau between the Kwen Lun Mountains on the north and the Himalaya range on the south, or between the Indian province of Kashmir on the west and the Chinese province of Sze-chuen on the east. The great plateau, which in few places is lower than 10,000 feet, contains the sources of several of the great rivers of China and India. The estimated area is 651,500 square miles, and the estimated population, 6,000,000. The seat of the civil government and of the religious authority is the mysterious city of Lhasa, which has a large population and contains many monasteries. The country is under the rule of lamas, or priests, who represent a form of Buddhism. Attempts are being made to increase the Indian trade with Thibet, but as yet there are no British representatives in the country. There are said to be at Lhasa two Chinese residents, who represent the Chinese government. Pursuant to a treaty concluded in the early part of 1894, Yatung, a town beyond the Sikkim frontier, was opened for trade, and an official of the Indian government and a Chinese official were stationed there. The treaty stipulated that for the first five years all articles except Indian tea, drugs, intoxicating liquors, and war munitions should be free of duty. The Indian tea was entirely prohibited. The leading imports into Thibet are cottons, woollens, maize, metals, and tobacco.

THOMPSON, MRS. ELIZABETH, philanthropist, was born at Lyndon, Vt., in 1821; died at Littleton, N. H., July 20, 1899. She was known as the benefactor of the Women's Free Medical College, New York; she contributed to many charities, and gave over \$100,000 for educational purposes. She purchased for \$25,000 the famous painting, "President Lincoln Signing the Emancipation Proclamation," by Mr. Francis Bicknell Carpenter, and presented it to Congress. For this act she was given the freedom of the floor, being the only woman, it is said, who has received this courtesy.

THOMPSON, FRANK, president of the Pennsylvania Railroad Company, died at his home at Merion, near Philadelphia, June 5, 1899. He was born at Chambersburg, Penn., July 5, 1841; was educated at the Chambersburg Academy, and at the age of seventeen entered the Altoona shops of the Pennsylvania Company, where he spent four years in obtaining a practical and scientific knowledge of mechanical engineering. During the Civil War Thompson was chief assistant to Colonel Thomas A. Scott, of the Pennsylvania Railroad, who was assistant secretary of war. Until June, 1864, Thompson did valuable service for the Union in the South and Southwest by building and repairing bridges and railroads, and making possible the transportation of troops and forwarding of supplies, etc. He then accepted the position of superintendent of the eastern division of the Philadelphia and Erie Railroad; but in 1873 he became superintendent of motive power at Altoona for the Pennsylvania system, and a year later was appointed general manager of the system east of Pittsburg and Erie. In this position Thompson introduced various important reforms and improvements, among them being the superior track and equipment of the Pennsylvania road, the picturesque stations, and the system of track inspection and of the block-signal. In

1882 he became second vice-president and five years later first vice-president, and upon the death of George B. Roberts in 1897 he succeeded to the presidency of the great railway system. Thompson was a splendid example of the "self-made" man. He knew the railroad business in all its detail, and had that executive power by which he was able to make his knowledge effective. He was succeeded as president by Mr. Alexander J. Cassatt.

THORNE, SARAH, a notable English actress and theatre manager, died at Chatham, England, February 27, 1899. She was the daughter of Richard Thorne, a manager, and was born more than sixty years ago in London. She first played in pantomime as a child under her father's management and made her professional debut at the Surrey Theatre in London, becoming soon the leading actress at the Theatre Royal, Dublin; at this time she played a classic repertory, including *The Lady of Lyons*, and was associated with G. V. Brooks and Charles Kean. Miss Thorne played frequently in London, made numerous tours, and for many years was the principal actress in the regular Edinburgh season, but she never visited the United States. She is said to have been the first actress to undertake the rôle of Lady Audley in the dramatization of Miss Braddon's *Lady Audley's Secret*, in which she appeared in 1863. Some of the most successful of the younger English actors served under Miss Thorne. Among the older members of the profession with whom she played are Sir Henry Irving, Wilson Barrett, John Hare, Charles Mathews, and Squire Bancroft. Her career as a manager began in 1870, from which time for seven years she had control of the Theatre Royal at Margate, which she was again directing at the time of her death. She had managed theatres in several English towns, and from 1870 her time was given alternately to acting and managing.

TIDES, THEORY OF OCEAN. See ASTRONOMICAL PROGRESS.

TIEMANN, DANIEL FAWCETT, ex-mayor of New York, died in that city, June 29, 1899. He was born in New York, January 9, 1805; was educated privately, and entered his father's business of paint manufacture in 1824, becoming partner three years later, and succeeding to the entire business in 1848. After being repeatedly elected alderman he was chosen mayor, serving as such in 1858-60. He was a State senator in 1871.

TISSANDIER, GASTON, French chemist and aéronaut, died September 8, 1899. He was born in Paris, November 21, 1843; studied at the Lycée Bonaparte, and, having specialized in chemistry, was admitted to one of the laboratories of the Conservatory of Arts. Later he became director of the Laboratory of Experiment and Analysis. After investigating the subject of meteorology he turned to ballooning, and in August, 1868, made his first ascension from Calais; he drifted out above the sea, and returned by allowing the balloon to sink to an air current that was setting landward. After this he made many voyages, and not a few of his observations proved to be of real scientific interest. He sometimes made his ascensions alone and sometimes accompanied by his brother or MM. Sivel and Croce-Spinelli. At the time of the siege of Paris he and his brother escaped in a balloon. In April, 1875, he ascended to the height of about 28,000 feet, an altitude that was fatal to the life of his companion. Tissandier submitted to the Academy of Sciences numerous papers and essays on the subject of aerial navigation. Among his works may be mentioned: *In a Balloon*; *The Souvenirs of an Aéronaut*; *The Application of Electricity to Aerial Navigation*; *Photography in a Balloon*.

TOGOLAND, a German protectorate on the coast of Upper Guinea, lies between French Dahomey, on the east, and the British Gold Coast, on the west. The areas of most of the African territories are indeterminate; that of Togoland is placed by some authorities at 23,160 square miles, by others at 33,000 square miles. The coastline is only 32 miles long, but inland the country broadens out. The neutral zone in the hinterland, which had been determined by Great Britain and Germany in 1888, and which was the last remaining portion of neutral territory in western Africa, has been divided between the British Gold Coast and Togoland, pursuant to the Samoan treaty of November 14, 1899. By this arrangement the territory secured by Great Britain is the larger, while that falling to Germany is said to be more important commercially. The estimated population of Togoland is 2,500,000. Togo, on the lake of the same name, is the chief native town, and has some 8000 inhabitants. Lorne, the chief port, is the capital. Other coast towns are Porto Seguro, Little Popo, and Bagida. The protectorate is administered by an imperial commissioner. Inland are several government stations, and there is a small military and police force. Four missionary societies are at work among the natives, most of whom are Ewe negroes. The country is largely unexploited, but some trade in gum, palm oil, palm kernels, and ivory is carried on. Coffee culture has been introduced, and to some extent maize, bananas, yams, and ginger are cultivated. There are a few native industries, such as weaving, pottery, etc. In the forests are found oil-palms,

the rubber tree, dyewoods, and the cacao tree. The imports are chiefly cotton goods, tobacco, and spirits. The imports and exports in 1896 amounted to 1,886,840 marks and 1,651,416 marks, respectively; in 1897 imports, 1,975,940 marks; exports, 771,025 marks. The value of the mark in United States currency is \$0.238. Customs duties are the chief source. Togoland is said to be the only German colony that is almost self-supporting.

TOLSTOY, Count **LEO**, was born in 1829. By descent he belongs to one of the oldest families of the Russian nobility. Educated for a military career, he served as an officer in the Russian army through the Crimean War. He made his début in literature by his war sketches, which at once secured for him a place among the great masters of Russian prose. Resigning from the army, he devoted himself entirely to literature. Within the next decade he wrote his *War and Peace*, a historical novel from the Napoleonic times, remarkable for the masterly portrayal of the characters, taken from all walks of life. It was not, however, the literary genius of Tolstoy that first made his name known beyond the boundaries of the Russian Empire; but, on the contrary, that which most of his countrymen would call his vagaries, and the "Westerners," his religious teachings. In truth, Tolstoy's philosophy lacks all originality, being nothing but the current philosophy of Russian "Nihilism" so called, divested, however, of its revolutionary mantle. Tolstoy's idealization of peasant life in a primitive agricultural community is that of Russian "populism" (*narodnitchestvo*) of the seventies. His abhorrence of all modern civilization—commercialism, science, and all—can be easily traced through Russian "populism" to the apostle of anarchy, Michael Bakunin. Tolstoy's Christianity is not the unsophisticated faith of the Christian believer in Christ—God. His Christ is a social reformer, the forerunner of nineteenth-century Socialism, as penned by the early writer of Russian "populism"—Colonel N. Sokolov, *Les Réfractaires*. Nor is the interest he has taken in the Russian sect of "Doukhobors" and their emigration from Russia, first to Cyprus, and last year to Canada, original with him. It dates back as far as the early sixties with the founders of "Nihilism," to whose imagination the dissident movement among the Russian peasantry recalled the days of the peasant wars in Germany or the Puritan movement and the revolution in England. The numerous sects among the Russian peasantry had been a subject of thorough study with a number of "populist" writers of the seventies and early eighties before they attracted the attention of Tolstoy. And, lastly, the most conspicuous characteristic of Tolstoism, the ethical doctrine of perfectibility, is a marked feature of Russian "Nihilism" of the days of Tchernyshevsky, as well as of its later development, the "populism" of the seventies.

Tolstoy's doctrine of non-resistance grew out of the political reaction in Russia under Alexander III., which followed the revolutionary or terrorist period of 1878-81. All opposition of any form was ruthlessly crushed by the iron hand of the government. Resistance to "evil" was hopeless. Political or social reform appeared like a visionary dream; pessimism was the philosophy of the day. At a different epoch, brought home to us by another great Slav writer, Henryk Sienkiewicz (*Quo Vadis*), similar conditions created religious martyrs. Amid the agnostic atmosphere of Russian educated society the counterpoise of pessimism was supplied by the secular quasi-Christianity of Tolstoy, which showed to the active altruists a new road to philosophical salvation—by setting to the darkened world examples of ethical lives. The few Tolstoyan settlements of university men and women founded in the rural districts differ from similar settlements of the "populist" period of the seventies only in that they have discarded the element of revolutionary propaganda, which insures them greater permanency, although by no means complete immunity under the Russian police régime. Their imitations in England are of a kind with the numerous communistic experiments, beginning from Robert Owen's down to our own day.

Tolstoy's latest production, *The Resurrection*, which appeared in 1899, leads the reader through that period in contemporary Russian history in which Tolstoism has found its origin. As in *War and Peace*, the all-embracing vision of the greatest pen-artist of our times takes in all conditions and classes of men, from the imperial palace down to the overcrowded prisons along the great Siberian highway. The author admirably succeeds in that which proved the stumbling-block of no meaner a talent than that of Tourgueniev; in Tolstoy's new work we are for the first time presented with real-life pictures of the men and women of the Russian revolutionary, or "Nihilist," movement. That they are not treated like criminals is but natural with a Russian author. Even the most biased pictures, bordering on the caricature, from the pens of the pro-government writers of fiction, have at no time attempted to represent them otherwise than as rebels or "enemies of society." Tolstoy is, however, entirely free from all bias in the opposite direction, which makes, for example, of Stepaniak's *Underground Russia* a chapter of hagiology. The genius of Tolstoy manifests itself in his ability to think and feel as each of his characters

would think and feel himself; you are, as it were, in a theatre, where the world's greatest players enact before your mental eyes the drama of real life.

TONQUIN, or TONKING, formerly a province of Anam, but a French colony since 1884, occupies a part of the Indo-Chinese peninsula, and lies to the south of the Chinese province of Yunnan, east of the Burmese Shan states, and north of Anam. The country comprises 14 provinces, the area of which is 34,740 square miles, and the estimated population, which includes 8000 villages, is 9,000,000. Including the Laos territory, annexed by France from Siam in 1893, the total area is 135,000 square miles, and the population, 12,000,000. The chief town and seat of government, Hanoi, on the Hanoi, or Song-koi River, is said to be an aggregation of villages, with a population of about 150,000. The country is governed by a resident under the French council of Indo-China; there is an army of occupation, numbering about 19,000. The principal crop is rice, the export of which goes mostly to Hong-Kong; other products are cotton, silk, sugar-cane, fruits, tobacco, and pepper. The chief port and trading centre is Haiphong. At Hongay, near this place, and at Kebao are coal deposits, worked by French companies. There are also copper and iron mines. The leading imports are machinery and other metal goods, tissues, yarn, and beverages. There is a railway 64 miles long. See **INDO-CHINA**.

TORONTO, UNIVERSITY OF. See **PSYCHOLOGY, EXPERIMENTAL**.

TOWER, CHARLEMAGNE, LL.D., was promoted by President McKinley on January 10, 1899, from the post of minister to Austria-Hungary to that of ambassador to Russia, to succeed the Hon. Ethan Allan Hitchcock, who had been called to the portfolio of the interior in the President's cabinet. Mr. Tower was born in Philadelphia, April 17, 1848, and after studying at a military academy in New Haven and at Phillips Academy, Exeter, entered Harvard, and was graduated in 1872. During the next four years he travelled in Europe, visited Palestine and Egypt, and devoted himself to the study of history, modern languages, and literature; he studied particularly at the University of Madrid, at Paris, Tours, and Frankfort-on-the-Main. Returning to America, he studied law in Philadelphia, and was admitted to practice in 1878. From 1882 to 1887 he lived in Duluth, Minn., where he became president of the Duluth and Iron Range Railroad and managing director of the Minnesota Iron Company. Mr. Tower has large interests, and is an officer and director in several corporations. He has been vice-president of the Historical Society of Pennsylvania, is a trustee of the University of Pennsylvania, and a member of the Academy of Natural Sciences, of the American Institute of Mining Engineers, and of the Numismatic Society. In March, 1897, he was appointed minister to Austria-Hungary; his successor in this position is Mr. Addison C. Harris (*q. v.*). Mr. Tower has written *The Marquis of Lafayette in the American Revolution*.

TOWNSEND, LAWRENCE, United States minister to Belgium, on April 15, 1899, was transferred to this position from the embassy at Lisbon, to succeed Mr. Bellamy Storer, appointed minister to Spain. Mr. Townsend was born August 13, 1860, in Philadelphia; there he was educated at the Mantua Academy in 1872-77, and entered the University of Pennsylvania, but was not graduated. After passing five years in ranch life in western Colorado he went to Europe to study international law and the history of diplomacy, and while thus engaged made a number of translations in these subjects from the French and German. Under President Cleveland he was appointed—1893—first secretary of legation at Vienna, where he remained until the spring of 1897, when President McKinley appointed him minister to Portugal. He was succeeded at Lisbon by Mr. John N. Irwin.

TOWNSEND, Fifth Marquess of, JOHN VILLIERS STUART TOWNSEND, died October 29, 1899. He was born April 10, 1831, and was educated at Eton. From 1850 to 1854 he was a clerk in the foreign office, and from 1856 to 1863 represented Tarnworth, as a Liberal, in Parliament. In the latter year he succeeded his father to the title. He is succeeded by his son, the Viscount Raynham, who was born in 1866.

TRACK and FIELD ATHLETICS. See **ATHLETICS, TRACK and FIELD**.

TRACT SOCIETY, AMERICAN, founded in 1825, has distributed up to 1899, 475,788,587 copies of religious books and pamphlets to many millions of families in all parts of the world. President, General O. O. Howard; secretaries, W. W. Rand, D.D., and George L. Shearer, D.D. Offices, 150 Nassau Street, New York City.

TRADES UNIONS. The report on trades unions in the United Kingdom for the year 1898 was issued by the Board of Trade in 1899. This gives the figures for 1267 trades unions with a membership of 1,644,591. It shows a decrease in the number of separate unions, but an increase of some 2 per cent. in the membership over 1897. The amount of funds in the hands of the one hundred principal unions in 1898 was about \$13,474,000, and their income about \$8,651,000, amounting to a per capita contribution of \$8.29. The amount expended by these unions in the past seven years

was \$53,636,830. The distribution of these funds for the period 1892-98 was as follows: Dispute benefit, 23 per cent.; unemployed, 23.3 per cent.; working expenses, 17.7 per cent.; sickness and accident, 16.2 per cent.; funeral and other expenses, 11.2 per cent.; superannuation, 8.6 per cent. The report of the British delegates who were present at the Detroit convention of the American Federation of Labor in December, 1899, showed the remarkable progress of unionism in Great Britain. One of these delegates said that the unions in Great Britain numbered 1267, with 1,644,591 members, and an accumulated fund of \$23,500,000. The one hundred principal unions had over a million members; thus 8 per cent. of the unions control some 63 per cent. of the membership, and by far the greatest portion of the fund. According to a recent report of the French Bureau of Labor, the number of trades unions in France was 2324, with a membership of 437,793.

Labor Congresses in Great Britain.—At the thirty-second annual congress of trades unions, held at Plymouth, England, September 4-9, 1899, there were 385 delegates present, representing 147 organizations with a membership of 1,120,164, a falling off in the number of organizations, delegates and members as compared with the preceding year. The congress passed resolutions upon a great variety of subjects, including a recommendation for eight-hour bills for certain industries, for the representation of workmen in parliament, for the better housing of the people, for municipal bakeries, public education, co-operative production, and old-age pensions, and resolutions concerning the restriction of Sunday trading, juvenile labor, etc. The place of meeting for the 1900 congress was fixed at Huddersfield. On January 24-26, 1899, the question of a federation of trades unions was discussed at a special labor congress held at Manchester, where 288 delegates representing organizations having a total membership of nearly one million were present. The meeting resolved in favor of a general federation of trades unions to improve the status of workmen, promote unity of action and industrial peace, and maintain the rights of combination among workers.

Labor Convention in the United States.—On December 11, 1899, the American Federation of Labor held its annual meeting at Detroit, Mich. The 200 delegates present represented organizations having a membership of about 800,000. The presence of British delegates bore witness to the efforts which have been made for some years to form a closer union between the labor organizations of the United States and those of Great Britain. The most significant result of the congress was its declared opposition to anti-trust legislation as likely to injure organized labor. In the report of the president, which was accepted by the federation, the laws to prevent combinations and trusts were condemned as likely to deprive labor of the benefits of organization. The congress also declared against the principle of a general boycott on account of the difficulties in the way of its application.

TRANSVAAL. THE, known officially as the South African Republic, lies on a lofty plateau in the interior of South Africa, at an elevation of from 4000 to 6000 feet above the sea. This descends toward the north to the Limpopo or Crocodile River, which forms the northern boundary and flows toward the Indian Ocean. The southern boundary is formed by the Vaal River, which empties into the Orange River, below Kimberley, in Cape Colony, the seat of the diamond industry. The great gold fields of the Transvaal lie between these two rivers, in the Witwatersrand or White Water range of hills. The Transvaal is entirely surrounded by other states. Portuguese possessions and Zululand, a province of Natal, shut it off from the eastern coast, while British possessions hem it in on the north and west. On the south lie the Orange Free State and the British colony of Natal. The area of the republic is 119,139 square miles, and the population, according to an estimate made in 1898, is 1,094,156. Of this number 748,759 were natives and 345,397 were whites, the latter numbering about 3 Boers to 7 Outlanders. Probably 80 per cent. of the Outlanders were British. The capital, Pretoria, had a population of about 12,500, of whom 10,000 were whites. Johannesburg is the largest town, and a mining centre of great importance. Its estimated population in 1899 was 106,000, of whom 60,000 were whites, mostly Outlanders. The Kaffirs, or natives, make up most of the remaining inhabitants, with a few Malays, coolies, and Chinese. The Boers are almost wholly devoted to agriculture and stock-raising, although the natural produce of the land is not sufficient for the wants of the people. The Outlanders, on the contrary, are confined mostly to industrial, and especially to mining pursuits. The great mineral product of the Transvaal is gold, which was discovered about 1885 in the Witwatersrand hills. The South African Republic now contains the most important gold fields in the world. In 1897 the output of the Witwatersrand mines was for a number of months over £50,000 every 24 hours, and the total output of the Transvaal in that year was about £11,653,725 (\$56,162,743), that of the United States being at the same time £12,208,411, or \$59,412,232. In 1898 the total amount of Transvaal gold mined reached 4,555,000 ounces, valued at £17,000,000, or \$82,722,000, while that of the United States was about £13,214,000, or \$64,300,000. The world production in 1898 was valued at £59,423,000, so that Transvaal gold furnished nearly a third of the

year's total supply. Most of the ore comes from the Witwatersrand or Johannesburg fields. The next important are those at Barberton. In the first nine months of 1899 the output of the Johannesburg mines was 3,913,810 ounces, as compared with 2,697,917 for the first nine months of 1898. Soon after the close of this period, in October, 1899, the war with Great Britain broke out. The United States consul-general in Cape Town wrote as follows on November 4 regarding later mining conditions in South Africa: "The exodus of Outlanders from the South African Republic and Orange Free State has, I believe, been unprecedented in history. Many of these people—the mining population, the bone and sinew of the country—have scattered over the world. Numbers of them, too poor to get out of the country, are subjects of charity in the cities of Cape Colony and Natal, and have to be fed. Johannesburg, in the Transvaal, and Bloemfontein, in the Free State, are, to all intents and purposes, deserted cities. Johannesburg, the largest commercial centre in South Africa, has, so far as trade is concerned, ceased to exist. This once busy, bustling city, producing monthly over 15 tons of gold and yearly \$60,000,000 worth, is silent. Up to this time goods have reached the Transvaal via Delagoa Bay, but it is not supposed that they will long be permitted to enter. The two republics must then live on their own resources. Their crops are ready for the sickle, but cannot be cut, as the men are off to the war. Large quantities of gold en route to seaports in this colony for shipment to England have been taken by the Boers." Some years ago the discovery of the rich South African diamond fields was made in territory at that time claimed by the Boers. After the diamond discoveries, however, British rule was proclaimed over the area which contains the fields, and the Transvaal permanently lost a rich source of income. In 1897, however, diamonds were discovered at Reitfontein. In 1898 the output of the Pretoria district was 11,025 carats, valued at \$43,151, and that of the whole Transvaal 22,843 carats, valued at \$212,812. The size and value of the stones is less than of those found at Kimberley in Cape Colony, or at Jagersfontein in the Orange Free State, but the output gradually increased in value during the two years between the discovery of the district and the outbreak of the war. There are a few other minerals, including considerable unworked iron deposits. About 1,953,000 tons of coal were produced in 1898, most of which was taken by the mines. There are a number of important railroad lines. A trunk line starts at Pietersburg, in the north, passes southward through Pretoria and Johannesburg, traverses the Orange Free State, and terminates at Port Elizabeth and Cape Town in Cape Colony. This is known as the Netherlands railway. A second runs eastward from Pretoria into Portuguese territory, and terminates at Lourenço Marques on Delagoa Bay. It is over this road that the Transvaal government was able to keep up connection with the world after the outbreak of war, as it is the only railroad to the seaboard running through neutral territory. British possessions, in fact, enclose the two Boer republics on all other sides. A third railroad starts at Johannesburg, and runs southwestwardly into Natal, which it enters through a tunnel under Laing's Nek. The latter is a pass in the Drakenburg Mountains, near Majuba Hill. Thence the railroad passes to Durban, the port of Natal, by way of Ladysmith and Pietermaritzburg. A road leads westward also from Johannesburg to Krugersdorp, and thence via Potchefstroom into the Free State, where it connects again with the Pietersburg-Cape Town Railroad. Johannesburg is connected by wagon-road with the all-British Cape Town-Bulawayo Railroad, 1360 miles long, which closely follows the western frontier of the Transvaal. The state religion is that of the United Dutch Reformed Church, whose estimated membership in 1895 was about 30,000, with as many more in other Dutch churches. Next in membership comes the English Church, followed by the Wesleyans, the Jews, the Presbyterians, the Catholics, and members of other Christian churches. About 12,000 children attend the state schools. The latter include village and ward schools, a model school, a gymnasium, and a girls' school. There are many English and other denominational schools in Johannesburg, Pretoria, and elsewhere. The finances of the republic have greatly improved since the discovery of gold, the revenue having increased from £177,407 in 1882 to £4,480,218 in 1897. The importance of mining to public finance may be seen from the sources of revenue, which in 1897 were import duties, £1,276,319; Netherlands Railway, £737,366; prospecting licenses, £427,230; explosives, £300,000; stamps, £258,396; posts and telegraphs, £215,320. The expenditures in 1897 amounted to £4,394,066, including £1,012,866 for public works, £696,960 for salaries, £396,348 for the war department, and £271,435 for the purchase of explosives. The receipts of the Mining Commissions Department at Johannesburg were £896,044 and the expenditure £101,369. The public debt in 1898 was £2,675,690. About £147,000 were direct liabilities to the British crown, the remainder being included in the "Rothschild loan." The payment of the debt to Great Britain is provided for by a sinking fund, and is to be extinguished at the end of a stated period. The Transvaal government holds a considerable amount of territory, including the Barberton gold fields.

The constitution of the South African Republic, which has been amended in various ways down to the year 1897, provides for a president, S. J. Paul Kruger

SCENES IN THE TRANSVAAL.—1. Johannesburg since the exodus of Uitlanders, before the exodus of Uitlanders. 3. A sortie with the armored train from Ladysmith. 4. Scene in Church Square, Pretoria. 5. A company of Boers on the way to Pietermaritzburg. 6. Commandant General Jan Piet Joubert, commander-in-chief of the South African Republic.

(*q. v.*) being the executive in 1899, and for a parliament composed of an upper and a lower chamber, with 27 members each, called the First and Second *Volksraad*. Members must be Protestants, at least 30 years of age, and possess certain property qualifications, and are elected for 4 years. Members of the upper house are elected by what are known as first-class burghers, no others having the right to vote. To possess the rights of a first-class burgher, one must be a male white person resident before May 29, 1876, or a veteran of the 1881 war of independence, or the Jameson raid, or various other campaigns. His rights then extend to his children from the age of sixteen. The lower house is voted for by the second-class burghers, who comprise naturalized male aliens and their children over 16 years of age. The latter must register on becoming of age, and come into their rights at the age of 18 years. Aliens may become naturalized after two years' residence, and in special cases they may be naturalized in a shorter time. By special legislation sons of aliens may become first-class burghers after 10 years from naturalization. By limiting the votes of second-class burghers to the election of the Second *Volksraad*, or lower house, whose bills must be approved by the First *Volksraad*, the Boers have managed to prevent the government from falling to the control of the alien whites, or Outlanders. The president and commandant-general also are elected by first-class burghers only.

HISTORY.

In order to understand the conflict in South Africa, which has been the main feature of the history of the Transvaal during the year, it is necessary to examine the previous relations between England and the Boers. The racial antagonism, which is at the root of the present struggle, springs from causes that reach far back in the history of South Africa, and for that reason the historical writings are generally tinged with partisanship, and there is hardly a stage in the history of England's gradual expansion in South Africa that is not involved in controversy. At the same time, a brief historical sketch which shall present both sides may be of service. The history of South Africa may be divided into four periods. First, from the British occupation of Cape Colony in 1814 down to the date of the South African independence in 1852. Second, from the latter date to the assumption of British sovereignty in 1877. Third, the period of the first Anglo-Boer war, and of the conventions of 1881 and 1884. Fourth, the period from the discovery of gold in the Rand in 1885 to the present time, comprising as its leading feature the discontent of the alien element in the Transvaal.

To the Sand River Convention.—When the Dutch established a port of call at the Cape in 1652, the dominant native race was the Bantu, which had pushed southward from Central Africa, and occupied the region which now comprises Matabeleland, Bechuanaland, the Boer Republic, Swaziland, and Zululand, driving the Hottentots and Bushmen into Natal and Cape Colony. Thus it was the Hottentots with whom the Dutch first came in contact. It was only later, when the limits of the Dutch settlements extended, that they encountered the Bantu tribes—that is, the Kaffirs, Zulus, Basutos, Bechuanas, and Matabeles. The thieving propensities of the Hottentots laid the foundation of a bitter hostility toward the natives on the part of the Dutch, and from the very first the relations between the two races were unfriendly. The Dutch colony was controlled by the East India Company, a close corporation whose governor had arbitrary powers. As a result of the Napoleonic wars, Cape Colony came into the possession of England in 1806, and, by a convention signed in 1814, the English occupation was made permanent. The historians, whatever be their sympathies, agree that England's policy in her new possession was unwise in the extreme. In the first place, the same arbitrary form of government was set up by the English, and any form of resistance to the command of the governor was treason. Dutch customs and traditions were disregarded and English became the official language. But the main cause of the irritation was the government's interference with the Dutch policy toward the natives. The Dutch were accused of great cruelty in their dealings with the native tribes, and on one occasion they were charged by a member of the London Missionary Society with nearly one hundred murders of natives. The government found this charge greatly exaggerated, but the methods employed to procure witnesses and seek out the supposed murderers provoked a feeling of distrust on the part of the Dutch which could not be dispelled. Their bitter enmity toward the missionaries dates from this time. The suspicion that the English authorities were trying to fasten on them crimes which they had not committed was increased by the attempt of the authorities to arrest one of the Boers for an assault upon a native slave. The accused party rallied his friends around him and resisted the arrest, with the result that he himself was killed and five of his comrades were arrested and afterward put to death. What is regarded by some as a still more important cause of the ill feeling between the Dutch and the English was the abolition of slavery. Slavery was practised by the Dutch, and it is estimated that at the time of the Emancipation act (December 1, 1834) there were 40,000 slaves in the colony. The main cause of complaint was the manner in which

the emancipation came about. In 1826 a meeting of slave-holders adopted resolutions in favor of gradual emancipation, and there were signs that if the matter had been handled in a prudent and reasonable way the end might have been gained without injurious results, but the abolitionists were unwilling to adopt gradual measures. Moreover, though the slaves were valued at £3,000,000 sterling, the compensation awarded by the imperial government was only £1,250,000, and worse than that the money was made payable in London. Great financial disaster resulted from the wholesale emancipation, which amounted in many instances to a total loss of property. At the same time the colonial government contrived to give offence by its attitude toward the commando system, which appeared to be the Boers' only protection against native tribes. The abolition of this system left the Boers defenceless at the time of the Kaffir War of 1834-35, and the result was the devastation of wide areas by the 12,000 armed Kaffirs that invaded the colony. The home authorities accepted on insufficient foundation many tales in regard to cruelty and unscrupulousness of the Boers, and on the other hand refused to believe the statements of men who were really trustworthy, such as Lord D'Urban and others who understood the conditions in the colony. The colonial office seems, in fact, to have blundered at every point. When, for example, Lord D'Urban stretched the boundary of the colony to the Kei River in the hope of preventing a conflict between the Dutch and the natives, the home government misunderstood his object and required the retrocession of the territory to the Kaffirs. Englishmen and Boers alike were disgusted with the administration of the colony. These in general were the causes which led to the exodus of the Boers in 1836, which is known as the Great Trek. Eight thousand of them, preferring the wilderness to British authority, moved into the great plain north of the Orange River. They also settled in part of Natal, where they were welcomed by a small body of English traders that had already colonized the district around Port Natal. But they were soon afterward involved in a war with the Zulus, in which they were ultimately successful (1838). During the war the English traders had fled, and the Dutch farmers were now supreme in that region. Still these settlers were under allegiance to Great Britain, and the governor of Cape Colony declared his intention of taking possession of the Port of Natal. In 1843 the British government asserted its authority over Natal, and the Dutch settlers, again finding themselves confronted with English rule, trekked into the interior. During this period the race antagonism continued, and the Boers showed a steady purpose to escape from British control. At last, by the Sand River convention in 1852, the British government recognized the independence of the Transvaal Boers, and in 1854 that of the Orange River territory.

From 1854 to 1877.—The chief features of this period were the wars with the natives, the discovery of diamonds, and the assumption of British sovereignty. The Boers were divided among themselves, and on one occasion a raid was made by the Transvaal Boers into the Orange Free State. The concluding treaty between the two republics is significant in the light of subsequent events from the clause in which the government of the Orange Free State ceded to the citizens of the South African Republic the same rights and privileges as were enjoyed by the inhabitants of Cape Colony and Natal. In 1856 began the wars with the Basutos, which gave the governor of Cape Colony the opportunity to intervene. The British authorities promised protection to the native chief, who had been the leader in the wars, and the boundaries of Basutoland were changed in the interest of the natives. This was followed by the annexation of Basutoland by the imperial government. The effect of this was still further to arouse the enmity of the Boers. Another case of intervention by the British, which was followed by the acquisition of lands claimed by the Boers, arose out of the discovery of diamonds on the Orange River near the Vaal. The richest part of these diamond lands was on territory claimed by the Boers, but this claim was disputed by the Griqua chief, who asked the intervention of the British authorities. The result was that British rule was proclaimed over this territory. Disputed claims to territory on the part of the natives and the Boers finally led to the choice of a board of three arbitrators, two of whom were British. The decision awarded the disputed lands to the natives, but the latter ceded them to the British, who, though they gave up a large part of the territory, retained the diamond district. These events made the Boers feel that they were the victims of superior force. Their grievances may be summed up as follows: First, the intervention on behalf of the Basutos, Griquas, and Bantus; second, the establishment of police and magistrates on the Vaal; third, the seizure of lands claimed by the Orange Free State, and fourth, the stoppage of ammunition destined for the Free State, and the open sale of ammunition to the natives. On the other hand, pro-British writers emphasize the oppressive policy of the Boers in dealing with the natives, and especially the continuance of slavery. In the Sand River convention the Boers pledged themselves that slavery should not be practised or permitted. It is claimed that slavery went on as before, and that the Boers made raids upon the natives, carrying off large numbers of prisoners into slavery, which was disguised under the name

of apprenticeship. That slavery in some form or other was practised appears probable from several independent sources, although the Boer writers have denied it. Another point urged by the defenders of England's policy is the constant danger of war which resulted from the Boer's attitude toward the natives. At the same time a condition bordering on anarchy developed within the Transvaal itself. It had passed through a period of currency inflation, and in 1876 was absolutely bankrupt. Taxes could not be collected, the salaries of public officers were unpaid, and there was no public credit. And while the country was without resources for its own defence, the Zulus were gathering their forces and preparing to invade the Transvaal. In 1877 Sir Theophilus Shepstone, a special commissioner from the British government, arrived in the Transvaal under authority to annex that country to Great Britain, if such a course met the wishes of the inhabitants, and appeared to be justified by the circumstances. At this crisis many of the Boers regarded annexation as the only course of safety. President Burgers appeared to acquiesce in the necessity of annexation. In an address to the *Volksraad* he declared that it was a choice between the adoption of very radical changes in the government or annexation to Great Britain. The whole tenure of his speech seemed to be that affairs were hopeless, and that annexation was the only way out of the difficulty. After an investigation lasting about three months, Sir Theophilus Shepstone proclaimed the annexation of the Transvaal, having first submitted the draft of this proclamation to the president, and modified it according to his suggestions. The president and the Boer executive council made a formal protest, which was understood by the commissioner as merely for the purpose of preventing a certain party of Boers from causing a disturbance.

From 1877 to 1885.—This whole episode of annexation is a subject of dispute, some writers claiming that the great majority of the Boers, including the better element, were in favor of annexation, and others seeing in the whole movement nothing but the designs of the imperialists. The next step on the part of the British was to settle the Zulu question. Finding it impossible to make the Zulus restore certain property which they had seized and to give up some marauders demanded by the British, war was made upon them, with the result that the Zulus were finally subdued and Zululand annexed by Great Britain. Soon after the annexation of the Transvaal the Boers showed hostility toward the new régime. The executive council sent commissioners to England, one of whom was Vice-President Kruger, to protest against annexation, and on the return of these commissioners there was a movement to submit the question of British rule to a plebiscite, but the authorities would not make any concessions. There is sharp criticism of the British policy at this point. In the first place, it is said by pro-British writers that, while the proper policy would have been one of firmness and consistency, the British government wavered and delayed. It made a serious mistake in recalling Shepstone, who had won the respect of the Boers, and supplanting him by a military officer, whose rigorous methods made him unpopular. At the same time the protest against annexation was met by a refusal to consider the reopening of the question. It was said again and again that the Transvaal should remain under British control. Yet popular opinion in England on the subject was changing, and the spokesman of the anti-annexationists was Mr. Gladstone, who, in 1880, declared that the government ought to restore the Transvaal, since it was acquired by means dishonorable to the country. In the meanwhile the Boer population was preparing for war. The history of that short campaign, so disastrous to the British, need not be repeated here. The Boers were prompt in taking the field, and their victories at Laing's Nek, Nicholson's Nek, and Majuba Hill bore witness to their superiority in that kind of fighting. These victories coincided in time with the change in policy on the part of the government. In less than two months from the date of Mr. Gladstone's speech, calling upon his country to give back the Boers their independence, his party came into power. Yet at first he replied to a letter from the Boers, requesting the restoration of independence, with the statement that "looking at all the circumstances, our judgment is that the Queen cannot be advised to relinquish her authority over the Transvaal." The English and the Boer loyalists thought they had every reason to believe that the British government would maintain its control over the Transvaal. But Kruger and the anti-annexation element continued their hostility, and on December 13, 1880, proclaimed the South African Republic. The Gladstone government now completely reversed the British policy. In spite of the many declarations that British rule would not be given up, the Gladstone ministry now determined to treat with the Boers on the basis of their independence. For this act Mr. Gladstone has been sharply criticised. Some have accused him of lack of foresight, and even cowardice. Others have confined themselves to saying that it was a premature attempt to carry "into international affairs the principle of the gospel." The friends of Mr. Gladstone, however, characterized his conduct as in the highest degree magnanimous. It was based on the feeling that England had been in the wrong, and that the only

thing for her to do was to recede from her position. To do this after reverses on the battle-field required the highest courage, since her motives would no doubt be misinterpreted. The practical effects of Mr. Gladstone's policy were injurious. On the strength of previous assurances many inhabitants of the Transvaal had remained loyal and some of them had fought on the British side. These people regarded themselves as betrayed by what they called their undeserved desertion by the government. England's conduct was not interpreted as the result of magnanimity among the Boers, but was construed as simple cowardice. It gave the Boers confidence in their military power, and in the opinion of many writers greatly strengthened the Afrikaner sentiment, and encouraged the ambition for the establishment of a strong Afrikaner state which should rival the British in South Africa. In 1881 peace was concluded, and in the same year the Pretoria convention granted the Boers their independence under the suzerainty of the Queen. In 1884, the Boers having objected to the terms of this arrangement, a new convention was concluded in London, which made no express reference to suzerainty, and granted the Transvaal its entire independence, subject to the right of the British government to reject treaties formed by the republic with foreign powers. The status of the Transvaal under these conventions has been the subject of sharp dispute in connection with the events of 1899, and an outline of the discussion will be found in a later paragraph.

From the Discovery of Gold to 1899.—Since 1885, when the discovery of gold in the Witwatersrand began to draw large numbers of foreigners into the republic, the main feature of its political history has been the relations between the government and this constantly increasing body of alien settlers, known as the Outlanders. Among them there were representatives of every race, but the predominant element was British. So rapid was this influx of foreigners, that in a short time the population of the two mining centres, Johannesburg and Barberton, exceeded that of all the rest of the Boer Republic. The attitude of the Boer government toward these Outlanders, since it furnished the occasion of the war of 1899, is naturally involved in controversy, and there is hardly a point connected with it that is discussed in an impartial manner in the works hitherto published. For that reason the best way of presenting the subject is to outline the arguments on each side. The Boer side of the case may be summed up as follows: Previous to the discovery of gold the naturalization laws had been liberal, but as the alien population became more numerous the qualifications for citizenship were raised. In 1881 the franchise was granted for two years' residence. In 1885 the term of residence was raised to five years, and in 1887 to fifteen years. The reason for this was the danger ever present in the minds of the Boers that their nationality would be "swamped" by the extension of full rights of citizenship to the Outlanders. These Outlanders were most of them British subjects, and suspected by the Boers of hating all Dutch institutions. The Boers appealed to their previous history. They had receded before the British farther and farther into the interior in order to be rid of what they considered an oppressive form of government. Now to permit a transfer of political power from the descendants of the very men who had fled from British oppression to those who would no doubt do all that they could to bring the Transvaal under British authority seemed the height of folly. Again, it was argued that these Outlanders came into the country merely to enrich themselves, and that they would then return to their homes, and the transfer of political power to a floating element like this was not to be thought of. In the so-called grievances of the Outlanders and the sympathy which these grievances enlisted among the British, the Boers saw only the working of imperialistic ideas. To them it seemed that these grievances were to be made the pretext for interference with the Transvaal. The imperialists were openly aiming at a confederation of British South Africa, and the extension of British power to the Zambesi, and the inclusion of the Transvaal within the sphere of British control appeared to be a part of this programme. The two Boer republics blocked the way of the imperialistic schemes of Mr. Cecil Rhodes. Hence, the Boers argued, these alleged grievances of the Outlanders would naturally be made the most of. The rich mine owners in the Rand were in sympathy with the imperialist policy. Thus, there was a strong party within the republic and without which was seeking to destroy its independence. In these circumstances it was reasonable that they should not consider very respectfully the demand of the Outlanders. But if any further justification was needed for their suspicions of the Outlander element and their imperialistic friends, it was afforded by that criminal attempt known as the Jameson Raid. Dr. Jameson was a member of the British South Africa Company, and his attempt upon the Transvaal was regarded by the Boers as the culmination of a conspiracy between the managers of the South Africa Company and the alien element in the Transvaal. The association between Dr. Jameson and the Outlander organization, known as the National Union of the Transvaal, is obscure, but the Boers did not doubt that there was complicity between them, and they more than suspected the complicity of prominent British imperialists, who were secretly sup-

ported by the colonial government. Moreover, the action of the British government after the failure of Jameson's raid, and the capture of him and his followers, was not vigorous enough to allay the Boer suspicion. The Outlanders were naturally viewed with greater distrust than before. The National Union, though it carried on its agitation by peaceful means, made little headway. In general, the Boers denied that the Outlanders were oppressed, but they offered to introduce certain reforms in answer to some of the complaints which appeared to be well founded.

The British contention rests upon, first, the somewhat technical and complicated discussion of the conventions of 1881 and 1884, and, second, upon the more important matter of the Outlander grievances, which were held to justify interference on general ground of equity.

The Conventions.—The claim of certain British writers that intervention was justified on the ground that Great Britain still retained suzerainty over the Transvaal involves a purely legal discussion. The convention of 1881 in its preamble grants "complete self-government, subject to the suzerainty of Her Majesty, to the inhabitants of the Transvaal territory upon certain terms and conditions and subject to certain reservations and limitations." This language seems to subject the Transvaal Republic not only to the suzerainty of the British government, but to certain restrictions in its internal government. The annexation of the republic was nowhere formally renounced, and the right of self-government was made the subject of an express grant under certain limitations. The Boers, not satisfied with the status which this language implied, now tried to induce the British government to withdraw its assertion of suzerainty. This was refused on the ground that the Transvaal was not in fact an independent state, but, at the same time, a concession to the Boer demands was made to the extent of concluding a new convention in 1884, known as the London Convention, which did not contain certain articles imposing limitations and restrictions upon the internal government. In this convention the only reference to reserved British rights was that in regard to approval or rejection by the British government of treaties between the Transvaal and foreign states. The discussion of the status in which this new convention placed the Transvaal is marked by the assertion of extreme claims on each side and is complicated by the different interpretation which was placed upon the convention at the time of its formation. The extreme British claim is that the new convention was merely a concession in form, a change in wording to avoid giving offence to the national pride of the Boers, and that British suzerainty was not affected by this change in phraseology. It was claimed that the Transvaal delegates at London knew that the British government did not mean to give up anything essential. It is also claimed that from oral assurances and from the use of the term "the inhabitants of the Transvaal" that political rights were not recognized as appertaining to the Boers alone, but to the other elements in the population. It was held, too, that the preamble of the 1881 convention remained in force, and some even maintained that it justified interference in the internal affairs of the Transvaal in certain circumstances. One writer goes so far as to say that it cannot be maintained that the convention of 1884 superseded that of 1881. According to this view, the disappearance of the term suzerainty from the convention of 1884 did not invalidate Great Britain's suzerain powers, which were still implied, if not expressed, and further there were certain restrictions and limitations imposed upon the Boers in their internal government. This is an extreme view. Unfortunately, the word suzerainty was differently understood at the time when it was employed. Mr. Gladstone held that it was related to sovereignty, but altogether distinct from it; Lord Salisbury, that it did not preclude interference in internal affairs; Lord Kimberly, that it carried with it the transfer of authority over internal affairs; and Lord Melbourne, that it was concerned only with foreign and frontier relations. This diversity of view was apparent in the course of the debates in the House of Commons in 1881. As to the purport of the convention of 1884, the more generally accepted opinion was that expressed by Lord Derby, who told the representatives of the Transvaal Republic that the omission of certain articles in the 1884 convention left the Transvaal government free to manage its own internal affairs without interference, and to shape its foreign policy as it chose, provided it observed the single requirement that a treaty draft must be subjected to the Queen's approval. This view of the matter did not, however, suit the extremists on the other side. Their arguments seemed to assume that the South African Republic was in reality a sovereign international state, and there were signs that they were trying to make Great Britain's acknowledgment of this a condition precedent for any concession to the demands of the Outlanders. The attempts of British writers to justify interference on strictly legal ground have not been generally successful. The stronger basis of their claim was that of equity, and the arguments which have carried the most weight have been based upon considerations of British paramountcy in South Africa, of the so-called right of higher civilization, and of the obligation to protect British subjects against oppression. The British claim rests chiefly on the

right to insist that her subjects in the Transvaal shall enjoy the same privileges as she accords to the alien elements in her own South African colonies. It is conceivable that, apart from strict principles of international law, the grievances of a nation's subjects residing in another country may be such as to warrant interference. It is therefore important to consider these grievances in detail.

Outlander Grievances.—There was a marked economic antagonism between the interest of the Outlanders and the Boers, the former being essentially industrial and the latter being almost wholly agricultural. There was a scarcity of capital in the Transvaal before the discovery of gold, and consequently an insufficient basis for taxation, but, with the influx of the large mining population and the increase of wealth, an extensive body of capital accessible to the tax-collector came into existence. The government took advantage of this new condition. It levied a tax on the mines and a tariff on imports. Naturally these burdens fell chiefly upon the Outlanders. The farmers suffered but slightly from it, since they consumed comparatively little of the goods upon which taxes were levied. Thus, the financial situation gave the Outlanders one great cause of complaint, and the denial to them of political rights prevented any redress of this grievance. In April and May, 1899, the discussion of the Outlander grievances attracted much public attention. A petition, signed by 21,648 Outlanders, was submitted to the British government, asking for intervention on their behalf. In general, it blamed the Transvaal government for withholding political rights from the European residents, who, it said, bore the greater part of the public burdens. The following summary gives the principal grievances of which the Outlanders complained: First, the Boers have levied excessive taxes on articles of domestic consumption, and these have imposed a heavy burden upon the Outlanders. The latter, being without political rights, have thus been taxed without representation. Second, in spite of the heavy taxation, the government has not furnished a proper water-supply or sanitation. It has not protected its citizens from violence, and it has permitted the liquor trade with natives. A general charge of corruption was made against the administration. Third, the Boers have prevented the majority of the population from using their own language in the law courts. Fourth, a religious test is imposed and inquiry as to a man's religion is made before admitting him to state employment. Roman Catholics are not employed by the South African Republic. Fifth, the police force has shown great brutality, as illustrated by the killing of the Englishman Edgar on the mere appearance of an intention on his part to resist arrest, and also by their resort to a system of espionage and by threats of violence on the occasion of reform meetings. On the other hand, the police have not supplied adequate protection against crime. Sixth, the law courts have been wholly under the control of the executive and judges who would not act as mere creatures of the government were dismissed. An illustration of this was the action taken in the case of Justice Koetze, who was known to be a friend to the civil liberty of the individual. He was replaced by Justice Gregorowski, who was a mere tool of the executive. Seventh, the liberty of the press is denied, and newspaper editors have been harshly treated for publishing views opposed to the administration. Eighth, the minority—that is, the Boers—have been allowed to carry arms, while this has been forbidden to the majority, who have thus been placed on the same footing with the disarmed blacks and earned the nickname of "White Kaffirs." The special grievances complained of by the capitalists were the dynamite monopoly, the tariff on machinery, chemicals, etc., and the tax on mines. The demands of the Outlanders were that there should be an equitable franchise with a fair representation; that the constitution should be reformed by a body representing the whole people; that there should be improvements in the efficiency of the civil service; that religious disability should be removed; that liberal education should be provided for; that the Dutch and English languages should be placed upon the same footing; that South African products should be admitted free of duty, and that the legislature should be responsible to the heads of departments. These grievances represent not only those which were expressly mentioned in the petition, but those which were discussed by the Outlanders and their friends in the South African and British press. In general, the Boer authorities, while admitting that some of these grievances should be redressed, considered the claims excessive, and denounced the appeal for intervention as wholly unwarrantable. This was the state of affairs when an attempt at settlement was made by the Bloemfontein conference May 30, 1899.

Bloemfontein Conference.—It was finally decided to hold a conference at Bloemfontein, in the Orange Free State, between President Kruger, of the South African Republic, and Sir Alfred Milner, the governor of Cape Colony and the high commissioner for South Africa. In the meanwhile, on the 16th of May, the Transvaal government had caused the arrest of eight Outlanders, nearly all Englishmen, on the charge of fighting against the republic. This further angered the Outlanders and their sympathizers, many of whom declared that there had been no plot, and that it

was merely a pretext on the part of the Transvaal government for employing still harsher measures against the Outlanders. The negotiations at Bloemfontein lasted from June 2 to June 6, but did not result in a settlement of the points at issue. The main question discussed was the franchise of the Outlanders, although some other points, like the dynamite monopoly of the Transvaal government and the murder of the Englishman Edgar by the Transvaal police, came up for discussion. It was the plea of the Outlanders that the present state of affairs, whereby the government of the republic was in the hands of the minority, was intolerable and must come to an end. Until recently a residence of fourteen years was required for the full franchise, and since the mining industry in the Rand had not reached its present importance fourteen years ago, this requirement virtually excluded the Outlanders from all political life. The Transvaal government had, to be sure, consented to the reduction of the term of residence from fourteen to nine years, but this was not regarded by the Outlanders as a sufficient concession. The demands which Sir Alfred Milner preferred at the conference were as follows: 1. That the term of residence required as a qualification for the franchise should be changed to five years, and should be retroactive in effect, bestowing the franchise on all the Outlanders who had been five years resident in the Transvaal. 2. That the vote of naturalization should be modified, so that the new citizen should not be required to renounce the country of his birth. 3. That the new population should be fairly represented in the *Volksraad*. 4. That naturalization should carry with it immediately the right to vote. 5. The franchise to comprise a property qualification. President Kruger submitted the following counter-propositions: 1. A residence of two years should be required for naturalization, after which the full right to vote should follow at the expiration of five years. 2. That all persons settled in the Transvaal before 1890 should have this right at the end of two years. 3. That the population of the mining district should be largely represented in the *Volksraad*. 4. That one of the conditions of naturalization should be the possession of a certain amount of property, the value of which was specified. 5. Naturalized citizens should give proof that they had enjoyed civil rights in the country where they had formerly lived. 6. That the form of naturalization should correspond to that of the Orange Free State. 7. That these propositions were made on the condition that Great Britain would accept arbitration for all differences which might thenceforth arise between the two countries. The members of the conference could come to no agreement upon these points. To Great Britain the last proposition of President Kruger was the most displeasing, since to admit the principle of arbitration between the Transvaal and Great Britain seemed to the latter a violation of her suzerain rights over the Transvaal. Sir Alfred Milner declared that his government would "not have any foreign interference at all between them and the South African Republic." The situation though critical was not hopeless. President Kruger appeared earnest in his wish to conciliate Great Britain. The *Volksraad* approved the principle of the concessions which the president had offered, and expressed regret that the high commissioner had not accepted them.

Diplomatic Negotiations.—Nevertheless, the war feeling in Great Britain gained ground. Mr. Chamberlain added somewhat to its bitterness by his speech at Birmingham on June 26, in which he blamed the Transvaal government for its egotistic and oppressive policy, and implied a doubt of the good faith of President Kruger. Nevertheless the Transvaal *Volksraad* voted a law, based on the principle of electoral reform, which President Kruger had proposed—namely, the naturalization of the Outlanders at the end of seven years, which was to be retroactive in effect. But there was no adequate provision for a distribution of seats, and the new concessions did not apply to presidential elections. On July 27 Mr. Balfour made a rather sharp speech against the Transvaal, saying that England would not be content with what the Transvaal had offered. At the end of July an important debate occurred in Parliament, where the speeches of Lords Salisbury and Selborne in the House of Lords and that of Mr. Chamberlain in the House of Commons indicated that in the opinion of the Government the Transvaal concessions were insufficient, and it was doubtful if they would be carried out in good faith. On August 2 Mr. Chamberlain sent, through Sir Alfred Milner, a proposition to the government of the Transvaal looking to the nomination of a mixed Anglo-Boer commission which should investigate the nature and the probable results of the electoral law that had been voted by the *Volksraad*. The law, while falling far short of what the British government desired, was still an important step in the direction of reform. The British government did not reject this compromise. The commission which Mr. Chamberlain proposed was merely for the purpose of ascertaining how far the new law was a real measure of reform. The demand for such a commission does not at first sight seem excessive, but it met at once with opposition from the Transvaal government, since it seemed to establish a precedent for the interference of the British government in the internal affairs of the Transvaal—an interference which in the course of time it was feared would gain wider scope and in the end lead to complete British control. Neverthe-

less, the Boer government gave much thought to the matter, and it was not until August 22 that it submitted its reply. In the meanwhile Parliament had been prorogued, and Mr. Chamberlain was free to conduct the affair without the embarrassment of parliamentary comment. On the last day of the session he had given evidence of his fixed determination to enforce his demands upon the Transvaal government. In reply to a member of the house, who had called in question the extreme measures that had been adopted against the Boers, he said that British ascendancy in South Africa was clearly imperilled by the obstinacy of the Transvaal government in refusing justice to the Outlanders and that it was a state of affairs that could not be endured much longer. He concluded with the declaration that the government had put its hand to the plough and would not turn back. President Kruger's reply on August 22 to Mr. Chamberlain's proposal for a mixed commission was somewhat evasive. It did not actually accept or reject the proposal for a commission of inquiry, but submitted certain counter-propositions which emphasized the concessions which had been made to the Outlanders, and explained that the conditions which he had imposed were necessary for the safeguarding of his country's independence. His counter-propositions were: 1. That the electoral franchise should be accorded at the end of five years, as Sir Alfred Milner had demanded at the Bloemfontein conference. 2. That eight new members should be added to represent the mining districts, which would bring the number of Outlander representatives in the *Volksraad* up to ten out of a total membership of thirty-six, and that the proportion of their seats should never fall below one-fourth. 3. That the new citizens should have the same right to vote as the old citizens in all elections, including those for president and commandant-general. 4. That the government of the Transvaal should receive through the British agent and should submit to examination all amendments which the government of Great Britain should see fit to suggest in respect to the administration of the new franchise law, provided that Great Britain would renounce its pretensions to suzerainty over the Transvaal, and would accept the principle of arbitration with the exclusion of every foreign element, with the exception of the Orange Free State. 5. The interference of Great Britain in the present circumstance should not be taken as a precedent. Here the question of suzerainty at once assumes the greatest importance. Mr. Chamberlain showed himself strongly opposed to the conditions offered by the Transvaal government and professed to regard the question of suzerainty as of vital interest to Great Britain. He published a blue book, giving an account of the negotiations between the two governments down to this point. As to suzerainty, it should be noted that it was definitely expressed in the convention of 1881, which had regulated the relations between Great Britain and the Transvaal, but in the convention of 1884 the word suzerainty did not occur, and the Transvaal government contended that it had ceased to exist in fact as well as in name, holding that the convention of 1881 had been superseded by the adoption of that of 1884. On August 26 Mr. Chamberlain made a speech in which he attacked President Kruger and the obstinacy of the Boers, contrasting with it the patience which Great Britain, "a sovereign power," had shown in dealing with a "vassal nation." He spoke openly of the possibility of a rupture. The reply to the Transvaal government was published on August 30. In this Mr. Chamberlain said that he could not understand why his proposal for a commission of inquiry in regard to the operation of the law had not been favorably received. He now proposed a commission which should consist wholly of Englishmen. As to the interference of Great Britain in the internal affairs of the Transvaal, he said he hoped there would be no need for such interference in the future if equal rights were accorded to the Outlanders, but that the government could not abandon the rights which the conventions of 1881 and 1884 had conferred upon it, nor could it renounce its obligation to protect its citizens in another country. His opinion in regard to the suzerainty was contrary to that of the Transvaal. He accepted the principle of arbitration, but declared that certain differences might arise between the two countries which could not be settled by such a court of arbitration. He suggested that a new conference should be held at Cape Town for the purpose of discussing this question of arbitration. It was the opinion of the Boers and their sympathizers that throughout all these negotiations it was the wish of the London government to push the Transvaal government to extremes; that the question of the franchise was only a pretext; that the matter of the suzerainty was only a means for attaining ends which it was not expedient to disclose; that in forcing war England had in view not only the assertion of her sovereignty over the Transvaal, but the establishment of her power over all South Africa upon a firm basis. Great Britain wished to add to her prestige in Cape Colony, where the Afrianders had a majority in Parliament. In fact, the conduct of the British government throughout all this was merely the part of a wider scheme involving her complete supremacy in South Africa. In the Cape Government the ministry of Sir J. G. Sprigg had been replaced by an Afriander cabinet under Schreiner. The Dutch population of the Cape sympathized with the Transvaal, and it was feared that they would make common cause with their fellow-Boers. The

party in opposition there tried to induce the government to prevent the transportation of arms and munitions from the colony to the Orange Free State on the ground that these arms were destined in part for the Transvaal and would be used against Great Britain if war broke out. The Africander premier refused this, alleging the treaties between Cape Colony and the Free State. (See *CAPE COLONY*.) On the other hand, the position of the British government was that the acceptance of the condition on which the concessions were offered would mean the complete abrogation of British control over the external as well as internal affairs of the South African Republic. This was too high a price to pay for the same privileges which Great Britain freely granted to the alien element in her own colonies, and which, therefore, she could demand on principles of equity from the Transvaal. It was too much to expect that she should bargain away her suzerainty. In the official reply of August 30 it was stated that the British government could not pledge itself to abstain from protecting its subjects if protection was needed, and could not give up the rights secured to it by treaties and conventions. It refused to discuss the question of suzerainty.

As time went on it was more and more certain that war was destined to break out. To the continental press it seemed that England was trying to force the Transvaal into war. Few writers either in France or Germany could find anything to say on behalf of Great Britain. To almost all it seemed that under the pretence of honesty and fair play she was working steadily to overthrow the independence of the Transvaal. There was profound disbelief in the declaration of the British government that it was intervening in the interest of the Outlanders. On September 8 a despatch of the Pretoria government was published, expressing regret that Great Britain refused the terms offered in the despatches of August 22. It still held, however, to the law granting the franchise after seven years, and declared that it was not opposed to the holding of an inquiry upon the operation of the law, although it expected no advantage to come from it. Thus it withdrew the concessions of August 22, the British government having refused to abrogate its suzerainty. Mr. Chamberlain replied to this despatch from the Transvaal on September 12. He began by repudiating anew the claim of the republic that it should be treated as a sovereign international state. He next announced that he considered the law granting the seven-year franchise unsatisfactory, but that he continued to accept the concessions offered on the 22d of August, on the condition that an inquiry, mixed or unilateral, should prove that the operation of the new electoral law is not impaired by vexatious and restrictive regulations. Finally he demanded another concession—namely, that the new members of the *Volksraad* should be allowed to use their own language in debate, and he implied that the Transvaal government had itself suggested this to the British agent. If Great Britain's demands were accepted, the government was ready to arrange for a new conference to settle details of the proposed court of arbitration and other matters referred to in the note of August 30, with the exception of Outlander grievances and the interpretation of the conventions. His despatch concluded with references to the increasing danger of prolonging the present situation and insisted upon an immediate and definite reply, in default of which the British government would consider the whole situation anew and formulate its own propositions. The reply of the Transvaal was published on the 17th of September. It was negative. It said in substance that the conditions which it had imposed upon the concessions of August 22 were essential, since they alone could insure the independence of the republic. It denied that the suggestion had been made to the British agent that the representatives of the Outlanders should be allowed the use of their own language. The despatch also declared that the propositions of August 22 had been made because the British agent had given the Transvaal government to understand that they would be accepted by Mr. Chamberlain. Complaint was made that the representative of the English government had acted in bad faith. As to the new conference proposed by England, the Transvaal government was not opposed to it in principle, but it desired that the matters with which it should concern itself should be precisely stated.

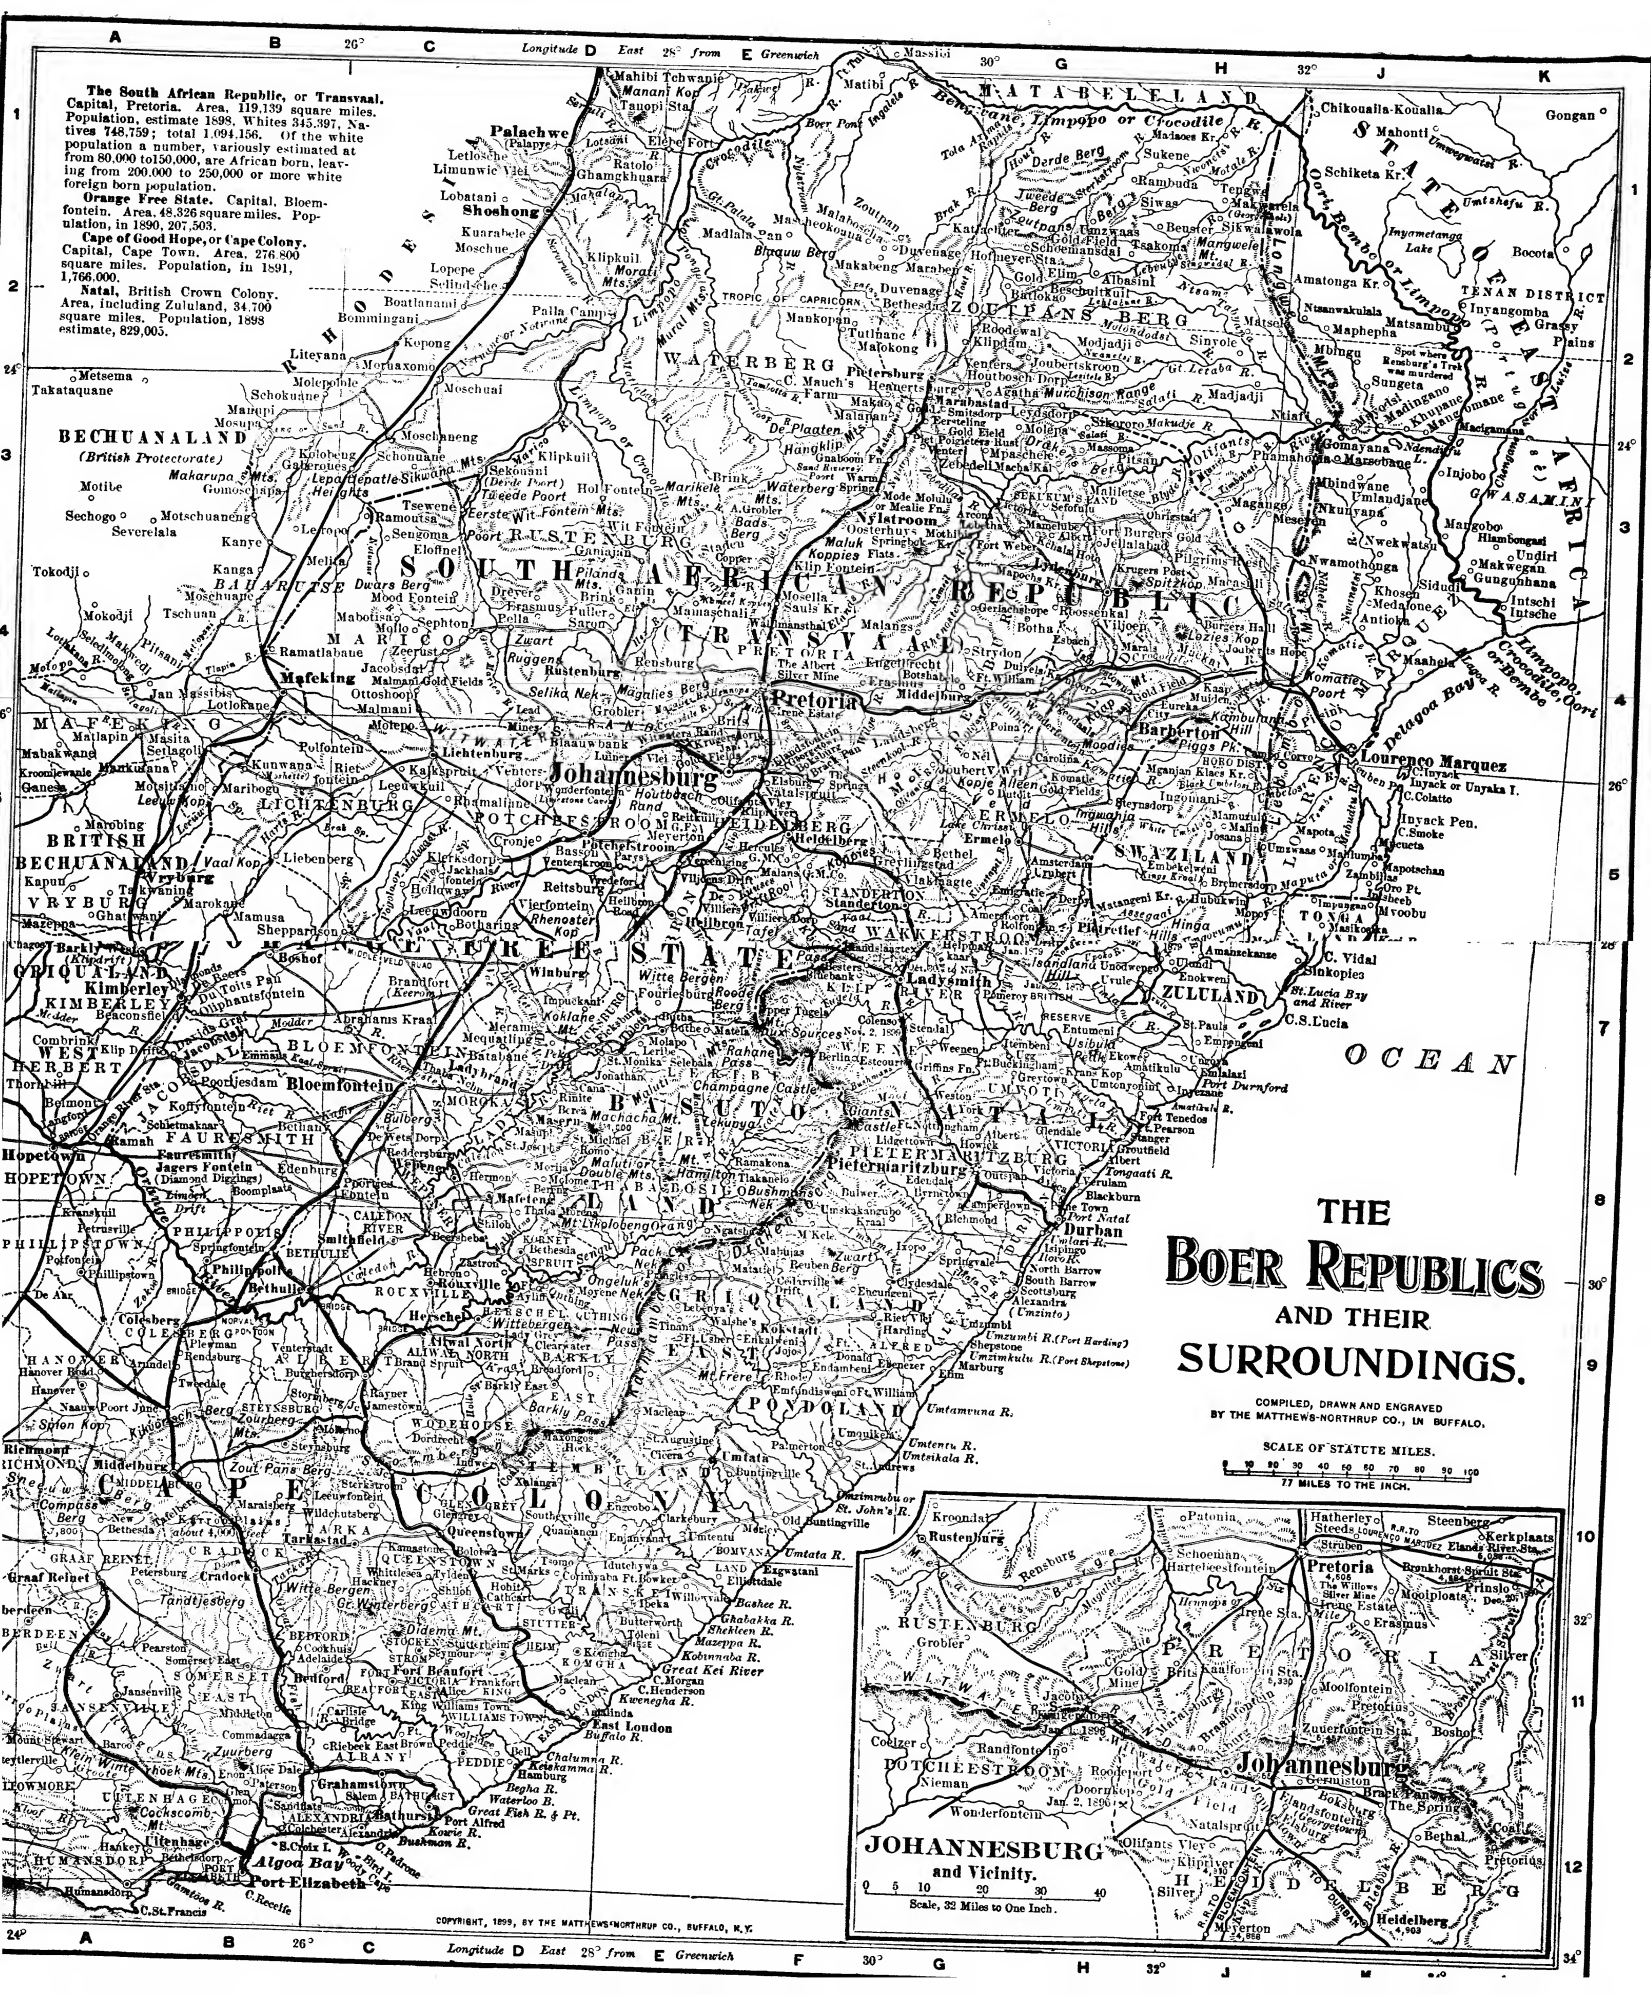

The tone of this reply seemed injudicious to many who had hitherto sympathized with the Boers. It was a common opinion that since Mr. Chamberlain in his despatch of September 12 asked less in some respects than President Kruger had shown a willingness to grant, these demands would be accepted. The Boer attitude seemed to many uncompromising and even defiant. It was clearly seen that the real point at issue was whether Dutch or British supremacy should prevail in South Africa. A Dutch republic with an international status seemed to threaten the British colonies in South Africa, and to menace the whole imperial programme on the African continent by alliances with foreign powers. On the other hand, British suzerainty over the Transvaal seemed to some a very small matter. Prominent Liberals, not in sympathy with wide imperialistic projects and strong in the Gladstone traditions, saw in it only a pretext for ambition. It seemed to them wholly inadequate as a cause of war.

The next important event in the history of the affair was the calling of a council of the cabinet at London, on September 22. After this meeting Mr. Cham-

berlain sent to Sir Alfred Milner, for communication to the Pretoria government, a despatch stating that it was henceforth useless to discuss the question along the lines hitherto followed, and that the government "would consider the situation afresh and formulate its own proposals." To the unfriendly critics of Great Britain it seemed that the prolonging of the negotiations was wholly in the interest of that country, since it thereby gained time to make the necessary military preparations, while it was to the advantage of the Transvaal to force matters to an issue. Since a pacific settlement was impossible it seemed likely that the Boers would take the offensive. If they did so they would be only nominally the aggressors. It was thought that they would not only have the advantage of finding the English unprepared, but might stir up in their favor the Dutch elements in the population of South Africa. It was quite likely that the Dutch population of the Cape might take sides in the matter in spite of Mr. Schreiner's declared policy of neutrality. The Orange Free State was openly on the side of the Transvaal, and in a resolution of its legislature on September 27 declared that while it would strive to maintain peace it would aid the Transvaal in the event of war.

Continental View of the Affair.—The attitude of many continental writers toward the points at issue between the British and the South African governments is well illustrated by the remarks of a contributor to the *Revue des Deux Mondes*, of which the following is a summary: It is hard to tell whether Mr. Chamberlain or President Kruger has shown the greater ingeniousness and subtlety. Each submitted propositions and counter-propositions and held to them with equal firmness. After the cabinet meeting in London in the early part of September a firmer tone was taken by the British government and a sort of ultimatum was sent to the government at Pretoria. To President Kruger was given the alternative of a simple yes or no without the opportunity to submit any new counter-propositions. He would have done well if he had accepted the demands of England at once, since, according to this French writer, it is the practice of English diplomacy constantly to increase its demands as the negotiation is prolonged. This is what Mr. Chamberlain is charged with doing. He constantly shifted the ground of the debate, wearing out his adversary by new and unexpected demands, so that by the time President Kruger was ready to accept one set of propositions others had cropped up. He was thus in the absurd position of a man who yields always a little too late and brings himself to grant one concession only after a new one is demanded. President Kruger was always accepting the next to the last proposition. This singular operation continued until all of the propositions contained in Sir Alfred Milner's programme at Bloemfontein were conceded by the Transvaal government, but, in the meanwhile, an entirely new set of demands had come into being, and these the South African republic refused. For example, President Kruger objected for a long time to grant the Outlanders the electoral franchise after five years of residence. He ended by making this concession, but the situation had changed, and Mr. Chamberlain was no longer content with a mere adjustment of the electoral franchise qualifications. The question of the independence of the Transvaal came up. This, in the opinion of the writer for the *Revue*, "was the main point at issue from the first," but Mr. Chamberlain was afraid to bring it up until public opinion had been gradually accustomed to the situation. By wearing out the patience of the public by these prolonged negotiations, which were not wholly intelligible, and which could readily be imputed to the obstinacy of the Transvaal government, Mr. Chamberlain hoped to ripen the war feeling, which was the ultimate motive of his policy. He convinced the people that there was no other way of ending the matter, since President Kruger had shown himself so obdurate. In France a certain cynical praise greeted his success, which was there attributed in equal parts to skill and to unscrupulousness. He finally brought Mr. Kruger to the position of saying, in substance, "I grant you everything provided you recognize my independence," to which Mr. Chamberlain, with an assumption of impatience and irritation, declared that it was precisely the independence of the Transvaal which could not be granted. Afterward at his country house at Highbury he renewed his statements in still more energetic language, giving to the Transvaal government no alternative but submission. This view of the matter, though not borne out by a careful study of the correspondence, is worthy of notice on account of its prevalence among continental critics.

The Outbreak of War.—On October 9 the Boer ultimatum was handed to the British agent at Pretoria. It demanded the reference of the points in dispute to arbitration; the instant withdrawal of all British troops on the border and of all reinforcements that had been sent to South Africa since June 1; that no more troops should be landed in South Africa, and it declared in conclusion that, unless the British government should answer before 5 o'clock P.M. on October 11, the Boer government would with regret be compelled to regard the action as a declaration of war. The British government replied that these terms could not be discussed, and on October 10 the British agent was instructed to apply for his passport. On the following

The South African Republic, or Transvaal. Capital, Pretoria. Area, 119,139 square miles. Population, estimate 1898, Whites 345,397, Natives 748,759; total 1,094,156. Of the white population a number, variously estimated at from 80,000 to 150,000, are African born, leaving from 200,000 to 250,000 or more white foreign born population.

Orange Free State. Capital, Bloemfontein. Area, 48,326 square miles. Population, in 1890, 207,503.

Cape of Good Hope, or Cape Colony. Capital, Cape Town. Area, 276,800 square miles. Population, in 1891, 1,766,000.

Natal, British Crown Colony. Area, including Zululand, 34,700 square miles. Population, 1898 estimate, 829,005.

THE BOER REPUBLICS AND THEIR SURROUNDINGS.

day, the time stated in the ultimatum having expired, and the British agent at Pretoria having demanded his passport, war was declared. At this time the British forces were disposed as follows: The main body under General Sir George Stewart White, comprising about 15,000 men, was stretched across the frontier of Natal from Ladysmith to Dundee, holding well-intrenched positions. Another force, small in numbers but well equipped, was at North Aliwal on the Orange River, which at that point marks the boundary between Cape Colony and the Orange Free State. A third force was intrenched at Kimberley, on the western frontier of the Orange Free State; a fourth, under Colonel Baden-Powell, was at Mafeking on the Bechuanaland frontier, and a small local force was farther north on the Rhodesian frontier. The Boer forces at each of these points outnumbered the British, the numerical superiority of the Boers being the most marked at Mafeking. On October 12 the Free State troops occupied Philipstown in Cape Colony, and another body entered Natal through the Tintwa and Van Reenen's passes. On the same day occurred the attack of the Boers upon an armored train at Kraai-Pan, resulting in the wrecking of the train and the capture of an officer and 15 men, together with two guns. On the following day the British took up their position near Ladysmith, the Boers having previously occupied Laing's Nek and Ingogo Heights. On the same day the town of Vryburg on the Cape Town railway to the south of Mafeking surrendered to the Boers. On October 14 and 15 fighting occurred at Mafeking and Kimberley. At the former place the Boers destroyed one armored train, but were repulsed with heavy losses in an attack upon another. The engagement near Kimberley was unimportant, but resulted in the repulse of the Boers. In the meanwhile, on October 14, General Sir Redvers Buller with his staff left London for South Africa. During the next few days the Boers received reinforcements on the frontier of Natal, and on the 17th General Joubert reached Newcastle and assumed command of the forces in that region. On October 18 the House of Commons was requested to vote an addition of 35,000 men to the army, and of £10,000,000 to the military appropriation.

British Successes.—In the meantime several unimportant skirmishes took place at the seat of war, but the first engagement that could be reckoned at all serious occurred on October 20. On that day about 4000 Boers under Commandant General Joubert were defeated by the British under General Symons near Glencoe. The British plan was to attack the Boer advance in detail, and, upon learning that one of the Boer columns had seized Talana Hill overlooking the British camp at Glencoe, General Symons sent a column consisting of the Sixtieth Rifles and the Dublin Fusiliers to attack the position under cover of the British artillery fire. This order was gallantly executed, and the artillery, having been brought around the base of the hill in order to cut off the Boers from retreat, did considerable execution among the fugitives. The Boer loss was not known, but was reported to be heavy. General Symons was mortally wounded at Glencoe, and the British losses included 10 officers killed, 25 wounded, 30 non-commissioned officers and men killed and 164 wounded. The British lost also a squad of hussars, which, while pursuing the enemy, were surrounded and taken prisoners. The second action of the war occurred at Elands-laagte on the following day. General White, upon learning that a force of Boers had severed the railway communication between Ladysmith and Glencoe, made another attempt to attack the Boers in detail in order to restore this communication. A detachment sent out under Commandant General French was completely successful in this purpose, carrying out much the same tactics as in the previous engagement—that is, shelling the enemy's position and then attacking the heights which they occupied. The British success was greater than in the previous engagement, since 200 Boers were taken prisoners, together with two guns, some camp stores and a number of horses. The Boer losses in killed and wounded were variously reported, according to one statement being more than 100 killed and according to another 400 killed and wounded. The Boers lost their commanding general and other officers of high rank. The British loss was placed at 42 killed and 205 wounded. The third engagement took place at Rietfontein on October 24. This action occurred in covering the retreat of General Yule from Glencoe to Ladysmith, the former position having become untenable on account of the increasing numbers of the Boers. General White sent out a force to attack the division of the Boers which was on the west of the railway line, in order to prevent their interfering with General Yule's march. The British loss in killed and wounded was placed at about 100, the Boer loss was not known. On the same day occurred a sortie from Kimberley, resulting in a defeat of a force of 700 Boers by 500 British, and the bombardment of Mafeking was begun by the Boers. By October 26 General Yule had effected a junction with General White at Ladysmith.

British Reverses at Ladysmith.—General White planned to attack the Boer position on Monday, October 30, including as a feature of this operation the sending of a force during the previous night to turn the right flank of the Boers. The column sent out for this purpose comprised four and a half companies of the Gloucestershire

Regiment, six companies of the Royal Irish Fusiliers, and the Tenth Mountain Battery, all under the command of General Carleton. They were ordered to seize Nicholson's Nek. Starting out on Sunday night, they marched up a narrow valley running north from Ladysmith, but when about two miles from Nicholson's Nek the mules carrying the batteries and infantry ammunition were stampeded by rifle shots and the rolling of boulders, and the column thus lost its reserve ammunition. The troops then took up a position on a hill near the road, where they were attacked by superior numbers. They resisted bravely so long as ammunition held out, but early in the evening were obliged to surrender. It was reported that about 20 officers and men were killed, 100 wounded, and about 870 sent as prisoners to Pretoria. In his report of this disaster General White expressly declared that the blame for it rested on himself alone, and that the conduct of the troops had been excellent. It seems to have been the plan of General White to attack the Boers at once at three points, but in carrying out this movement it was found that at each of these points the enemy were stronger than had been supposed. The British were obliged to retire. During this engagement the British artillery fire was especially well managed and the Boer guns were repeatedly silenced. The Boers in their turn showed remarkable skill and courage, and the British losses were exceedingly heavy, being placed, according to some estimates, at 60 killed and 240 wounded. Heavy naval guns had been brought up from Durban, and were manned by blue-jackets. During October 31 and November 1 there was heavy artillery firing on both sides. On November 2 it was announced that the telegraph connection to the south of Ladysmith had been severed.

Change in Plan of Campaign.—For several weeks nothing was heard from Ladysmith except occasional rumors to the effect that the garrison was still holding out, and that the Boer artillery was doing very little damage. In the meanwhile, on November 1, General Buller had arrived at Cape Town. The original plan was to concentrate a large force on the southern boundary of the Orange Free State, but General White's detention at Ladysmith and the Boer raid in Natal changed the whole course of the campaign. It was decided that Ladysmith must be relieved, and the troops, upon arriving at Cape Town, were at once sent to Durban in Natal. Early in November 16,000 fighting men were thus diverted from the original object of the campaign. And while General Buller was accumulating a large force at Estcourt for this purpose, another force under General Gatacre was sent to Queenstown to check the invasion from the Free State into the northern part of Cape Colony, and a considerable force under Lord Methuen gathered near the Orange River preparatory to marching to the relief of Kimberley. In Natal the Boers showed great activity, and were raiding the country and doing what they could to surround the British forces, but the main interest of the campaign was now changed to the west, where Lord Methuen's operations near the Orange River resulted in some severe fighting.

Belmont and Modder River.—On November 23 Lord Methuen attacked the Boers in a strong position at Belmont, and repulsed them after a hard contested fight, in the course of which some 225 were killed and wounded on the British side. The next battle occurred at Graspan or Enslin on November 25, where some 3000 Boers were dislodged at the point of the bayonet. In this battle the British troops were aided by the naval brigade, which displayed great gallantry and suffered heavy losses. The general result was a gain of twenty-five miles in the march toward Kimberley, but a large force of Boers barred the way on the Modder River. Here occurred the sharpest battle that had thus far been fought during the war. On November 28, after having shelled the Boers' position with a portion of the artillery, Lord Methuen dispatched a force of infantry before daylight to attack the position. The Boers were entrenched in the Modder village and in an island, as well as along the banks of the river. The fighting lasted ten hours, and the British troops were without water or food. The Boers were forced to retire, but during the night received reinforcements and occupied a still stronger position. The British losses were very heavy, amounting to nearly 500 killed and wounded, and including many officers.

British Reverses.—The days following Lord Methuen's battle at the Modder River brought news of nothing but disaster to the British, and were regarded as one of the darkest chapters in British military history. In the first place, came the news from General Gatacre, who, as has been said, was operating in the northern part of Cape Colony to check the invasion from the Free State, that he had met with a serious reverse in an attack on Stormberg on December 10. His dispatch attributed the failure to the fact that he had been misled as to the enemy's position by his guides. According to the reports in the press, he seems to have intrusted his forces to the guidance of a single scout and to have conducted his march in the darkness. The distance was underestimated, and the enemy's position was not reached until daybreak. It was then found that this position was on the top of an inaccessible hill, from which there was no line of retreat except over nine miles of hilly ground, commanded for the most part by the Boer artillery. The result of this mistake was a comparatively small loss in killed and wounded, but of some 500 prisoners. Another reverse which was

reported about the same time was the failure of Lord Methuen at Magersfontein. He attempted to attack the enemy commanded by General Cronje, who had retired after the previous battle on the Modder. The Boers numbered some 12,000. The Highland Brigade, which led the attack, was compelled to withdraw upon encountering the heavy fire of the Boers, who were concealed in trenches. Many officers and men were killed, including General Wauchope. The loss inflicted upon the British was estimated at 1000, and they were compelled to retire. There was much criticism of the conduct of the campaign in this quarter. In the first place, it was said that the successes at Belmont and Graspan were won at too great a cost. Secondly, General Methuen was blamed for his inactivity at the Modder River, where, after achieving some successes, he remained for nearly two weeks without attempting to attack the already shaken enemy. In the third place, the reverse which befell the Highland Brigade was criticised as unnecessary. It seemed as if these troops had been sent into a trap which might have been known to exist. When news came that Sir Redvers Buller had taken the command of the force operating on the Tugela River for the relief of Ladysmith, it was hoped that a report of success would soon come from Natal. At first there were reports of successful skirmishes, and these were followed by rumors that Ladysmith had been relieved. But it was soon learned that the most serious reverse of all had befallen the British arms. General Buller, having found the Boer position opposite Colenso impregnable, was repulsed in an attack at that point with a loss of 1100 men killed, wounded or prisoners. The attempt had been made to force a passage of the river at the same time that a part of the troops tried to keep off the flank attack of the enemy. Despite the great gallantry shown by the attacking force the movement failed, owing to the superior position of the enemy and their excellent marksmanship. Great losses were caused by the enemy's sharpshooters. The general's despatch concluded with the words, "We have retired to our camp at Chieveley."

TRIASSIC FORMATION. The triassic formation assumes considerable importance in the Atlantic States, especially in the Connecticut Valley and in New Jersey. It consists of a series of sandstones and sandy shales, which have been deposited in shallow water and have been subsequently intruded by sheets of diabase. W. M. Davis has given considerable attention to those of the New England region, and those of New Jersey have been investigated by Russell, Darton, and others. Recently Kummel has made a somewhat detailed examination of the New Jersey occurrence. His results show that these beds (of the Newark formation, as they have been renamed in recent years) have been deposited in an estuary that extended across what is now northern New Jersey into New York, and that the material was sorted considerably by currents before it was laid down. The presence of raindrops, mud cracks, and ripple marks proves the shallowness of the estuary. Before the deposition of these materials had ceased great flows of lava took place, some of which came up through the soft mud in the bottom of the estuary. There were at least three periods of eruption, separated by long periods of quiet, during which the deposition of material in the estuary went on as before. Subsequently the whole formation was faulted. These facts also apply in general to the formation as seen in the Connecticut Valley.

TRINIDAD and TOBAGO, West Indian islands, lying off the Venezuelan coast, north of the Orinoco delta, constitute a British crown colony. Tobago was included in the government of the Windward Islands up to 1889, when it was annexed to Trinidad, and on January 1, 1899, it became a ward of the latter island. The area of Trinidad is 1754 square miles, and of Tobago, 114 square miles; their estimated populations are 260,000 and about 20,800 respectively. The capital and seat of government is Port of Spain, with a population upward of 34,000; other towns in Trinidad are San Fernando (population, 6570); Princetown (population, 4197), and Arima (population, 3653). There are two towns in Tobago, Scarborough (population, 1370), and Plymouth. The government is directed by a governor, Sir Hubert E. H. Jerningham, K.C.M.G., since January, 1897, who is assisted by an executive council of 7 official members and a legislative council of 9 official and 11 unofficial members, all of whom are nominated by the crown. For Tobago there is a subordinate commissioner. Public schools, numbering 196, and having about 24,000 pupils, receive government grants; in addition, there are private schools, a Roman Catholic college, with about 200 students, and a Queen's royal college, with about 100 students. The public debt in 1898 was £911,211. Other statistics of finance and statistics of commerce for the two islands have been:

	Revenue.	Expenditure.	Imports.	Exports.
1896.....	£586,462	£568,968	£2,477,457	£2,176,585
1897.....	575,265	587,414	2,172,886	1,999,607
1898.....	615,372	640,952	2,283,056	2,310,133

The aggregate shipping (foreign trade) entered and cleared in 1897 was 1,340,906 tons. In Trinidad the following acreages are given to the various important crops: Coffee and cacao, 99,500; sugar-cane, 57,000; cocoanuts, 14,000; ground provisions, 13,500; and 10,000 acres are pasture. The cacao export from this island in 1897 was valued at £605,690; sugar, £537,107; molasses, £16,991. The chief exports in 1898 were: Cacao, 28,196,224 pounds; sugar, 113,578,304 pounds; molasses, 660,535 gallons; rum, 86,513 gallons; bitters, 33,989 gallons. Other products are cocoanuts, timber, and fruits. A pitch lake of 110 acres, near the village of La Brea, containing an immense supply, yielded in 1898 an export of 100,208 tons, valued at £113,829. In 1897 Trinidad imported textiles valued at £309,611; flour, £127,383; rice, £148,777. There are 84 miles of railway and 690 miles of telegraph lines. Pursuant to the Colonial Loans acts in 1899 the imperial government advanced £110,000 for the development of the resources of the island. On September 10, 1898, a hurricane did much damage in the islands.

TRIPOLI, a Turkish province, lies in northern Africa on the Mediterranean, between Tunis and Egypt, with a coast-line of about 900 miles, an area of 410,000 square miles, and a population estimated at 1,300,000, contained within the four provinces of Khoms, Jabel-el-Sharb, Fezzan, and Benghazi. There is a military force of about 10,000 men in the province. The revenue is mainly raised by a poll-tax, the size of which grows with the wealth of the person taxed, and by tithes. The coast region is fertile, and produces tropical fruits, grain, wine, cotton, madder, which with ostrich feathers, ivory, skins, sponges, hides, and live stock, form the exports. The imports are manufactures, tea, wines and spirits, and articles for barter in the interior. Away from the coast the country is less productive, and the rainfall is light. The country contains many ancient ruins, notably at Cyrene, Ptolemais, Apollonia, and Leptis.

TROPICAL DISEASES, STUDY OF. During 1899, schools for the study of tropical diseases have been founded in Edinburgh and Liverpool. Germany has always produced men who investigate diligently the diseases of her tropical colonies, as well as those of Brazil, Mexico, Java, and Borneo. Our new tropical possessions will make it necessary for the United States to undertake actively an investigation of tropical diseases. New York University established, a few years ago, a professorship of tropical diseases, and called to the chair Professor J. E. Stubbett, physician-in-charge of the Loomis Sanitarium for Tuberculosis, at Liberty, N. Y. If American universities, with the help of the government, will endow chairs for the proper investigation of tropical diseases, this country can train and send forth to Cuba, Puerto Rico, Hawaii, the Philippines, and Guam well-equipped scientists whose researches may take rank with Koch's discovery of the cholera-germ in India, and his researches regarding rinderpest in Africa, with Ross and Manson's discoveries regarding malaria, as well as with Manson's researches regarding sleeping sickness in West Africa. A college has been founded at Witzenhausen, Germany, for the study of tropical problems, supposedly to include medical subjects. The German federal government, acting on a proposition of Professor Robert Koch, has decided to erect in Hamburg an institute for research in tropical diseases. It is said that this city was chosen in place of Berlin on account of its harbor, whence sick sailors and passengers can be brought directly to the institute without railway travelling. There are to be 30 beds in the establishment.

TROPICAL FEVER. A very common fever in the Philippine Islands is tropical fever, also called calentura. It has the latter name in Cuba, where it is also termed Cuban fever. It is said to begin without any prodromal symptoms, a chill and rise of temperature to about 103° ushering in the disease. The temperature is likely to rise higher; muscular pains supervene, with headache, loss of appetite, nausea, and marked weakness. Cases as a rule recover spontaneously in a week. Quinine proves of no efficacy. A preliminary dose of calomel, followed by a saline cathartic, and subsequent administration of large doses of tincture of aconite for a few days, shorten the attack.

TRURO, Baron, THOMAS MONTAGUE MORRISON WILDE, died March 8, 1899. He was born March 11, 1856, was admitted to the bar in the Inner Temple, London, in 1878, and succeeded his uncle to the title in 1891. He was the third and last Baron Truro.

TRUSTS. The great increase in the number and extent of industrial combinations in 1898 and 1899 gave special prominence in the latter year to what was known as the trust problem. There was evidence in many quarters of a strong determination to check the spread of such combinations and to restrain those which were already in existence. The attempt was made to bring the trust question into national politics, and make it a campaign issue. (See UNITED STATES.) One estimate, formed early in 1899, places the number of trusts at 353, and reckons the increase in the year as

75 per cent. Combination in industries and concentration of capital continued during the year. There was a renewed effort on the part of several States to legislate against them, and in many States, especially in the West and South, the rigorous enforcement of existing laws led to the withdrawal of some corporations and the reduction of capital in the case of others. New Jersey was regarded with especial disfavor by the opponents of trusts on account of the facilities offered by its laws for the formation of these combinations. The number of companies incorporated in New Jersey in 1898 was 1103, and the State has won for itself the nickname of the "home of corporations." In Texas the anti-trust spirit showed itself by the rigorous enforcement of penalties upon corporations for the non-payment of their franchise taxes; by the refusal to allow corporations chartered under New Jersey laws to do business within the State, and by an act of the legislature against all unions or combinations aiming at the regulation of prices, such unions or combinations being regarded as conspiracies under the law. A similar act was passed in Michigan, but with heavier penalties for violation. The members of such combinations were not only subject to fines and forfeitures, but were liable to imprisonment, and any person injured in his business by the combination was authorized to bring suit for twice the amount of damages sustained. Among the important decisions of the courts the following may be mentioned: In Arkansas the supreme court declared the Arkansas law against trusts unconstitutional in so far as it applied to combinations formed outside the State (May 7). In Indiana the supreme court decided on June 6 that any combination on the part of combinations for the purpose of fixing prices or limiting production rendered them liable to a forfeiture of franchise, and the supreme court of Illinois rendered a similar decision on October 19, holding that such a combination to fix prices was a conspiracy to defraud. In Kentucky a combination of insurance companies to maintain rates was decided by the court of appeals on June 15 not to be an indictable offence, and the New Jersey supreme court held that a corporation might legally compel the concerns which they had bought up to abstain from competition in the business. On December 4 the United States Supreme Court held that an agreement between the Addyston Pipe and Steel Company and five other companies to divide the territory of the United States and keep prices affected interstate commerce and was illegal. Two important public conferences to discuss trusts were held in 1899. The first, which met at Chicago September 13-16, comprised delegates from 30 States and from various trades organizations. Among its members were several prominent economists and many political leaders. The conference refrained from taking sides with any political party, and passed no resolutions. A great variety of views was expressed, ranging all the way from the conservative statement of students of economics that the data at hand were not yet sufficient to warrant any definite conclusions in regard to the effects of trusts upon prices, to the extreme denunciation of trusts as altogether bad and as the certain forerunners of industrial slavery. The defence of trusts by Hon. Bourke Cockran and the criticism of them by Hon. W. J. Bryan attracted more attention than any other features of the conference. The general points of agreement brought out in the course of the discussion were that trusts could be best dealt with if kept clear of partisan politics; that government should not discriminate in their favor, and that they were a possible menace to industrial welfare. The other conference was held at St. Louis, September 20-21. It was composed of the governors and attorneys-general of eleven States. It was distinctly anti-trust in character and passed resolutions recommending legislative action. Among its suggestions were: A clear definition of contracts in restraint of trade; a requirement of full public reports from corporations, whether chartered in the State or not; the denial to any corporation of the right to hold stock in another corporation engaged in a similar or competitive business; and the rendering of shareholders liable to twice the face value of their stock whenever stock is issued beyond the amount of paid-in capital. A conference on the subject of trusts which attracted less public attention but which produced more valuable results than either of these took place at the meeting of the American Economic Association, December 27-29. For a brief account of the discussion, see the article *ECONOMIC ASSOCIATION, AMERICAN*. For further information in regard to anti-trust legislation, see the separate articles on the States.

TUBERCULOSIS. *Statistics.*—Statistics regarding a disease are compiled slowly, and but local or fragmentary reports are published so as to be accessible at the end of the year. Early in 1899 a report by Dr. A. R. Guerard was presented to the Senate Commission on Tuberculosis of the State of New York, regarding the spread of tuberculosis in the crowded tenement portion of New York City. He finds that out of 71,828 dwellings in New York City, deaths from tuberculosis have occurred in 18,771, or about 23 per cent. during the past 5 years. In 14,479 houses there have been 15,511 deaths from this disease in one year. In the old fourth ward there are 663 houses, sheltering 18,323 persons; and in 248 of these houses there have been 541 cases of tuberculosis in 3 years. In the old sixth ward there are 630

houses, sheltering 22,897 persons; and 465 cases of tuberculosis were reported in this ward. Continued recurrence of the disease is reported in many houses. A summary made for 5 years of the entire city is as follows:

Total number of dwellings in New York City.....	81,828
Number of dwellings in which there were deaths from tuberculosis.....	18,771
Percentage on total.....	22.94
Houses with deaths in one year.....	14,479
Total deaths in same.....	15,511
Deaths per house.....	1.07
Houses with deaths in more than one year.....	4,202
Total deaths in same.....	11,232
Deaths per house.....	2.61

It was reported by Dr. T. W. Grimshaw, the registrar-general for Ireland, at the meeting held June 30, 1899, in Dublin, in the interest of an anti-tuberculosis crusade, that from 1871 to 1880, 10 per cent., and that from 1881 to 1890, 11 per cent. of all the deaths in Ireland were due to tuberculosis in some form. In Great Britain 70,000 deaths are attributed annually to tuberculosis, but the ratio is not increasing, and population is not decreasing as it is in Ireland.

Congress.—The International Tuberculosis Congress, promoted by the central German committee for the establishment of sanitariums for pulmonary diseases, was held in Berlin, Germany, May 24-27, 1899. Of the 2000 present, 112 were delegates from foreign countries, including the United States. The Congress was held under the patronage of the German Empress; the Duke of Ratibor and Professor von Leyden were the presidents, and Prince Hohenlohe, the imperial chancellor, was honorary president. The following subjects were discussed: (1) Dissemination of Tuberculosis, (2) etiology, (3) prophylaxis, (4) therapeutics, and (5) sanitariums.

Infection and Primary Lesions.—G. Cornet, of Berlin, published in 1899 the results of several experiments made with dried sputa of tubercular patients, the results of which controvert the assertions of Flügge. Flügge asserts that the disease is spread by moist particles expelled from the respiratory tract during coughing and speaking, and denies that infection is caused by dry sputum. Cornet scattered some dry sputum over a rug on the floor of a room. Twelve guinea pigs were placed so as to inhale this sputum. Twenty-four pigs were placed in a wooden cage so arranged in four groups that each group of six could be kept at a different level from the floor, the rug being directly in front of the cage. The rug was then swept vigorously with a broom, raising dust that the animals inhaled. Twelve pigs were placed in an open cage three metres from the rug, and one-half metre above the floor. All but one of the 48 animals became tuberculous, those in the first series showing the most extensive lesions. The animals in the second series suffered more than in the last, and their lesions varied inversely with the distance from the floor. Some of the animals were obliged to breathe through the mouth. Of these one-half acquired tuberculous lesions in the cervical glands and also more marked general lesions. But one-fifth of those which breathed through the nose had such lesions. Weaver found that in the majority of human cases the primary lesion occurred in the posterior portion of the lung apex, which fact he considers due to the discharge of infected chyle into the vena cava. Should the apex of the lung be healthy and resistive, the tubercle bacilli will pass on to some vulnerable spot in another area, unless the blood has exerted its bactericidal power over them. Trudeau, of Saranac Lake, N. Y., believes that adenoid growths in the nasal fossæ are very frequently the primary channels of infection. He has studied the problems of individual or racial predisposition. He finds chickens are highly susceptible to infection with the avian tubercle bacillus, while resisting inoculation with the bovine or the human tubercle bacillus. On the other hand, the guinea pig succumbs readily to infection from the human bacillus, and still more readily to the bovine bacillus, but resists infection with the avian variety. The rabbit, on the contrary, is killed by all these forms.

Prevention and Notification.—D. S. Davies, in the *British Medical Journal*, April, 1899, discusses the great importance of the question of the spread of tuberculosis through the medium of infected dwellings. The dissemination through food is of common occurrence. He urges a thorough inspection of all slaughter-houses, proper inspection of dairies with notification of all udder diseases in cows, the extension of legal powers with regard to the exclusion of tuberculous cows from any district, the examination of samples of milk and the inspection of cow-sheds. Davies recommends registration, apart from the general notification, of all cases of the disease in man.

Arthur Newsholme, in the *London Lancet*, in February, 1899, says that the prevention of tuberculosis must have regard to the disposition of the infectious discharges from the patient, especially his desiccated sputa, and the personal and environmental conditions which favor the origin of phthisis. He favors voluntary isolation of the patient in some sanitarium or the removal from his home of relatives who are apt to fall victims to the disease. Newsholme regards the notification of the disease to the medical officer as the best means of prevention of its spread, as this course leads to inspection of the premises and the ordering of remedial measures against spread of infection during the disease and for disinfection after death. It is the custom in many of the English towns to send by mail a circular to the head of the house in which a death from tuberculosis has occurred giving directions, this circular being followed by an inspector in a few days, to ascertain if directions have been followed. The text of the circular is as follows:

"1. Strip the wall-paper from the wall. The paper should afterward be burnt in the fireplace of the same room.

"N.B.—The chief danger is from dust. Hence all articles should be thoroughly wetted before cleansing them. A supply of disinfectant for mixing with the water can be obtained free of cost at the office of the town hall, but a disinfectant is not essential if everything is thoroughly wetted.

"2. Thoroughly wash the ceilings and floors and walls of the room.

"3. Wash all bed-linen and other articles in the room, and expose all bedding, pillows, etc., out of doors for several hours in bright sunshine."

For the past 5 years fatal tuberculous disease in England has been recorded in full, inquiry being made under the following heads:

"Deaths from tuberculous diseases—sex, age, disease, address, name of doctor, date of death, duration of illness, source of milk-supply, places of residence during illness, nature of occupation during the last 10 years, other cases of allied disease in the family, previous history of the house.

"Condition of the house as regards (1) overcrowding, number of occupants (over 10, under 10), number of living-rooms and bedrooms; (2) whether animals are kept; (3) condition as to dampness, condition as to cleanliness; (4) ventilation; (5) lighting; (6) drainage arrangements; (7) dust-bin; (8) size of yard, condition of paving."

On June 10, 1899, in the State of Washington, a law went into effect requiring physicians to report to local boards of health in cities of the first and second classes all cases of tuberculosis, giving name, age, sex, occupation, and residence, within five days of seeing the case for the first time. The board of health is required to furnish to the patient or the head of his family printed instructions for the prevention of communication of the disease. The law contains further provisions and penalties. A similar law has been in effect in Buffalo, N. Y., for five years, and also in New York City for nearly as long. In the latter city a circular requesting notification of cases in private practice and directing cases arising in dispensary and hospital practice was issued from the board of health, February 23, 1894.

The government of South Australia adopted a compulsory notification act, which took effect January 4, 1899, providing that "every medical practitioner attending on, or consulted by, any person suffering from pulmonary tuberculosis shall, as soon as the fact becomes known to him, report the same to the local board of the district in which the person resides." Disinfection is to be made at the discretion of the medical attendant or the health officer. Provision is made for the inspection of cattle and meat, and the destruction of tuberculous cattle.

What is known as the "Infectious Diseases Notification Extension Act" of 1899 will go into force in England and Wales at the close of the year mentioned. It was found that 28,000,000 of England's 29,000,000 population were governed by local acts of Parliament for certain towns, regulating the spread of infection. The new act is expected to supersede those now in existence and impart a uniformity to the system of notification.

During the latter months of 1899, action was taken by the California State board of health to set a date for the discussion of the propriety or advisability of certain proposed measures, looking toward quarantining tuberculosis. Mistaken zeal on the part of newspaper correspondents and groundless fear led to a prevailing idea that tuberculous patients were hereafter to be forbidden to enter the State. Such a measure as this was not considered.

Treatment.—Dr. Vincenzo Cervello, professor of pharmacology in the University of Palermo, Italy, has published reports on 26 cases of undoubted pulmonary tuberculosis which he commenced treating with inhalations of a formalin mixture in January. In 19 of these cases there was a return to the normal temperature, a cessation of the cough and the characteristic râles, and a disappearance of the bacilli from the sputa. Finally 10 of these were decided to be cured, 3 were distinctly improved, 2 remained in stationary condition, and 2 died. Signor Florio, a Palermitan

banker, has given \$1,000,000, with which an ample sanitarium has been equipped, on the model of the Paris Pasteur Institute, to continue Cervello's experiments. At the Loomis Sanitarium, Liberty, N. Y., a new drug, kalagua, has been used during 1899, in 21 cases with an apparent cure in 5 per cent., improvement in 62 per cent., stationary condition in 14 per cent., while 19 per cent. grew worse under the treatment. Kalagua is a plant brought from Colombia, South America. It is reported that its antitubercle properties were first discovered through the cure of tuberculous cattle which ate its leaves. Experiments show that it is not toxic for dogs, rabbits, or horses, and that it has antiseptic power. Small doses soon saturate the patient, as shown by the presence of its odor in the breath, the urine, and the perspiration. The majority of the incipient cases at the Loomis Sanitarium have been treated with anti-tubercle serum with satisfactory results. (Incipient cases are defined to be "those in which there is slight localized involvement of the lung, with little or no constitutional disturbances.") Of these cases thus treated, 31 per cent. were apparently cured, 44 per cent. improved, 17 per cent. remained stationary, while 8 per cent. grew worse. The nitrogen gas compression treatment, so vaunted in certain sections of this country, consisting of introducing nitrogen into the pleural cavity, seemed of use only in cases of hæmoptysis, and in these it relieved this one symptom.

All authorities and experimental clinicians agree in urging and commending the open-air treatment—absolute life in the open air for a number of years. Exposure to fresh air, abundant dietary, freedom from all excitement, with repose of mind as well as of body, exercise suited to the strength and requirements of the patient, and careful medical supervision of every detail of the invalid's daily life are the principles of the ideal care of a tubercular patient. For those who can afford it, sanitarium treatment is the only treatment worth considering, in Europe or America. In choosing a resort, it must be remembered that there is no one place suitable for all cases, and that frequently patients make most headway by spending part of the year in one place, part in another. Osler, of Philadelphia, suggests in the *British Medical Journal* for October, 1899, for those who cannot leave home for a sanitarium—about 90 per cent. of the cases—that much can be done for them in the way of a fixed number of hours daily in the fresh air, on the veranda, on a sofa in the garden, or in a bright room with the windows wide open, resting as long as fever is present, and using a well-regulated diet.

Societies for the Prevention of Consumption.—The British National Association for the Prevention of Consumption has succeeded in arousing public sentiment and implanting the conviction that tuberculosis is infectious. The society is now engaged in allaying the fears of the public that founding sanitariums for the open-air treatment of tuberculosis is fraught with danger to the immediate community. On July 7, 1899, a league to combat tuberculosis was founded in the Argentine Republic, where 8000 persons die of tuberculosis annually. In December it was reported in the *British Medical Journal* that a league against tuberculosis was being organized in Spain. In the summer of 1899 the Illinois Society for the Prevention of Consumption was formed, and has begun crusaders' work. The special inspection of milk will be urged and the State will be requested to erect a State sanitarium for tuberculous patients. The people will be educated by means of pamphlets in the matter of infection and the spread of the disease among cattle and human beings. The compulsory isolation of consumptives in virulent stages will be sought through legislation now contemplated.

Special Hospitals and State Care.—The most promising prophylactic measure in the care of tubercular patients will be the erection of State and municipal sanitariums in proper localities for the treatment of incipient cases, and the establishment of special hospitals in large cities for the shelter of advanced or hopeless cases. The Massachusetts State Hospital for Tuberculosis reports excellent figures for 1899. The citizens' committee of Chicago that undertook to aid in the acquisition of \$150,000 for a special building for tuberculous patients under the auspices of the Sisters of St. Elizabeth Hospital, secured \$10,000 in November. The projected building will care for 300 patients. The National Jewish Home for Consumptives, erected in Denver, Col., by the Order of B'rith, was formally dedicated early in December. In the latter part of the year a sanitarium was established at Fort Bayard, N. M., for the treatment of officers and enlisted men in the United States Army suffering with tuberculosis. The climate is praised as dry and equable. The elevation is 6000 feet above tide.

A bill was passed by the New York legislature in April, 1899, providing that hospitals for the treatment of pulmonary tuberculosis may be established by any municipal corporation having a population of 250,000 or more inhabitants, outside of its corporate limits, and not within the corporate limits of any other municipal corporation. Sites shall be selected by boards of health, and the municipality in question may acquire title to lands for the purpose. Early in the autumn the State

board of health took action upon this legislation, toward the establishment of proper hospitals. It was hoped that during the session of the legislature in 1900, in accordance with a special committee's report, a State sanitarium would be established in the Adirondack Mountains, on the forest preserve already belonging to the State. It was suggested that the accommodations should be for at least 200 patients, and that those unable to pay should be cared for at the expense of the State.

Zoological Distribution of Tuberculosis.—At the 1899 meeting of the Zoological Society of London, a paper was read, founded mainly on observations made in the society's gardens. Of 215 necropsies made during the previous 6 months, 49 of the mammals and birds presented lesions of tuberculosis. The ruminants and gallinæ suffered the most, the carnivores and raptorial birds the least. Race and family seemed to exert little influence upon susceptibility to the disease and mode of housing a small amount, while food and food-habits seemed largely responsible.

Medico-legal Aspects of Tuberculosis.—The following story is taken from the *Philadelphia Medical Journal* of April 1, 1899: "At the local county court of Folkestone, the well-known Kentish port, a case was recently decided by the stipendiary judge of considerable importance to medical men and to the public at large, and more particularly to hotel-keepers. A gentleman died in one of the fashionable hotels last October on his way back from Cannes. He died of phthisis, and the medical man who signed a death-certificate to this effect advised that the furniture of the room occupied by the deceased should be disinfected, and the bedding destroyed. The estimated cost of this procedure—namely, £19 13s. 6d. (\$100)—was claimed by the hotel from the executors, but the claim was disputed on the ground that the measures of disinfection had not been carried out, certain furniture not having been destroyed, the wall-paper not having been stripped off, and the wood-work not having been repainted. The hotel authorities then amended their claim, and asked a sum equivalent to the rent of the room for a month, during which time it was stated to have been left unoccupied after disinfection; at the same time they disputed the diagnosis of tuberculosis. The judge refused to go behind the medical certificate, and disallowed all claim for repayment by the executors, except 15s., which sum the hotel proprietors were able to prove had been spent in fumigation, etc. The case is the first of the sort in England, and proves how widely the doctrine that phthisis is infectious is now held. The decision so seriously affects the interests of hotel-keepers that it is sure not to remain long unchallenged." See INSECTS AND THE PROPAGATION OF DISEASE; MARRIAGE, MEDICAL CONTROL OF; MILK; SERUM AND SERUM THERAPY; VITAL STATISTICS.

TUNIS, a French dependency since 1882, lying on the Mediterranean coast between Algeria and Tripoli, has an area of 50,000 square miles, and a population of 1,700,000, including 27,000 Frenchmen. It is nominally under the dominion of the bey, but France administers the country and collects the taxes, and there is a special department for Tunisian affairs in the French foreign office. French dominion has been confirmed by all the powers. The country is surrounded by French territory excepting Tripoli on the East, and recent events have made it appear that France wishes to obtain certain portions of that country, including several important oases in the Sahara. The capital, Tunis, has a population of about 153,000, and includes Moors, Arabs, negroes, Jews, and about 40,000 Europeans. It has a considerable number of manufactures in silk and woollen stuffs, shawls, carpets, fez caps, attar of roses, etc. The chief exports include grain, oil, cattle, wine, sponges, and esparto-grass. There are about 900 miles of railway and over 2000 miles of telegraph line. The city of Tunis is an interesting town, and contains the Great Mosque, and the bey's palace, which is a building of Oriental gorgeousness.

TUNNELS. The most important railway tunnel now actually under construction anywhere in the world is the Simplon Tunnel, through the Simplon Alps, between Italy and Switzerland. This tunnel when completed will be 12.2 miles in length; at the end of 1899 about 2½ miles had been excavated. At the highest point in its grade, which is near the centre, the Simplon Tunnel is 2313 feet above the sea level, and the depth of the mountain over the tunnel at this point is 7003 feet. When completed the tunnel will consist of two parallel tunnels, each accommodating a single track railway line, but at the present only one of these is being excavated to its full size. On the line of the other a small gallery is being excavated, which will be employed to convey material to and from the full-size excavation, to supply ventilation, etc. Afterward, if the traffic warrants it, this gallery will be enlarged to the full size necessary for railway use. The total cost of the single tunnel and gallery now under way is estimated at \$11,764,000. It is estimated that the completion of the gallery excavation with the necessary collateral work will bring the total cost of the double tunnel line up to \$15,000,000, or about \$1,230,000 per mile.

The Tarchino Tunnel, in Italy, on the lately completed railroad connecting Genoa,

Orada, and Asti, pierces the Apenines, and is 21,084 feet long. This railway is only 60.7 miles long, but has an aggregate of 16.1 miles of tunnels. The tunnel is double track, with a full centre arch of 13.12 feet radius; is 25.25 feet wide at the level of the rails, and 19.7 feet high in the clear at the centre. It was driven through alternating strata of calcareous schists and clay.

Among the more notable railway tunnels under construction in America are the following: Point Richmond Tunnel, San Francisco and San Joaquin Valley Railroad, California, 800 feet long, with a section 30x26 feet. The very large section is a notable feature of this tunnel. This same road has other tunnels under construction which have the following lengths: 5600 feet, 1300 feet, 1100 feet and 300 feet. The Baltimore and Ohio Railroad is building two tunnels, one 1600 feet and the other 1800 feet long, on its new cut-off between Whitehall and Thomas stations, near Pittsburgh, Penn. A novel tunnel on the Golden Circle Railway, in Colorado, consists of a covered way made of steel I-beams, curved to the requisite arch form and filled between with brickwork to form the roof and sides. This covered way runs through the dumping grounds of the Portland Mine, Cripple Creek mining district, and will ultimately be covered by the dumpings from the mine. One railway tunnel, the Busk-Ivanhoe Tunnel, on the Colorado Midland Railroad, was abandoned in 1899. This tunnel was completed in 1892-93 and is 9395 feet long. It replaced a line of railway over the Hagaman Pass, which has been again put in operation.

Submarine tunnel work during 1899 comprised as its chief example the Thames River tunnels for rapid transit in London, the water-works tunnels at Cleveland, O., and Chicago, Ill. (see WATER-WORKS), and several projected tunnels under the East River in New York City, under the Irish Channel, and under the Hoogly River, in Calcutta, India. The Irish Channel Tunnel is an old scheme revived, and to carry it out would require a tunnel between 25 and 30 miles long, to be excavated under about 80 fathoms of water. It is projected for railway use. The projected tunnel under the Hoogly River is 6875 feet long, of which 1290 feet under the river proper would be under a depth of 36 feet of water. The tunnel would consist of two parallel iron-lined cylinders, 17 feet in diameter, spaced 16 feet apart. Of the projected East River tunnels the most important are the Long Island Railroad Tunnel extension from Brooklyn to Manhattan, and the South Brooklyn Tunnel, extending from Whitehall Street, Manhattan, to Ilamilton Avenue, Brooklyn. Plans have been completed for the Long Island Railroad Tunnel, but the South Brooklyn Tunnel has not yet been surveyed. Including approaches, the Long Island Railroad Tunnel would be about 15,000 feet long, and would carry two lines of track. It is estimated to cost about \$6,000,000, including three tunnel stations. During 1899 the partly completed Hudson River Tunnel at New York City was sold under foreclosure proceedings. Work was abandoned on this tunnel in 1892, after \$4,000,000 had been expended in excavating some 4600 feet, out of the total 27,000 feet of tunnelling required to complete its work as projected. See RAPID TRANSIT (paragraph Underground Railways); WATER-WORKS.

TURINI, GIOVANNI, sculptor, died in New York City, August 27, 1899. He was born near Verona, Italy, May 23, 1841; he studied sculpture at Milan and Rome, and subsequently was a professor at Milan. He was a volunteer in the Fourth Regiment of Garibaldi's army in 1866, and the following year he came to New York, where he had thereafter a studio. Turini's name recently came before the public in connection with difficulties between him and the Venezuelan government; he made for the latter several statues, for which he was to receive about \$75,000, and for which he did receive only \$8000, an amount said to cover only about half of the cost of the preliminary work. The matter was finally laid before the secretary of state at Washington, and it was reported in May, 1899, that favorable action would soon be taken by Venezuela. Among Turini's works are the group "Angelica and Medoro;" a bust of Pope Leo XIII., which is now in the Vatican; a colossal bust of Mazzini; the statue of Garibaldi, now in Washington Square, New York; the equestrian statue of General Bolivar, in Central Park, New York. Just before his death Turini was engaged upon a statue for the temporary Dewey Arch, erected at Fifth Avenue and Twenty-fourth Street, New York, in celebration of the victories of the Spanish-American war and the return of Admiral Dewey to this country.

TURKEY, or the OTTOMAN EMPIRE, embraces a large amount of territory in Europe, Asia, and Africa, a distinction being drawn between Turkey proper, which is governed directly by the Sultan, and several dependent and tributary states. The head of the Turkish government is the Sultan, Abdul Hamid II., who has complete and absolute monarchical power, in so far as he does not oppose the authority of the Koran. The legislative and executive powers are under him administered by the Grand Vizier and the Sheik-ul-Islam, the former being chief of the temporal and the latter of the religious government. The former is assisted by twelve ministers. The

country is divided for purposes of administration into thirty vilayets, which are again divided into sanjaks (provinces), districts, sub-districts, and communities. The area of the whole empire is estimated to be, in Europe, 62,744 square miles, with 5,711,000 inhabitants; in Asia, 650,097 square miles, with 16,823,500 inhabitants; in Africa, 398,900 square miles, with 1,300,000 inhabitants; total, 1,111,741 square miles, with 23,834,500 inhabitants. The other possessions or dependencies of the Ottoman Empire are Bulgaria (with eastern Roumelia), having 37,860 square miles and a population of 3,309,816; Bosnia, Herzegovina, and Novibazar, with 23,570 square miles and a population of 1,568,092; Crete, with 3326 square miles and a population of 294,190; Samos, with 180 square miles and 49,733 inhabitants, and Egypt, with 400,000 square miles and a population of 9,734,405. The total estimated area and population, including tributary states and dependencies accordingly, is 1,576,677 square miles and 38,790,736 inhabitants. The population of European Turkey is largely made up of Turks, Greeks, and Albanians, while there are many other races represented. The chief city is the capital, Constantinople, with a population in 1885 of 873,565. The present estimated population is not considerably larger. Other large cities are the following, the estimated population being given in each case: Smyrna, 200,000; Damascus and Salonica, each 150,000; Bagdad, 145,000; Aleppo, 127,000; Beyrout, 120,000.

Army and Navy.—All Mohammedans between 20 and 40 years of age are liable to military duty. Those not Mohammedan are not obliged to serve, but to pay each a tax of about \$1.50, irrespective of age. There is no little evasion of service on the part of the Mohammedan population among the nomadic Arabs and Kurds. The Martini-Peabody rifle is used by the infantry. A large number of Mauser rifles have been bought, but at the time of the latest reports had not been supplied to the troops. The total war footing of the regular army is: Infantry, 583,200 men; artillery, 54,720 men; cavalry, 55,300 men, and engineers, 7400 men; total, 700,620 men. Including reserves, etc., the total war footing in 1897 amounted to about 900,000 men. Information regarding the Turkish navy is not readily accessible, and such figures as are given are on the whole, it is said, too favorable. According to the *Statesman's Year Book*, there is no evidence of any definite building programme. Most of the vessels of the present fleet are of such small displacement or were built so long ago as to be largely inefficient, except for minor local defence.

Finance.—The budget for the fiscal year ending February 28, 1898, was: Expenditures, 18,429,411 Turkish pounds, and revenues, 18,511,322 Turkish pounds. The chief sources of revenue were tithes, land and property taxes, customs, taxes on salt, tobacco, spirits, etc., and various tribute revenues. The largest item of expenditure was for war, 4,489,698 Turkish pounds. The value of the Turkish pound in United States currency is about \$4.40. In 1898 the Turkish national debt amounted to £128,350,917.

Religion and Education.—The national religion is Mohammedanism, which prevails almost entirely in Asiatic Turkey, but in European Turkey only with about one-half of the population. Seven other creeds are tolerated by the Sultan, among them Roman and Protestant Christian, Greek, Armenian, and Jewish forms of worship. The number of Christians has been estimated at about 5,000,000. There are 2120 mosques in the empire and 11,600 ecclesiastics. Free public education is recommended by the Koran, which is the source of all Turkish law, and there are 1780 elementary schools and a number of colleges (medresses) connected with the mosques where education is given.

Commerce, etc.—The latest official reports concerning the exports from and imports into Turkey are for the year 1894-95. The total exports were valued at \$60,516,743, and the total imports were valued at \$105,932,154. The greatest amount of foreign trade is with England, the exports to that country amounting to \$26,197,223, and the imports, \$40,986,987. France and Austria rank next. The official invoices of goods shipped to the United States in 1898 amounted to \$1,678,065, which shows a considerable decrease from the official figures of 1895. American manufactures have an excellent reputation for quality, but the cost of transportation prevents American products from successfully competing with those of Great Britain. The chief products of the United States sold in Turkey include agricultural implements and other tools, clocks, watches, cotton goods, and various other commodities. Flour has recently been introduced with some success. An examination of the total tonnage shipped from Turkish ports either directly or indirectly to the United States, and an estimate, based on the value of imports, has led the American consul-general to recommend the establishment of a line of steamers sailing direct from the United States to Turkish ports, and accordingly a line from New York was started in the spring of 1899. The number of vessels in the merchant marine of the Ottoman Empire in 1898 was 87 steamers, of 46,498 tons, and 1349 sailing craft, aggregating 252,947 tons. The entrances and clearances at the port of Constantinople in the year 1897 were 14,753 vessels, registering 11,456,178 tons. The total length of railroads in

operation in 1897 in European and Asiatic Turkey was 2542, the railroad companies being subsidized by the government to the amount of 650,000 Turkish pounds. The empire has 21,800 miles of telegraph lines, with 33,760 miles of wire.

Events of the Year 1899.—In the year 1899 the province of Yemen in Arabia was the seat of an insurrection, for an account of which see the article ARABIA. It was estimated on good authority that 80,000 Armenians—men, women, and children—were in destitute circumstances, and dependent upon the charitable efforts of various societies in Europe and America. The Sultan promised to pay \$100,000 to American claimants on account of damages received in the Armenian troubles of 1895. An iradé of the Sultan in 1899 made provision for certain reforms in the administration of Armenia. The reforms included the following features: (1) The free movement of the Armenians in the provinces was to be allowed, except persons who were under suspicion; (2) monasteries, churches, and schools destroyed during the Armenian disorders were to be rebuilt or repaired with the help of the government; (3) sums of money owed by the Turkish government to Armenian officials who were killed in the massacres were to be paid; (4) an orphanage was to be built at Yedikule, a short distance from Constantinople; (5) fifty-four Armenians were to be pardoned and twenty-four others, formerly sentenced to death, were to be imprisoned for life. A number of massacres occurred in November, 1899, in Alashgerd, in the northeastern district of Armenia, the conflicting parties being Armenians and Kurds. The political party known as "young Turkey" in 1899 assumed proportions which caused alarm to the Porte, and Mahmud Pasha, a brother of the Sultan, was forced to leave the country, being suspected of complication in the designs of this revolutionary movement. In 1899 the government instituted a permanent agricultural exhibition in Constantinople for the purpose of disseminating knowledge, awaking interest, and fostering enterprise in agriculture. A feature of the exhibition will be the instruction given to Turkish agriculturists by American specialists, concerning the use of modern agricultural machinery. For an account of the tributary states and those nominally subject to Turkey, see BULGARIA; BOSNIA AND HERZEGOVINA; ROUMANIA; CRETE; and EGYPT.

TURNER, JOHN WESLEY, major-general, United States Army, resigned, died in St. Louis, Mo., April 8, 1899. He was born in Saratoga County, New York, July 19, 1833; was graduated from the Military Academy at West Point in 1855, and assigned to the First Artillery. He took part in the Seminole War, 1857-58, at the beginning of the Civil War was promoted to the rank of first lieutenant, and soon became a captain and commissary of subsistence. Subsequently he was made a colonel and chief-of-staff of the Department of the South, and in this capacity took an active part in the operations against Fort Wagner and Fort Sumter. Having been raised to the rank of brigadier-general of volunteers in September, 1863, he was placed in command of the Tenth Corps, Army of the James; with this command he participated in the engagements before Richmond until August 1864. Afterward he was appointed chief-of-staff in the Department of Virginia and North Carolina. For "services in the field" he was brevetted major-general, United States Army. Being mustered out of the volunteer service in September, 1866, he acted as depot commissioner at St. Louis until September, 1871, when he resigned from the army and entered upon the profession of civil engineer. In 1877 General Turner was chosen a member of the Board of Public Works of St. Louis and street commissioner, in which position he was serving at the time of his death.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE, at Tuskegee, Ala., was founded in 1881 for the mental, religious, and industrial training of young colored men and women. Instruction is given in agriculture, blacksmithing, brick masonry, carpentry, and many other trades. The institute had in 1899 an average attendance of 1218 students coming from 23 States and Territories, and from Cuba, Puerto Rico, Africa, and England. There were 88 officers and teachers, an endowment fund of \$154,000, and a library of 5000 volumes. The property owned by the institution is valued at \$300,000. A sum of \$24,000 was received from the estate of Mr. Edwin Austin. Mrs. C. P. Huntington gave \$10,000 for the erection of an additional dormitory for girls, the total cash receipts for the fiscal year being \$104,636. Principal, Booker T. Washington.

TYPHOID FEVER. The prevalence of enteric, or typhoid, fever in the Netherlands in 1899 was discussed at length by the members of the Epidemiological Society of London at its April meeting. A fall of 72 per cent. in the typhoid fever mortality among the urban population, and of 60 per cent. in the rural population of the country, is considered due to the sanitation resulting from medical progress (improved supplies of drinking water and methods of sewage disposal), and also to the fact that the people are enjoying a diminished infectivity. This view was shared by Dr. R. H. Saltet, professor of hygiene and preventive medicine in the

University of Amsterdam; Shirley Murphy, of the London County Council and ex-president of the Epidemiological Society; and Dr. Lane Nottter, professor of hygiene in the Army Medical School at Netley, shared this view. Opinions regarding the Widal reaction are changing with new experience. Experimenters are inclined to regard reaction to this test as an immunity reaction, and not merely a reaction of infection, as assumed by Widal. The agglutinins are not the true immunizing substances, and their quantity bears no relation to the degree of immunity. Certainly in some cases of the disease the test fails. In general, the cases with a relative slowing of the pulse have exhibited a more marked agglutination. There appears to be no relation between the gravity of the infection and the height of the fever, on the one hand, and the time of appearance and intensity of agglutination on the other. The cases that present a strong agglutination are shorter in duration than those in which the reaction is weak. In short, the stronger the reaction the more favorable the prognosis. The reaction is feeblter in children under 7 years than in adults, and it disappears earlier; nevertheless, it is perhaps the most valuable sign, in children, of typhoid fever. These conclusions are reached by Kasel and Mann.

In cases of typhoid in which perforation occurs, W. W. Keen, of Philadelphia, summarizes his views on operative treatment as follows: (1) The surgeon should be called in consultation the moment that any abdominal symptoms indicative of possible perforation are observed. (2) If it be possible to determine the existence of the preperforative stage, exploratory operation should be done under cocaine-anesthesia before perforation, shock, and sepsis have occurred. (3) After perforation has occurred, operation should be done at the earliest possible moment, provided, (4) that we wait till the primary shock, if any be present, has subsided. (5) In a case of suspected but doubtful perforation, a small exploratory opening should be made under cocaine to determine the existence of a perforation, and if hospital facilities for a blood-count and for immediate bacteriological observation exist, their aid should be invoked. (6) The operation should be done quickly, but thoroughly, and in accordance with the technic already indicated. (7) The profession at large must be aroused to the possibility of a cure in nearly, if not quite, one-third of the cases of perforation, provided speedy surgical aid is invoked.

The treatment of typhoid fever with an antityphoid extract promises fair results. Jez, in the *Wiener Medicinische Wochenschrift* for February 18, 1899, published the result of his observations and experiments in this line. He found that he was able to obtain from the organs of animals inoculated with typhoid bacilli substances capable of exercising productive and curative influences upon typhoid infection. An antityphoid extract he produced was employed in the treatment of 18 cases of typhoid fever, administered by the mouth, subcutaneous exhibition of it proving less serviceable. In these cases the characteristic fever curve was broken, and the pyrexia soon disappeared; the pulse declined in frequency and increased in strength; diarrhoea ceased; the tongue cleared, and convalescence followed speedily. No unpleasant secondary effects were noticed, even with large doses of the extract.

The India correspondent of the London *Lancet* reported in February, 1899, that inoculation against typhoid seems very successful. A. E. Wright, professor of pathology at Netley Military Hospital, and one of the plague commissioners, inoculated about 3000 British troops in India. He stated to the soldiers that 1500 troops are attacked with typhoid in India every year and that 300 of these died; that of the 200 nurses and attendants exposed during the Maidstone epidemic 95 were inoculated, not one of whom took the fever, while of the remainder 19 died of typhoid; also that of 8 subalterns who went to Khartoum 6 were inoculated and remained well, both of the others being attacked with fever which proved fatal in the case of one. The symptoms following inoculation are malaise and slight fever lasting generally not over 24 hours. The British War Office has decided that troops proceeding to military stations abroad where enteric fever is rife shall have the opportunity of inoculation against the disease. Seventy per cent. of the men ordered to Natal have accepted the offer and been inoculated with antityphoid serum. As between 20,000 and 30,000 soldiers were engaged in the African campaign when 1899 closed, the test as to the efficacy of the antityphoid serum will be excellent and valuable. See SERUM THERAPY; THERMOL; VITAL STATISTICS; WATER-SUPPLY.

TYPOGRAPHICAL UNION, INTERNATIONAL, organized in 1855, had in 1899 a membership of 38,000; publishes the *Typographical Journal*. The general meeting for 1900 to be in Milwaukee, Wis., August 13-18. President, Samuel B. Donnelly; secretary, John W. Bramwood, 7 DeSoto Block, Indianapolis, Ind.

UGANDA is a British protectorate in the interior of East Africa, and includes, besides Uganda proper, the territories known as Unyoro and Usoga, and several other divisions. The whole protectorate lies west of the East Africa Protectorate and adjacent to Lake Victoria Nyanza, and contains the head-waters of the Nile River. The total population has been roughly estimated at from two to three

millions; the population of Uganda proper is from 300,000 to 500,000. The capital of the latter is Mengo, but the administrative centre of the protectorate is Kampala, where there is a British fort. The government is administered by a British commissioner, but the native prince retains a nominal authority in Uganda proper. Uganda lies mostly on a plateau, and possesses a good soil and climate, besides being well watered. It is adapted to the successful growth of both temperate and tropical crops and is, altogether, capable of a great development, which is expected to be much furthered by the completion of the railroad from Mombasa on the coast to Lake Victoria Nyanza. At the close of 1899 less than 200 miles remained uncompleted of the total 560 miles of this road. Much discussion has occurred concerning the Uganda railroad since the parliamentary grant of £3,000,000 in 1896 for its construction. An English writer ridiculed it recently as a road "from nowhere to nowhere," claiming that it has no reason for existence and that the portion already said to be in operation is "open for traffic as a beggar's hat is open to receive checks of £1000." On the other hand, Colonel F. D. Lugard, who led the British invasion in Uganda in 1891, and who knows the country, describes this railway as running "from one of the finest harbors in the world to the second largest lake on the planet," through a rich, well-watered region, with a promising commercial future. This railroad passes within 40 miles of Mount Kilima-Njaro, the highest mountain of Africa. In the fall of 1898, after the pacification of the revolting Uganda troops, Major Cyril Martyr undertook the reorganization of the Soudanese soldiery and set out on an expedition through the British sphere of influence in the equatorial provinces. His purpose was to occupy certain posts, to make treaties, and establish relations with the native tribes, and build a series of forts to connect with the outposts of the Anglo-Egyptian Soudan. The result of his expedition was the establishment of an effective occupation as far north as Refaj, an advance of 180 miles beyond the former outposts at Foweira and Fajao, on the Nile, which lies about 140 miles north of the capital of Uganda. Several outposts, some sixty miles north, were established along the River Nile, and one was built to command the overland route to the Nile. These posts were strongly garrisoned with Soudanese troops. One break remains in the line of posts now established from Mombasa to Cairo in Egypt, some 350 miles of waterway between Refaj and Fashoda having yet to be brought under British control. It is believed that this may easily be traversed and controlled, but a stretch of about 150 miles of the river is obstructed by an impassable tropical growth of a lacustrine nature, which complicates the problem of control. An important expedition, which returned in 1899, was that of Colonel Macdonald, in East Africa. This party explored and mapped a large territory, extending as far as beyond Lake Rudolph, toward Abyssinia, and friendly relations were entered into with the various tribes. Some trouble was encountered, however, and one of the officers, Captain Kirkpatrick, was killed by a native, near the Karamoyo country. Dr. Donaldson Smith, a pioneer explorer in East Africa, returned for further exploration during the year. Among other scientific expeditions was the first ascent made of Mount Kenya, which was climbed in September, 1899, by Dr. Mackinder and two Alpine guides. The height was found to be between 17,000 and 18,000 feet. Fifteen glaciers were noted upon the flanks of this mountain. A new special commissioner to Uganda was appointed in 1899 in the person of Sir H. H. Johnson, K.C.B.

UNDERGROUND RAILWAYS. See RAPID TRANSIT (paragraph Underground Railways).

UNION VETERAN LEGION, organized in 1884, had in 1899 over 20,000 members, veterans of the war of 1861-65, who volunteered prior to July 1, 1863. There are 152 encampments in 21 States and the District of Columbia. National commander, W. R. Wooters; adjutant-general, John N. Rober, Philadelphia, Penn.

UNION VETERANS' UNION, founded in 1886, is composed of honorably discharged Union soldiers, sailors, and marines who served six months or more in the war of 1861-65. Commander-in-chief, Charles W. Wood, Worcester, Mass.; adjutant-general, C. W. Putnam, Worcester, Mass.

UNITARIANS. This sect reports for 1899 a prosperous year, and numbers 552 ministers, 460 churches, and 75,000 communicants. The American Unitarian Association, organized in Boston in 1825, has for its objects the collection and diffusion of information regarding the state of unitarianism in the United States, the supplying of missionaries, and various benevolent aims. It holds annual meetings at Boston in May. Secretary, Rev. Samuel A. Eliot, Cambridge, Mass.

UNITED BRETHREN IN CHRIST, founded in 1760 by Philip William Otterbein, reports for 1899 an uneventful year. Two missionaries were sent to Ponce, Puerto Rico, and six new missionaries were sent to Africa. This body reports, for the past year, 2529 ministers, 4965 churches, and 264,980 members, a decrease of 20,900 for 1899. This decrease is explained by the wrecking of the missionary work in Africa in 1898, due to the massacre of missionaries engaged there.

UNITED CONFEDERATE VETERANS, organized in 1889, had in 1899, 1170 camps and about 45,000 members. Its aims are literary, historical, social, and benevolent. The headquarters are in New Orleans, La.; commander, General John B. Gordon, of Georgia; adjutant-general and chief of staff, Major-General George Moorman, New Orleans, La. The organ of this association is the *Confederate Veteran*.

UNITED EVANGELICAL CHURCH had in 1899, 454 ministers, 734 churches, with membership of 59,830; 810 Sunday-schools, with 10,764 teachers and 75,481 scholars, and church property valued at \$2,154,169. A new annual conference was organized in the far West. Fourteen periodicals are published, three being in German. The total numbers of the Evangelical bodies are 1485 ministers, 2553 churches, and 177,443 church members. See **EVANGELICAL ASSOCIATION**.

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA reports a successful year, having 966 ministers, 968 congregations, 32 churches erected, and 126,783 communicants, 12,148 of whom are in the foreign field. The Synod of the Nile has four presbyteries.

UNITED SONS OF CONFEDERATE VETERANS, organized at Charleston, S. C., in 1896, held a reunion there in 1899. Commander-in-chief, Walter T. Colquitt; adjutant-general, L. D. T. Quinby, Atlanta, Ga.

UNITED STATES. The total area of the United States is 3,025,600 square miles, with an estimated population on December 31, 1899, of 76,977,000, including Alaska. The area of the latter territory is estimated at 577,600 square miles. The recently acquired islands of Hawaii, Guam, the Philippines, Puerto Rico, and Tutuila in Samoa, and the island of Cuba, under temporary control, have an aggregate area of about 170,000, and an estimated population of from 10,000,000 to 12,000,000.

Agriculture, Live Stock, etc.—The United States is the leading agricultural country in the world, and the year 1899 was one of the most prosperous in its history. The total value of the staple products, corn, wheat, oats, rye, and buckwheat, together with cotton, was nearly \$1,500,000,000, besides one-third as much for hay, potatoes, tobacco, rice, sugar-cane, and beet-root. This country is the world's greatest wheat producer, raising nearly one-fourth of the whole. The centre of cereal production is rapidly moving westward Minnesota, Kansas, North and South Dakota, and Nebraska are now the five great wheat States, growing 40 per cent. of the American production. The six great corn States are Illinois, Iowa, Kansas, Nebraska, Missouri, and Indiana, which produce over half the corn grown in the United States. This country raises the larger part of the cotton used by the cotton-mills of the world, though Egyptian cotton and some of the products from a few other regions is of superior quality, and is imported even into this country. In 1898 the price of American cotton was low, but in 1899 the world's supply fell off about 1,200,000 bales, resulting in an advance of nearly 50 per cent. in the price of American cotton. The production in America increased. The important products hay and tobacco also showed an increased yield in 1899. Besides its agricultural importance this country furnishes a large amount of meats for the consumption of the world. The total value of farm animals in 1899 was estimated at nearly \$2,000,000,000. The statistics of live stock are necessarily approximate. For 1899 the estimated number of swine was in round numbers 50,000,000; sheep, 42,000,000; milch cows, 16,000,000; and oxen and other cattle, 28,000,000. The number of swine raised is far in excess of that of any other country, and the value has increased one fourth within five years. The value of all other live stock has grown also, especially that of sheep. One item of interest in noting the increased agricultural production of recent years is that it has come about through improved methods and increased acreage largely, and that the agricultural population itself has not greatly increased. A definite result of the prosperity has been the liquidation of many farm mortgages. For details, see the separate articles on **AGRICULTURE**; **CORN**; **WHEAT**; **COTTON**; etc.

Public Domain.—Of the public lands, including those in Alaska, there were at the close of the fiscal year ending June 30, 1899, about 929,308,000 acres unappropriated and unreserved, two-thirds of which were unsurveyed, and 727,401,600 acres which had been appropriated or reserved. The unreserved lands in Alaska are mostly unsurveyed and unappropriated. For a discussion of this subject the reader is referred to the article **LANDS, PUBLIC**, in which are treated also the national forest reserves. See also **FORESTRY**.

Commerce.—The foreign commerce of the United States in 1899 showed a continuation of the marked increase which has been a feature of its trade in recent years. While the most wonderful year in her history, the indications were at the close of 1899 that the following year would show a still greater foreign trade. In 1899 this trade was over \$2,000,000,000, with a favorable balance of nearly \$477,000,000. The increased import trade in 1899 was in round numbers about \$164,000,000, and the increase in exports about \$20,000,000, or a total increase in trade of nearly \$184,000,000.

ooo. Our trade showed a growth in all parts of the world, also, especially in Australia and the Far East. Our Asiatic trade increased in round number from \$94,300,000 to \$136,864,000, imports, and from \$47,000,000 to \$54,000,000 exports. We added nearly \$7,000,000 to our imports from China, and \$3,000,000 to our exports there. Our imports from Japan increased \$11,000,000, and our exports by \$1,000,000. Our imports from Oceania increased nearly \$6,000,000, although the British Australasian trade fell off over \$2,000,000, due mostly to the droughts in Australia, from which country we take much wool. Our exports to Oceania increased nearly \$13,000,000, half of which increase was with British Australasia. Our African imports increased about \$3,500,000, our export trade remaining about stationary. South American trade showed a healthy, but not remarkable, growth. Our trade with the West Indies increased nearly \$14,000,000 for imports, and still more for our exports there. From Europe we purchased over \$77,000,000 worth of goods more than in the previous year, but our exports fell off to the amount of nearly \$22,000,000. Our imports from the United Kingdom increased \$31,000,000, our exports decreased nearly \$29,000,000; our French imports increased over \$14,000,000, while our exports fell off nearly \$10,000,000, and there was a similar increase of imports and decrease of exports in our trade with Germany.

In our export trade the most striking fact is the great increase of manufactures, which in 1899 were over 30 per cent. of the total exports, or \$380,787,891. Agricultural products exported were somewhat less than in 1898, but they still formed nearly two-thirds of our exports, being valued in 1899 at \$782,105,048, or over 62 per cent. Forest woods and products were \$47,562,121, or 4 per cent., and mining products \$33,279,187, or 3 per cent. The most important single class of exports was bread-stuffs, \$209,955,771. Then follow cotton, mostly raw, \$216,020,033; iron and steel, and manufactures of, \$105,689,645, great increases; crude and refined mineral oils, \$65,384,128; wood and manufactures of, copper and copper manufactures, tobacco and manufactures of tobacco, leather and leather goods, including gloves; oil cake, etc.; vegetable oils, etc. Our most important article of import was sugar, \$108,124,877, the principal sources being the East Indies, Hawaii, Cuba, and Germany. Then came raw silk, \$43,546,872, mostly from Japan, China, and Italy, and \$27,880,683 silk manufactures, nearly 50 per cent. French. Other leading imports were hides and skins, \$51,127,659; coffee, \$56,068,980, Brazil by far the largest producer; wool and hair, largely Australian; chemicals, drugs, and dyes; india rubber, etc., mostly Brazilian; raw cotton, largely Egyptian, and cotton manufactures, mostly European; vegetable fibres, including flax, mostly European; jute, East Indian; manila, from the Philippines, and sisal grass, from Mexico; jewelry, precious stones, etc., also fruits and nuts, copper ores and ingots, iron and wood manufactures, wines, tobacco, tea, plate and pig-tin, raw and manufactured leather, gloves, earthen and china-ware, feathers, furs, fish, cocoa, oils, spirits, metal manufactures, etc.

The commerce with Puerto Rico, Cuba, Hawaii, and the Philippines has shown a marked growth both in imports and exports since those islands have come into closer touch with the United States. The secretary of the treasury in his report for 1899 calls attention to the fact that Cuba and the new possessions of this country offer a natural market in both branches of trade. "The classes of agricultural productions," he says, "for which the United States relies, and in most of them must continue to rely, upon tropical countries, form a large proportion of our natural and necessary imports. Our importations of coffee, sugar, tropical fruits, tobacco of high grade, hemp, jute, etc., with sundry other miscellaneous products of tropical climates, average \$250,000,000 annually, and all of these are produced in greater or less degree in the islands in question, while they in turn must rely upon the temperate zones for their supplies of wheat and flour, provisions, clothing, and manufactures of various classes. As a result, the commerce between the United States and these islands is already showing a marked growth, and there is every reason to believe that it will continue to increase." The statistics given in the preceding paragraphs on the general commerce of the United States are for the calendar year 1899. In the following table the growth of trade with the various islands is shown, but the figures there given by the Treasury reports are for the fiscal year ending June 30 instead of for the calendar year. The table shows quite well, however, the marked increased of trade in the years mentioned.

YEAR.	PUERTO RICO.		CUBA.		HAWAIIAN ISLANDS.		PHILIPPINE ISLANDS.	
	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.
1897.....	\$2,181,024	\$1,988,888	\$19,400,815	\$8,359,776	\$13,687,799	\$4,690,075	\$4,388,740	\$94,597
1898.....	2,414,356	1,808,346	15,233,477	9,561,656	17,187,380	5,907,155	3,880,415	127,804
1899....	3,179,827	2,685,848	25,408,628	18,616,377	17,881,463	9,306,470	4,409,774	404,198

For the calendar year 1899 the relative value of the foreign trade of the United States is shown in the succeeding statement of Treasurer Gage:

COUNTRIES.	Imports From.	Exports To.	COUNTRIES.	Imports From.	Exports To.

Industries.—The year 1899 was marked by a general industrial prosperity, a rise of wages and of the price of goods, and by an unprecedented increase in the export of manufactures. See MANUFACTURES; IRON AND STEEL; MINING; COTTON AND THE COTTON INDUSTRIES; SUGAR; RAILWAYS; STRIKES AND LOCKOUTS; SILK MANUFACTURES.

Internal Communications.—The two principal authorities on railroad matters are the annual reports of the Inter-State Commerce Commission, and *Poor's Manual*. Neither brings the statistics of railroads down to the year 1899. The latter work shows, that on December 31, 1898, the total mileage of surface steam railroads in the United States was 186,809.63, an increase during the previous twelve months of

1915.3 miles. The capital stock of all railroads was \$5,581,522,858; bonded stock, \$5,635,363,594; unfunded debt, \$368,182,584; current accounts, \$383,682,168; profit and loss, \$457,898,053, making the total liabilities for the year \$12,426,649,257. The assets included the following items: Cost of railroads and equipment, \$10,256,275,585; investments, \$1,594,565,979; other assets, \$265,264,972; current accounts, \$169,261,166; profit and loss, \$141,281,555. The traffic earnings of the year were, from passengers, \$272,589,591; freight, \$868,924,526; miscellaneous, \$99,180,966; total gross earnings, \$1,249,558,724. The net earnings were \$389,666,474, which with a revenue of \$104,536,904 from other sources made a total available revenue of \$494,203,378. The surplus for the year was \$58,642,238, a large gain over the preceding year. During the year the casualties to railroad employees was 1958 killed, 31,761 injured. Among passengers 221 were killed and 2945 injured. Only one passenger to every 2,267,270 carried was killed, and one passenger injured to 170,141 carried.

Immigration.—The principal features of immigration into the United States during the fiscal year ending June 30, 1899, is sketched in the article IMMIGRATION (*q. v.*). The number of immigrants and the countries from which they came are given for that period in the following table, as well as for the preceding fiscal year:

COUNTRIES	1897-98.	1898-99.	Increase.	Decrease.
Austria-Hungary	39,797	63,491	22,694

Navigation.—The United States commissioner of navigation, in his report to the Treasury Department for the fiscal year ending June 30, 1899, made a number of interesting statements regarding the growth of the merchant marine. The total documented tonnage on June 30 was the largest since 1865, and the registered tonnage the largest since 1875; the tonnage enrolled for the coasting trade was the largest in our history and greater than the coasting tonnage of any other nation; we built more vessels in 1899 than in any year since 1875, excepting the year 1891; we built more steel vessels than in any year in our history, and the production on the Pacific coast was double that of any year except 1898. There is a reverse, the

commissioner adds, to these statements. During the fiscal year 1898-99 American vessels carried the smallest percentage of our exports and imports in our history. The commissioner continued the discussion contained in his previous report regarding the promotion, by legislation of some sort, of the American merchant marine. He mentions five methods which have been proposed in recent years for the increase of the American merchant marine in the foreign trade: First, discriminating duties or additional duties on imports in foreign vessels or on the tonnage of foreign vessels entering the United States above those imposed on American vessels or their cargoes; second, bounties on exports in American vessels; third, free registry for foreign-built ships; fourth, mail subsidies to fast steamships; fifth, navigation bounties, based on tonnage, mileage, and speed. The fifth proposition was embodied in a bill before the Fifty-fifth Congress, which proposed to offset by graded payments from the Treasury the difference in the cost of constructing vessels in the United States and in Great Britain and Germany, so far as that difference enters into cost of operation, and also to offset other differences in cost of operation. The maximum expenditure under the bill during any one year is fixed at \$9,000,000, which includes the sum now paid for the carrying of ocean mails on American vessels, which is about \$1,300,000 annually. The maximum figure named in this bill would not be reached in some years, since the number of American steamships of over 14 knots regularly engaged in foreign trade is only 27, aggregating 122,940 gross tons. The amounts which these vessels would receive under the proposed act, conditioned on building new vessels in the United States, and that which they now receive under the present Postal-subsidy law are as follows:

	Proposed Subsidy.	Present Postal Subsidy, 1897.
American Line (4 vessels).....	\$1,247,199	\$766,300
New York and Cuba Mail (9 vessels).....	342,899	203,580
Admiral Line (4 vessels).....	88,029
Red "D" Line (7 vessels) ..	61,040	82,962
Oceanic Line (3 vessels).....	154,400	135,000
Total	\$1,903,127	\$1,187,242

The figures for 1897 are given, as during part of the years 1898 and 1899 the mail service on American vessels was discontinued on account of the war and the employment of mail steamships as auxiliary cruisers and transports.

The following table gives statistics of the American merchant marine for the fiscal years 1897-98 and 1898-99:

The Army.—After a reduction of the army early in 1899 from a war footing of 2324 regular officers and 61,444 men, and 5216 volunteer officers and 110,202 men, to a peace footing of about 26,000 regular soldiers, with nearly the whole volunteer force discharged, authority was granted to again increase the force in view of the Philippine insurrection. In consequence the regular army has been increased to a present standing of 2248 officers and 61,999 men, and a new volunteer force has been created of 1524 officers and 33,050 men. The volunteers are stationed mostly in the Philippines. The regular army is distributed as follows:

	Officers.	Enlisted Men.
In Cuba.....	384	10,796
In Puerto Rico.....	87	2,825
On the continent of North America.....	910	17,317
In Hawaii.....	12	453
In the Philippine Islands.....	905	30,578
Total.....	2,248	61,999

The Navy.—In spite of the notable increases made in the navy during the past few years, the United States war fleet does not yet occupy the position that it should among the navies of the world. The rebuilding of the navy began in 1883, and in the sixteen years ending June 30, 1899, the amount expended in new vessels has been only \$98,529,512, and the estimated sum to be expended on unfinished vessels now in hand is \$62,570,610, making the total expenditure only \$161,160,122. That this sum is comparatively small is shown by the amount paid in the year 1899 alone for pensions, which was \$138,355,053. Foreign navies have in the meantime shown great increases, particularly the navy of Japan. The following comparative table from the latest annual naval returns of the British Parliament shows the condition of the principal fleets of war on December 31, 1899. The leading classes of vessels only are given:

	COMPLETED.							UNDER CONSTRUCTION.						
	England.	France.	Russia.	Germany.	Italy.	United States.	Japan.	England.	France.	Russia.	Germany.	Italy.	United States.	Japan.

The tendency of modern navy building is toward the construction of larger vessels, one large ship being considered more efficient than two vessels one-half the size, while requiring a smaller crew than the combined force of the two small vessels. A United States Navy Report says: "All countries are at present building battleships of about 12,000 tons, England and Japan even of 15,000 tons. If some of the Powers are building smaller battleships, it may be safely assumed that the reason is lack of funds or that the ships in question are intended for limited modes of warfare." No unprotected cruisers were being constructed by this or any other power in 1899, and although this country was building four coast defence vessels, the tendency at large is rather toward the construction of vessels adapted for battle on the open sea. The secretary made the following recommendations for the increase of the navy:

"The number of large, swift, and powerful armored cruisers of great coal endurance in our navy is largely disproportionate to the rest of the naval establishment. The experience of the last year has also shown the need of several smaller vessels, usually classed as gunboats. It is therefore recommended that Congress be requested to authorize the construction of the following vessels:

First. Three armored cruisers, of about 13,000 tons trial displacement, of a maximum draft at deep load not to exceed 26 feet, carrying the heaviest armor and most powerful ordnance for vessels of their class, to be sheathed and coppered and to have the highest practicable speed and great radius of action.

Second. Twelve gunboats, of about 900 tons trial displacement, to be sheathed and coppered.

And, third, as recommended a year ago, three protected cruisers of about 8000 tons trial displacement, carrying the most powerful ordnance for vessels of their class, to be sheathed and coppered, and to have the highest practicable speed and great radius of action.

The increase in the tonnage of the last three named vessels from 6000 tons, as recommended a year ago, to 8000 tons is suggested by the naval board on construction as better adapted to the present needs of the service. The same board are also of the opinion that if any of the foregoing vessels are authorized, the law should provide that in case satisfactory bids can not be obtained for their construction by contract, the Department shall have authority to construct the same in the navy yards."

During 1899 a large number of vessels were dropped from the American navy. Nine vessels were condemned and sold, about \$450,000 in all being received for them. Since the 1897-98 report of the Navy Department there were dropped also many vessels used during the war. Four large auxiliary cruisers and 2 converted yachts were returned to their owners, 4 light-house tenders, 16 revenue cutters, and 2 fish commission vessels were transferred to the various departments controlling them, and various vessels which had been purchased for war purposes were sold.

Indians, Patents, Pensions, and Lands, Public.—See the special articles on these subjects.

Revenue and Expenditure.—The revenue for the fiscal year ending June 30, 1899, was \$610,982,004.35, and the expenditure \$700,093,564.02. The largest sources of income were internal revenue, \$273,437,162; customs, \$206,128,482; and postal service, \$95,021,384. The principal expenditures of an annual nature were for the military establishment, including river and harbor supervision, \$229,841,254; pensions, \$139,394,929; postal service and postal revenue deficiencies, \$103,232,954; and interest on public debt, about \$40,000,000. The receipts for the fiscal year were increased by over \$116,648,050, in spite of the fact that nearly \$64,750,000, representing the sale of the Union Pacific and Kansas Pacific Railroads had been an item in the receipts for the fiscal year 1898. The principal increases in 1899 were an added income of

\$102,536,520 from internal revenue, and \$56,553,419 from customs. There was also a large increase in expenditures—namely, \$161,703,597—the largest items being the expenditure of \$20,000,000 in the fulfilment of treaty obligations with Spain, \$62,951,019 increase for the quartermasters' department of the military establishment, and \$48,145,489 for Cuban and Philippine expeditions. "The transactions of the fiscal year, as shown by the report of the treasurer of the United States, were of unusual magnitude, the net ordinary receipts having been exceeded but once, in 1866, and the net ordinary expenditures in 1863, 1864, and 1865 only. Inclusive of the amounts involved in the issue and redemption of bonds, notes, and certificates, the gross receipts, under warrant, were \$1,038,451,340.18, and the gross expenditures \$946,222,148.83. There was, in consequence, an addition of \$92,229,191.35 to the general Treasury balance, which increased from \$775,751,368.11 to \$867,980,559.46." As will be seen from the figures given at the beginning of this paragraph there was a deficiency in the ordinary revenue of \$89,111,559.67. Nevertheless, the excess of receipts over disbursements on account of loans was sufficient to realize a net surplus of \$100,791,521.35 as the result of the fiscal operations of the year. The secretary of the Treasury reports that the popular subscriptions to the war loan came from every part of the country, and were largely paid into the Treasury in gold.

The revenues of the government for the fiscal year ending June 30, 1900, are estimated upon the basis of existing laws:

From customs.....	\$225,000,000.00
From internal revenue.....	290,000,000.00
From miscellaneous sources.....	25,000,000.00
From Postal Service.....	100,958,112.00
Estimated revenues.....	\$640,958,112.00

The expenditures for the same period are estimated as follows:

For the civil establishment.....	\$100,000,000.00
For the military establishment.....	150,000,000.00
For the naval establishment.....	55,000,000.00
For the Indian Service.....	11,000,000.00
For pensions.....	144,000,000.00
For interest on the public debt.....	40,000,000.00
For Postal Service.....	100,958,112.00

Estimated expenditures..... \$600,958,112.00

Treasury Operations.—The large financial transactions of the fiscal year have already been touched upon in the preceding paragraph on Receipts and Expenditures. The gold holdings of the Treasury are reported to have exceeded all previous records, both in the aggregate and in the net amount above outstanding gold certificates. On October 31, 1899, the gross amount of gold coin and bullion was \$379,817,316. The maximum net gold was \$258,081,565 on October 12.

Important changes took place during the year in the composition and distribution of notes and silver certificates in circulation. The amount of these was increased by \$43,828,386, reducing the paper holdings of the Treasury to the minimum required for the transaction of business. The outstanding Treasury notes of 1890 were cut down, by cancellation on redemption in silver dollars, from \$101,207,280 to \$93,518,280. This process, however, did not involve a contraction of the currency, since the coins paid out for the notes either remained in circulation or were re-deposited in the Treasury for silver certificates.

The National Debt.—The amount and classification of the public debt on December 31, 1899, was as follows:

Interest-bearing debt.....	\$1,026,772,320.00
Debt on which interest has ceased since maturity.....	1,208,500.26
Debt bearing no interest.....	389,914,640.16

Aggregate of interest and noninterest-bearing debt.....	\$1,417,895,460.42
Certificates and Treasury notes offset by an equal amount of cash in the Treasury	686,979,403.00

Aggregate of debt, including certificates and Treasury notes... \$2,104,874,863.42

At the same time the amount of cash in the Treasury was as follows:

Currency.—For currency discussions the reader is referred to the articles CURRENCY REFORM and BANKS. For the production of gold and silver in the United States, see the articles GOLD and SILVER. The year 1898 was in some respects the most remarkable year in the financial history of the country. Although the original deposits of gold bullion at the mints and assay offices was in 1899 slightly below those for 1898, the figures for 1899 being \$143,497,191, domestic deposits were the largest known, \$76,252,487. In regard to the movement of gold to and from the country, the imports for the fiscal year 1899 were \$84,280,674, and the exports were \$37,507,771. The imports of gold decreased in 1899 and the outflow of gold largely increased for the year. The exports for 1898 were so low, however, that those for 1899 still remained much smaller in amount than for any year since 1890, excepting 1898 only. And while less gold was imported than in 1898, the amount still remained larger, except for that year, than the imports of any year since 1881. The director of the United States Mint reports that the coinage of gold in the fiscal year 1899 was by far the greatest in our history. The total coinage in all metals was as follows:

DENOMINATIONS.	Pieces.	Value.
Gold:		
Double eagles	3,793,043	\$75,860,860.00
Eagles	1,216,892	12,768,920.00
Half eagles	3,897,422	19,487,110.00
Quarter eagles	24,116	60,290.00
Total gold	8,991,473	\$108,177,180.00
Silver:		
Standard dollars	18,254,709	\$18,254,709.00

DENOMINATIONS.	Pieces.	Value.
Subsidiary:		
Half dollars.....	6,433,259	\$3,216,629.50
Quarter dollars.....	15,638,709	3,907,177.25
Dimes.....	23,430,709	2,343,070.90
Total subsidiary.....	45,492,677	\$9,466,877.70
Total silver.....	63,747,386	\$27,721,586.65
Five-cent nickels.....	11,539,732	\$576,986.60
One-cent bronze.....	37,092,854	\$79,923.54
Total minor.....	49,532,096	\$956,910.14
Total coinage.....	122,270,945	\$136,855,676.79

The total circulation of money on June 30, 1899, is shown in the following comparative table. With an estimated population at the time of 76,148,000, the circulation per capita would be \$25.

	General stock coined or issued.	In Treasury.	Amount in circulation.
Gold coin, including bullion in Treasury.....	\$963,498,364	\$283,780,334	\$679,738,050
Standard silver dollars, including bullion in Treasury.....	563,697,063	502,215,656	61,481,407
Subsidiary silver.....	74,866,563	5,800,728	69,065,834
Gold certificates.....	24,397,919	1,641,900	22,756,019
Silver certificates.....	406,086,504	3,848,887	402,237,617
Treasury notes, Act July 14, 1890.....	93,518,230	950,516	92,567,714
United States notes.....	346,681,016	38,329,174	308,351,842
Currency certificates, Act June 8, 1872.....	21,335,000	1,080,000	20,255,000
National-bank notes.....	241,350,571	3,545,432	237,805,139
	\$2,745,350,508	\$841,278,627	\$1,904,071,881

The amount of money in circulation on December 31, 1899, was \$1,980,398,170.

Banks.—The report of the controller of the currency for the year ending October 31, 1899, gives the following general deductions regarding the banking strength of the country. There were, in 1899, 12,804 banks of all kinds, with 13,153,874 depositor's accounts, representing a total deposit of \$7,513,954,361. The number of loans made were \$5,067,252, the total value of loans and discounts being \$5,751,467,610. The number of individual depositors is constantly increasing, and greatly exceeds that of borrowers. The latter are also increasing in numbers, but in a smaller ratio than the depositors. During the decade ending in 1899 there has been a gradually lessening rate of interest charged by the banks on loans, while at the same time the banks are paying a lessening rate of interest on deposits. The average deposit is shown to be gradually increasing in amount, while the average size of the loans has not varied much in the last decade. The following table shows the condition of national banks on December 2, 1899:

Resources:	Dec. 2, 3602 Banks
Loans and Discounts.....	\$2,479,819,494.90
Overdrafts.....	33,681,370.97
U. S. Bonds to secure circulation.....	234,403,460.00
U. S. Bonds to secure U. S. Deposits.....	81,265,940.00
U. S. Bonds on hand.....	17,717,840.00
Premiums on U. S. Bonds.....	17,375,215.21
Stocks, Securities, etc.....	325,490,163.55
Banking House, Furniture, and Fixtures.....	79,446,858.81
Other Real Estate and Mortgages owned.....	29,662,473.64
Due from National Banks.....	198,611,069.85
Due from State Banks and Bankers.....	60,155,021.84
Due from approved Reserve Agents.....	345,556,047.73
Checks and other Cash Items.....	21,432,440.94
Exchanges for Clearing House.....	90,514,921.48
Bills of other National Banks.....	17,522,237.00
Fractional Currency, Nickles, and Cents.....	1,013,122.40

Resources :

Specie	314,825,376.60
Legal-tender Notes	101,675,795.00

Bills payable	13,546,905.23
Liabilities other than those above.....	22,627,712.30

Total..... \$4,475,343,923.55

Business Activity.—The industrial prosperity of 1899 was shown not only by the growth of foreign commerce, but by an increased demand for products at home, a general rise in wages, and the establishment and enlargement of many industries. The number of incorporations exceeded that of any previous year, the number of new concerns established during the first three months of 1899, it is said, being greater than during the whole of 1898. Considering only the important firms established, the capitalization is placed at over \$4,207,000,000. These industries were capitalized at sums ranging from \$150,000,000 down through \$100,000,000 to various amounts, of which many exceeded \$50,000,000. There was also a large increase in the capitalization of existing industrial concerns, amounting for the important industries to nearly \$250,000,000. There were also many combinations formed, besides increases in the capital stock of various railroads. Perhaps the most prosperous business was the iron and steel trade, the prices in which increased 100 per cent. The growth of the textile industries was also remarkable. The business expansion in the South was a marked feature of the year, but every part of the country shared in the conditions of prosperity. These conditions were reflected in the stock market. An extraordinary amount of business was done in Wall Street during the first three months, being nearly 15,000,000 shares greater than during the same period in 1898. In May, just after the passage of the Ford Franchise bill, taxing corporations in New York State, had somewhat unsettled the market, the sudden death of ex-Governor Flower occurred. Mr. Flower was the most prominent operator on the street at the time, and the news of his death caused almost a panic, and the transfer within two hours on Saturday, May 13, of 745,000 shares in the various stocks represented by him. Nevertheless, the evident prosperity and general confidence were proved by a sharp rally in the market on the following Monday. Toward the end of the year there was considerable depression in stocks. This has been attributed largely to surface conditions and as in no way reflecting industrial tendencies at large, one writer having called it a "prosperity panic." Other conditions were a tight money market, caused largely by the development of business activity itself. The Boer war was another cause. To relieve the temporary stringency in the money market the secretary of the Treasury announced on December 18 that deposits of public money to the amount of \$30,000,000 to \$40,000,000 would be made with banks offering bonds as security. The National City Bank of New York and other banks offered bonds to the amount of \$18,000,000 within the next ten days. The deposit of public funds with private banks aroused sharp criticism in the press, and opinion was divided as to the propriety of such a course.

Bankruptcy.—The bankruptcy law passed in 1898 provides that any person except a wage-earner or a person engaged chiefly in farming may be judged an involuntary bankrupt upon default or an impartial trial. The law sets forth the rights and duties of bankrupts at great length, establishes courts of bankruptcy, defines their jurisdiction and procedure, and creates the offices of trustee and referee. It was the outcome of a movement extending over many years to secure a uniform system of

bankruptcy. The operation of the law aroused some criticism, and the modification of it in some particulars was discussed. The number of failures in the year ending December 1, 1899, was 9700 as against 12,569 in the previous year, and the liabilities \$89,292,750, as against \$130,636,796. With the exception of 1880 and 1881 the number of failures in 1899 was smaller than in any one of the previous twenty-five years, the average liability smaller than in any previous year, and the ratio of default to solvency was also smaller (97 cents per \$1000).

HISTORY.

Congress.—The third session of the Fifty-fifth Congress opened on December 5, 1898. Among other recommendations made by the President in his message were the following: That the Cuban people should be aided in the formation of a government, and that the military régime should continue until a stable civil government was established; that Congress should provide for the construction of an inter-oceanic ship-canal to be controlled by the United States; that the regular army should be increased to 100,000 men; that the addition of fifteen vessels should be made to the navy; that a measure of currency reform along lines already suggested should be carried out. The most important occurrence in the early part of the session was the transmission to the Senate of the treaty of peace with Spain on January 4, 1899. There was a strong opposition to the ratification of the treaty, and for a time it seemed doubtful if the necessary two-thirds vote could be secured. An amendment was offered declaring that Spain merely relinquished her sovereignty, and that the United States government was assuming only temporary control, but on February 6 this was defeated. The treaty was now ratified by a vote of 57 to 27. The House bill for the increase and reorganization of the army was passed on January 31, but it encountered opposition in the Senate, and a compromise measure was offered in its stead. This became a law on March 2. It placed the strength of the regular army at 65,000 men until July 1, 1901, and authorized the recruiting of 35,000 volunteers during that period. It also authorized the re-enlistment of volunteers for six months. The Naval Appropriation bill and the Navy Personnel bill, which were passed on March 3, fixed the number of sailors in the navy at 17,500 and the number of marines at 6000. Among the other measures passed during the session were an act creating the office of admiral (Rear-Admiral Dewey being immediately raised to that rank); an act providing for the taking of the Twelfth Census of 1900 (see CENSUS); and an act establishing a code of criminal law and procedure for Alaska. Among the bills which failed to pass were the Shipping Subsidy bill, the bills for the establishment of government in Hawaii (see HAWAII); and a bill for the construction of the Nicaragua Canal. (See NICARAGUA CANAL.) In regard to the Nicaragua project, however, its advocates succeeded in obtaining from Congress a grant of \$1,000,000 for the expenses of another investigation of routes. As to currency reform, all that was accomplished was the appointment of a committee in the House to report a measure to the next Congress and the authorization of the Senate finance committee to hold sessions during the recess. The first session of the Fifty-sixth Congress opened on December 4, 1899. David B. Henderson, of Iowa, was unanimously nominated speaker by the Republican caucus. The first question that arose in the session was that of the admission of Mr. Brigham H. Roberts, the Democratic Congressman-elect from Utah. (An account of the discussion on this matter will be found in the article MORMONISM.) The composition of both houses of Congress was as follows: Senate, 52 Republicans, 26 Democrats, 4 Populists, 2 Silverites, and 2 Independents; the House, 185 Republicans, 164 Democrats, 5 Populists, and 3 Silverites. One of the chief matters to come before Congress was the currency question, and bills for the reform of the currency and the establishment of the gold standard were drafted, both in the House and in the Senate. See CURRENCY REFORM.

Cabinet and Other Changes.—In December, 1898, the cabinet officers were as follows: Secretary of state, John Hay, of Ohio; secretary of the treasury, Lyman J. Gage, of Illinois; secretary of war, Russell A. Alger, of Michigan; attorney-general, John W. Griggs, of New Jersey; postmaster-general, Charles Emory Smith, of Pennsylvania; secretary of the navy, John D. Long, of Massachusetts; secretary of the interior, Ethan Allen Hitchcock, of Missouri; and secretary of agriculture, James Wilson, of Iowa. The only change in the cabinet during the year was the appointment of Mr. Elihu Root, of New York, as secretary of war, in place of Russell A. Alger, who retired on August 1. Important changes in the diplomatic service were the appointment of Joseph H. Choate, of New York, as ambassador to St. James's; the transfer of Bellamy Storer from the Belgian to the Spanish mission; of Lawrence Townsend from Portugal to Belgium, and of Arthur S. Hardy from Persia to Greece; and the appointment of John N. Irwin, of Iowa, as minister to Portugal, and Herbert W. Bowen, of New York, as minister to Persia.

Foreign Relations.—The most important affair in the foreign relations of the United States during the year was the Alaska boundary dispute (*q. v.*). The Anglo-American commission to consider this and other points of dispute between the United States and Canada reassembled at Washington on November 10, 1898, and adjourned on February 20, 1899, without reaching any basis of agreement in the Alaska boundary matter; but on October 20 a *modus vivendi* was concluded, by which the United States retained possession of the passes leading from tide-water to the Klondike. Another important event was the appointment of the commission under Admiral Walker to make another report for an interoceanic canal route. This new commission, known as the Isthmian commission, was organized on June 10, and proceeded promptly to work on the investigation of the route for the proposed Nicaragua Canal. Several new reciprocity treaties were signed during the year under the reciprocity clause of the Dingley Tariff act of July 4, 1897. In July the President signed conventions of reciprocity with Great Britain for her colonies, British Guiana, Barbados, Bermuda, Trinidad, Jamaica, and Turks and Caicos Islands, and with the republic of Nicaragua. Reciprocity agreements were also formed with France and the Argentine Republic. As to France, a provisional agreement had been formed on May 5, 1898, relieving the French imports into the United States from the operation of the tariff; but in 1899 a new reciprocity treaty was under discussion, according to the "most-favored nation" treatment to France. It was signed on July 24, but required ratification from the legislatures of both countries. This treaty was introduced in the French chamber of deputies on December 20, 1899. As outlined in the press, the proposed treaty excluded from the minimum tariff in France the American products of cast iron, leather articles, machine tools, agricultural and cattle products. In France it was claimed that only four per cent. of the American products, to the value of 25,000,000 francs, benefited from the new changes, while 53 per cent. of French products, to the value of 156,940,000 francs, benefited. Diplomatic relations were definitely resumed in the summer of 1899 between Spain and the United States, the Spanish minister having presented his credentials at Washington and the American minister having presented his at the Spanish court. Commercial relations were soon afterward restored by the appointment of consular officers. Friendly relations with Germany, which seemed to be threatened by the popular ill-feeling, caused by the conduct of the admiral of the German fleet in the Philippines, were restored in 1899. There was some controversy in regard to the "most-favored nation" clause in the commercial treaties between Germany and the United States, but reciprocity negotiations were reported to be in progress, and the harmony of the two nations was illustrated by the conclusion of a parcels post agreement, the arrangement for a connecting cable, and the co-operation of the two governments in regard to Samoa. Friendly relations with Italy were temporarily endangered by the lynching of Italian workmen on July 21 in Louisiana. The case was not unlike that which had occurred in 1891, the main difficulty being the responsibility of the United States according to the terms of the treaty with Italy and the embarrassment caused by the independent jurisdiction guaranteed by the constitution to the separate States in dealing with crimes of this character. The citizenship of the victims was investigated, but the matter had not been thoroughly sifted out at the close of the year. The Samoan problem and its successful solution have been described in the article Samoa (*q. v.*). The dangers of the tripartite control of Samoa have long been obvious, and the partition of the islands between Germany and the United States is regarded as in every way the best arrangement. During the year the United States took a definite stand in regard to the "open door" in China. On September 6, 1899, the government entered on a correspondence on this subject with the foreign powers that claimed a sphere of influence in China, sending to each of them a formal declaration, stating the desires of the United States government in regard to the "open door." It requested that the government addressed should declare its intention not to interfere with any treaty port or vested interest within any so-called sphere of influence or leased territory it may have in China; that the Chinese treaty tariff shall apply to all merchandise destined for ports within this sphere of influence, no matter to what nationalities such merchandise belongs, and that the government having a sphere of influence will levy no higher harbor dues on foreign vessels than on its own. The correspondence was still in progress at the close of the year. In the South African war the United States maintained an attitude of strict neutrality, instructing its representative at Pretoria to see that American interests were respected by the combatants. The relations of the government with foreign powers throughout the year were generally satisfactory, but with Turkey they offered an exception to the rule. After the Armenian massacres the United States representative in Turkey was instructed to demand an indemnity for certain property belonging to missionaries, which had been destroyed at Harpoot and Marash. In spite of repeated demands and an apparent acknowledgment of the justice of the claims,

the Porte took no steps to pay the indemnity. Other claims that had been standing for a still longer time were also disregarded, and it was the subject of additional complaint that the Porte refused to recognize the alien status of native Turkish subjects who had been naturalized in foreign countries since 1867. A further complaint was made in respect to the arbitrary treatment of American productions in Turkish ports, where, as the result of certain antiquated tests, American flour in particular was denied entrance on the ground that it was injurious to health. Before the close of the year an agreement was reached with Russia for the submission of her long-standing sealing claims to the decision of a single arbitrator.

War Department Investigation.—In the autumn of 1898 the President, at the request of the secretary of war, appointed a commission to investigate the charges of maladministration which had been made on all sides against the War Department. This commission was in session during the early part of 1899, and rendered its report on February 9. The general purport of this report was to dismiss as unproved the more serious charges against the military administration. It declared that "notwithstanding the haste with which the nation entered into war with Spain, the resulting and almost inevitable confusion in bureau and camp, the many difficulties of arming, assembling and transporting large bodies of hitherto untrained men, the carrying on of active operations in two hemispheres, the people of the United States should ever be proud of their soldiers, who, co-operating with its sailors, in less than three months put an end to Spanish colonial power," etc. At the same time it made some criticisms of several departments in detail, and declared that in the general administration of the War Department there had not seemed to be that complete grasp of the situation which was essential to the highest efficiency and discipline of the army. Some of the arrangements for the transportation of the army were criticised, and the officers who had charge of the loading and unloading of trains were blamed for an inexcusable lack of executive ability. The medical department was censured for its unprepared state when the war broke out. The most serious charges against the administration of the commissary department were dismissed. In general, the evils were attributed to routine methods and lack of preparation, and not to dishonest motives on the part of officers. On December 21, 1898, Major-General Miles testified before the commission that the canned beef supplied to the army was unfit for food, and that the refrigerated beef, which he called embalmed beef, had been treated with chemicals. This testimony brought out an abusive letter from Commissary-General Charles P. Eagan, attacking General Miles in such violent terms that it was not considered fit for publication. General Eagan was tried by court martial on a charge of conduct unbecoming an officer and a gentleman, and was found guilty. The verdict was dismissal from the service, but it was accompanied with a request for executive clemency, and the President commuted the sentence to suspension from rank and duty for six years with pay. A court of inquiry was now established to investigate the charges which General Miles had made before the commission. The court reported that the canned beef was not suitable as a field ration or for use on transports, and that the commissary-general had done an unwarrantable thing in purchasing such enormous quantities of a food that was untried and unknown. But as to the refrigerated beef, the court held that it was a suitable ration for the troops. The court censured General Miles for his failure to report to the secretary of war his belief that the refrigerated beef was unsuitable for the troops. As to the effect of these rations upon the health of the army, the report declared that they could not be regarded as to any appreciable extent the cause of disease among the troops. The findings of the court, in that they reproved the commanding officer, General Miles, for "dereliction of duty," and the commissary-general for "a colossal error," left an unfavorable impression as to the efficiency of the army administration.

Colonial Problem.—For a discussion of some of the main points at issue in regard to the question of our new dependencies, see the article COLONIES, and for a brief record of events in these dependencies themselves see the articles CUBA; PUERTO RICO; the PHILIPPINES; HAWAII; and SAMOA. In the present article reference will be made chiefly to the colonial question in its relation to party issues. Opinion in the United States was sharply divided on the question of the proper policy to pursue toward our newly acquired territories, and the names "expansionists" and "anti-expansionists" or "anti-imperialists" came into general use as roughly indicating the attitude of the respective parties. On February 27 the Democratic caucus in the House of Representatives declared that a colonial policy was contrary to the theory of our government, and demanded that the United States should disclaim any intention of exercising permanent sovereignty over the Philippines. Colonel W. J. Bryan, who was regarded as the certain candidate of the Democratic party in the coming Presidential election, came out in favor of a policy that would first establish a just and independent government in the Philippines, and then leave that government in the hands of the people of the islands. The Anti-Imperialist League

of Boston was conspicuously active in its opposition to expansion. Its members characterized the administration's Philippine policy as not only in violation of the constitution, but wholly out of keeping with the traditions of the country and with rules of justice and morality. One of the ablest opponents of expansion was Senator Hoar, of Massachusetts, who condemned the Philippine policy as mistaken from every point of view. He would not admit that even on the selfish ground of economic interest there was any advantage to the United States in exercising sovereignty over the Philippines, and as to the moral and constitutional objections his attitude was most uncompromising. In an address to the people of the United States a number of prominent anti-imperialists stated very clearly the grounds of their opposition and the course which they desired to see the government pursue. They held that the native government which chose Aguinaldo president and framed a constitution fairly represented the intelligence of the people, and they declared that President McKinley's assumption of power in the Philippines in his proclamation of January 5, ordering General Otis to extend the military government of the United States to the whole of the ceded territory, was unwarrantable and greatly exasperated the people of the islands. They demanded that the government should suspend hostilities in the Philippines, hold a conference with the Philippine leaders to insure peace, and tender an official promise to the natives that as soon as a government should be organized in the islands the United States would recognize their independence and gradually withdraw its military and naval forces. On the other hand, the President's speeches and those of members of his cabinet indicated a firm belief that the retention of the Philippines was desired by the great majority of Americans. In an address on February 16 the President declared that it would have been a weak evasion of our duty if we had required Spain to transfer the island to some other power or powers. The only alternative was for the United States or Spain to possess them, and it was inconceivable that they should be abandoned to their fate. The Philippines had been committed by the treaty to the guidance of the United States, and until Congress should direct otherwise it would be the President's duty to hold the islands and strive so far as possible to establish peace and order there. It was the opinion of a very large number of people, even including those who regretted the acquisition of the Philippines, that the policy of the administration was the only possible course. They distrusted the government of Aguinaldo, and were certain that a condition of anarchy would follow the withdrawal of American control. They held that without our desiring it the responsibility for the future of the Philippines had been thrust upon us, and that the only thing to do was to retain control, and work for the establishment of a stable government there. Others, however, favored the retention of the Philippines precisely because it was a movement toward expansion, and marked the entrance of the United States upon the great work of extending its civilization. In other words, they frankly held the view that was characterized by their opponents as imperialism.

Ratification of the Treaty of Paris.—The treaty of peace, signed by the Spanish and American commissioners in Paris on December 10, 1898, was sent to the Senate by President McKinley on January 4, 1899, and after a long discussion was formally ratified by that body on February 6 by a vote of 57 to 27. The opposition to the treaty, led by Mr. Gorman (Dem.), of Maryland, and Mr. Hoar (Rep.), of Massachusetts, directed its attacks chiefly against those clauses that provided for the annexation of the Philippines. The treaty was signed by President McKinley on February 10 and by the Queen Regent of Spain on the 17th of the following month, and on April 17 the ratifications were formally exchanged at Washington, M. Jules Cambon, the French ambassador, acting in behalf of Spain. The treaty did not bind the United States government to any definite policy in regard to the Philippines, but left their final status—either that of a colony, a territory, a protectorate, or an independent government—to be determined subsequently by Congress. Besides the 87 senators voting on the treaty there were 2 opposed to it paired with 4 against. The opponents comprised 24 Democrats, 2 Republicans (Hoar, Massachusetts, and Hale, Maine), 2 Populists (Heitfield, Idaho, and Turner, Washington), and 1 Silver Republican (Pettigrew, South Dakota). The supporters comprised 42 Republicans, 10 Democrats, 3 Populists (Butler, North Carolina; Allen, Nebraska; Harris, Kansas); 3 Independents (Cannon, Utah; Kyle, South Dakota; Teller, Colorado); and 2 Silverites (Jones and Stewart, Nevada). After the ratification of the treaty the Senate adopted a resolution, introduced by Mr. McEnery (Louisiana), stating that by ratification it was not intended to extend citizenship to the Filipinos or permanently to annex the islands. It was generally recognized, however, that this action of the Senate could have no binding force on future Congresses. Mr. McEnery, Mr. Jones (Nevada), and Mr. McLaurin (South Carolina) were the three senators who just before the final vote went over from the opposition to the supporters of the treaty, and thus insured its ratification.

The Philippine Commission.—At the beginning of 1899 there existed in the public mind an uncertainty, due largely to ignorance of the Philippines, as to what the course of the United States toward them should be. Accordingly, President McKinley appointed a commission of investigation the names of whose members were announced on January 17: Jacob Gould Schurman, president of Cornell University, chairman; Admiral Dewey, Professor Dean C. Worcester, of the University of Michigan, Mr. Charles Denby, and General E. S. Otis. Early in April this commission issued a proclamation to the Filipinos, extending to them the good will of the American people, but insisting upon American authority. On November 3, 1899, the preliminary report of the Philippine Commission was published. It was signed by all of the commissioners except General Otis, who remained in Luzon throughout the year. The report was regarded as a very strong argument in favor of the administration's policy in the Philippines. It gives an account of the events leading up to the Filipino attack of February 4, stating that at no time after Dewey's victory in Manila Bay had it been advisable to withdraw American authority, and that the Filipino attack was not justifiable. The report stated that "no alliance of any kind was entered into with Aguinaldo," and that there was no promise of independence made to him either when Dewey brought him to Manila or at any other time. The commissioners were convinced that the Filipino plans for attacking the Americans dated from the time when troops were first landed by General Anderson. It was also shown that practically the Tagalogs of Luzon were the only rebels, and that the Filipinos in general are unfit for purely self-government. The commissioners were convinced that the duty of the United States government lay in thoroughly repressing the insurrection in the islands, and in maintaining there law and order.

The Philippine Insurrection.—Before the commissioners (excepting Dewey and Otis) arrived at Manila, the Filipinos had made a general attack on the American forces before the city. General Otis, who from August, 1898, and throughout 1899 was commander-in-chief of the troops in the Philippines and military governor-general of the islands, had exercised much care and forbearance in striving to avoid friction between the American soldiers and the natives who had served under Aguinaldo against the Spaniards. Aguinaldo was determined upon Filipino independence, and had set up a nominal native government. About the 20th of January the Filipino congress at Malolos had empowered Aguinaldo to make war on the Americans at any time he might deem it advisable. On the night of February 4 a number of Filipinos made a deliberate attempt to cross the American lines, and, refusing to return at command of the sentry, were fired upon. This seemed to be the signal for the Filipino attack, which continued fiercely with some intermissions until the next day. Some of the United States vessels in Manila harbor assisted the army by shelling the insurgents. General Otis then directed an advance of the entire American line, which extended some seventeen miles, and the Filipinos were soon pushed back some six miles from Manila, losing the villages of San Pedro, Santa Ana, San Juan del Monte, Santa Mesa, Lomia, and Macati. On February 7 General Otis reported that the insurgents numbered about 20,000 and were well armed, that the American casualties were about 250, and that the Filipinos lost some 3500 in killed and wounded, besides 500 prisoners. On February 10 the insurgents, who had been gathering at Caloocan, were driven out of that town by the brigade of Brigadier-General H. G. Otis, of General MacArthur's division. Up to February 11 the total American casualties recorded were 57 killed and 215 wounded. By the next day a cordon had been established around Manila, reaching from Caloocan, on the north, for nearly thirty-five miles, through San Francisco del Monte, San Juan del Monte, Santolan, and San Pedro Macati to Manila Bay, near Pasay.

There was little aggressive campaigning on the part of the Americans from the time of the battle of Caloocan to nearly the middle of March. General E. S. Otis waited for reinforcements, and then organized expeditions under Generals MacArthur, Lawton, Wheaton, and Hall. In the meantime the Filipinos made two unmilitary and dastardly attempts against the Americans. On February 15 there was issued from Malolos an order for the assassination of all foreigners in Manila, but the plot could not be carried out. At about the same time General Charles King engaged a band of insurgents and drove them back beyond Guadalupe. The other Filipino attempt was that of burning Manila; it happened, however, that they succeeded in destroying only that part of the city inhabited by Filipinos. The loss amounted to about \$1,000,000.

During March 13-19 General Wheaton made an expedition north beyond Pasig, thus piercing the insurgent lines, and having captured several towns established a garrison at Pasig. From the 25th to the 31st of March General MacArthur, having in command under him Generals Wheaton, H. G. Otis, Hale, and Hall, advanced against the Filipinos, who were commanded by General P. Garcia, with Aguinaldo in the rear, and after some hard fighting and the capture of several towns, including Malabon, he occupied Malolos, at that time the insurgent capital, on March 31. In

each of the fights of this expedition the insurgents fled, and upon entering Malolos General MacArthur found that Aguinaldo had escaped, together with his government. San Fernando was then made the Filipino capital. It was in this series of engagements that Colonel H. C. Egbert, of the Twenty-second Infantry, and Prince Ludwig Karl Loewenstein, who was with the American troops, were killed. The next expedition sent out by General E. S. Otis was that of General Lawton, who had arrived at Manila on the transport *Grant* on March 10. His first campaign took place during April 8-17, when he conducted a flotilla expedition across Laguna de Bay and captured several towns, including the city of Santa Cruz.

An important expedition was now undertaken by General MacArthur from Malolos to Calumpit and San Fernando during April 25-May 5. General Hale's brigade comprised the centre of the advancing column, and General Wheaton was on the left, while General Lawton conducted an almost independent expedition on the right, finally joining MacArthur's division at Balinag on May 1. In MacArthur's expedition several towns were captured, the Filipinos constantly retreating after engagements. The most noteworthy battle was at Calumpit, where Colonel Funston, of the Twentieth Kansas, gained distinction from the part he took in capturing the town, April 27. General Lawton's "flying column" did some remarkable work, engaging in 22 fights and taking 28 towns in 20 days. Aguinaldo had made San Isidro his capital, but this town being abandoned by the Filipinos, the seat of the so-called insurgent government was transferred to Tarlac. Commander-in-Chief E. S. Otis, who directed the American movements from his headquarters in Manila, now determined to transfer his aggressive campaigning from the north of Manila to the east and south, General Lawton being placed in command. A detachment took Morong on June 5. General Lawton, with General Wheaton and General Owenshine as brigade commanders, proceeded south against the Filipinos, who while the operations were progressing in the north had been intrenching themselves at Bacoor, Paranaque, Zapoti, and Imus. The great heat of the tropical summer caused the American advance to be deferred until June 10. The insurgents were engaged on each day from this date to June 13, when the most severe fight—at Zapoti Bridge, near Bacoor—took place. Here, it is said, the insurgents numbered some 4000, of whom about one-third were lost in killed, wounded, and captured. The Filipinos were further routed by General Wheaton's brigade. General Lawton next directed a movement on Laguna de Bay.

For a number of weeks—up to August 9—American aggression was delayed by the difficulties due to the tropical rainy season. From the 9th to the 16th of August General MacArthur conducted an expedition from San Fernando north to Angeles, this town being occupied on the latter date. Under MacArthur were General Lisicum on the left and General Wheaton on the right. The advance was attended with great difficulties. In the meantime troops under General Samuel B. M. Young routed the insurgents from San Matco.

During the autumn hostilities in Luzon continued, but the fighting, though sharp at times, was in general more desultory. A large number of engagements took place, in all of which the Americans were victorious, but though in the later months of the year organized rebellion seemed to be broken, insurgent outbreaks repeatedly occurred in districts that were thought to be pacified or at least under American subjection. On October 1 Aguinaldo, who twice before during the year had attempted to confer through his representatives with General Otis, sought to obtain a conference for bringing about a cessation of hostilities. His tone, however, as before, indicated his insistence upon a recognition of the Filipino "republic," and, accordingly, his overtures came to nothing. Among the more noteworthy of the engagements during October were those near Imus and Angeles. November marked continued American advance in the north. On the 8th of the month the forces of General MacArthur occupied Mabacalat, and on the day before General Wheaton had succeeded in landing his force of 2700 men at San Fabian. At the same time operations under General Lawton were being carried on in the province of Nueva Ecija. On November 10 Aguinaldo again changed the seat of his government—this time from Tarlac to Bayombong; two days later the former town was occupied by the American troops. A number of engagements took place about the middle of the month, and on the 17th General MacArthur entered Gerona and two days later General Wheaton occupied Dagupan. A week later reports came that though Aguinaldo was succeeding in eluding the Americans, his government was disorganized and the insurrection practically broken. American successes continued in December in northwestern Luzon, and on the 26th of that month General Young was appointed military governor of the district, with headquarters at Vigan. In the meantime the American cause suffered a severe blow in the death of General Lawton, who was shot while leading a successful attack at San Mateo, province of Manila. Before the end of the year it was believed by many in the United States that the independent government which the Tagalogs were seeking to establish was in nowise

representative of the islands, and was little more than a despotism of the Tagalog leaders, of whom Aguinaldo was the head. On the other hand, the anti-imperialists believed the resistance was a genuine popular movement against the establishment of alien rule.

Though the most active interest in the establishment of American authority centred in Luzon, important measures were taken in several of the other large islands during the year. On February 11 Iloilo, capital of the island of Panay, was occupied after a bombardment, in which there were no American casualties. The city of Cebu was taken on the 26th, and on March 1 a military district, comprising the islands of Panay, Cebu, and Negros, was established, and put under the supervision of General Marcus P. Miller. Bacolod, on Negros, was then occupied by the Americans under J. F. Smith without opposition. Negros was the first island to accept American sovereignty, and a provisional government was established there in the summer. It consisted of a military governor, appointed by the governor of the Philippines, and a civil governor and advisory council elected by the people. In November slight engagements in Panay and Cebu were reported. In the same month United States authority was extended over the southern half of Mindanao. In December a native outbreak in Negros was reported. It was conceded that there would be little difficulty in establishing American authority in the islands other than Luzon were it not for the influence of the Tagalogs.

The United States troops in the Philippines in November, 1899, according to the report of the secretary of war, dated on the 29th of that month, comprised "905 officers and 30,578 men of the regular force and 594 officers and 15,388 men of the volunteer force, making an aggregate of 1499 officers and 45,966 men;" with the arrival of the troops then *en route* the total force would number 2051 officers and 63,483 men. The deaths in the army in the Philippines from January 1 to November 1, 1899, including those killed in battle and dying of wounds and other injuries, aggregated 477, while those dying of disease numbered 366, the total being 843. The secretary of war calls attention to a comparison of the death-rates in several American cities and the death-rate of American soldiers in the Philippines. The annual death-rate per 1000 is stated to be: Washington, 20.74; Boston, 20.09; San Francisco, 19.41; New York, 19.28; Baltimore, 19.10; soldiers in the Philippines, 17.20.

The Sulu Treaty.—A conditional agreement made by General Bates with the Sultan of Sulu in August was submitted to the Senate in December, and its text was made public on December 13. The chief features of the agreement were as follows: The sovereignty of the United States over the archipelago of Sulu and its dependencies; the recognition of the rights and dignities of the Sultan and of the religious customs of the Moros; the right of the United States to control such points in the archipelago as public interests seemed to demand, except that the land immediately about the residence of the Sultan is not to be encroached upon, except in cases of military necessity in connection with a war with a foreign power; free trade between the archipelago and any portion of the Philippine Islands when conducted under the American flag; prohibition of the introduction of firearms and war material; the co-operation of the Sultan in the suppression of piracy; the trial of criminals by the authorities of the United States, except where crimes and offences are committed by Moros against Moros; the right of any slave in the archipelago to purchase his freedom by paying to his master the usual market value; American protection to the Sultan and his subjects in case of aggression on the part of a foreign nation; non-alienation by the United States of any island of the archipelago to a foreign nation without the consent of the Sultan; the payment of a monthly stipend to the Sultan and to some of his chief officials.

Cuba.—After the withdrawal of Spanish authority from the island of Cuba on January 1, 1899, the United States officials set to work to improve the administration by the introduction of sanitary reforms, by the promotion of industry and trade, and by the spread of education. The President, in his December message, renewed the pledge contained in the resolution of Congress, passed just before the Spanish-American war, that the United States disclaimed any intention of exercising sovereignty or control over Cuba, except for the pacification of the island, and declared that this pledge was in the highest degree obligatory. The treaty of peace allowed the Spanish people on the island till April 11, 1900, to decide whether they would remain citizens of Spain or become citizens of Cuba. An order was issued for the taking of a census on August 19, with the expectation of arranging for elections after the census returns should have been tabulated. The declared intention of the administration was to permit the establishment on the island of a representative and independent government as soon as it seemed practicable. See CUBA.

Puerto Rico.—The insular commission, appointed by the President to make recommendations in regard to the civil government of the island, rendered its report to the secretary of war on August 30. It recommended the substitution of civil

government for the military rule, and suggested a code of laws. The new government was to be administered wholly by natives, the higher officers to be chosen by the President and the lower by the governor-general and the county commissioners. The new civil government did not give the natives the elective franchise or the right of trial by jury, except for felony involving amounts in excess of \$500, which cases should be tried in United States courts. In the commission's preliminary report, rendered on May 27, 1899, it was asserted that radical and immediate reforms were necessary for the protection of the people and the upbuilding of the island. The new laws were based on the common law of the United States on the ground that while the Spanish system was not entirely bad, it would render it difficult to Americanize Puerto Rico or give it the benefit of a complete judicial system on the American plan. The commission recommended that all the Spanish laws applicable to Puerto Rico should be set aside and the common law of the United States be established in their place. In his December message the President dwelt on the need of promptly establishing a civil government in Puerto Rico, and recommended the application of the principle of local self-government, though not advising the committal of the entire government of the island to officers selected by the people. As to taxation, he said: "Our plain duty is to abolish all customs tariffs between the United States and Puerto Rico, and give her products every access to our markets." It was stated, however, in the report of Brigadier-General Davis on the industrial and economic conditions of Puerto Rico that the removal of all trade restrictions between the island and the United States would, if it involved the application to Puerto Rico of the United States revenue laws, mean a loss to the island of the principal sources of revenue on which it had relied. He pointed out that if the island were to receive no direct benefit from customs and internal revenue taxation, "local expenditures must be provided for by property and income taxes," and he added that "under existing conditions not one-quarter of the revenue needed could be collected through the present machinery." The question of civil government in Puerto Rico and of the system of taxation to be adopted were still pending at the close of the year.

The Trust Problem.—The question of regulating trusts was a subject of much discussion during the year, and in some quarters there was an effort to make it a national political issue. Party lines, however, were not distinctly drawn in this matter. Some of the prominent Democrats referred to a definite anti-trust issue as likely to form a plank in the Democratic platform in the Presidential election, and Mr. Bryan toward the close of the year declared that the three principles for which he stood were anti-trusts, anti-imperialism, and free silver. On the other hand, there were many Republicans who emphasized the dangers of trusts, and the President, in his December message, declared that the subject ought to receive the attention of Congress. Though pointing out the evils of combinations of capital to control the market and crowd out competition, he did not recommend any definite measure of relief, though he suggested that if the present law could be so extended as better to control or check monopolies or trusts, it should be done without delay. State legislation on the subject had failed to accomplish its object, owing chiefly to the fact that different views as to the nature of these combinations were taken in different States. The industrial commission, established on June 18, 1898, continued its investigation into the subject of combinations in restraint of trade and competition. See TRUSTS and ECONOMIC ASSOCIATION, AMERICAN.

Pacific Cable.—In a special message of February 10, 1899, the President pointed out the need of a Pacific cable to connect our island possessions with our western coast, and the matter was the subject of much discussion during the year. A Pacific cable was proposed by Cyrus W. Field nearly thirty years ago, but especial interest in the project has been aroused by our recent acquisitions in the Pacific. Present communications with the Philippines are by way of England, France, Egypt, India, and China, and messages can be transmitted only at great cost. In his annual report the secretary of war says: "A very thorough investigation recently made by Great Britain preparatory to the laying of a trans-Pacific cable between British Columbia and Australasia has demonstrated beyond question the practicability, not only of the cable proposed by Great Britain, and for which bids are now being received [November, 1899] but of a cable between California and the Philippines via Hawaii, Wake Island, and Guam. The length of such a cable would be 7493 miles, as against 7986 miles for the proposed British cable, and the cost is estimated by the United States Signal Office as not exceeding \$8,500,000 at the present market rates for material." In 1899 a survey was made of a cable route from Honolulu to the Philippines, the route from San Francisco to Honolulu having been surveyed in 1892. This cable would not take the shortest route, but it would touch only at points under the control of the United States, thus satisfying the claim of those who demand an "all-American" route.

Federal Judiciary.—The following were among the most important decisions

rendered by the Supreme Court in 1899: On January 16 the court sustained a State law which abridged the right of jury trial in civil cases. On January 16 it sustained another State statute by which fire insurance companies were required to pay the full amount for which property was insured in cases of total loss. On April 3 the court decided that the tax on transactions of boards of trade, exchanges, etc., under the 1899 War Revenue act was constitutional, being an indirect and uniform tax. Two important decisions in regard to national banks were rendered—one on April 3, denying to the State legislatures power to tax national banks, and the other on May 15, denying the right of one national bank to invest its capital in the stock of another. A decision on May 15 held that the conflict of an act of Congress with a treaty with an Indian tribe did not injure its validity. A most important decision on the subject of trusts, which has already been noted in the article on Trusts (*q. v.*), was the Addyston Pipe case. The questions brought before the Supreme Court were whether the constitutional clause for the regulation of interstate commerce applied to individuals and corporations; and whether, if the clause did so apply, the Addyston Pipe combination was in restraint of interstate commerce. The court decided both these points in the affirmative on December 4, 1899.

The November Elections.—Elections were held in the following twelve States: Iowa, Kentucky, Maryland, Massachusetts, Mississippi, Nebraska, New Jersey, New York, Ohio, Pennsylvania, Virginia, and South Dakota, of which the first five chose a complete set of State officers, including the governor, while the others had only to choose State officials of more or less importance. As to the significance of these elections in showing the probable character of the campaign of 1900, there was naturally a divergence of opinion corresponding to party affiliations. The party platforms adopted in the States where elections were held seemed to show that the issues of 1896 will continue to divide parties in 1900. The Republican platforms continued to uphold the gold standard, the policy of protection, the building up of a navy and a merchant marine. The Democrats still insisted upon the unlimited coinage of silver at 16 to 1 and the establishment of free trade. In the main, each party renewed the principles of its national platform of 1896. On the whole, the popular attitude seemed to indicate a suspension of judgment on the vital national questions involved in our relations with the Philippines and with the other territories acquired by the Spanish-American war. Although there was in certain quarters a vigorous arraignment of the administration's policy, there seemed to be a general inclination to await further developments and to give that policy a chance to operate. See the articles on the separate States.

UNITED STATES DAUGHTERS OF 1812, founded in 1892, is composed of women above the age of 18 years, who are lineal descendants of ancestors who rendered civil, military, or naval service during the War of 1812. President-general, Mrs. William Gerry Slade; secretary-general, Mrs. Leroy S. Smith, 322 West Eighty-seventh Street, New York City.

UNIVERSAL BROTHERHOOD, founded in 1898, being the outgrowth of the Theosophical Society, which now constitutes the literary department of the Universal Brotherhood, has for its object the teaching of brotherhood and the toleration of all accepted religions. It has 150 lodges in the United States and Canada, and others in many countries of Europe and Asia. It includes also the International Brotherhood League, which has practical humanitarianism for its object. General secretary, Frank M. Pierce, 144 Madison Avenue, New York City.

UNIVERSALISTS, a sect of Christians, report for 1899, 760 ministers, 776 churches, 46,522 members, and church property amounting to \$9,623,762. At the convention, held in Boston, Mass., a committee of five was appointed to meet with a similar committee of the Unitarians (*q. v.*), and the home missionary operations were placed under a general superintendent and a council of superintendents.

UNIVERSITIES AND COLLEGES. The year covered by the last annual report of the United States Commissioner of Education (1897-98), on which the following statistics are based, was a prosperous one for the universities and colleges of the country, showing an increase in attendance of 3924. The total number of students in collegiate, graduate and professional departments of institutions for higher education and in professional schools was 144,477: 43,419 were professional students of law, medicine, and theology; 101,058 were students of the liberal arts and of technology. The graduate students numbered 5514, an increase of nearly 600 over the preceding year, showing an increased demand for special studies in science, sociology, politics, jurisprudence, and similar topics. The total amount of money invested in universities, colleges, and schools of technology was reported to be \$311,842,428, which is about \$16,000,000 more than the amount reported for the preceding year. The total income of these institutions was \$25,963,242. Gifts and bequests were received in 1899 amounting to \$8,204,281. See EDUCATION IN THE UNITED STATES.

URUGUAY, the smallest republic of South America, is bounded on the north by Brazil, on the east by Brazil and the Atlantic Ocean, on the south by the Atlantic Ocean, and on the west by Argentina. The capital is Montevideo.

Area and Population.—There are 19 departments, or provinces, the estimated area of which is 72,110 square miles. The smallest and most densely populated department is Montevideo, area 256 square miles, population (estimated in 1897) 264,838; the largest and most sparsely populated department is Tacuarembó, area 8074 square miles, population (estimated in 1897) 27,929. A regular census has never been taken; the estimated population in 1879 was 438,245, and in 1898, 840,725. Immigrants number about 10,000 a year and emigrants about 6000. In 1897 the more important countries represented among the immigrants were, in the order of their numbers, Italy, Spain, Brazil, France, Germany, and England. About 70 per cent. of the inhabitants are native born. Montevideo is the only large city, and has a population of about 249,250.

Government.—According to the constitution of Uruguay, which dates from July, 1830, the executive authority devolves upon a president, elected for a term of four years, who is assisted by a cabinet of five departments—the interior, foreign affairs, war and marine, instruction and public works, and finance. The president is Señor Juan Lindolfo Cuestas. The legislative authority devolves upon a parliament of two houses, the senate and the chamber of deputies, which hold annual sessions from February 15 to July 15. The legislative power *ad interim* is assumed by a permanent committee of two senators and five representatives. Each of the departments is represented in the parliament by one senator, who is chosen for a term of six years by an electoral college, the members of which are elected by popular vote. There are about seventy representatives, elected for three years, in the proportion of one to each 3000 male adults able to read and write.

Army and Navy.—The regular army comprises four battalions of infantry and four cavalry and one artillery regiment, numbering in all 233 officers and 3222 men. There are 3200 armed police, and a national guard of about 20,000. The navy consists only of one small steamer and three gunboats, the complement being 184 officers and men. There is a military college with 8 professors and 41 cadets.

Finance.—The chief source of revenue is customs, and the principal expenditures are interest on the public debt, administrative expenses, and pensions. The approximate revenue for the fiscal year 1898 was 14,257,722 pesos. Early in 1899 the revenue and expenditure for the fiscal year 1899 were estimated at 15,973,546 pesos and 15,799,231 pesos respectively. Subsequently, however, President Cuestas reported a deficit of about 1,500,000 pesos. The budget for the fiscal year 1900, presented June 16, 1899, showed an estimated revenue of 15,977,990 pesos, and an estimated expenditure of 15,969,698 pesos. Service of the foreign debt, grants, pensions, and railway guarantees required 9,120,209 pesos of the total expenditure. According to the *Bulletin* of the Bureau of American Republics, the *direccion-general* of statistics of the government of Uruguay reported custom-house receipts as follows: For fiscal year 1899, import duties, 8,358,696 pesos; export duties, 1,375,945 pesos; total, 9,734,641 pesos; for fiscal year 1898, import duties, 8,191,003 pesos; export duties, 1,376,637 pesos; total, 9,567,640 pesos. The national debt, of which about four-fifths is external, was reported to amount in October, 1898, to 128,265,097 pesos. The finances of the city of Montevideo are kept distinct from the national budget. The value of the peso in United States currency is \$1.034.

Industries and Commerce.—Though agricultural interest is increasing, by far the most important industry is the raising of sheep and cattle. There were reported for 1896: Sheep, 16,397,484; cattle, 5,881,402; horses, 392,246; mules, 15,589. The value of the flocks and herds is placed at somewhat more than 73,000,000 pesos. The wool produced in 1896-97 amounted to 33,000 tons; for the same year the wheat crop was estimated at 300,000 tons. The wool clip for the year 1897-98 amounted to about 114,371,400 pounds, the average price a pound in United States currency being 11 cents; for 1898-99, 102,294,540 pounds, average price 12½ cents; the estimate for 1899-1900, something more than 97,000,000 pounds, with an average price of 25 cents. Thus the income from wool in this last year will be nearly double that of the year previous. The number of cattle slaughtered in Uruguay for packing purposes in fiscal years has been reported as follows: 1896, 723,400; 1897, 683,300; 1898, 665,300; 1899, 821,600. To some extent tobacco, olives, and grapes are cultivated. In the northern provinces are found gold, silver, lead, magnesium, copper, and lignite; little attention, however, is paid to mining. Wool, jerked beef, hides and skins, and other products of the herds constitute the principal exports; the chief imports are machinery and raw materials, textiles, comestibles, and liquors. The value in pesos of imports and exports was: In 1897, imports, 19,512,212; exports, 29,301,571; in 1898, imports, 24,784,356; exports, 30,276,914. Of the last amount 26,243,492 pesos represented animal products (exclusive of live stock), and 3,315,543 pesos agricultural products. Exports of wheat were valued at 2,406,716 pesos,

and of wheat flour at 601,219 pesos. According to the *Montevideo Times*, the exports and imports for the first six months of 1899 amounted respectively to 21,605,123 pesos and 12,963,763 pesos; for the corresponding period of 1898 the exports amounted to 18,250,026 pesos, and the imports to 13,246,372 pesos; for the corresponding period of 1897, exports 17,527,944 pesos, and imports 9,271,205 pesos. The imports are principally from Great Britain, Argentina, Germany, France, Italy, Spain, the United States, Belgium, and Brazil; to these also the exports are chiefly sent, the most important being Brazil, Belgium, France and Argentina. Trade with the United States seems to be increasing.

Shipping and Communications.—In 1897 there entered at Montevideo from foreign ports 1126 vessels aggregating 1,904,626 tons, and cleared 1024 vessels of 1,796,529 tons; the river and coasting trade was: Vessels entered, 2439; tonnage, 621,406; cleared, 2447; tonnage, 621,244. The merchant marine in 1895 comprised 64 vessels, steam 19, aggregating 4608 tons net, and sail 45, of 13,171 tons net.

The following statistics of the Uruguayan railways are taken from reports (April, 1899) of the United States minister and the United States consul at Montevideo:

Railway.	Length in Miles.	Invested Capital.
Central Uruguayan Railway:		
Main line.....	199	\$13,780,421
Eastern extension.....	380	14,780,874
Northern ".....	182	7,960,490
Total.....	761	\$36,501,285
Western Railway.....	323	13,150,000
Great Eastern of Uruguay.....	260	10,182,951
Midland of Uruguay.....	196	7,708,989
Northwestern of Uruguay.....	110	4,936,500
Central Northeastern.....	77	3,898,000
Northern Railway of Uruguay.....	71.8	2,837,867
Northern Railway.....	14	746,440
Total.....	1,792.8	\$78,959,992

The government guarantees interest on the railway bonds, they being formerly 5 per cent., but now 3½. Consequent deficits in the seven years, 1892-98, amounted to \$5,875,628. The Interior Railway Company, having a capital of \$15,011,187, has been formed and projects a line of 617 kilometres (383 miles). Toward the close of 1899 it was announced that the government had granted a concession for the building of a narrow-gauge railway from Algota, on the Uruguay Central Railroad, to the port of Independencia, with branches to Mercedes and Nuevo Berlin. There are 89 miles of tramway in operation. The principal telegraph lines in 1897 aggregated a length of 4370 miles, of which 982 belonged to the railways. There were 97 telegraph offices and 636 post-offices.

Religion and Education.—The state religion is Roman Catholic, but all other faiths are tolerated. The proportion of Protestants to Catholics is about one to sixteen. Primary education is compulsory. The last report obtainable, made in the early part of 1898 for the year 1896, places the number of public primary schools at 533, with 1041 teachers (258 male and 783 female), and an enrolment of 51,312 pupils. The private schools numbered 379, with 949 teachers and 22,689 pupils. There is one pupil for each eleven inhabitants, a proportion which, though small, is larger than that of any other South American country. The cost of primary education defrayed by the state is about 677,000 pesos. The high-school system is not known. There are two normal schools. The government supports a school of arts and trades, having about 200 students. The university at Montevideo, under government control, has collegiate, law, medical, and engineering departments; the enrolment in 1896 was 87 professors and 587 students. Besides the institutions mentioned there are many religious seminaries. There is a national museum and a national library. It is reported that about 126 periodicals are published in Uruguay; 120 are Spanish, 2 Italian, and 2 English.

History.—During the month of February, 1899, revolutionary attempts were reported, but they were unsuccessful and of little importance. On March 1, 1899, Señor Juan Lindolfo Cuestas was elected to the presidency for the term of four years. He was vice-president when President Idiarte Borda was assassinated in August, 1897, and on the 25th of that month assumed the presidency *ad interim*. He continued as acting president until elected for the regular term. When the congress adjourned on November 27, 1899, the government had a large majority, and the political situation seemed to be peaceful.

UTAH, a Western State of the United States, has an area of 84,970 square miles. Capital, Salt Lake City. Utah was admitted as a State in 1896.

Mineralogy.—Revised reports for 1898 showed the production of silver to have been 6,485,900 fine ounces; coining value, \$3,385,810, and gold, 110,556 fine ounces, value, \$2,285,400—both in excess of official estimates. The estimates for 1899 were, silver, \$9,696,969, and gold, \$3,369,509. Copper in 1898 yielded 3,750,000 pounds; lead, 39,299 short tons; and coal, from 20 mines, 593,709 short tons, valued at \$752,252, an increase both in production and price. Quarry products were: Granite, \$3545; sandstone, \$15,752, and limestone, \$11,721—total, \$31,018; and 6 salt plants yielded 405,179 barrels of all kinds, valued at \$196,056. During 1899 there was a large inflow of capital for investment, especially from the Eastern States and for copper properties. A number of extensive consolidations were made; rich iron deposits and excellent coking coal were found together near Cedar City; the first copper reduction works erected in the State was started, and in June shipped 10,000 tons of pig-copper; and in midsummer arrangements were completed for beginning the shipment of guano from Gunnison and Hat Islands, Great Salt Lake, to San Francisco. Local authorities reported the following shipments during the year: Silver-lead ores, 89,925,277 pounds; silver-lead bullion, 50,017,257 pounds; copper bullion, 7,812,875 pounds, and copper ore, 30,000 pounds—total, 147,785,359 pounds. To haul this output 3775 railways cars were used. The increase in the value of the mineral output over that of 1898 was more than \$2,000,000, and the total amount paid in dividends by Utah mines during the year was \$1,914,500, an increase of \$312,750 over the total of 1898. See ABRASIVES.

Railways.—The new railway construction in the calendar year 1898 was 38.75 miles, and in 1899, 101.60 miles, giving the State a total mileage of 1581.13.

Banks.—On October 31, 1899, there were 11 national banks in operation and 6 in liquidation. The active capital aggregated \$1,650,000; circulation, \$756,371; deposits, \$4,835,753, and reserve, \$2,001,609. The State banks, June 30, 1899, numbered 11, and had capital, \$835,000; deposits, \$5,181,428, and resources, \$6,253,664; and stock savings banks, 8, with capital, \$581,800; depositors, 5217; deposits, \$1,742,972, and resources, \$2,939,103. The exchanges at the United States clearing house at Salt Lake City, in the year ending September 30, 1899, aggregated \$116,111,560, an increase of \$30,356,286 in a year.

Education.—At the close of the school year 1897-98, the school population was 83,196; enrolment in the public schools, 70,878, and average daily attendance, 49,638. There were 1339 teachers, 675 buildings used as school-houses, and public school property valued at \$2,652,595. The revenue was \$1,154,642; expenditure, \$1,047,174, of which \$563,119 was for teachers' salaries. There were 4 public high schools, with 33 secondary teachers, 891 secondary students, and 71 elementary pupils; 14 private secondary schools, with 87 teachers, 1174 secondary students, and 1337 elementary pupils; 2 public normal schools, with 39 teachers and 613 students in all departments, and 2 private ones, with 42 teachers and 1189 students. Normal training was also given in 2 colleges. Two universities and colleges for men and for both sexes reported 100 scholarships, 37 professors and instructors, 905 students, 19,000 volumes in the libraries valued at \$42,000, \$20,500 invested in scientific apparatus, \$325,000 in grounds and buildings, and \$196,427 in productive funds, and \$82,948 in total income. In 1899 there were 76 periodicals, of which 6 were dailies, 53 weeklies, and 8 monthlies.

Finances.—The total assessed valuation for 1898 was \$100,241,331, a decrease of \$2,195,852 in a year; estimated real value, \$250,000,000; tax rate in 1899, \$5 per \$1000, and total bonded debt, February 1, 1899, \$900,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 282,000.

Legislature.—The balloting for United States senator began on January 17 and continued on each legislative day until March 10, when the legislature adjourned without making any choice, having taken 161 fruitless ballots. The votes were divided among twenty candidates, one of whom, Martha H. Cannon, received the first vote ever cast for a woman for the United States Senate. The session was notable for exhibitions of bad spirit between members, charges of bribery and personal conflicts. In the end, however, the legislature, by a vote of 33 to 20, postponed action indefinitely on the bribery charges in connection with the canvass. Laws were passed by means of which primary elections are regulated and illegal voting thereat punished. A State institute of art was established, with a State board to govern and control. The State Board of Pardons was given power to parole convicts who have served the minimum term fixed by law, except those convicted of murder. A State fish and game commissioner was appointed with large powers, and each county is to appoint a county game and fish warden. The State Board of Health was granted extraordinary powers, and can extend quarantine regulations. The feeding of cows by dairymen was regulated. A State experimental fruit farm

was established. A new mining law was enacted, among other things, doing away with mining location work, except the assessment work under United States laws.

State Officers and National Representatives.—Governor, Heber M. Wells; secretary of state, J. T. Hammond; attorney-general, A. C. Bishop; auditor, M. Richards, Jr.; treasurer, James Chipman; superintendent of public instruction, J. R. Park. Supreme Court: Chief justice, George W. Barch; justices, J. A. Miner, R. N. Bas-kin; clerk, L. P. Palmer. The State legislature consists of 17 Republicans, 42 Democrats, and 4 Fusionists. Senators, Joseph L. Rawlins (Dem.), from Salt Lake City; the other senatorship is vacant. Representative, Brigham H. Roberts (Dem.), of Centreville. See MORMONISM and IRRIGATION.

VACCINATION. See SMALLPOX.

VANDERBILT, CORNELIUS, head of the great Vanderbilt system of railways, died at his home in New York City, September 12, 1899. He was the son of William Henry Vanderbilt, and the grandson of Cornelius ("Commodore") Vanderbilt, the founder of the fortune now amounting to many millions. He was born on his father's farm in New Dorp, Staten Island, November 27, 1843. His grandfather's wealth was of little help to the boy in early life, for the commodore believed he should win his own way. He attended school on Staten Island and in New York, and when about sixteen years of age began work as a messenger in the New York Shoe and Leather Bank. After four years of service there he entered the banking house of his uncles, the Kissam Brothers, and remained with this firm until his grandfather gave him a place in the offices of the New York and Harlem Railroad. At first he acted as assistant treasurer, but soon was made treasurer, which position he retained for ten years. He then resigned the treasurership to accept the vice-presidency of the same road, and subsequently he became president, and held the position to the time of his death. When William H. Vanderbilt died in 1885 Cornelius became the head of the Vanderbilt system of railroads. Having determined to conduct the New York Central and its connecting lines on the English system of management, he became chairman of the board of directors instead of president. Mr. James H. Rutter succeeded to the presidency and he in turn was succeeded by Mr. Chauncey M. Depew. Vanderbilt's time and energy were largely taken up in keeping himself informed concerning the business and in directing the policies of the numerous corporations which the Vanderbilt interests dominated, and which comprise the Vanderbilt system—a system that embraces nearly 10,000 miles of railroad. Its principal lines are: The New York Central, the West Shore, the Michigan Central, the Lake Shore, the Chicago and Northwestern, the Cleveland, Cincinnati, Chicago and St. Louis, the Adirondack and St. Lawrence, the Rome, Watertown and Ogdensburg, the New York and Harlem. Besides being chairman of the New York Central board of directors, Vanderbilt was chairman of the Michigan Central board, and was a director in nearly forty-five other railway corporations that are included in the Vanderbilt system, while he had large interests in the New York, New Haven and Hartford, the Delaware and Hudson, and a number of smaller lines. Cornelius Vanderbilt was public-spirited and generous; his contributions to various philanthropic, educational, and religious causes were many, and often amounted, it is said, to \$1,000,000 a year, or about half his income. The amount of the fortune left by him was variously estimated; its value was probably more than \$70,000,000.

VAN DYKE, HENRY, clergyman and author, was born at Germantown, Penn., November 10, 1852. He was educated at Brooklyn Polytechnic Institute, Princeton College and Theological Seminary, and Berlin University (D.D. Princeton, 1884, Harvard, 1893, Yale, 1896; LL.D. Union, 1898). He married Ellen Reid, of Baltimore, December 13, 1881. He became pastor of the United Congregational Church of Newport, R. I., in 1878, and from 1882 to 1899 was pastor of the Brick Presbyterian Church in New York City, but resigned from the pastorate upon being unanimously elected by the board of trustees to be the first incumbent of the newly endowed Murray chair of English literature at Princeton University. Publications: *The Poetry of Tennyson*; *The Reality of Religion*; *The Story of the Psalms*; *The National Sin of Literary Piracy*; *Little Rivers*; *The Other Wise Man*; *The Gospel for an Age of Doubt*; *The First Christmas Tree*; *The Builders and Other Poems*; *Straight Sermons to Young Men and Other Human Beings*; *The Christ Child in Art*; *Ships and Havens*; *The Lost Word*; *The Toiling of Felix and Other Poems*, and *Fisherman's Luck and Some Other Uncertain Things*, which was published in 1899 and received warm commendation.

VARIATION. See ZOOLOGICAL LITERATURE.

VASSAR COLLEGE, near Poughkeepsie, N. Y., was incorporated in 1861. The most important items to be mentioned in regard to events connected with its history during the past year are the gifts that were received. Among these were three scholarships of \$8000 each, given respectively by Miss Helen M. Gould, of New York; Mr.

D. M. Ferry, of Detroit, and the late Mrs. Luther Elting; a building for an infirmary given by Mrs. E. S. Atwater, of Poughkeepsie; a chapel, the gift of Mrs. W. R. Thompson, of Pittsburg, and Mrs. C. M. Pratt, of New York, and \$30,000 toward a biological laboratory. Changes in the faculty were made by the death of Professor Van Ingen, of the art department, whose place has not yet been filled, and the resignation of Miss Bickford, professor of biology, whose place has been filled by Frank R. Little, Ph.D. The number of candidates who received the degree of A.B. last year was 118. For statistics, see **UNIVERSITIES AND COLLEGES**.

VAUGHAN, General ALFRED J., a Confederate veteran, died at Indianapolis, Ind., October 1, 1899. Born in Dinwiddie County, Va., May 10, 1830, he was graduated at the Virginia Military Institute in 1851 and entered the profession of civil engineering. He surveyed the route of the Hannibal and St. Joseph Railroad and later became United States surveyor for the district of California. At the outbreak of the Civil War he entered the Confederate service as a captain in the Thirteenth Tennessee Volunteers, which was one of the regiments in Cheatham's division. During the war he rose to the rank of major-general. Among the engagements in which he took part were those at Columbus, Ky., Dalton, Ga., Peach Tree Creek, and Chickamauga. In his various battles eight horses were killed under him, he was wounded repeatedly, and at Chickamauga lost a leg. After the war he was active in the work of the National Grange; he organized the State granges of Arkansas, Tennessee, and Mississippi, and in the last-named State was for a time master of the State Grange. In 1873 he removed from Mississippi to Memphis, Tenn., and from 1878 to 1886 was clerk of the criminal court in Shelby County. At the time of his death he was State commander of the United Confederate Veterans for Tennessee.

VENEZUELA, a republic of South America, is bounded on the north by the Caribbean Sea, on the east by British Guiana and Brazil, on the south by Brazil and Colombia, and on the west by Colombia. The capital is Caracas.

Area and Population.—The country consists of eight states, a federal district, and eight territories, the combined area of which was placed by the estimate of 1891 at 593,943 square miles. Of the Yuruari territory (area 81,123) more than one-half, and of the Delta territory (area 25,347) about one-third have been claimed by Great Britain as part of British Guiana. For an account of the settlement of this claim, see section on Boundary Arbitration. According to the census of 1891, the population was 2,323,527; the Indian population was about 326,000, three-fourths of whom were called civilized. The area of the federal district is 45 square miles and the population over 89,000. Of the states Miranda has the most inhabitants, 484,509, and Carabobo has the densest population, about 61 a square mile. Bolivar is the largest state, 88,701 square miles, and is the most sparsely inhabited, 0.6 a square mile. The largest territory is Alto Orinoco, 119,780 square miles. The total territorial population, excepting that of Goajira, numbers only about 75,000; Goajira comprises 3608 square miles and has 65,990 inhabitants. Recent municipal statistics are not available; the last reported figures, however, give the following town populations: Caracas, 72,429; Valencia, 38,654; Maracaibo, 34,284; Barquisimeto, 31,476; Barcelona, 12,785; Ciudad de Cura, 12,198; Ciudad Bolivar, 11,686; Guanare, 10,880. For several years official encouragement has been given to immigration, but has not met with large success. Immigration and emigration are about equal. In July, 1899, was announced the enactment of a law looking to a constitutional amendment for re-establishing the political divisions that constituted the Venezuelan union in 1864. The purpose is to revive the states of Apure, Aragua, Barcelona, Barinas, Barquisimeto, Carabobo, Cojedes, Coro, Cumaná, Guárico, Guayana, Maracaibo, Margarita, Maturin, Mérida, Portuguesa, Táchira, Trujillo, Yaracuy, and Zulia.

Government.—The chief executive authority is vested in a president, who is elected for a term of two years, and is assisted by a federal council of nineteen members and a cabinet of six members. The federal council is chosen by the congress every second year, and neither its members nor the president are eligible for the succeeding term. The president is General Cipriano Castro. The legislative power rests with a congress of two houses, the senate and the house of representatives; members of the former are twenty-four in number, three for each state, and are elected by their respective legislatures for terms of four years; representatives serve for the same length of time and are chosen by popular vote at a nominal ratio of one for each 35,000 inhabitants. The number of representatives reported, however, is only 52. Territorial administration is controlled by the federal government, but the states are granted considerable independence. They have their own executive, legislative, and judicial officers and manage their own finances. There are various inferior courts, the supreme court of appeal, and the supreme federal court.

Army and Navy.—The regular army in 1898 consisted of ten battalions numbering about 3600 men. Citizens from their eighteenth to their forty-fifth year are liable to service in the national militia; this at times has reached the number of 60,000 men.

Venezuela's naval power is barely better than nothing. There are reported a few small river gunboats, two sailing vessels, and three steamers.

Finance.—The chief source of revenue is import duties, which for the fiscal year 1898-99 were estimated at 24,838,000 bolivars; for the same year the largest item of expenditure was for governmental administration, estimated at 16,736,200 bolivars. The revenue and expenditure in bolivars for fiscal years ending on the 30th of June have been:

	1896-97	1897-98	1898-99
Revenue.....	48,313,540	Estimated..40,150,000	Estimated..34,542,000
Expenditure....	103,904,780	Estimated..40,150,000	Estimated..34,542,000

The total external debt in 1897 amounted to \$22,324,925, United States currency. Interests on parts of this, due in February and July, 1898, were not paid. At the beginning of 1898 the outstanding internal debt was 131,292,120 bolivars.

Venezuela adopted the gold monetary standard in 1896; at this time the currency consisted of about 12,000,000 bolivars in gold and 8,000,000 bolivars in silver. The value of the bolivar in United States currency is fixed at \$0.193. In commercial language the word "peso" is frequently used; there is, however, no such coin in Venezuela, and the word signifies four bolivars. The Venezuelan dollar is a coin of five bolivars in value.

Industries.—The country is naturally adapted for agriculture and cattle-raising, while the mineral resources are very considerable. Manufacturing industries not only have not been developed, but have scarcely been introduced. About one-fifth of the inhabitants are engaged in agriculture, and the principal crop is coffee. Venezuela, in fact, ranks second among the coffee-producing countries of the world. The area under coffee cultivation is estimated at from 180,000 to 200,000 acres, and the estimated product for 1898 was about 116,400,000 pounds. Sugar and cacao are also important products, while in the untitled districts, or the "forest zone," the inhabitants take the products of the wild rubber trees, the copaiifera, the cinchona trees, and the vanilla and tonga plants. Cattle-raising is already an important industry and will probably become one of the most lucrative in Venezuela. In 1895 the number of cattle was estimated to be between 4,000,000 and 5,000,000. The government has the management of the lands that are without lawful owners, and is empowered to dispose of them either to natives or immigrants. Agreements have been entered into whereby each of the members of immigrant families brought by the Italian Colonization Society may receive free 6 hectares (14.8 acres) of land.

Among the metals and minerals found in Venezuela are gold, silver, copper, iron, sulphur, asphalt, coal, tin, lead, salt, kaolin, and petroleum. Mining, however, is little developed, there being little done at present in the industry beyond the exploitation of gold, silver, and salt. Iron mines, however, are being worked along the Imataco and Santa Catalina Rivers, near their confluences with the Orinoco. Gold is taken chiefly in the Yuruari territory and silver in the states of Lara, Los Andes, and Bermudez; the gold sent from the Yuruari region in 1896 aggregated 60,674 ounces, and in 1897, 43,500 ounces.

The general financial condition of the country was bad in 1898, and the prospects for 1899 were no better. In the former year the coffee crop was large, but the price had depreciated about 50 per cent.; in 1899 a large part of the crop was destroyed by long-continued drought, while the price remained very low. Other causes of financial distress in 1899 were the revolutionary disturbances and the suspension of payments on the national bonds.

Commerce and Shipping.—The principal exports include coffee, cacao, rubber, hides and skins, Peruvian bark and other medicinal products, gold, and feathers. The leading imports are provisions, textiles, hardware, coal, machinery. In the fiscal year 1895-96 the exports amounted to 111,455,143 bolivars. For the next fiscal year the leading exports were: Coffee, from Maracaibo, Puerto Cabello, La Guaira, and Ciudad Bolivar, 44,667 tons; cacao, from the same ports, 4047 tons; rubber, 339 tons; hides and skins numbering 3,440,109; Peruvian bark, 68,439 pounds; gold in bars, 1352 kilogrammes. The total value in United States currency of the exports for the fiscal year 1897 was reported to be \$17,960,114; the reported value of the imports for the previous fiscal year was \$8,456,952. Venezuelan exports go chiefly to the United States, France, and Germany, though many cattle are shipped to the West Indies.

In 1898 the Venezuelan merchant marine comprised 11 steamers, with an aggregate net tonnage of 2185, and 17 sailing vessels, of 2760 tons. In 1897 there entered and cleared at La Guaira 312 vessels of 676,500 tons; at Maracaibo, 285 vessels of 78,620 tons; at Ciudad Bolivar, 133 vessels of 58,367 tons.

Communications.—Land transportation is difficult and lake and river routes are gaining in importance. In the early part of 1899 there were fourteen lines of railway in operation, aggregating 503 miles (810 kilometres), and 1000 miles were under con-

sideration. In 1895 the length of telegraph lines was 3882 miles and the telegraph offices numbered 113. In his message of February 27, 1899, President Andrade stated that during the previous year 1231 miles of telegraph wire had been strung, and that eight new lines were under construction. There were 214 post-offices in 1898.

Religion and Education.—Toleration in matters of faith prevails, but permission for formal and organized expression is granted only to Roman Catholicism, which is the state religion. In 1894 all Venezuelans were reported as Catholic except 5906 without profession, 3575 Protestant, and 411 Hebrew. Education is in a backward condition, notwithstanding the statement of President Andrade in the early part of 1899 that it was "in a flourishing state." Primary education is free and nominally compulsory. The latest available statistics (1891) place the number of primary schools at 1415 federal and 151 state, with about 100,000 pupils in attendance. There were also reported one school of arts and trades, 4 normal schools, and 9 "barrack" schools. The institutions for higher education have been reported as follows: 22 federal and 26 private colleges, 11 federal colleges for girls, schools for fine arts, music and technics, one naval school, and 2 universities; the teachers and students of these institutions numbered 436 and 4882 respectively.

HISTORY.

Revolutionary Movements.—A revolt broke out in February, 1899, in the state of Guarico under General Ramon Guerra, but it did not extend beyond the limits of that state. The insurgents were defeated early in the following month, and before the close of March it was reported that the insurrection had been suppressed. A far more important event was the revolution under General Cipriano Castro, who took advantage of the discontent caused by an unconstitutional measure which had been passed at the instigation of President Ignacio Andrade and soon organized a formidable force. He defeated the government troops on August 23. President Andrade now took command of the government troops in person, and the revolt became so serious that in September the United States cruiser *Detroit* appeared in Venezuelan waters for the protection of American interests. The government troops suffered another serious reverse on September 15, and from that time on the success of the revolutionists was continuous. At the close of September Castro established a provisional government at Valencia. On October 1 a brief truce was arranged through the efforts of the commanding officer of the *Detroit* and other foreign representatives, but the overthrow of the Andrade government was now certain. In the latter part of October General Castro entered Caracas and assumed control of the government as provisional president. Andrade fled and most of his followers were disbanded. A small part of them, however, still held out, and a revolutionary movement was attempted by General Hernandez, but before the close of the year the Castro government appeared to be securely established in control.

Boundary Arbitration.—Diplomatic relations between Great Britain and Venezuela, which had been broken off by reason of the boundary dispute, were restored on February 2, 1897, when an arbitration treaty was signed. For Venezuela, Chief Justice Fuller and Justice Brewer, of the United States Supreme Court, were appointed arbitrators, and for Great Britain Mr. Justice Collins and Baron Herschell. Upon the latter's death, March 1, 1899, he was succeeded by Lord Russell of Killowen. Professor Martens, of St. Petersburg, was the fifth member and president of the tribunal. The arbitrators met in Paris in June, 1899, and on the 15th of the month Attorney-General Sir Richard Webster opened the case for Great Britain, and spoke thereafter twelve times. The case for Venezuela was first presented on July 21 by Mr. Severo Malet-Provost. The other speakers in order were as follows: Mr. Soley, for Venezuela; Sir Robert Reid and Mr. G. R. Askwith, for Great Britain; ex-Secretary Benjamin F. Tracy, for Venezuela; Sir Richard Webster, who made the final speech for Great Britain, and ex-President Benjamin Harrison, who closed the case for Venezuela. The dispute involved about 60,000 square miles, and, according to the award, which was made unanimously on October 3, 1899, all but a few hundred square miles of this territory was granted to Great Britain. Hence the decision, though a compromise, was very gratifying to the British. It brought to an end a dispute that had lasted over fifty years. The country thus definitely acquired by Great Britain contains a number of valuable gold fields. The disputed territory extended from the Essequibo River, on the east, nearly to the Caroni and Orinoco Rivers on the west, and from the Atlantic south to the Brazilian frontier. The Essequibo River marked the extreme claim of Venezuela, while the extreme claim of Great Britain was a line beginning at Punta Barima, at the mouth of the Orinoco, "running thence southwest and west, nearly parallel with and from 40 to 60 miles from the Orinoco to Upata; thence southward through the valley of the Caroni and close to that river, and southeast of Mount Roraima and the Brazilian frontier." The claims of Venezuela were based on those of Spain, to whose rights she succeeded upon gaining independence in 1821. The British claims were based on those

of the Netherlands, which country ceded the Guiana territory to Great Britain in 1814. In 1839 Sir Robert Schomburgk surveyed for Great Britain a line which the latter government did not consider as a limit to which it was rightfully entitled, but merely as a reasonable compromise. This famous Schomburgk line "wanders" southward from the mouth of the Barima River to Mount Roraima; it follows no natural boundary lines, such as rivers or mountains. This line, however, Venezuela refused to accept, and subsequent negotiations amounted to nothing. In 1881 a line known as the modified Schomburgk line and including somewhat more territory than the original one was drawn, and this in 1890 Great Britain declared to represent her minimum demand. The dispute threatened to become very grave when in 1894 and 1895 Venezuelan troops made demonstrations against British officials at Uruan, in the Cuyuni district, and when soon after the United States made a warning protest against what was considered a policy of unjustifiable aggrandizement on the part of Great Britain. An investigating commission was appointed by President Cleveland, but before the close of its sessions the arbitration treaty of February 2, 1897, had been signed.

The boundary established by the arbitration commission almost coincides with the old Schomburgk line. The new line, however, follows a number of rivers instead of going direct across open country. In Volume II. of the *Proceedings of the Arbitration Between the Governments of Her British Majesty and the United States of Venezuela*, it is defined as follows:

"Starting from the coast at Point Playa the line of boundary shall run in a straight line to the River Barima at its junction with the River Mururuma, and thence along the midstream of the latter river to its source, and from that point to the junction of the River Halowa with the Amakuru, and thence along the midstream of the Amakuru to its source in the Imataka Ridge, and thence in a southwesterly direction along the highest ridge of the spur of the Imataka Mountains to the highest point of the main range of such Imataka Mountains opposite to the source of the Barima, and thence along the summit of the main ridge in a southeasterly direction of the Imataka Mountains to the source of the Acarabisi to the Cuyuni, and thence along the northern bank of the River Cuyuni westward to its junction with the Wenamu, and thence following the midstream of the Wenamu to its westernmost source, and thence in a direct line to the summit of Mount Roraima, and from Mount Roraima to the source of the Cotinga, and along the midstream of that river to its junction with the Takutu, and thence along the midstream of the Takutu to its source, thence in a straight line to the westernmost point of the Akarai Mountains, and thence along the ridge of the Akarai Mountains to the source of the Corentin, called the Cutari River."

VENTILATION. See MINING ENGINEERING (paragraph Ventilation).

VENUS, ATMOSPHERE OF. See PHYSICS.

VERMONT, a New England State, has an area of 9565 square miles. The capital is Montpelier.

Mineralogy.—During the calendar year 1898 the State made a gratifying advance in the value of its quarry products, marble only showing a decline and that but slight. The values were: Granite, \$1,094,218; slate, \$732,684; marble, \$2,067,938, and limestone, \$174,150—total, \$4,058,990, enabling the State to retain its rank as the second producer. In granite it held the first place, with the largest output in its history. Copper-mining showed renewed activity in old fields that were once an important source of supply, and yielded 5,395,226 pounds, the highest production in any year of local record. In 1899 there was a greatly increased interest in both copper and gold. A diamond rock-drilling machine was put up in the Springfield mine in Windsor County to determine the real value of the property, where so far operations have been confined to the croppings. As the shafts are sunk deeper the dirt becomes richer. An assay in November showed that in one ton of dirt, from which the sample was taken, there were: Gold, \$9.51; silver, \$44.40, and lead, \$10.08—total, \$64.59. It is believed that there are many other veins of ore in the Green Mountains that will pay even better. Professor Richardson, of Dartmouth College, made a number of assays of ore showing gold, silver, and lead to the value of about \$25 per ton, and this is thought to be an average valuation.

Manufactures.—Vermont and Maine are included in the internal revenue district of New Hampshire, and the details of their taxable manufactures are combined with those of that State. In the year ending June 30, 1899, the collections of internal revenue in Vermont alone amounted to \$196,213. There were 6 manufacturers of tobacco and 38 of cigars, and in the calendar year 1898 the aggregate production was 1,865,056 cigars and a small quantity of smoking tobacco.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Memphremagog and Vermont aggregated in value \$4,376,420; exports, \$10,025,878, an increase in a year of \$289,384 in imports, and \$1,983,449 in ex-

ports. The movement in gold and silver was, imports, \$1000; exports, \$6764, making the total foreign trade of the year \$14,410,062.

Banks.—On October 31, 1899, there were 49 national banks in operation and 19 in liquidation. The active capital aggregated \$6,860,000; circulation, \$3,860,757; deposits, \$11,341,020, and reserve, \$4,022,966. There were also June 30, 1899, 40 mutual savings banks, with depositors, 113,369; deposits, \$36,526,750, and resources, \$39,369,732.

Railways.—The new railway construction in the calendar year 1898 was 2 miles, and in 1899, 14.50 miles, giving the State a total mileage of 1001.86.

Education.—At the close of the school year 1897-98, the school population was 90,388; enrolment in the public schools, 65,532, and average daily attendance, 48,060. There were 2786 teachers, 1891 buildings used as school-houses, and public school property valued at \$1,800,000. The revenue was \$901,689; expenditure, \$933,424, of which \$620,910 was for teachers' salaries. There were 55 public high schools, with 141 secondary teachers, 3156 secondary students, and 961 elementary pupils; 23 private secondary schools, with 117 teachers, 2076 secondary students, and 890 elementary pupils, and 3 public normal schools, with 19 teachers and 273 students in all departments. Normal training was also given in one college and 17 public high schools. Three universities and colleges for men and for both sexes reported 188 scholarships, 81 professors and instructors, 745 students, 88,268 volumes in the libraries valued at \$112,500, \$105,000 invested in scientific apparatus, \$725,000 in grounds and buildings, and \$755,000 in productive funds, \$104,489 in total income, and \$34,640 in benefactions. In 1899 there were 78 periodicals, of which 9 were dailies, 55 weeklies, and 10 monthlies.

Finances.—The assessed valuations for 1899 were: Real estate, \$117,642,114; personal property, \$57,969,558—total, \$175,611,672, an increase of \$848,039; tax rate, \$2 per \$1000. The total debt, July 1, 1899, was \$666,237, and the State had resources amounting to \$879,248, making an excess of assets over liabilities of \$213,011. More than one-half of the total debt was a floating one.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 337,000.

Legislation.—A State bacteriological laboratory was established; also a board of prison commissioners, to investigate applications for pardon and report to the governor. The governor was authorized to appoint a State highway commission, and a board of normal school commissioners, the latter to take charge of normal and training schools. County courts may hereafter render judgment and enter decrees in vacation if the case was heard during term. Laws were passed protecting game and fish, and prohibiting the desecration of the flag of the United States. Street cars must be equipped with fenders and guards. Provision was made for travelling expenses, medical attendance, and pay of soldiers and sailors. Railroads connecting at the State line may own, construct, and maintain terminal and connecting facilities. Mileage books of 1000 miles must be sold by railroads at two cents per mile and may be used by bearer.

State Officers and National Representatives.—Governor, Edward C. Smith; lieutenant governor, Henry C. Bates; secretary of State, Frederick A. Howland; treasurer, John L. Bacon; auditor, Orion M. Barber; adjutant-general, T. S. Peck; superintendent of education, Mason S. Stone. Supreme Court: Chief justice, Russell S. Taft; assistant justices, Loveland Munson, John W. Rowell, John H. Watson, H. R. Start, L. H. Thompson, James M. Tyler; clerk, M. E. Smilie. The State legislature consists of 233 Republicans, 41 Democrats, 1 Prohibitionist, and 1 Independent. Senators, Redfield Proctor, from Proctor; and Jonathan Ross, from St. Johnsbury—both Republicans. Representatives: H. Henry Powers, from Morrisville; and William W. Grout, from Barton—both Republicans.

VICTORIA, the smallest of the British colonies in Australia, occupies the south-eastern corner of the continent, and has an area of 87,884 square miles, with a coast-line of about 700 miles. Its population is estimated at about 1,179,000, including about 9000 Chinese and 560 natives. The last named are gradually diminishing in numbers. The capital, Melbourne, is the largest city in Australia, and has a population of 458,610. It contains the University of Melbourne, the mint, and a museum, public library, observatory, public gardens, hospital, and many churches, being also an Episcopal see. Other large cities are Ballarat, population about 46,000; Sandhurst, 43,000, and Geelong, 25,000. The density of the population is comparatively great, and over 655,780, or nearly five-ninths, of the inhabitants of Victoria live in towns. There is a considerable number of manufactories, about 2800 being the estimate for 1898. The products chiefly exported are the staples gold and wool, and in addition wheat and butter; less important exports are live stock, skins and hides, and preserved and frozen meats. In agriculture the total area cultivated in 1898-99 was 3,877,922 acres, over half of which, or 2,154,163 acres, was given over to wheat, the production of which was over 14,000,000 bushels; oats had an acreage of 266,159,

with about 16.35 bushels to the acre. The live stock includes principally sheep, which numbered, according to the latest estimates obtainable, over 13,000,000. In 1897 nearly 26,000 dairy farms were in operation, with nearly 400,000 milch cows, producing over 34,000,000 pounds of butter. The greater part of the trade is with Great Britain and the Australasian colonies; in imports, the United States and Germany are the first foreign countries, followed by India, China, France, and Belgium; in exports France, Germany, and the United States lead among foreign countries, followed by India, Belgium, and China. The total imports for 1898 were £16,768,904. The exports were £15,872,246, the principal items being as follows: Wool, £4,036,968; gold (including specie), £5,921,775; butter, £736,325; wheat (including flour and biscuit), £502,461; leather, £301,145; skins and hides, £373,054; live stock, £259,950. The magnitude of the trade is shown by the shipping entries and clearances for 1898, which aggregated over 4000 vessels, with a tonnage of nearly 5,000,000. There is a tariff on imported goods, amounting to about 12 per cent. While the exports to the United States show a decrease in 1897-99, due to the bad wool season, the imports have increased. United States Consular Reports during 1899 stated that there is a renewed growth in American-Australian trade, with every prospect of a continuation of such conditions. The exports to the United States are almost entirely wool, and this, together with agriculture, has been affected by the prolonged drought which has affected eastern Australia. (See NEW SOUTH WALES.) The revenue for the year 1898-99 was £7,378,842, and the expenditure £7,027,415. The outstanding public debt on June 30, 1898, was £47,058,088, of which the largest part was incurred in the construction of the railways, all of which now belong to the government. Of these, there were 3129 miles completed at the beginning of 1899, at a capital cost of £38,593,205; of this amount £2,803,740 were paid from the general revenue, and the remainder raised by loans. There were in 1898 about 14,730 miles of telegraph and 11,425 miles of telephone lines. The government of Victoria consists of a governor, appointed by the crown, and of a parliament, which has a legislative council of 48 members and a legislative assembly of 95 members. The governor and commander-in-chief in 1899 was Lord Brassey, and the premier and treasurer, Sir George Turner.

History, 1899.—One of the most important political acts of the year was the passage of the Federal Enabling bill, giving the assent of Victoria to the proposed federation of the Australian colonies, for a full account of which see the article AUSTRALIAN FEDERATION. By a vote of the assembly in October a contingent of Australian troops was offered to the imperial government for service in South Africa. At a later date they were transferred to the seat of war. In the council a bill for woman suffrage was defeated by a large majority. In December the ministry, having been defeated by a majority of 4 votes, resigned, and a new cabinet was formed under the Hon. Allan McLean. This was due to the withdrawal of those who had supported the government only during the movement for federation, and who were now re-enforced in their opposition by former friends of the government who had not been in favor of federation. A similar change of government took place in the other Australasian colonies which voted for federation.

VIRGINIA, a Southern Atlantic State of the United States, has an area of 42,450 square miles. The capital is Richmond.

Mineralogy.—During the calendar year 1898 the production of coal from 20 mines was 1,815,274 short tons, valued at \$1,070,417, an increase of 286,972 short tons in the year. Iron-mining yielded 557,713 long tons, valued at \$1,226,290, a decrease of 153,415 long tons. The ore was nearly all brown hematite, in the output of which the State held first place. In manganese there was a product of 5662 long tons, having a local value of \$9.88 per ton. Gold yielded 218 fine ounces, valued at \$4500, and gypsum, 8378 short tons, valued, when commercially prepared, at \$23,388. The quarry output was: granite, \$136,180; slate, \$150,946, and limestone, \$182,852—total, \$469,978.

Manufactures.—In 1898 six coking plants, with 1564 ovens, used 852,972 short tons of coal, and produced 531,161 short tons of coke, valued at \$699,781, an increase of 177,094 short tons. The production of pig-iron was 283,274 long tons, and of all kinds of rolled iron and steel, 34,497 long tons. In the fiscal year ending June 30, 1899, collection of internal revenue on taxable manufactures aggregated \$4,818,191. There were 126 manufactories of tobacco and 197 of cigars, and the combined output in the calendar year 1898 was 149,220,737 cigars, 22,048,362 pounds of plug tobacco, 21,385 pounds of fine cut, 4,826,332 pounds of smoking, and 711,098 pounds of snuff. Grain and fruit distilleries in operation numbered 630; the production of fruit brandy was 40,474 gallons; amount of spirits rectified, 919,342 gallons; distilled spirits gauged, 2,007,070 gallons, and fermented liquors produced, 137,079 barrels.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Alexandria, Newport News (1,066,727), Norfolk and Portsmouth,

Petersburg, and Richmond, aggregated in value \$1,336,389; exports at Newport News (\$28,177,817), and Norfolk and Portsmouth (\$13,831,233), \$42,009,050, making the total foreign trade of the year \$43,345,439, a net decrease in a year of \$2,243,505, chiefly in exports.

Banks.—On October 31, 1899, there were 36 national banks in operation and 20 in liquidation. The active capital aggregated \$4,641,000; circulation, \$2,554,646; deposits, \$20,716,533, and reserve, \$5,166,709. The State banks, June 30, 1899, numbered 89, and had capital, \$5,840,080; deposits, \$21,106,621, and resources, \$31,190,713. The exchanges at the United States clearing houses at Norfolk and Richmond, in the year ending September 30, 1899, aggregated \$221,434,718, an increase of \$47,853,254 in a year.

Transportation.—The new railway construction in the calendar year 1898 was 66.15 miles, and in 1899, 55.60 miles, giving the State a total mileage of 3730.13. On October 14, 1899, the famous Dismal Swamp Canal, extending from Deep Creek, near Norfolk, to Pasquotank River in North Carolina, a distance of 22 miles, was formally reopened to navigation, after having been abandoned for more than a century. The waterway was originally surveyed by George Washington, and its reconstruction cost nearly \$1,000,000. It is 10 feet deep and 80 feet wide, and has a lock at each end. Any vessel drawing less than 10 feet of water can now avoid the dangers of Cape Hatteras by taking this inside route.

Education.—The last official reports of the common schools available at the time of writing were for the school year 1896-97, when the school population was 665,865; enrolment, 367,817; daily attendance, 213,421. At the close of the school year 1897-98 there were 66 public high schools, with 166 secondary teachers, 3911 secondary students, and 2769 elementary pupils; 80 private secondary schools, with 278 teachers, 3146 secondary students, and 3122 elementary pupils; 3 public normal schools, with 105 teachers and 1578 students in all departments; and 6 private ones, with 53 teachers and 756 students. Normal training was also given in 5 colleges and 11 public high schools. Ten universities and colleges for men and for both sexes reported 9 fellowships, 107 scholarships, 131 professors and instructors, 1909 students, 160,425 volumes in the libraries valued at \$173,700, \$95,200 invested in scientific apparatus, \$2,159,000 in grounds and buildings, and \$1,779,000 in productive funds, \$273,769 in total income, and \$155,381 in benefactions. Thirteen colleges for women reported 12 scholarships; 182 professors and instructors, 1714 students, 11,195 volumes in the libraries, \$902,000 invested in grounds and buildings, and \$102,000 in productive funds, and \$177,086 in total income. Two schools of technology reported 45 professors and instructors, 555 students, \$77,000 invested in scientific apparatus, \$420,000 in grounds and buildings, and \$365,312 in productive funds, and \$118,785 in total income. In 1899 there were 258 periodicals, of which 29 were dailies, 177 weeklies, and 39 monthlies.

Finances.—The assessed valuations for 1898 were: Real estate, \$308,761,367; personal property, \$100,046,014—total, \$408,807,381, an increase of \$3,582,556 in a year and the highest total yet reached. The total debt, September 1, 1899, was \$24,331,477, consisting of bonds issued to the bondholders' committee, \$16,359,860; bonds deposited with sinking fund commissioners, \$1,645,420; Riddleberger bonds, \$6,329,554—total, \$24,334,834, less bonds cancelled, \$3357. On September 19 the debt in the hands of individuals was further reduced by \$114,000 in "century" bonds, purchased for retirement by the sinking fund commissioners.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 1,780,000.

State Officers and National Representatives.—Governor, J. Hoge Tyler; lieutenant-governor, Edward Echols; secretary of state, Joseph T. Lawless; first auditor, Morton Mayre; second auditor, Josiah Ryland, Jr.; treasurer, A. W. Harman, Jr.; superintendent of free schools, J. W. Southall; attorney general, A. J. Montague. Supreme Court of Appeals: President, James Keith; justices, John W. Riely, John A. Buchanan, George M. Harrison, Richard H. Cardwell; clerk, G. K. Taylor. The State legislature consists of 131 Democrats and 9 Independents and Republicans. Senators: Thomas S. Martin, from Scottsville, and John W. Daniel, from Lynchburg—both Democrats. Representatives: William A. Jones, from Warsaw; William A. Young, from Norfolk; John Lamb, from Richmond; Sydney P. Epes, from Blackstone; Claude A. Swanson, from Chatham; Peter J. Otey, from Lynchburg; James Hay, from Madison; John F. Rixey, from Brandy; William H. Rhea, from Bristol, and Julian M. Quarles, from Staunton—all Democrats.

VIRGIN ISLANDS, a West Indian archipelago, lying to the east of Puerto Rico, comprise about 35 islands, with a total area of 176 square miles and a population upward of 40,000. St. Croix, St. Thomas, and St. John, having a combined area of 118 square miles, belong to Denmark (see DANISH WEST INDIES). The remaining islands, the more important of which are Tortola, Virgin Gorda, and Anegada, are owned by Great Britain and form a presidency of the colony of the Leeward Islands

(q. v.). The capital is Roadtown (population, 1891, 403), on the south side of Tortola. The following figures for the British presidency are for 1898: Exports, £3855; imports, £3943; revenue, £1715; expenditure, £1783. The aggregate entrances and clearances in foreign shipping in 1897 amounted to 11,545 tons.

VITALISM. See BIOLOGY.

VITAL STATISTICS. From the report of the health department of the city of New York for the quarter year ending June 30, 1899, are compiled the following figures. The subsequent reports were not available at time of writing. On that date the estimates of the population were, by boroughs: Manhattan, 1,953,569; the Bronx, 163,537; Brooklyn, 1,231,543; Queens, 134,139; Richmond, 67,260; total, 3,550,053. The death-rate for the three months was 18.16 per 1000; marriage-rate, 9.12; birth-rate, 20.07. Richmond appears to be the healthiest borough, with a death-rate of 15.17; Queens shows 17.09; Brooklyn, 17.45; Manhattan, 18.53; and the Bronx, 21.21. The last figures are explained by the number of deaths in institutions in the Bronx, transferred thither from Manhattan. Of the 16,119 deaths, 8742 occurred in tenements, and 3950 in institutions. There were 160 suicides during the quarter, 121 being males. Of these, 44 took carbolic acid, 32 inhaled gas, and 36 shot and 15 hanged themselves. Two deaths are reported of women who had passed the century mark: Eliza Stanwood, aged 100 years 11 months and 29 days, and Margaret Jackson, aged 102 years, both natives of the United States, and both residents of Brooklyn. The former died of "old age," and the latter from apoplexy, according to the certificates of the physicians.

From the annual bulletin of the New York board of health it is learned that the number of deaths in the State for 1899 was 121,320, an increase of 850 over the previous year, and of 4740 over 1897—a year of unusually low mortality. The average death-rate remains about the same, however, 17.3 per 1000. The mortality of infants was less than the average by about 5000, amounting to 29 per cent. of the deaths of persons under 5 years, against an average of 35 per cent. Diphtheria carried off about half the usual number. About 15 per cent. of the total deaths, or 18,000, were due to respiratory diseases, nearly 7000 having perished from la grippe (epidemic influenza) in the first four months of 1899.

The total number of deaths in Philadelphia during 1899 was 23,796, or about 18.78 per 1000. This, with the single exception of 1897, is the lowest ratio for twelve years. Of the whole number of persons who died in 1899, 4560 were under 1 year of age, 2496 between 1 and 5, and 5677 over 60 years. Of these, 145 died of membranous croup, 849 of diphtheria, 132 of scarlet fever, 948 of "scarlet rash," 146 of cerebro-spinal meningitis, 2818 of tuberculosis of the lungs, 2424 of inflammation of the lungs, 290 of epidemic influenza, 1482 of heart disease, 726 of cholera infantum, and 766 of "old age." There was an increase in the mortality from typhoid fever of 209 cases over last year as a result of the epidemic during the first three months of the year.

In the bulletin of the Chicago health department, issued November 30, 1899, are computed the mortality statistics for the eleven months of 1899. There was a joint epidemic of scarlet fever and diphtheria in November, and an increased mortality was feared for the closing month of the year. There had been 484 deaths from scarlet fever, against 67 in 1898, and 81 in 1897; 738 deaths from diphtheria, against 622 in 1898 and 702 in 1897. The excess of the city's death-rate for 1899 was 2545, or 12.03 per cent. The April, 1899, report of the Chicago health department shows that the average age at death of all who died in Chicago in 1899 was double the average age 30 years ago. It is calculated that the aggregate ages of those who died in 1898 reach a total of 672,540 years, "a gain of 324,735 years of life among the 22,897 persons who died in 1898."

The city of Denver, as a result of public improvements and reform in sanitary administration, shows a death-rate of 12.13 during the past 7 years, and of 11.18 during the past 4 years, as against 19.4 per 1000 during the six years from 1886-91. In a population of 160,000 this is calculated to mean a saving of 1315 lives per year.

The unprecedented death-rate of Dublin continues. During the first week in December, 1899, it reached 40.2 per 1000 of population, as against 27.4 in former years, and 17 to 18 per 1000 in the larger cities of England. Conferences of the medical officers of health in the city are frequent, but differences in religion or politics frustrate or delay every definite scheme for sanitary reform.

An erroneous opinion prevails regarding the mortality from disease of the American army at Santiago, and of the expedition in the Philippines. It is usually considered to be greater than that sustained by armies of other countries in tropical climates. Dr. E. H. Bradford published, in July, 1899, in the *Boston Medical and Surgical Journal* the following table. The statistics show an undue mortality of 2000 in the summer camps, in August and September, after the practical cessation of campaigning.

COMPARISON OF MONTHLY DEATH-RATES (PER 1000) FROM DISEASE.

1861-62.				1898-99.		
Months.	Mean Strength.	Number of Deaths.	Ratio per 1000 of M. S.	Ratio per 1000 of M. S.	Number of Deaths.	Mean Strength.
May	16,161	18	1.11	.26	42	163,726
June	66,960	55	.82	.44	90	202,526
July	71,125	106	1.49	1.73	451	363,613
August	112,359	242	2.15	5.21	1,400	268,507
September	165,126	365	2.21	5.69	1,541	261,824
October	256,884	725	2.82	3.17	809	255,000
November	301,848	1,145	3.79	1.51	365	242,000
December	343,184	1,471	4.29	.84	201	240,000
January	32,760	1,593	4.62	.85	180	211,000
February	327,734	1,346	4.11	.87	156	190,000
March	328,878	1,575	4.79	.90	123	186,000
April	410,416	1,881	4.58	.71	80	113,000
Annual	229,453	10,522	45.86	25.73	5,438	211,350

The following table was prepared by Dr. Mosher, of Boston, Mass., to show a statistical comparison of the Spanish war with other wars. The table shows the percentage of mortality in campaigns by the French, English, Americans, Germans and Japanese in tropical countries.

Deaths from Disease.		Deaths from Disease.	
Walcheren (E.), 1809	23.33	Cape Coast (E.), 1873	17.30
West Coast Africa (E.), 1824	69.00	Afghanistan (E.), 1878-80	9.37
Mexican (U. S.), 1846	10.00	Egypt (E.), 1882	7.21
Mexican (U. S.), 1848	10.00	Soudan (F.), 1883-86	28.00
Crimea (E.), 1854	23.00	Madagascar (F.), 1895	30.00
China (F.), 1862	11.80	Chino-Japanese (J.), 1895	1.48
Civil War (U. S.), 1862	4.00	Spanish-American (U. S.), 1898-99	2.50
Civil War (U. S.), 1863	6.00	Manila Expedition (U. S.), 189980
Franco-Prussian (G.), 1870-71	1.43		

The subjoined table by Dr. Bradford shows the percentage of strength of the army that succumbed to disease:

TABLE OF MORTALITY FROM DISEASE IN CAMPAIGNS IN TROPICAL COUNTRIES.

British Army.		French Army.	
Name and Date of Campaign.	Died of Disease. Percentage of Strength.	Name and Date of Campaign.	Died of Disease. Percentage of Strength.
Soudan, 1889	0.06	Tonkin, 1884	6.0
Mashonaland, 1876-97	0.20	Tunis, 1881	6.1
Suakin, 1885	0.22	Mexico, 1862-63	7.1
Soudan, 1885-86	0.41	Tonkin, 1885	7.5
China (Talienwan), 1860	0.54	Dahomey, 1893	8.7
Ashanti, 1895-96	0.56	Tonkin, 1886	9.9
Egypt, 1882	0.57	Tonkin, 1887	10.6
* Manila Expedition, 1899, U. S. A.	0.80	Cochin China, 1863	10.7
Abyssinia, 1867-68	1.21	Soudan, 1887-88	11.6

Nile, 1884-85	3.64	" 1883-81	23.0
Dongola, 1896	4.06	Madagascar, 1895	30.2
Afghanistan, 1878-80	9.37		

* United States Army.

The English campaigns show figures partly better, partly worse, than those of the Manila campaign. Their mortality in one tropical campaign was as low as 0.06 per cent., says Bradford. In contrast with this the English mortality from disease in the Afghan war ran up to 9.37 per cent., and to-day, in time of peace in India, it averages from 4 per cent. to 6 per cent. Kitchener's troops in the Soudan campaign, mostly seasoned natives, with a small acclimated European contingent, were not comparable with our green troops, none of whom were acclimated. While the English had the same heat to bear, they did not have the tropical rains nor the yellow fever. Yet typhoid broke out among the English troops, and one battalion lost 16 per cent., an average fully equal to that of some of our green volunteer regiments on their return from Cuba, where they had the special disorders of malaria and yellow fever also to combat. Up to the writing of Dr. Bradford's paper, from which we quote largely, in the Manila expedition the losses from disease were 0.8 per cent. In 1824 the British lost from disease on the west coast of Africa 69 per cent. of their men. Inspection of the tables will show what a very small per cent. of our men died of disease in 1898, as compared with the number in 1862 and 1863. The losses from disease in the Santiago campaign were relatively small, and the losses in the Manila expedition will compare with the best. No quotations are made from the weekly *Public Health Reports* of the United States Marine Hospital Service to the treasury, as their disease tables and mortality tables are incomplete and at best only approximate. See DIPHTHERIA; EPILEPTIC COLONIES; INFLUENZA; PLAGUE; SCARLET FEVER; SMALLPOX; TUBERCULOSIS; TYPHOID FEVER; WATER SUPPLY AND TYPHOID FEVER; YELLOW FEVER.

VOGEL, Sir JULIUS, K.C.M.G., colonial statesman and writer, died March 13, 1899. He was born in London, February 24, 1835; was educated privately and at the London University School and the Government School of Mines. He emigrated to Melbourne in 1852, and after engaging in journalism went to New Zealand in 1861, and established the first daily paper in the colony—the *Otago Daily Times*. He entered politics, and in 1866-69 was the head of the provincial government. In the latter year he was colonial treasurer in the Fox ministry, and in 1870 became commissioner of customs, telegraph commissioner, and postmaster-general. On his way to England in 1871, by way of San Francisco, he established the present mail service between that city and New Zealand. The Fox ministry was defeated in 1872, but a vote of want of confidence in the new ministry being carried, Vogel was again called to the offices of postmaster-general and colonial treasurer. Becoming premier in 1873, he established the "public trustee" system and a system of government life insurance. After visiting England again he returned to New Zealand in 1876 and resumed his place as premier, but in the same year was sent to England as agent-general, in which position he remained until 1881, returning to the colony in 1884. He formed then with Sir Robert Stout a ministry, in which he was colonial treasurer and postmaster-general. He held the office until 1887, when he returned to England. While agent-general he succeeded in obtaining after much effort an act of Parliament in 1877, permitting an arrangement by him with the Bank of England for an inscription of colonial loans. The plan was similar to the one adopted with consols. Vogel received the title C.M.G. in 1872 and K.C.M.G. in 1875. Besides pamphlets and magazine articles, he published *A. D. 2000, or Woman's Destiny*.

VOLCANOEES. Another eruption of Mauna Loa, one of the volcanoes of the Hawaiian Islands, occurred on the 4th of July, 1899. The lava flow came from the side of the mountain, about 3000 feet from the top, and near the source of the flow of 1880-81. The lava flowed from two vents, and the eruption was so violent that masses of lava and heated rock were not infrequently thrown to a height of nearly 200 feet. The two lava flows joined farther down the mountain and formed a main stream that was about a mile wide in its lower course and 12 to 15 miles long. The eruption was preceded by an earthquake on June 11, and the smoke from the eruption was encountered by a steamer on the 17th of July at a point 600 miles to the northeast of the island.

VOLUNTEERS OF AMERICA, formed by a secession in 1896 from the ranks of the Salvation Army (*q. v.*) under the leadership of Commander Ballington Booth, report for 1899 a great work in the prisons of the country. The number of prisoners reached by them is put at 10,500, and the influence and good works of the organization extend to them after they are discharged from prison. The Volunteers have 500 officers and 200 posts. The commander is Mr. Ballington Booth; headquarters, 1 Fourth Avenue, New York City.

WAGES. Official reports on wages for 1899 are not issued in time for their results to be included in the present article, and statistics for 1897 and 1898 are the only ones available at present from the publications of the various State bureaus of labor statistics. The report of the Indiana department of labor for 1897 and 1898 shows an increase in the number of persons employed and in the amount of wages

paid in the following industries: Agricultural implements and machinery, breweries, furniture, iron and steel products, paper and paper goods, planing mills, hog and cattle products, railway construction and ship-building, wagons, and carriages. The report of the Kansas bureau of labor and industrial statistics gave the returns received from 819 male wage-earners in various occupations. It was found that the average annual wage of 668 employees was \$443, and that the average cost of living of 452 was \$377. The great majority of those who reported were members of labor organizations, and nearly half were protected by insurance. A similar compilation of returns from 135 female wage-earners showed that their average working day was nine hours, and the average annual earnings of the majority were \$219. Only three of the number reported were members of labor organizations, and only 24 were insured. The report of the Maine bureau of labor and industrial statistics for 1898 contained a tabulated comparison of statistics of cotton and woollen mills for the years 1897 and 1898. This showed a slight decrease in the amount of wages paid and in the average weekly wages for the cotton mills, and an increase in the amount of wages paid in the woollen mills, but a slight decrease in the average weekly rate. The weekly wages of men in the cotton mills during the year 1898 averaged \$7.58; of women, \$5.60. In the woollen mills the weekly wages for men were \$7.97, and for women, \$5.98. The report of the labor bureau of Missouri for 1898 estimated the daily wage of employees from the returns of 863 private establishments. The daily wage rate for skilled labor averaged \$2.23 for men and \$1.31 for women, while the average for unskilled labor was \$1.21 for men and \$0.75 for women. Some wage statistics are included in the report of the secretary of internal affairs of Pennsylvania for the year 1897. This shows, on the basis of returns from 363 establishments representing 49 industries, that between 1892 and 1897 there was a considerable decrease in the average number of persons employed and in the aggregate amount of wages paid, but in both these items there was an increase in 1897 over 1896. The report of the labor bureau of West Virginia contains statistics of employment in 500 manufacturing establishments. These show a rapid expansion of industry during the year 1897. On January 1, 1898, there was an increase in the number of employees in all but one of the industries that reported. The report of the Connecticut bureau of labor gives statistics based on returns from 564 identical establishments. These show a great increase both in the number of persons employed and in the amount of wages paid during the year ending July 1, 1898, as compared with the preceding year.

The general purport of the statistics contained in these and other State reports is the same. The expansion of industry since 1896 is clearly traceable in the movement of wages which in the great majority of industries have increased. One of the most important reports published by State bureaus is that on the annual statistics of manufactures issued by the bureau of statistics of labor in Massachusetts. The last report on this subject shows that the wages paid in 80 industries had increased by 1.61 per cent. in 1898 over the previous year. The average annual rate of wages decreased by a small fraction; in 1897 it was \$422.26, and in 1898 \$421.48. The number of employees, however, increased from 326,778 to 332,669. The following table contained in this report compares the wages of men with those of women:

PER CENT OF MALES AND FEMALES OF THE WHOLE NUMBER EMPLOYED AT SPECIFIED WEEKLY WAGES IN 80 INDUSTRIES, 1897 AND 1898.

Weekly Wages.	1897.		1898.	
	Males.	Females.	Males.	Females.
Under \$5	38.90	61.10	38.60	61.40
\$5 or under \$6	37.44	62.56	39.33	60.67
\$6 or under \$7	47.73	52.28	48.32	51.68
\$7 or under \$8	57.53	42.47	58.21	41.79
\$8 or under \$9	64.92	35.08	67.22	32.78
\$9 or under \$10	81.47	18.53	82.35	17.65
\$10 or under \$12	86.83	13.17	86.69	13.31
\$12 or under \$15	94.01	5.99	93.30	6.70
\$15 or under \$20	97.41	2.59	97.65	2.35
\$20 or over	98.64	1.36	98.86	1.14
Total	66.40	33.60	66.31	33.69

WAIT, JOHN TURNER, M.A., LL.D., ex-congressman from Connecticut, died in Norwich, April 21, 1899. Mr. Wait was the oldest practising lawyer, and one of the best-known citizens in the State. He was born in New London, Conn., in 1811. With his parents he moved to Norwich in early life; was educated in the public schools,

at Bacon Academy, Colchester, and at Washington, now Trinity, College, Hartford. In 1836 he was admitted to the bar, and began practice in Norwich. In 1864 the Republican State Convention nominated him by acclamation, as a war Democrat, to be the first elector on the Lincoln and Johnson ticket. During 1865 and 1866 he served as State senator, and in 1867, 1871, and 1873 was a member of the lower House of the legislature, serving in the first-named year as speaker. In 1876 he filled a vacancy in the Forty-fourth Congress, and subsequently was five times elected to the position; having served eleven years, he declined further renomination.

WAKEMAN, HENRY OFFLEY, fellow and bursar of All Souls' College, Oxford, died April 29, 1899. He was born in September, 1852; was educated at Eton and at Christ Church, Oxford; became a barrister, and taught in Keble College. He was a member of the Oxford Hebdomadal Council. He wrote: *Life of Charles James Fox; The Church and the Puritans; An Introduction to the History of the Church of England*.

WALDECK-ROUSSEAU, PIERRE MARIE, premier of the French republic, was born in Rennes, December 2, 1846. He entered the profession of the law, and in 1879 was elected to the chamber of deputies. When Gambetta formed his ministry in 1881 he intrusted to Waldeck-Rousseau the portfolio of the interior; the latter, however, held office only to January 26 of the following year. In February, 1883, in the cabinet of Jules Ferry he was given the same position, which he held until March, 1885. He then retired from politics, but on October 7, 1894, was by a large majority elected to the French senate from the department of Loire. After the resignation of the presidency by M. Casimir-Périer in January, 1895, M. Waldeck-Rousseau received for the office of president 184 votes on the first ballot, but then withdrew from the contest in favor of Felix Faure. On June 12, 1899, the cabinet of M. Charles Dupuy resigned. French politics were in a turbulent condition, and the task of organizing a new cabinet was difficult. Several unsuccessful attempts were made to form a ministry before M. Waldeck-Rousseau accepted the premiership (June 22). The new ministry represented most diverse elements, comprising on the one hand General De Gallifet, distinguished for his vigor in suppressing the Commune, and on the other M. Millerand, the socialist leader. See FRANCE.

WALFISCH BAY, a British possession on the southwest coast of Africa, is cut off from the interior by German territory. The area is 430 square miles and the population (1891), 768. It was acquired by Great Britain in 1878, and made a dependency of Cape Colony. Some years later the protectorate of Southwest Africa was acquired by Germany, but Great Britain retained possession of Walfisch Bay, which, therefore, divides the coast-line of the German territory and excludes from it its chief harbor. There has been considerable discussion as to the value of this possession to Great Britain, on account of its relative position to and its encroachment on the German protectorate. It has been proposed that it be transferred to Germany in return for concessions elsewhere; for instance, that, if possible, a strip of territory be obtained in German East Africa between the head of Lake Tanganyika and British East Africa. A glance at the map of Africa will show that British territory extends continuously from the Cape to the Mediterranean, a distance of 5000 miles, excepting for the strip mentioned above, which is only about 200 miles long, and Lake Tanganyika, 400 miles long, which is, however, open to navigation for the ships of all countries bordering upon it. Whether Germany would be willing to give this immense advantage to Great Britain is another question.

WALLACE, HILL, C.B., British major-general, retired, died June 5, 1899. Born at Alicante, August 13, 1823, and educated at private schools and Addiscombe College, he entered the Bombay Artillery in 1843. He was subsequently transferred to various regiments, but almost his entire service in the army was with the artillery. He became a lieutenant-colonel in 1863, and the following year assistant adjutant-general in the Bombay army. For his services in the Abyssinia expedition, in which he commanded a division of the Royal Artillery, he was decorated, and for his part in the capture of Magdala he was mentioned in the despatches, was awarded a medal, and was created a C.B. His last command was in Mysore, from 1875 to 1879, when he retired.

WALLACE, ROBERT, M.A., D.D., member of Parliament, was born at St. Andrews, Scotland, June 24, 1831; died June 6, 1899. He was educated at the universities of St. Andrews and Edinburgh, and became parish minister at Newton-upon-Ayr in 1857; three years later he became minister of Trinity College Church, Edinburgh, and in 1868 was called to Old Greyfriars in the same city. He accepted the chair of church history in the University of Edinburgh in 1872. From 1876 to 1880 he was the editor of the *Scotsman*, and in 1883 became a barrister-at-law. From 1886 to the time of his death he represented East Edinburgh in Parliament, as a Liberal. Dr. Wallace wrote *Church Tendencies in Scotland*, the article *Church*

History in the *Encyclopædia Britannica*, and numerous essays on politics and economics which have appeared in well-known periodicals, including the *Fortnightly Review*, *Nineteenth Century*, and *Saturday Review*.

WALLER, Mrs. EMMA, a once famous actress and teacher of elocution, died in New York, February 28, 1899, at the age of seventy years. She was born in England; in 1848 she married in London a well-known American actor, Daniel Wilmarth Waller, who died in 1882. Mrs. Waller first acted in this country in 1851. Her husband was stage manager at Booth's Theatre, New York, from 1869 to 1873; during this time and a few years before she was at the height of her fame, being regarded by many as a tragic actress of the first rank. Her manner resembled that of Charlotte Cushman, but she never equalled the latter's artistic perfection. She was associated with many prominent actors, including Edwin Booth. Among her rôles which in a quarter of a century have not been forgotten were Meg Merrilies and Katharine of Aragon.

WALSH, PATRICK, ex-United States senator from Georgia, died in Augusta, March 19, 1899; he was born in Ballingary, County Limerick, Ireland, January 1, 1840. At an early age he came to Charleston, S. C., where by self-exertion he was educated and entered upon journalistic work. He removed to Augusta in 1862, and the following year became editor of the *Augusta Constitutionalist*. In 1866 he was appointed southern agent of the New York Associated Press, and in 1867 became business manager of the *Chronicle and Sentinel*, which ten years later united with the *Constitutionalist*. Mr. Walsh was prominent in the Democratic party of the State, and from 1872 to 1878 represented Richmond County in the legislature. He was a delegate to the national Democratic convention of 1880, and delegate-at-large to that of 1884. In 1894 Governor Northern appointed him to fill the vacancy in the United States Senate caused by the death of Alfred H. Colquitt. In 1897 he was elected mayor of Augusta, for three years. Mr. Walsh was prominent in the work of the Roman Catholic Church and was actively interested in the advancement of the South.

WAR OF 1812, GENERAL SOCIETY OF THE, is composed of federated State societies, the first of which was founded in New York in 1826 by veterans of the war. The membership of the society now consists of lineal descendants of soldiers and sailors of the War of 1812. It had in 1899 nine State societies and over 700 members. Next general biennial congress at Philadelphia, June 19, 1900. President-general, John Cadwalader; secretary-general, Captain Henry Hobart Bellas, U. S. A., 421 South Forty-fourth Street, Philadelphia, Pa.

WARBURTON, Colonel Sir ROBERT, C.S.I., died April 22, 1899, at the age of fifty-six. He entered the British army in 1861, and served brilliantly in the Abyssinian War of 1867-68, and in the Afghan War of 1879-80. He was promoted to the rank of colonel in 1893, and was created a K.C.I.E. in 1898.

WARREN, Lieutenant-General Sir CHARLES, the son of the late Major-General Sir Charles Warren, was born in Bangor, North Wales, February 7, 1840. After receiving his education at Cheltenham, Sandhurst, and Woolwich, he entered the Royal Engineers in 1857, and became captain in 1869, major and lieutenant-colonel in 1878, and colonel in 1882. In 1876-77 he was a boundary commissioner in Griqualand, and served in the Kaffir War in 1878, and Griqua and Bechuana campaigns of 1882. In 1884-85 he led with success the Bechuanaland expedition. Having returned to England, he was chief commissioner of the Metropolitan police in 1886-88. In 1889 he was appointed to command the troops in the Straits Settlements with the temporary rank of major-general; and, returning to England in 1894, he was appointed to the command of the troops in the Thames district. In November, 1899, General Warren took command of the Fifth Infantry Division assigned for service in South Africa. He has also performed efficient work for the Palestine Exploration Fund, having conducted a series of excavations in 1867-70 in Palestine, principally around the walls of the Temple of Jerusalem. He is the author of *Underground Jerusalem* (London, 1876); *The Temple or the Tomb*, 1880; and *Jerusalem*, 1884.

WASH-HOUSES, MUNICIPAL. See MUNICIPAL BATHS AND WASH-HOUSES.

WASHINGTON, a Pacific coast State, has an area of 69,180 square miles. The capital is Olympia. Washington was admitted to the Union, November 11, 1889.

Mineralogy.—During the calendar year 1898 the State again surpassed all its previous records as a coal producer, with an output from 23 mines of 1,884,571 short tons, valued at \$3,352,798, an increase in a year of 450,459 tons. Of the total output King County yielded 785,806 tons, Kittitas, 566,396, and Pierce, 509,142. Of the precious metals, gold yielded 37,065 fine ounces, valued at \$760,200, and silver 254,400 fine ounces, coining value, \$328,981. The official estimates for 1899 were, gold, \$806,202; silver, \$452,525. Quarrying showed increased activity, with productions of granite valued at \$9700; sandstone, \$15,575; marble, \$3600, and limestone,

\$140,239—total, \$169,114. The year 1899 was the busiest and the most satisfactory in the mining history of the State. More mines were opened, more money expended in working them, and the output was larger than ever before. In gold, silver, copper, and lead the production aggregated in value \$2,500,000, more than double that of the previous year, and the greatly enlarged operations gave a conservative promise of another doubling in values in 1900. Among the most noteworthy events of the year were the discovery of sodium sulphate deposits in Okanogan County, near the river of the same name, which bids fair to result in the establishment of a glass-making plant at Seattle; the discovery of anthracite coal in Whatcom County, 40 miles from tidewater, and of several large silver-lead and gold-copper ledges in the same vicinity; an extensive copper strike on Palmer Mountain; an unusually large strike of ore on the 600-level of the Republic mine, in consequence of which the company, which was reported to have sold the property to Canadian capitalists for \$3,000,000, determined to erect a 200-ton mill for the treatment of the ore; and the uncovering of a great deposit of tellurium in the State Creek district. More than 5000 men were employed in the coal mines, and all were working night and day with an equipment of the best machinery. Preparations were completed for working the great copper ore belt near Index, in the western part of the State, during 1900 to the fullest extent of capital and experience.

Manufactures.—Washington and Alaska are included in the internal revenue district of Oregon, and the details of their taxable manufactures are combined with those of that State. In the year ending June 30, 1899, the collections of revenue in Washington alone aggregated \$637,245. The principal tobacco manufactures were cigars, the combined output of 105 factories being 4,759,115. Washington has the only coking plants on the Pacific coast. In 1898 one with 30 ovens went out of business, leaving 2 with 90 ovens, which used 48,559 short tons of coal, and produced 30,197 short tons of coke, valued at \$128,933, an increase of about 4000 tons in the year and the largest production yet reached. At the close of the season of 1898, the value of the salmon fishery plants in the Puget Sound region was estimated at \$1,769,980; number of men employed, 3516; cases of salmon packed, 400,200. Of these totals Washington was credited with investment, \$865,680; persons employed, 1775, and cases packed, 111,525. The State fish commissioner reported that while the Columbia River fisheries, as a whole, did not show a material decrease in output from that of 1897, the Washington side of the river had proven a great disappointment. The sturgeon fishery alone had declined till in 1898 it was not 10 per cent. of what it was in 1892. See OREGON.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise in the Puget Sound district aggregated in value \$7,239,718; exports, \$15,200,320, an increase of \$2,181,629 in imports, and a decrease of \$2,718,672 in exports. The movement of gold and silver was, imports, \$3,139,654; exports, \$87,845, a decrease in both. The total foreign trade of the year was \$25,667,537, a net decrease in a year of \$2,556,787.

Railways.—The new railway construction in the calendar year 1898 was 14.23 miles, and in 1899, 75 miles, giving the State a total mileage of 2884.85. The Great Northern Railroad had surveyors out in November, 1899, running lines for a branch from Index to Galena, 15 miles along the north fork of the Snohomish River, for the benefit of the troublesome mining district. Transportation facilities were further increased in 1899 by the federal government, which, by improving the navigation of the Okanogan River, opened up a large mineral section that has heretofore been almost inaccessible for nine months in the year. Railway property was assessed for taxation in 1899 at \$20,500,983.

Banks.—On October 31, 1899, there were 31 national banks in operation, and 46 in liquidation. The active capital aggregated \$3,360,000; circulation, \$1,017,197; deposits, \$19,005,351, and reserve, \$8,310,118. The State banks, May 31, 1899, numbered 28, and had capital, \$1,602,800; deposits, \$5,558,044, and resources, \$7,650,044. The exchanges at the United States clearing houses at Tacoma, Seattle, and Spokane in the year ending September 30, 1899, aggregated \$201,083,408, a net increase of \$51,722,780 in a year.

Education.—At the close of the school year 1897-98, the school population was 118,491; enrolment in the public schools, 97,916, and average daily attendance, 64,192. There were 3321 teachers, 1941 buildings used as school-houses, and public school property valued at \$4,977,679. The revenue was \$2,094,775; expenditure, \$1,795,795, of which \$1,081,008 was for teachers' salaries. There were 36 public high schools, with 101 secondary teachers, 2630 secondary students, and 431 elementary pupils; 12 private secondary schools, with 52 teachers, 419 secondary students, and 763 elementary pupils; and 2 public normal schools, with 15 teachers and 403 students in all departments. Normal training was also given in 5 colleges and 2 public high schools. Nine universities and colleges for men and for both sexes reported 8 scholarships, 106 professors and instructors, 1102 students, 27,146 volumes

in the libraries, \$45,000 invested in libraries, \$23,958 in scientific apparatus, \$644,000 in grounds and buildings, and \$150,000 in productive funds, \$111,688 in total income, and \$32,250 in benefactions. In 1899 there were 224 periodicals, of which 15 were dailies, 176 weeklies, and 27 monthlies.

Finances.—The equalized assessed valuations for 1899 were: Real estate, \$172,129,311; personal property, \$36,507,245, and railway property, \$20,500,983—total, \$229,137,539; tax rate, \$6.65 per \$1000. The total bonded debt, exclusive of bonds for \$390,000 issued for investment of the State school fund, was \$220,000; floating debt, \$1,472,983. All State bonds are subject to call at any time.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 475,000.

Legislation.—To encourage the cultivation of beets, a bounty is placed upon sugar made from them. A State hop inspector was to be appointed. A State dairy commissioner, having large powers, was also to be appointed; skimmed milk and cheese made from it must be labelled in large letters; milk cans must be marked showing capacity, and all milkmen in cities must be licensed. It was made unlawful to destroy or remove fixtures, buildings or permanent improvements on mortgaged real estate. The office of State game warden was created. A pure food bill was passed. The State board of pharmacy is to examine and license all druggists. A horseshoers' board of examiners is required to examine, register, and license all horseshoers in cities, as is done in Minnesota, Maryland, New York, Colorado, and Illinois. It is now a misdemeanor to black-list an employee, and eight hours was made a day's work on public works. An elaborate mining law, similar to that of Colorado, was passed; the State board of pardons was abolished. Attendance at school was made compulsory in cities of over 10,000 inhabitants.

State Officers and National Representatives.—Governor, John R. Rogers; lieutenant-governor, Thurston Daniels; secretary of State, W. D. Jenkins; treasurer, C. W. Young; auditor, Neal Cheatham; attorney-general, P. H. Winston; adjutant-general, E. H. Fox; superintendent of education, F. J. Browne. Supreme Court: Chief justice, M. J. Gordon; associate justices, R. O. Dunbar, M. A. Fullerton, T. J. Anders, J. B. Reavis; clerk, C. S. Reinhart. The State legislature consists of 83 Republicans, 28 Populists, and 1 Citizen. Senators, George Turner (Pop.), from Spokane; and Addison G. Foster (Rep.), from Tacoma. Representatives, Francis W. Cushman, from Tacoma; and William L. Jones, from North Yakima—both Republicans.

WATER, DRINKING. See HYGIENE.

WATER POWER. See WATER-WORKS.

WATER PURIFICATION. During 1899 the 15,000,000-gallon water-purification plant at Albany, N. Y., was completed and put in operation. The water is first settled in a large reservoir, then filtered through beds of sand, covered with groined arches of concrete. During the last four months of 1899 this plant treated 1,470,000,000 gallons (net) of water from the Hudson River, at an average cost of \$4.19 per 1,000,000 gallons, including all operating expenses, but no capital charges. The cost of lifting the water from the river to the filters accounted for \$2.52 of the \$4.19 per unit. For the four months, the works removed an average of 99.1 per cent. of the bacteria found in the river water. The typhoid deaths for the same period numbered only 7, against 24 during the corresponding months of the previous year. The cost of the whole plant, including the pumping station and a large steel pipe line 8000 feet long, was about \$500,000, or some \$30,000 per 1,000,000 gallons of capacity. The filters proper cost some \$255,000.

At Lawrence, Mass., where a slow-sand filter plant, without a covering, was put in operation in 1893, there has been a reduction in the number of deaths from typhoid fever from about 12 to 1.39 per 10,000 population, the latter rate being for 1898. Up to October 1, 1898, the Lawrence City filter removed 99.24 per cent. of the bacteria in the applied water, and for the whole year the removal was 97 per cent., the falling off being due to disturbances caused by reconstructing a part of the filter in the latter part of the year. It appears that this filter would give better results if it were covered, there being so much ice on the bed in winter that machinery has been installed for hauling it up the embankment and dumping it into the river.

Several mechanical filter plants were tested during 1899, to determine whether they were capable of fulfilling the guarantees of their contractors. A filter at East Providence, R. I., having a capacity of 500,000 gallons a day, was run for over a month at the rate of 125,000,000 gallons an acre, with the use of a coagulant at the rate of one grain of sulphate of alumina per gallon of water, and showed a removal of 99.24 per cent. of bacteria. The color of the water was reduced by 83 per cent. With lower amounts of the coagulant the work of the filter for a longer period showed a removal of 98.87 per cent. of bacteria. A similar filter at Norfolk, Va., but with a capacity of 6,000,000 gallons a day, showed good bacterial results during a 30 days' test, and a

very satisfactory removal of color, the plant having been installed largely for the latter purpose. Still another mechanical filter plant, of a somewhat different type, was tested at Louisiana, Mo., for six days. It removed an average of 97.3 per cent. of the bacteria, the highest per cent. remaining in the purified water being 72. The water is taken from the Mississippi River, and is liable to be very muddy, or heavy with suspended matters. During the test coagulants were used at the rate of 2.5 grains of sulphate of alumina and 1.25 grains of lime per gallon of water. This type of filter makes use of compressed air to agitate the sand during washing, instead of the revolving rake employed at the East Providence, Norfolk, and many other plants. The Louisiana filter is also supplemented by sedimentation tanks giving a normal subsidence of $3\frac{3}{4}$ hours.

At Kansas City and Carthage, Mo., sulphate of alumina has been used recently in connection with sedimentation reservoirs. Experiments with ozone as a method of treating water to get rid of bacteria have recently been made in this country and abroad, but the process has not been put on a practical basis, and seems likely to be costly, although otherwise efficient, providing the water is comparatively free from suspended matters. Experiments with slow-sand and mechanical filtration were begun on Potomac River water at Washington in 1899, and during the same year Philadelphia voted some \$12,000,000 for water purification works, which it is understood will be chiefly slow-sand filters. Pittsburg also voted \$2,500,000 in 1899 for water purification, and the introduction of meters to suppress waste. Settling-reservoirs and slow-sand filters will probably be built in Pittsburg. Numerous other places installed either mechanical or slow-sand filters in 1899, a plant of the latter sort, with a vaulted masonry roof, having been constructed at Superior, Wis., to remove iron from ground water.

WATER, SPECIFIC HEAT OF. See PHYSICS.

WATER-SUPPLY and TYPHOID FEVER. Interesting statistics have been compiled and published by Dr. A. C. Abbott, chief of the department of bacteriology of the Philadelphia board of health, and professor of hygiene in the University of Pennsylvania, relative to the condition of the water-supply as bearing on the frequency of typhoid fever. His figures are, in brief, as follows:

"Pure mountain springs: Munich and Vienna, 4.0 deaths [from typhoid] per 100,000 inhabitants. Properly filtered water: Hague, Berlin, London, Rotterdam, and Edinburgh, 8.3 per 100,000 inhabitants. Ground-waters, springs, wells: Frankfurt, Dresden, and Paris, 14.7 per 100,000 inhabitants. Impounded surface springs: Brooklyn, New York, Boston, and New Haven, 23.1. Normal rivers, pollution eliminated through the agency of time, dilution, sedimentation, etc.: Trenton, Montreal, Omaha, New Orleans, St. Louis, and Minnesota, 28.5. Large lakes subject to pollution: Toronto, Milwaukee, Detroit, 30.3. Upland streams and small lakes, water-sheds inhabited: Denver, San Francisco, Reading, Providence, 42. Rivers and wells known to be polluted: Philadelphia, Atlanta, Cincinnati, Albany, Jersey City, Pittsburg, Camden, and Washington, 60.8 per 1000 inhabitants."

WATER-WORKS. The new tunnel system at Chicago, twelve miles in aggregate length, begun in 1896, was practically completed during 1899. It connects a crib in the lake, nearly three miles from the shore, with three pumping stations, one at the shore and two some distance inland, the land sections being in the form of the letter Y. The whole of the lake section and the stem of the Y, four miles in all, is 10 feet in diameter; each of the branches is also about four miles long, but only 8 feet in diameter. The intake is a crib located in about 30 feet of water, and the centre line of the lake tunnel is 89 feet below the lake level. The crib is composed of timber work, steel plates and concrete, being 112 feet in diameter at the lake bottom and having a central well 60 feet in diameter. The crib is surmounted by a masonry superstructure and light-house tower. The former houses the crib-keepers. A steam-heating and electric-lighting plant is provided, there being a number of incandescent and two 150-candle-power arc lamps. One of the latter is in the light-house and the other is in the well. The tunnel is lined with brick throughout, either four or three rings in thickness. The tunnel was driven through a variety of material, including both hard and soft clay, and nearly two miles of solid rock, the latter in one of the 8-foot branches. Compressed air was used only for a part of the work. A system of electrical power was installed in March, 1897, to move material excavated at the heading. A 10-horse-power locomotive was used, which could haul eight cars each of 1 cubic yard capacity at the rate of six miles an hour. Besides connecting with the old Chicago Avenue pumping station, near the shore line, the land tunnels supply two new pumping stations, one at the end of each branch. Eventually there will be four 20,000,000-gallon vertical pumping engines at each of the new stations, but only three at each have been provided, the contracts for these having been let to Mr. Henry R. Worthington in 1897. The chief engineer for the tunnel system has been Mr. John Ericson, city engineer of Chicago.

The completion of the abandoned aqueduct tunnel at Washington, D. C., was resumed by the United States government in 1898 and is still in progress. The tunnel was begun in 1883 and abandoned some five years later, after the bore had been completed and partially lined. Faulty construction was the cause of abandonment, and a report adverse to its completion was largely responsible for its remaining idle for ten years. The tunnel is 20,715 feet long, and at an average depth of 150 feet below the surface. It is designed to connect the old aqueduct with a new reservoir in the city. It was driven through rock and was originally designed to have a cross-sectional area of 76.34 square feet where lined and 82.5 square feet where unlined. All of it will now be lined. The defective work consisted chiefly in improper lining and in voids back of the lining, which should have been filled with masonry. Acetylene gas is being used to light the tunnel. The work is being done under the direction of Lieutenant-Colonel A. M. Miller, U.S.A.

A large water-power pumping plant to supply water to Paterson and Passaic, and a number of other municipalities in New Jersey, was put in operation in 1899. It is located on and takes water from the Passaic River, at Little Falls, N. J. It is the property of the East Jersey Water Company, a syndicate which has been working systematically and persistently to control as large a portion as possible of the available water-supply sources of northeastern New Jersey. In 1892 this company completed large storage reservoirs on the headwaters of the Pequannock River, one of the branches of the Passaic, and constructed a steel pipe line 48 inches in diameter and 21 miles long, to deliver water into one of the reservoirs of the city of Newark; also a branch pipe line, 36 inches in diameter and five miles long, for the same city; steel plates $\frac{3}{4}$ to $\frac{1}{4}$ inch thick were bent to shape and riveted together to form these conduits. Later, the company paralleled the 48-inch line with one of the same size for its upper $5\frac{1}{2}$ miles and 42 inches in diameter for the lower $15\frac{1}{4}$ miles; it also constructed a third reservoir, thus providing a total storage capacity of over 9,000,000,000 gallons. These works were built under contract with the city of Newark for a gravity supply of 50,000,000 gallons of water a day. The contract price was \$6,000,000, but the city retained one-third of this sum for eight years, in return for which it allowed the company to sell 22,500,000 gallons a day to other municipalities until September 24, 1900. The largest consumer of this surplus has been Jersey City, which has been supplied from the Pequannock source since 1896, through a 42-inch steel pipe line, 10,000 feet long, connecting with the old works. Another large branch pipe line from this source provides for the supply of Bayonne, N. J. Since the whole yield of the Pequannock will go to Newark after 1900, the East Jersey Water Company built also the large pumping station at Little Falls, for the purpose of supplying Jersey City (temporarily), Bayonne, and other contract consumers after that date, and also to give better water to Paterson and Passaic. The station is located at the lowest point on the river from which anything like a safe supply can be drawn, the river below being little less than an open sewer. Above Little Falls the Passaic has a drainage area of 772 square miles. Allowing for the water already diverted for Newark, and that to be diverted for the permanent supply of Jersey City (see below), it is estimated that the Passaic at Little Falls can be made to yield 300,000,000 gallons of water a day, for power and supply, if ample storage is provided. The available head for power at the new works will range from 35 to 38 feet. The development consists of a supply canal or head-race about 60 feet wide, 1400 feet long and 8 feet in (water) depth, carrying about 1500 cubic feet per second; necessary gate-houses, one 3-foot and three 12-foot steel penstocks, two 66-inch and one 48-inch main to supply the pumps, the power and pump-house, and various accessories. The initial pumping-plant comprises three 10,000,000-gallon high and one 20,000,000-gallon low-pressure cross-compound duplex pumps, with the necessary turbines, and a 2500-horse-power steam plant. Both the steam engines and the turbines are direct-connected to the pumps, so that either or both may be used, as desired. The pumps, turbines, and engines were designed by Professor A. Riedler, of Berlin, Germany, but have been modified in some particulars here. Clemens Herschel, of New York, is chief engineer of the East Jersey Water Company.

During the year work was begun by Patrick H. Flynn, a Brooklyn contractor, on a permanent water development for Jersey City, capable of supplying 50,000,000 gallons a day by gravity and of being extended to a capacity of 70,000,000 gallons a day. The supply will be taken from the Rockaway River (a tributary of the Passaic), near Boonton, N. J., where a big dam and reservoir are being constructed. From the reservoir a 76-inch steel pipe line will extend for many miles to one of the existing reservoirs, delivering under a pressure equivalent to a head of 210 feet. The city may buy the works at \$7,395,000 for a 50,000,000-gallon plant or \$8,850,000 for a 70,000,000-gallon plant, with advances of about \$500,000 in each case if it waits 5, 10, or 15 years, instead of purchasing at completion. In case the works are not bought the city will pay for the water used as follows: For the first 25,000,000 gal-

lons a day, \$36 a million; for successive 5,000,000 gallons in addition at the rate of \$34, \$32, and \$24, respectively; for from 45,000,000 to 50,000,000 gallons a day, \$20.

During the severe winter months of 1898-99 many water-works in the West used electricity to thaw frozen water service and main pipes, making use of information supplied largely by a circular furnished by the University of Wisconsin, the system having been perfected by Professors Dugald Jackson and R. W. Wood, of the university. For service pipes up to 1½ inches in diameter a current of 200 to 300 amperes and 50 volts is recommended. A circuit is made so that current from electric lighting or other wires will pass through the frozen pipe, a transformer, with resistance, ampere-meter and fuse boxes being provided.

Electrolysis continues to give anxiety to water-works officials and others responsible for gas and water pipes. No better remedy has been suggested than proper bonding of the rails of electric railways, or else the double trolley system, so that the current will return direct to the power-house, instead of through gas and water mains. A few cities and water companies have taken legal measures to collect damages from street railway companies on this score. An interesting review of the subject, summarizing special reports from various cities, was presented at the last meeting of the Central States Water-Works Association, by F. A. W. Davis, of Indianapolis, Ind.

Lead-poisoning from lead water service-pipes became a subject of prominence in 1899, principally on account of trouble of this sort at Lowell, Mass. Exhaustive investigations of the subject are reported in the 1898 report of the Massachusetts State board of health, where the results of observations and experiments on many water supplies of the State are given in detail. The two active agents causing water to take lead into solution are held to be oxygen and carbonic acid. The trouble thus far experienced has been caused wholly by ground water supplies. Besides Lowell, Milford, Kingston, and Fairhaven, Mass., had many cases. The amount of lead water must take up to become dangerous cannot be stated in definite and universal terms, but the report states, "it is known that the continuous use of water containing quantities of lead as small as 0.05 parts per 100,000, or about 1-33 grain per gallon, has caused serious injury to health." The moral of all this is that lead service-pipes should not be used to convey water for human consumption unless it is known that the water will not materially attack the lead, which is a question for experts to decide for each water-supply. See DAMS; FIRE PROTECTION; WATER PURIFICATION.

WATER-WORKS ASSOCIATION, AMERICAN, organized in 1880, for the improvement of water-works construction and administration, had in 1899 a membership of 500. The twentieth annual convention is to be held in Richmond, Va., May 15-18, 1900. President, R. M. Clayton; secretary, Peter Milne, 14 John Street, New York City.

WATSON, Baron, WILLIAM WATSON, LL.D., a life peer, died September 14, 1899. Born in 1828, and educated privately and at the universities of Glasgow and Edinburgh, he was admitted to the bar in Scotland in 1851. From 1874 to 1876 he was solicitor-general for Scotland, and in 1875-76 dean of the faculty of advocates; from the latter year to 1880 he was lord advocate, and during the same period sat in Parliament, as a Conservative for the universities of Aberdeen and Glasgow. In 1880 he became lord of appeal in ordinary, retaining the position to the time of his death.

WATTERSON, Rt. Rev. JOHN AMBROSE, Roman Catholic bishop of Columbus, O., was born at Blairsville, Penn., May 27, 1844; died in Columbus, April 17, 1899. He was graduated in 1865 at Mount St. Mary's College, Emmitsburg, Md., in which institution, upon his ordination to the priesthood three years later, he became a professor, and in 1877 was made its president. He was consecrated bishop in 1880.

WAUCHOPE, ANDREW G., C.B., C.M.G., major-general in the British army, was killed in the battle of Magersfontein, near Kimberley, December 11, 1899. Having entered the army in 1865, he served in the Ashanti War in 1873, the Egyptian War in 1882, and the Soudan expedition in 1884. In that year and in 1885 he took part in the Nile expedition. As a brigadier-general in 1898 he was in command of the first brigade in the Egyptian expeditionary force. Before the Boer war General Wauchope had received four wounds in action, three of which were severe.

WEBB, WILLIAM HENRY, retired shipbuilder, died at his home in New York, October 30, 1899. He was the son of Isaac Webb, a shipbuilder, and was born in New York, June 19, 1816. He was a pioneer in the construction of steam vessels of large burden, and became one of the best-known shipbuilders and one of the foremost authorities on marine architecture in the United States. He built over 150 large vessels; a few of these may be mentioned. The *United States*, launched in 1845, a vessel of 2500 tons, made an international reputation; she was sold to Russia

and converted into a sloop of war just before the Schleswig-Holstein War. A new model for navy vessels devised by Webb was refused by the United States, and later by the French government, but was accepted by Russia, for which country, upon this model he built in 1858 the *General Admiral*, a screw frigate of 7000 tons. During the Civil War Webb designed a number of men-of-war for the Union service, and built several vessels that were used in maintaining the Southern blockade. Probably his most important ship was the iron-clad ram *Dunderberg* (now the *Rochambeau*), which he built for the French government two or three years before the Franco-Prussian War. At the time of its launching this was said to represent the highest type of offensive and defensive naval architecture, and was long the fastest armored vessel afloat. Webb also built two frigates for the Italian government, and received from King Victor Emanuel the decoration of the order of Saints Maurice and Lazarus. After his retirement from the shipbuilding business in 1869, he entered upon several business ventures, including the organization of a guano company, real estate investments, and an interest in the Central American Transit Company, which ran a line of ships to Nicaragua. Three times Webb declined the nomination for mayor of New York, and for fourteen years he was president of the New York City Council of Municipal Reform. He founded and endowed Webb's Academy and Home for Shipbuilders at Fordham Heights, New York City, the purpose of the academy being to "furnish gratuitous education in the art, science, and profession of shipbuilding."

WEHNELT INTERRUPTER. See PHYSICS.

WEILL, ALEXANDRE, French publicist and novelist, died in Paris, April 19, 1899. He was born May 10, 1811, of Jewish parents. In 1838 he wrote with J. J. Louis Blanc for *La Revue du Progrès Politique*, and later took a position on the staff of *La Presse*, where his work chiefly concerned foreign politics. From *La Presse* he went to *La Gazette de la France*, in which, from the Legitimist point of view, he defended the constitutional monarchy. Besides his novels, the first of which appeared about 1856, he wrote many essays on art, on politics, and on religious subjects; these last he treated according to the critical method.

WELLESLEY COLLEGE, at Wellesley, Mass., was established in 1875 by private benevolence, and entered upon its work with a costly material equipment, but with no endowment in money. It has thirty scholarships for the benefit of approved candidates for the M.A. degree and thirty-five for undergraduates. The college is a contributor to the support of the American School of Classical Studies at Athens and the American School of Classical Studies at Rome, thus giving its graduates opportunities for study abroad. In 1899 the degree of M.A. was conferred upon two candidates, that of B.A. upon 131 candidates. For statistics see UNIVERSITIES AND COLLEGES.

WELLS, J. MADISON, ex-governor of Louisiana, died on his native plantation in Lecompte, Rapides parish, February 28, 1899, in his ninety-second year. He is remembered for his prominence in the political disorders of Louisiana from 1865 to 1876. At the election ordered by President Lincoln in 1864 in that part of the State held by the Union forces, Wells was chosen lieutenant-governor; in the early part of the following year he succeeded to the governorship, and in 1867 was elected by the popular vote. Reporting on the New Orleans riots of 1866, General P. H. Sheridan accused the governor of want of vigilance and energy, and the next year an effort was made in the legislature to impeach him. In 1867 also there was trouble over the disbursement of \$4,000,000 appropriated for the improvement of the levees along the Mississippi; and General Sheridan, after advising Secretary of War Stanton that Wells was "a political trickster and a dishonest man," removed him from office, appointing in his place General Benjamin F. Flanders. Wells then entered the Republican party, and in 1876 was United States naval officer at the port of New Orleans; in this year, after the Hayes-Tilden campaign, he was made chairman of the Louisiana Returning Board, which board was believed by the opposite party to have thrown out a sufficient number of votes to insure the election of Hayes. For a number of years subsequently he held federal office, but was never again prominent in politics.

WELTL, EMILE, ex-president of the Swiss confederation, died in Berne, February 24, 1899. He was born at Zurzach, Canton Aargau, April 23, 1825. After studying law at Berlin and Jena he settled in 1847 as an advocate in his native canton. He was a volunteer in the secession (Sonderbund) war. In 1856 he became president of the district court of Zurzach, then a member of the legislative body of Aargau, and from 1857 to 1866 represented his canton in the state council (Ständerath), of which body he was president in 1860 and 1866. In December of the latter year he was elected president of the confederation, and was re-elected for the years 1869, 1873, 1876, 1880, 1884, and 1891. Aside from the years in which he was presi-

dent, Welti was connected with the military affairs, and had the rank of colonel. The military reorganization of 1874 was his work. Later he devoted himself to the post-office and railway departments, and succeeded in establishing more satisfactory freight tariffs on the railways. Later still he strove to bring about the nationalization of the railways, but the decisive step which he wished to take in this direction was denied him by the Swiss people in their rejection, in December, 1891, of the proposition to purchase the Central Railway. He thereupon retired to private life. Welti was the author of various articles on the history of law that appeared from time to time in the *Argovia* magazine.

WESLEYAN METHODIST CONNECTION OF AMERICA, in 1899 reported 23 conferences, 595 ministers, 506 churches, and 17,201 communicants, the last figure showing a gain of 700 over 1898. Much substantial progress was made during 1899, 3 new conferences having been organized in October. The body showed a strong revival spirit. The seminary at Houghton, N. Y., was raised to the grade of a college.

WESLEYAN UNIVERSITY, at Middletown, Conn., founded in 1831, is the oldest of the colleges established under the auspices of the Methodist Episcopal Church, although it is in no sense a sectarian institution. A large number of free scholarships, covering wholly or in part the charge for tuition are at the disposal of the president for the benefit of needy and worthy students. At the close of the college year in 1899 the number of students was greater than ever before, the faculty had been strengthened, the library had been added to and made more serviceable, important changes in the curriculum had been decided upon, and the facilities for athletic training had been multiplied, and made of more general advantage. A movement to raise \$150,000 for a new recitation and administration building was authorized. In order to reduce the expense of a college course, a college commons has been established where board may be obtained at a very low rate. Among the recent gifts to the university were a legacy of \$25,000 from the late John Humphrey Sessions, of Bristol, Conn.; \$38,000 from Miss Elizabeth J. Mead, of Stamford, subject, however, to an annuity during the life of the donor, and \$30,000 from the late Albert Sanford Hunt, D.D., class of 1850, the income of which is to be spent in the purchase of books. Dr. Hunt also left to the library his large and valuable collection of books and pamphlets. In June, 1899, a class of 64 was graduated. For statistics, see **UNIVERSITIES AND COLLEGES**.

WEST AFRICA is controlled almost wholly by the European powers, France, Great Britain, Portugal, Germany, Spain, and Belgium, the only states which are entirely independent being Morocco and Liberia. France is the leading power in western Africa, her territorial area aggregating over 3,000,000 square miles, with a population estimated at 27,000,000. Within this territory lies almost the entire length of the Senegal River, navigable for 500 miles, and the Niger, 2500 miles long, lies for nearly half its length within French Africa; French territory, also, extends along the northern bank of the Congo into the heart of the continent, where it meets the sources of the Nile. France has uninterrupted communication from Algeria and Tunis, opposite her home ports on the Mediterranean, through the Sahara and Soudan, Lake Tchad, and French Congo, to the Congo River in the fifth degree south latitude. Her coast-line is interrupted at intervals by Morocco, Spanish Rio de Oro, Portuguese Guinea, Liberia, German Togoland and Cameroon, and British Gambia, Sierra Leone, Gold Coast, Lagos, and the Niger coast and territories. All but the last named are, comparatively, of small extent. See the separate articles **ALGERIA**; **TUNIS**; **SENEGAL**; **FRENCH SOUDAN**; **FRENCH GUINEA**; **DAHOMY**, and **FRENCH CONGO**.

British possessions in Africa are very extensive, but they lie mostly in the southern and eastern sections. England's West African territory, which has been much increased within the last thirty years, includes Gambia, Sierra Leone, Lagos, Gold Coast, the Niger coast protectorate, and the Niger territories, descriptions of which are given under these titles. The last is a large and valuable tract, and contains the Niger River, which leads to the far interior.

Portugal controls two divisions of West Africa, the first being Portuguese Guinea, south of British Gambia, and the second Angola, south of the Congo state, with an area of nearly 500,000 square miles.

Germany first secured a foothold in Africa in 1884. On the western coast she has Togoland, Cameroon, and German Southwest Africa, and on the eastern coast German East Africa. See **EAST AFRICA**, **GERMAN**.

Spain retains only Rio de Oro, lying south of Morocco, with an area of about 243,000 square miles; the station of Ifni, and the islands of Fernando Po, Annabon, Corisco, Elobey, and San Juan.

Belgium has for some years administered, under international recognition, the Congo Free State.

WEST AFRICA, BRITISH. The possessions of European nations on the western coast of Africa grew out of the slave trade on the Guinea coast, and when that was suppressed early in the nineteenth century, the liquor trade continued to make these possessions worth holding. France, Germany, and Great Britain are the chief rivals and landholders of the west coast, and it is through the colonies of the latter power that the larger part of the trade with the United States is carried on. These British possessions at the present time include **GAMBIA**, **SIERRA LEONE**, the **GOLD COAST**; **LAGOS**; the **NIGER COAST PROTECTORATE**, and the **NIGER TERRITORIES**, which see for detailed descriptions.

WESTERN AUSTRALIA, occupying the western third of Australia, is the largest of the five British colonies which make up the continent. It has an area of 975,920 square miles, its greatest length north and south being nearly 1500 miles and its width about 1000 miles. The population of Western Australia was estimated in 1899 at 170,069; the capital, Perth, had about 43,000; the chief port, Fremantle, 15,000. It has a fine climate and one which extends over twenty degrees of latitude, insuring considerable diversity of conditions. Among natural products of value are the eucalyptus tree, especially the variety known as the jarrah, locally called mahogany, the karri, a tree of enormous size, and the tuart. In a different botanical class is the sandal-wood tree, whose timber has long been an export of the colony. It is estimated that there are over 20,000,000 acres of forest land in Western Australia; of this about 8,000,000 acres are jarrah forests, and 1,200,000 acres are covered by the karri. Besides timber, pearl and pearl shells contribute to the natural products, and gold, coal, lead, copper, iron, zinc, and tin. Western Australia has attained the leading position as a gold-producer in Australia, and is rapidly advancing toward the position of first world-producer of gold. Between 1886 and 1897 the output of gold increased from 302 ounces, valued at about £1147, to 674,993 ounces, valued at £2,564,976. In 1898 the output was 1,050,184 ounces, valued at £3,990,698. In 1899 it was officially estimated that the production would be fully £6,000,000. The gold reefs are said to be about 1200 miles long, the most famous field being the Coolgardie district. Valuable coal areas have recently been discovered, especially in the vicinity of Bunbury. The mining population has penetrated well into the interior, but the occupied portion of the colony is largely along the western coast, where the land is of considerable fertility. About 133,180 acres were under crop in 1897, but millions of acres are suitable for cultivation. Little dressing is required, and the rainfall being certain no crop failures such as have affected eastern Australia have ever occurred in this colony. About 20,000,000 acres of fairly good pasture exist along the rivers of the north and northeast. The exports of 1898 were valued at £4,960,006, of which gold amounted to £3,990,698, wool, £287,731, and timber, £326,195, other exports being sandal-wood, pearls, and pearl shells, tin, copper, guano, and kangaroo-skins. The imports in 1898 were £5,241,905, the principal items being provisions, sugar, tea, tobacco, spirits, machinery, clothing, etc. Albany and Fremantle are the principal ports. The public revenue in 1898-99 was £2,478,811, and the expenditure £2,539,358. The public debt on June 30, 1899, was £10,488,363.

Western Australia is administered by a governor appointed by the crown, and a parliament consisting of a legislative council and assembly, containing respectively 24 and 44 members chosen by the people. In 1899 the governor was Sir Gerard Smith, and the premier and treasurer Sir John Forrest. It was the last of the Australian colonies to be granted a colonial government, the present constitution being framed by the imperial government in 1890. Education is compulsory, but not free. Aid is given to denominational schools. There are about 1360 miles of railroad, and 275 miles under construction. There are about 7000 miles of telegraph lines. There is a movement on foot to promote the construction of railways on a large scale on the land-grant system for the purpose of developing the interior of the country.

History, 1899.—The proposal for federation among the Australian colonies was defeated in Western Australia, that colony being the only one which decided to continue as a separate state. An offer was made to the imperial government of a contingent of troops for South Africa, and these left for the seat of war early in November amid considerable enthusiasm. Western Australia was the only colony in Australia whose government was not overthrown during the year.

WEST INDIES, a large number of islands and islets lying between the Florida coast and the coast of South America, or between 27° and 10° north latitude and 59° 30' and 85° west longitude, comprise the Bahamas, the Greater Antilles, the Lesser Antilles, which are divided into the Leeward and Windward islands, and various islands adjacent to the Central American and South American coasts. The total area is about 92,270 square miles and the aggregate population, about one-half of whom are negroes and the greater part of the remainder mulattoes, is estimated at about 5,000,000. The political division of the islands is as follows: *Independent:*

Haiti, comprising the republics of Haiti and San Domingo; *American (U. S.)*: Cuba (provisional government) and Puerto Rico, Isla de Pinos, Culebra, Bieque, and other small islands; *British*: Jamaica, Turks, Caicos and Cayman islands, Antigua, Nevis, St. Christopher, Montserrat, the Virgin islands, St. Vincent, Grenada, St. Lucia, Barbados, Trinidad and Tobago, the Bahamas, and the islands adjacent to British Honduras; *French*: Martinique, Guadeloupe, Marie Galanta, St. Martin (in part Dutch), Les Saintes, Deseada, St. Bartholomew; *Danish*: St. Thomas, St. John, St. Croix; *Dutch*: Curaçao, St. Eustache, Saba, Bonaire, Aruba; *Venezuelan*: Tortuga, Margarita, Coche Cuagua. The areas and approximate populations of the West Indies belonging to European nations are as follows: British, area about 13,137 square miles, population 1,512,300; French, area 1068 square miles, population 357,000; Dutch, area 403 square miles, population 49,599; Danish, area 118 square miles, population 35,156.

Some of the more important statistics of West Indian finance and commerce have been:

	British.	Dutch.
	1896.	1897.
Revenue.....	£1,869,570	£1,776,941
Expenditure...	1,920,088	1,881,044
Imports.....	6,440,463	5,867,687
Exports.....	5,252,053	5,094,160

1898—Estimated, 683,000 guilders.
1898—Estimated, 700,000 guilders.
1896—(Curaçao) 2,962,668 guilders.

Foreign tonnage:

Entered.. }	8,234,484	9,143,035
Cleared.. }		1896—526,148.

Business depression in the West Indies during recent years caused the British government to empower a commission to investigate the matter to the end of bringing relief to the British possessions. The report of the commission was published in October, 1897, and by 1899 the recommendations had to a large extent been carried into effect. The general business depression was due chiefly to the serious falling off in the profits of the sugar industry. The best remedy is the abandonment of the bounty system, but this the commissioners found to be impracticable. The special measures of relief recommended by the commissioner and now being effected are: The settlement of laborers on small plots of land as peasant proprietors; the development of minor agricultural industries and the improvement of agricultural methods, especially with reference to small proprietors; the improvement of the means of communication, particularly between the different islands; the development of the fruit trade with New York and later, perhaps, with London; the establishment of central sugar factories in Barbados by means of an imperial loan of £120,000. Besides this sum the expenditure needed for these reforms was an immediate grant of £90,000 for the liquidation of the floating debt in some of the smaller islands, and for the settlement of laborers, and the construction of roads in St. Vincent and Dominica; and grants of £27,000 a year for ten years, and £20,000 a year for five years. Pursuant to a supplementary report measures were taken for the establishment of a West Indian department of economic botany, and for agricultural instruction, botanical stations to be established in the Leeward and Windward islands. It was thought in 1899 that the reorganization of industry thus undertaken, together with the natural resources of the islands, would effect a gradual return of prosperity.

On September 10, 1898, many of the islands, especially Barbados, St. Vincent, St. Lucia, and Trinidad, suffered much damage from a hurricane. On August 7 and 8, 1899, a terrific hurricane swept over the Lesser Antilles, Puerto Rico, and the Bahamas, touching also points in the island of Haiti and in eastern Cuba. Hundreds of persons in the smaller islands lost their lives, while in Puerto Rico the number of killed was reported to reach 2000. The amount of damage was incalculable, and in Puerto Rico about three-fourths of the population, it was said, were rendered homeless and destitute. The total loss of life in the West Indies was estimated at 5000. Relief measures for Puerto Rico were instituted at once by the United States government, and for the British islands by the imperial authorities. See AGRICULTURE (paragraph Agricultural Teaching).

WEST VIRGINIA, a central eastern State of the United States, with an area of 24,780 square miles. Capital, Charleston. West Virginia became a State on June 20, 1863.

Mineralogy.—During the calendar year 1898 the State increased its coal product over the output of 1897 by 2,452,840 short tons, and retained among the States its rank as the third producer, which it gained in 1896. The total production from 225 mines was 16,700,999 short tons, valued at \$10,131,264. In production, Fayette

County led, with 4,592,772 tons, followed by McDowell, 3,904,976; Marion, 2,114,352; and Kanawha, 1,354,500. Salt showed a decline, with 247,668 barrels of all kinds from four plants, valued at \$88,462; and quarrying yielded sandstone, \$14,381, and limestone, \$56,167. During 1899 the activity in all industries was unprecedented. Coal-mining suffered severely, because of a lack of miners. A number of well-paying mines were idle from scarcity of help, and in the Flat Top region alone fully 5000 more miners were needed. The chief mine inspector reported for the year ending June 30, 1899, a coal production of more than 18,000,000 tons, the employment of 25,000 men in and about the mines, and a steady increase in machine mining.

Manufactures.—During the calendar year 1898 the production of pig-iron was 192,699 long tons, and of all kinds of rolled iron and steel, 198,883 long tons. In the coking industry there were 87 plants, with 8659 ovens in operation, which used 3,145,398 short tons of coal, and produced 1,925,071 short tons of coke, valued at \$2,432,657. The yield of coke in the year ending June 30, 1899, was officially reported at more than 2,000,000 short tons. In the last period the collections of internal revenue on taxable manufactures aggregated \$1,430,106. There were 39 manufactories of tobacco and 148 of cigars, and the combined output in the calendar year 1898 was 72,470,252 cigars and 3,736,642 pounds of manufactured tobacco, principally smoking. The quantity of spirits rectified was 159,717 gallons; distilled spirits gauged, 702,326; and fermented liquors produced, 140,738 barrels.

Banks.—On October 31, 1899, there were 35 national banks in operation and 8 in liquidation. The active capital aggregated \$3,576,550; circulation, \$1,676,022; deposits, \$12,624,339; and reserve, \$4,254,980. The State banks, September 30, 1899, numbered 75, and had capital, \$3,251,257; deposits, \$15,960,308; and resources, \$21,322,955. One mutual savings bank had depositors, 4127; deposits, \$324,081; and resources, \$335,862.

Railways.—The new railway construction in the calendar year 1898 was 42 miles, and in 1899, 32.50 miles, giving the State a total mileage of 2232.01. At the close of 1899 a line was being constructed from Huntington to Pineville, a distance of about 100 miles, which will open up a new timber region and coal-field, and penetrate Cabell, Lincoln, Logan, Boone, and Wyoming Counties. Another one, requiring several bridges and an estimated outlay of \$800,000, was under contract, to extend from Elkins, on the West Virginia Central road, to the forks of the Greenbrier River, 43 miles, and there connect with a new line under construction along the Greenbrier Valley. Railway property was assessed for taxation at \$22,028,362.

Education.—At the close of the school year 1897-98 the school population was 302,354; enrolment in the public schools, 236,188; and average daily attendance, 159,768. There were 6808 teachers, 5856 buildings used as school-houses, and public school property valued at \$3,471,697. The revenue was \$1,933,718; expenditure, \$2,046,623, of which \$1,168,191 was for teachers' salaries. There were 28 public high schools, with 79 secondary teachers, 1778 secondary students, and 285 elementary pupils; 14 private secondary schools, with 56 teachers, 655 secondary students, and 799 elementary pupils; 7 public normal schools, with 49 teachers and 1475 students in all departments; and 3 private ones, with 19 teachers and 450 students. Normal training was also given in 2 colleges and 1 public high school. Three universities and colleges for men and for both sexes reported 2 fellowships, 63 professors and instructors, 808 students, 18,600 volumes in the libraries, \$51,000 invested in scientific apparatus, \$520,000 in grounds and buildings, and \$114,750 in productive funds, and \$90,836 in total income. One college for women reported 4 professors and instructors, 42 students, grounds and buildings valued at \$6500, and total income of \$4500. In 1899 there were 193 periodicals, of which 18 were dailies, 156 weeklies, and 14 monthlies.

Finances.—The assessed valuations for 1898 were: Real estate, \$147,058,218; personal property, \$53,101,906; and railway property, \$22,028,362—total, \$222,182,486, an increase of \$2,373,586 in a year, chiefly in personal property; tax rate, \$2.50 per \$1000. The State has a permanent school fund of about \$950,000, and no recognized public debt. Another movement for settling the old debt controversy with Virginia has been undertaken.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 965,000.

Legislation.—When the legislature met, January 11, 1899, contests concerning nine seats presented themselves for settlement, and a United States senator had to be elected before ordinary matters of legislation could be considered. On January 25 Nathan B. Scott was elected senator, and on February 7 the final settlement of the suspended contests resulted in giving the Democrats an additional vote in 1901, when a successor to Senator Stephen B. Elkins (Rep.) will be elected. The constitutional amendment, upon which the people will vote in 1900, declares that no charter of incorporation shall be granted to any church or religious denomination, but that

societies may be formed for missionary purposes. It was enacted that the death penalty is to be executed by hanging, within an enclosure in penitentiary walls not open to the public. Three hospitals were established, each under a State board, for free treatment of those hurt in mines and on railroads; others injured or hurt may be treated at cost of the State. Embalmers must be examined and licensed by a State board of embalmers. Eight hours were made a day's labor on all public works. A State board of pardons was created to consider and advise the governor as to pardons, commutations of sentence, and reprieves.

State Officers and National Representatives.—Governor, George W. Atkinson; secretary of state, W. M. O. Dawson; treasurer, M. A. Kendall; auditor, L. M. La Follette; attorney-general, E. P. Rucker; superintendent of schools, J. R. Trotter; adjutant-general, J. W. M. Appleton. Supreme Court of Appeals: President, M. H. Dent; judges, John W. English, Henry Brannon, H. C. McWhorter; clerk, J. A. Holley. The State legislature consists of 49 Republicans and 48 Democrats. Senators, Stephen B. Elkins, from Elkins; and Nathan B. Scott, from Wheeling—both Republicans. Representatives, B. B. Dovener (Rep.), from Wheeling; Alston G. Dayton (Rep.), from Philippi; David E. Johnston (Dem.), from Bluefield; and Romeo H. Freer (Rep.), from Harrisville.

WESTCOTT, EDWARD NOYES, banker-author, was born in Syracuse, N. Y., September 27, 1847, and died there March 31, 1898. He was educated at the public and high schools; compelled by circumstances to give up a college course, he devoted his attention to the banking business. He married Jane Dows, of Buffalo, N. Y., who died in 1890, leaving three children. In 1895 Mr. Westcott was compelled to retire from active business on account of his health, and in the summer of that year he began *David Harum*, which he completed about fifteen months later. The manuscript was read and refused by six publishers in turn, the author meanwhile being confined to his bed, and knowing that recovery was impossible. When the book was finally accepted by the seventh publisher, Mr. Westcott's health actually rallied a little, but only temporarily, and his most earnest desire then was that he might at least live to read the proofs himself, but he died six months before his book appeared. Although published in 1898, *David Harum* was one of the most widely read books of 1899, and at the end of the year its sale had reached upward of half a million copies.

WESTMINSTER, Duke of, HUGH LUPUS GROSVENOR, K.G., born 1825, died December 22, 1899. The Duke of Westminster was in some respects the most important territorial proprietor in Great Britain. His estates included about 30,000 acres of land in Cheshire and Flintshire and 600 acres within the city of London. The latter land is very valuable, being situated in lots within the heart of the city. Long leases made upon these lots are now expiring, making available to the family some of the most valuable real estate in the world. The wealth of the duke was already such as to place him among the richest men in the world, it has been asserted, and the prospective income to the new duke will be very great. The Duke of Westminster sold to William Waldorf Astor a few years ago his estate known as Clivedon, on the Thames, one of the finest estates in England, situated about twenty miles from London. The Duke of Westminster was born at Eton. After graduation at Oxford he represented Chester in Parliament from 1847 to 1868. In 1869 he succeeded his father as marquis. He became a duke in 1874. The Duke of Westminster was Master of the Horse, 1880-86; Lord Lieutenant of Cheshire, 1883, and of the county of London, 1888. Also High Steward of Westminster and aide-de-camp to the Queen. The youngest daughter of the duke, Lady Margaret Evelyn Grosvenor, was married in 1894 to Prince Adolphus Charles Alexander of Teck, grandson of the Queen.

WHARTON, MRS. EDITH (born Jones), author, is descended on both sides from old New York families; she married Mr. Edward Wharton, a well-known Philadelphian, and has spent several years abroad; she is specially fond of travel. Her first book, a collection of short stories, entitled, *The Greater Inclination*, published early in 1899, was one of the most highly commended books of the year.

WHEAT. The United States produces and exports more wheat than any other single country. In 1899 the production was nearly one-fourth of the wheat crop of the world, Russia, including Siberia, coming next, with about 17 per cent. of the world's supply, and France third, with nearly one-seventh. About one-third of our wheat is exported, mostly to Europe. Large quantities of wheat flour, also, are exported, and the amount is increasing rapidly each year. Russia will probably continue to be the chief competitor of the United States in the world's market. One of the principal features in the increasing growth of wheat in this country has been the concentration of the surplus wheat production in the immense territory west of the Mississippi. Production by States is shown in the following tables of the Department of Agriculture:

STATES AND TERRITORIES.	Acreage.	Average yield per acre.	Production.	Average farm price Dec. 1.	Farm value December 1.
	<i>Acres.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Cents.</i>	<i>Dollars</i>

WHEELER, BENJAMIN IDE, A.M., Ph.D., LL.D., president of the University of California, was elected to his present position on June 16, 1899, to succeed Dr. Martin Kellogg, who resigned in 1898. At the time of his election he was professor of Greek and comparative philology at Cornell. He was born at Randolph, Mass., July 15, 1854; graduated at Brown University in 1875; studied at German universities from 1881 to 1885; was called to the chair of comparative philology at Cornell in 1886, and two years later was made professor of Greek. On October 25, 1899, he was inaugurated president of the California university. President Wheeler's writings include: *The Greek Noun-Accent*, 1885; *Analogy*, and *the Scope of Its Application in Language*, 1887; *The History of Language*, in collaboration with two other scholars; *Principles of Language Growth*, 1891; *The Organization of Higher Education in the United States*, 1897; *Life of Alexander the Great*, 1899. He was the editor of the department of philology in *Macmillan's Dictionary of Philosophy and Psychology* and of the same department in *Johnson's Cyclopædia*; he has contributed to various philological and scientific journals, and was a co-editor of the *Cornell Classical Studies*.

WHIST. In 1899 the national championship tournament in whist was held, as usual, under the auspices of the American Whist League, the meeting place being Chicago. The Hamilton trophy, emblematic of the championship, was won by the Buffalo Whist Club. The national meeting, with representatives from all parts of the country, was continued during one week. The St. Paul Chess and Whist Club won the American Whist League challenge trophy. The prize for pairs, known as the Minneapolis trophy, was won by Messrs. Rollo and Keene, of the Chicago Whist Club. The Brooklyn trophy for auxiliary associations was won by the Atlantic Whist Association, including Baltimore, Washington, Wilmington, and Philadelphia. The Women's Whist League held its third annual congress in 1899 at Washington. The

Washington trophy for teams of four was won by the Ladies' Whist Club of New York.

WHIST LEAGUE, AMERICAN, founded in 1895, had in 1899 a membership of 143 clubs. The general meeting for 1900 is to be at Niagara Falls on July 5. Secretary, C. A. Henriques, 25 West Forty-ninth Street, New York City.

WHISTLER, JOSEPH NELSON GARLAND, colonel, U.S.A., retired, died at Fort Wadsworth, New York harbor, April 20, 1899. He was born in 1822; graduated from the Military Academy at West Point in 1846; served through the Mexican war, and was brevetted first lieutenant for gallantry at the battle of Centrerros. At the outbreak of the Civil War he was captured in Texas by the Confederates; upon his release he was promoted to a captaincy, and served from 1861 to 1863 as instructor of military tactics at West Point. In May, 1863, he was made colonel of the Second New York Artillery, and served in the Richmond campaign, being wounded in a battle before Petersburg, and within the defences of Washington. In 1865 he was brevetted brigadier-general of volunteers, but was mustered out of the volunteer forces, and returned to the regular army. In May, 1883, he was promoted to the colonelcy of the Fifteenth Infantry, and was retired in October, 1886.

WHITE, ANDREW DICKSON, Ph.D., LL.D., United States ambassador to Germany, was appointed by President McKinley chairman of the American delegation to the peace conference which was held at The Hague in May, 1899. Mr. White was born at Homer, N. Y., November 7, 1832, and was educated in the public schools of Syracuse and at Yale University, where he was graduated in 1853. After several months of study in France he became an *attaché* of the American legation at St. Petersburg; he then passed several years in travel and in study at French and German universities, and in 1857 accepted the chair of history and English literature at the University of Michigan. This position he held until 1864, and from the previous year until 1867 was a member of the New York State Senate. At this time Ezra Cornell, who was a member of the legislature, was perfecting plans for founding a university, and Mr. White rendered him considerable assistance, so that when Cornell University was founded Mr. White became its first president. He occupied this position, together with the chair of history, from 1867 to 1885; in the latter year he resigned, and made over to the university his historical library, comprising about 30,000 volumes. In 1871 he was one of the commissioners named by President Grant to study and report upon the question of the proposed annexation of Santo Domingo. In 1878 he was a commissioner to the Paris Exposition. President Hayes appointed him in 1879 minister to Germany, and he secured a two years' leave of absence from Cornell. On January 1, 1896, Mr. White was appointed by President Cleveland a member of the commission to investigate the Venezuela-British Guiana boundary line. The next year he was appointed by President McKinley ambassador to Germany; he has performed the duties of this last high position with ability. He is a regent of the Smithsonian Institution and a member of the Legion of Honor of France. Among his publications may be mentioned *A History of the Warfare of Science with Theology*, 1895, the proceeds of which he gives to the School of History and Political Science at Cornell. The appointment of Mr. White as chairman of the American delegation at The Hague met with general approval.

WHITE, SIR GEORGE STEWART, lieutenant-general in the British army, was in command of the forces in South Africa during the early part of the Boer war, which began with the Boer invasion of Natal on October 12, 1899. On October 21 he defeated the Boers at Elandslaagte, and the next day was reinforced at Ladysmith from Pietermaritzburg; on the 24th he repulsed a Free State force at Rietfontein, and soon after retired to Ladysmith, where his command was shelled on the 30th. Here, by November 2, General White was practically besieged and communications were cut off. General Buller (*q. v.*) was then appointed to the command of the forces in South Africa. During the weeks that followed, the English made several sorties from Ladysmith, and the town was repeatedly shelled by the Boers, and at the close of the year the siege was still in progress. (See TRANSVAAL, paragraphs on History.) General White was born July 6, 1835, and was educated at Sandhurst, entering the army in 1853. He served with distinction during the Indian mutiny with the Royal Inniskilling Fusiliers, and became a captain in 1863, and a major ten years later. In the Afghan war of 1878-80 he served with the Gordon Highlanders, and was present at the battle of Charasia and the capture of Kabul, and took part in the Maidan expedition and the capture of Takti Shah. He received special honor for his services under General Roberts on the march from Kabul to Kandahar, and became military secretary to the viceroy of India. He was promoted lieutenant-colonel in 1881 and colonel in 1885. In this year and in 1886 he commanded a brigade in Burmah, and so distinguished himself that he received the thanks of the Indian government, and was promoted to the rank of major-general. General White also commanded the expedition into Zhob. He was commander-in-chief of the forces in

India from 1893 to 1898, when he was made quartermaster-general of the British army, the last position held by him before going to South Africa.

WHITEING, RICHARD, author and editor, London, was born in that city, July 27, 1840; he was educated privately, and in 1869 married Helen, niece of Townsend Harris, first United States minister to Japan. In 1866 he contributed a series of satirical papers, political and social, to the *Evening Star*, which were afterward republished as *Mr. Sprouts—His Opinions*; he has been connected with the *Morning Star*, the Press Association, the *Manchester Guardian*, both editorially and as Paris correspondent, in which capacity he also served the London *World* and the New York *World*. Publications: Three novels, *The Democracy*, 1876; *The Island*, 1888; and *No. 5 John Street*, 1899, the last-named giving a remarkably vivid description of certain phases of life in the slums.

WIEDEMANN, GUSTAV, professor of chemistry and physics in the University of Leipsic, died in Leipsic, March 24, 1899. He was born October 2, 1826, in Berlin, and was educated there, becoming in 1851 a lecturer in the University. He was called to a professorship at Basel in 1854, at the Polytechnic School in Brunswick in 1863, and at Karlsruhe in 1866. In 1871 he became professor of physical chemistry at Leipsic, where, in 1887, he was appointed to the chair of physics. He devoted himself particularly to magnetism and dynamical electricity. Prominent in his work were the investigations concerning the relations between heat and electricity, and between the mechanical and the magnetic phenomena of bodies, and concerning the dependence of such phenomena on chemical composition. He wrote a work in four volumes entitled *Die Lehre von der Electricität*; after the death of Johann Christian Poggendorff, in 1877, Wiedemann edited the *Annalen der Physik und Chemie*.

WILLEY EXPEDITION See ZOOLOGICAL LITERATURE (paragraph Special Treatises).

WILLIAMS, HENRY WARREN, one of the seven justices of the Pennsylvania Supreme Court, died in Philadelphia, January 25, 1899. He was born at Hartford, Susquehanna County, Penn., in 1830. Having studied law at Wellsboro, he was admitted to the Tioga County bar in 1854. In 1865 Governor Curtin appointed him law judge of the fourth State judicial district, to which position he was afterward repeatedly elected. In 1887 he was elected as a Republican to the Supreme Court for a term of twenty-one years. In 1877 Judge Williams was a representative of the Presbyterian Church of the United States to the Pan-Presbyterian Council at Edinburgh, Scotland. He was active in Sunday-school work and in that of the Young Men's Christian Association. He was prominent in the Masonic order.

WILLIAMS, JOHN, D.D., LL.D., presiding bishop of the Protestant Episcopal Church of the United States, died at his home in Middletown, Conn., February 7, 1899. Born of Unitarian parents in Deerfield, Mass., August 30, 1817, he entered Harvard College in 1831; but after two years of study there he became an Episcopalian, and entered Washington (now Trinity) College, Hartford, where he was graduated in 1835. In the fall of that year he began his theological studies in the General Seminary, New York. He became a tutor in Trinity College; was ordained deacon in 1838; from 1842 to 1848 he was rector of St. George's Church, Schenectady, N. Y., the only pastoral charge he ever held. For the five years succeeding he was president of Trinity College; in 1851 he was consecrated assistant bishop of Connecticut. During his presidency at Trinity his theological influence was so considerable among the students that it resulted in the establishment of the Berkeley Divinity School at Middletown in 1854. From the beginning Bishop Williams was the dean of the institution, and the principal instructor in doctrinal theology. Upon leaving Trinity he was made the vice-chancellor of the college. He succeeded to the chancellorship and to the bishopric of Connecticut in 1865. In 1887 he became presiding bishop of the church in this country. Bishop Williams was a man of remarkable eloquence and scholarship; his influence was exceptionally strong, especially over young men. Besides many contributions to religious periodicals, his writings include: *Ancient Hymns of the Holy Church*, 1845; *Thoughts on the Gospel Miracles*, 1848; *Everlasting Punishment*, 1865; *The English Reformation*, 1881; *The World's Witness to Jesus Christ*, 1882; *The Seabury Centenary*, 1885; *Studies in the Book of Acts*, 1888.

WILLIAMS, Sir MONIER. See MONIER-WILLIAMS, SIR MONIER.

WILLIAMS COLLEGE, at Williamstown, Mass., established in 1793, is non-sectarian and for men only. In the year 1899-1900 there were 34 instructors, 386 students and a library of 44,251 volumes. The college received gifts and bequests to the amount of \$20,478. President, Franklin Carter, LL.D. See UNIVERSITIES AND COLLEGES.

WILLIS, EDMUND AYLBURTON, landscape painter, died February 3, 1899. He was the son of John Aylburton Willis, a professional artist, and was born in Bristol,

England, October 12, 1808. He studied art with his father, and travelled in the interest of his profession in many of the countries of Europe. In 1851 he came to the United States and after making a tour returned to England, but soon came to America again and lived thereafter during most of his life in Brooklyn. His best known picture is "The Prairie Fire." Willis was one of the foremost members of the Brooklyn Art Society. He was the brother of Henry Britton Willis, an artist of some reputation, and a member of the Royal Society of Painters in Water-Colors.

WINDWARD ISLANDS, a colony of Great Britain consisting of a group of West Indian islands lying to the east of the Caribbean Sea between Martinique and Trinidad. The islands comprising the colony are Grenada, the Grenadines, St. Vincent, and St. Lucia (*qq. v.*), having an area of 511 square miles and a population of about 154,100. The islands are under one governor, but there is no common legislature, laws, tariff, or treasury. In these departments each of the islands is separate, except the little group of the Grenadines, which administratively are divided between St. Vincent and Grenada. The governor, who resides at St. George's, Grenada, has been, since January, 1897, Sir Cornelius Alfred Moloney, K.C.M.G. The chief products are sugar, coffee, cacao, spices, etc. Statistics of finance and commerce:

	Revenue.	Expenditure.	Imports.	Exports.
1897..	\$143,008	\$141,812	\$480,433	\$377,641
1898.	156,990	146,178	554,267	491,254

On August 7 and 8, 1899, a hurricane which swept over the Lesser Antilles and Puerto Rico did a considerable amount of damage in the Windward Islands.

WINES, FREDERICK HOWARD, who was appointed in March, 1899, assistant director of the United States census, was born in Philadelphia, Penn., April 9, 1838. After graduation at Washington College, Penn., in 1857, he studied at the Princeton Theological Seminary, graduating in 1865, having left in the meantime and been licensed to preach by the Presbytery of St. Louis. From 1865 to 1869 he was pastor of the First Presbyterian Church in Springfield, Ill. Mr. Wines has served on many boards of public charities, was a delegate to the International Prison Congress at Stockholm in 1878, and is the author of many statistical books on charities, penal matters, and the liquor question. In 1862-64 he was chaplain in United States Army (regulars).

WINTEROP, WILLIAM R., colonel, United States Army, died at Atlantic City, N. J., April 8, 1899. He was born in 1832; was graduated at Yale in 1852, and then studied law. At the outbreak of the Civil War he entered the Union service in the Seventeenth New York Volunteers. For three years he was with the Army of the Potomac, when he was appointed a judge-advocate. Subsequently he served for a time as professor of law in the Military Academy at West Point. He was the author of *Military Law and Precedents*.

WIRELESS TELEGRAPHY. Considerable progress was made during 1899 in the application of wireless telegraphy to practical uses. Of the several systems for telegraphing without wires, that devised by Signor Marconi has been most before the public. Early in the year messages were successfully sent by this system from South Foreland, England, across the English Channel to Boulogne, France, a distance of 32 miles. A full description of the apparatus used and of the experiments themselves was published in a paper by Signor Marconi, read before the Institute of Electrical Engineers of London early in 1899. In September, 1899, Signor Marconi and several assistants came to America to report the international yacht races off Sandy Hook by wireless telegraphy. Sending apparatus were placed on two steamers which followed the yachts, and receiving apparatus were placed, one on the cable ship *Mackay-Bennett*, anchored near the Sandy Hook lightship, and the other on shore at the Highlands of Navesink. Bulletins of the progress of the races were sent from the following steamers to the receiving stations, and from them by wire to the office of the New York *Herald*. After the yacht races, tests were made by Signor Marconi in conjunction with the Signal Corps of the United States Army and with the Navy Department. The report of the inspecting board in the Navy Department tests was quite favorable to the utility of the system for communicating between vessels at sea. The findings of the board were in full as follows:

"1. It is well adapted for use in squadron signalling under conditions of rain, fog, darkness, and motion of ship. The wind, rain, fog, and other conditions of weather do not affect the transmission through space, but dampness may reduce the range, rapidity, and accuracy by impairing the insulation of the aerial wire and the instruments. Darkness has no effect. We have no data as to the effects of rolling and pitching, but excessive vibration at high speed apparently produced no bad effect on the instruments, and we believe the working of the system will be very little affected by the motion of the ship.

2. The accuracy is good within the working ranges. Cipher and important signals may be repeated back to the sending station, if necessary to secure absolute accuracy.
3. When the ships are close together (less than 400 yards) adjustments (easily made) of the instruments are necessary.
4. The greatest distance that messages were exchanged with the station of Navesink was $16\frac{1}{2}$ miles. This distance was exceeded considerably during the yacht races, when a more efficient set of instruments was installed there.
5. The best location of the instruments would be below, well protected, in easy communication with the commanding officer.
6. The spark of a sending coil or of a considerable leak, due to faulty insulation of the sending wire, would be sufficient to ignite an inflammable mixture of gas or other easily lighted matter, but with the direct lead (through air space, if possible) and the high insulation necessary for good work, no danger of fire need be apprehended.
7. When two transmitters are sending at the same time, all the receiving wires within range receive the impulses from transmitters, and the tapes, although unreadable, show unmistakably that such double sending is taking place.
8. In every case, under a great variety of conditions, the attempted interference was complete. Mr. Marconi, although he stated to the board, before these attempts were made, that he could prevent interference, never explained how nor made any attempts to demonstrate that it could be done.
9. Range of signalling: Between large ships (heights of masts 130 to 140 feet above the quarter deck), the range is at least 35 miles at sea and $16\frac{1}{2}$ miles or less when tall buildings of steel frames interfere. Between a large ship (height of mast, 140 feet) and a torpedo-boat (height of mast 45 feet), across open water, signals can be read up to 7 miles on the torpedo boat, and $8\frac{1}{4}$ miles on the ship. Communication might be interrupted altogether when tall buildings of iron framing intervened.
10. The rapidity is not greater than 12 words per minute for skilled operators.
11. The shock from the sending coil of wire may be quite severe and even dangerous to a person with a weak heart. No fatal accidents have been recorded.
12. The liability to accident from lightning has not been ascertained.
13. The sending apparatus and wire would injuriously affect the compass if placed near it. The exact distance is not known and should be determined.
14. The system is adapted for use on all vessels of the navy, including torpedo boats and small vessels, as patrols, scouts, and dispatch boats, but it is impracticable in a small boat.
15. For landing parties the only feasible method of use would be to erect a pole on shore and then communicate with the ship.
16. The system could be adapted to the telegraphic determination of differences of longitude in surveying.

The board respectfully recommends that the system be given a trial in the navy."

It is a matter of particular interest to electricians that an actual field test of wireless telegraphy in war is being conducted in the Boer-British campaign which is being carried on in South Africa. Conflicting reports have been published respecting the operation of the system in South Africa, but they are not circumstantial enough to enable fair conclusions to be drawn. During the year Professor Zickler, of Brunn, Moravia, announced the invention of a new system of wireless telegraphy. So far the work done by Professor Zickler appears to have been purely experimental.

WISCONSIN, a northern lake State of the United States, with an area of 56,040 square miles. Capital, Madison. Wisconsin became a State May 29, 1848.

Mineralogy.—In the calendar year 1898 the State increased its output of quarry products over that of the previous year by more than \$150,000, the values being, granite, \$175,867; sandstone, \$80,341, and limestone, \$698,454—in all, \$954,662. Of the limestone, \$167,875 were used for building purposes, \$111,726 for paving and road-making, and \$367,720 for burning into lime. Iron-mining, principally in those parts of the famous Menominee and Gogebic ranges that lap over from Michigan, yielded 509,645 long tons, all red hematite, valued at \$687,913. The single coking plant, with 120 ovens, more than doubled its production of 1897, using 59,900 short tons of coal, and yielding 35,280 short tons of coke, valued at \$123,480. Of pig-iron 172,781 long tons were produced.

Agriculture.—A suggestive agricultural feature of 1899 was the success of the tobacco-growing experiment, made in consequence of the steadily falling price of corn and pork. The crop of the year was 125,000 cases of 125 pounds each, a total of 15,525,000 pounds. Unlike the tobacco of Virginia and North Carolina, the Wisconsin product is made up wholly into cigars. The return of Wisconsin tobacco is between 1200 and 1500 pounds to the acre; the average planting is seven acres to the farm, and the average value of the crop is \$95 to the acre. Like cotton in the South, tobacco in Wisconsin is considered as ready money, because of the ease with which the crop is converted into cash.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$9,467,065. There were 96 manufactories of tobacco and 1060 of cigars, and the combined output was 79,875,895 cigars, 2903 pounds of plug tobacco, 475,610 pounds of fine cut, 4,743,873 pounds of smoking, and 3743 pounds of snuff. The quantity of spirits rectified was 1,379,888 gallons; distilled spirits gauged, 6,492,250 gallons, and fermented liquors produced, 2,797,188 barrels.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the port of Milwaukee aggregated in value \$624,557; exports, \$1327, a decrease of \$50,461 in imports and \$3188 in exports, and making the total direct foreign trade of the year \$625,884.

Banks.—On October 31, 1899, there were 79 national banks in operation and 46 in liquidation. The active capital aggregated \$9,685,000; circulation, \$3,433,359; deposits, \$63,744,405, and reserve, \$19,642,362. The State banks, July 3, 1899, numbered 133, and had capital, \$6,783,425; deposits, \$42,456,830, and resources, \$51,419,731; and private banks, 116, with capital, \$1,127,039; deposits, \$8,632,902, and resources, \$10,361,710. One mutual savings bank had depositors, 2350; deposits, \$405,196, and resources, \$430,052. The exchanges at the United States clearing house at Milwaukee, in the year ending September 30, 1899, aggregated \$278,715,347, an increase of \$10,225,866 in a year.

Railways.—The new railway construction in the calendar year 1898 was 63.81 miles, and in 1899, 99.92 miles, giving the State a total mileage of 6480.61.

Education.—At the close of the school year 1897-98, the school population was 708,535; enrolment in the public schools, 435,914, and average daily attendance, 287,000. There were 12,465 teachers, 6940 buildings used as schools, and public school property valued at \$14,800,000. The revenue was \$5,403,431; expenditure, \$5,132,053, of which \$3,577,978 was for teachers' salaries. There were 182 public high schools, with 609 secondary teachers, 16,796 secondary students, and 1329 elementary pupils; 26 private secondary schools, with 145 teachers, 1200 secondary students, and 1403 elementary pupils; 7 public normal schools, with 149 teachers and 4451 students in all departments; and 2 private ones, with 22 teachers and 260 students. Normal training was also given in 3 colleges and 12 public high schools. Ten universities and colleges for men and for both sexes reported 18 fellowships, 58 scholarships, 254 professors and instructors, 3304 students, 131,142 volumes in the libraries, \$151,500 invested in libraries, \$382,500 in scientific apparatus, \$2,596,000 in grounds and buildings, and \$1,662,091 in productive funds, \$497,903 in total income, and \$80,129 in benefactions. One college for women reported 17 professors and instructors, 170 students, 4211 volumes in the library, \$40,000 invested in grounds and buildings, and \$150,000 in productive funds, \$34,500 in total income, and \$18,500 in benefactions. In 1899 there were 685 periodicals, of which 64 were dailies, 554 weeklies, and 48 monthlies.

Finances.—The assessed valuations for 1898 were: Real estate, \$482,283,031; personal property, \$117,716,769—total, \$600,000,000, a decrease of \$28,504,011 in a year; State tax rate, \$2.48 per \$1000; amount of tax raised, \$1,918,779. The entire indebtedness of the State is held in trust funds, as follows: School Fund, \$1,563,700; Normal School Fund, \$515,700; University Fund, \$111,000, and Agricultural College Fund, \$60,600—total, \$2,251,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 2,150,000.

Legislation.—Age of consent was changed from 14 to 18 years. Judges must file oaths prior to receipt of salary that no cause pending has remained undecided for ninety days after submission. "Renovated butter" must be stamped and sold as such. Primary elections and caucuses are stringently regulated. In the interests of health, factories and workshops are regulated very strictly as to sanitation, air space and conveniences; clothing and cigars cannot be manufactured in living rooms except by members of the family, nor cigars manufactured underground; and the milk supply is carefully examined. Trees and nursery stock must be inspected and the incurably diseased destroyed. Travelling libraries were provided for. Labor legislation was not neglected: The places of payment of time-checks were fixed; notice to quit employment or discharge employee must be reciprocal; it was made a finable offence to threaten discharge or to promise higher wages to influence a person's vote, or to coerce any person to agree not to join any labor union as a condition for employment; and seats must be furnished for female employees. Minors under 14 shall not be employed except during public school vacations; those under sixteen must not work more than 10 hours in any one day, and only between 6 A.M. and 10 P.M. Marriage licenses have not heretofore been required in Wisconsin, and inhabitants of adjoining States have not hesitated to make of it a veritable Gretna Green; hereafter license must be obtained at least five days before marriage. It is unlawful for any political committee, candidate for office, State, county or municipal officers, to ask for or receive any pass or frank on any railroad, express, or telegraph company, for

the free transmission of any person, property, or message; the penalty for violation of this law is a fine of from \$200 to \$1000, or imprisonment in the penitentiary not less than one nor more than five years. A very extensive tax law was passed looking to a uniform and improved system, and a commissioner of taxation is to be appointed; taxes are even imposed on gifts and legacies of property worth over \$10,000, 5 per cent. when not to an immediate heir, and 1 per cent. to those of kin. Legislative agents and counsel employed to promote or oppose legislation affecting the pecuniary interests of any person or corporation must have their names recorded in a legislative docket provided for the purpose, under heavy penalty, and within thirty days after adjournment of the legislature the employer must file with the secretary of State a sworn statement showing in detail all the expenses and expenditures of such agent or counsel.

State Officers and National Representatives.—Governor, Edward Scofield; lieutenant-governor, Jesse Stone; secretary of State, W. H. Froehlich; treasurer, J. O. Davidson; attorney-general, E. R. Hicks; superintendent of education, L. D. Harvey; insurance commissioner, E. Giljohan; railroad commissioner, Graham L. Rice. Supreme Court: Chief justice, John B. Cassoday; associate justices, John B. Winslow, C. V. Bardeen, J. E. Dodge, Roujet D. Marshall; clerk, Clarence Kellogg. The State legislature consists of 111 Republicans and 22 Democrats. Senators, John C. Spooner, from Madison; and Joseph V. Quarles, from Milwaukee—both Republicans. Representatives, Henry A. Cooper, from Racine; Herman B. Dahle, from Mount Horeb; Joseph W. Babcock, from Necedah; Theobald Otjen, from Milwaukee; Samuel S. Barney, from West Bend; J. H. Davidson, from Oshkosh; John J. Esch, from La Crosse; Edward S. Minor, from Sturgeon Bay; Alexander Stewart, from Wausau; John J. Jenkins, from Chippewa Falls—all Republicans.

WISCONSIN, UNIVERSITY OF, at Madison, organized in 1849 and reorganized in 1866, is nonsectarian and coeducational; has colleges of arts and science, mechanics, engineering, law, pharmacy, agriculture, music; a department of university extension and a summer school. The enrolment in 1899-1900 was 2422 students. There were 140 instructors. President, Charles Kendall Adams, LL.D.

WOMEN'S CHRISTIAN TEMPERANCE UNION, NATIONAL, organized November, 1874, had in 1899 a membership of 300,000. Its purpose is to educate the young, form a better public sentiment, reform the drinking classes, and secure the entire abolition of the liquor traffic. The society publishes the *Union Signal* and the *Young Crusader*. General meeting for 1900, Washington, D. C., in November. President, Mrs. Lillian M. N. Stevens; secretary, Mrs. Susanna M. D. Fry, Rest Cottage, Evanston, Ill. Headquarters in Chicago.

WOMEN'S SUFFRAGE ASSOCIATION, NATIONAL AMERICAN, organized in 1868. It seeks to organize public sentiment in favor of woman suffrage in all the States of the Union. General meeting for 1900 to be held in Minneapolis, Minn. President, Miss Susan B. Anthony; secretary, Mrs. Rachel Foster Avery, 1483 North Fifty-second Street, Philadelphia.

WOOD. See NON-INFLAMMABLE WOOD.

WOOD, Commander EDWARD P., died at Washington, December 11, 1899, by disease contracted in the tropics during the Spanish war. Commander Wood was in command of the gunboat *Petrel* at the battle of Manila. His vessel, being of light draught, was especially active in destroying the Spanish boats that had sought shelter under the guns of Cavite, and in silencing the land batteries. The sailors and marines from the *Petrel* captured the navy yard at Cavite. Commander Wood was detached from the Asiatic station in December, 1898. For his services in the battle of Manila he was advanced ten numbers in grade. He was born at Mansfield, O., in 1848, was graduated from the United States Naval Academy in 1867, and served through the various grades to that of commander, which he received in July, 1897.

WOOD, General LEONARD. See CUBA.

WOODBURY, Judge E. W., framer of the first prohibitory law in the State of Maine, died at Bethel, Me., January 22, 1899, in his eighty-second year. He was well known as a speaker at political, religious, and temperance meetings. He had served in both houses of the legislature, and had been superintendent of the State Reform School, chairman of the executive committee of the Maine Congregationalist, and president of the Maine Bible Society.

WOOL and WOOLLEN MANUFACTURE. The year 1899 was one of the most remarkable ever experienced in the wool trade of the United States. Owing to a demand greatly in excess of the supply both in this country and abroad, the available stock had been very thoroughly cleared up at the end of the year, and prices had risen to what would have been an exorbitant figure twelve months previously. The following figures, compiled from the most reliable statistics which were available,

show briefly the main facts relative to the production of wool in the United States in 1899 as compared with the previous year.

ITEM.	1898.	1899.
Number of sheep on January 1	37,056,960	39,114,458
Value of flock	\$92,721,133	\$107,667,530
Total wool clip in pounds	206,720,694	272,191,230
Amount of pulled wool, pounds		33,764,761
Average weight of fleece, pounds	5.8	5.95
Total imports, pounds	132,795,362	76,735,309
Total exports, pounds	3,685,071	14,095,335
Total supply on hand January 1	339,033,853	157,398,979

The greatest demand of the year was in clothing wools, and although all the mills of the country were run to their full capacity and new mills were built (see TEXTILE MILLS) and existing plants were largely increased, the supply did not overtake the demand. In this line of woollen goods the prices advanced between 30 per cent. and 40 per cent. during the year. The advance in prices of carpet wools was less marked.

WOOLF, MICHAEL ANGELO, a well-known newspaper artist, died in Brooklyn, New York, March 4, 1899, in his sixty-third year. He was born in England, came to America when twelve years old, became an actor, and finally, having studied at an art school, entered upon what proved to be his life-work. Woolf has been called the father of the modern comic picture; his drawings are forceful, sometimes rude, and depict types rather than particular individuals. He was the artist of the waifs, for the work he enjoyed most thoroughly, and on which his reputation in large part rests, was the portrayal of the children of the streets; these drawings were almost always half-humorous, half-pathetic. Woolf's work rarely fell to the order of the mere cartoon; he put forth, however, some vigorous drawings of this kind during the Tweed scandal and the Hayes-Tilden campaign. His work appeared chiefly in the Harpers publications.

WORCESTER, DEAN CONANT, assistant professor of zoology in the University of Michigan, was appointed by President McKinley a member of the Philippine commission, the announcement of which was made January 17, 1899. Professor Worcester was born at Thetford, Vt., October 1, 1866. In 1887-88 he was a member of the Steere scientific expedition to the Philippine Islands, and in the following year was graduated at the University of Michigan, and became an assistant in the department of botany in that institution. He returned to the Philippines in 1890 as one of the leaders of the Menage scientific expedition, and remained until 1893, when he became an instructor in zoology at his alma mater; since 1895 he has been assistant professor of zoology. The time he passed in the Philippines was given not only to scientific study of the fauna of the islands, but to historical research, and to careful observations of the people and existing conditions. He has written various papers on the birds and mammals of the Philippines, and in October, 1898, published *The Philippine Islands and Their People*.

WRESTLING. See BOXING AND WRESTLING.

WRIGHT, HORATIO GOUVERNEUR, brigadier-general, United States Army, retired, died in Washington, D. C., July 2, 1899. He was born at Clinton, Conn., March 6, 1820; was graduated from the United States Military Academy at West Point in 1841, ranking second in his class. For a brief time he served in the engineer corps, and in 1842-44 was an instructor at West Point, first in French and later in engineering. He became a lieutenant in 1848, and during the next seven years superintended the construction of fortifications in Florida. In 1855 he was promoted to a captaincy and was transferred to Washington, where he became assistant to the chief engineer, retaining the position until the outbreak of the Civil War. Wright took part in the first battle of Bull Run as chief engineer of Heintzelman's division, and he commanded the second division in the Port Royal expedition. In August, 1861, he was promoted to the rank of major, and in the following month to that of brigadier-general of volunteers. In 1862 he commanded the expedition that took Fernandina, Fla., and in July of that year became major-general of volunteers, after which until the following March he was successively in command of the department of the Ohio and the district of Louisville. In the battle of Gettysburg he commanded a division of the Army of the Potomac. In May, 1864, he was brevetted colonel, United States Army, for gallantry at Spottsylvania, and in the same month succeeded to the command of the Sixth Corps after the death of General Sedgewick, and was in command during the Richmond campaign. General Wright took a prominent part in the battle of Cedar Creek. On April 2, 1865, he took his entire corps through the Confederate lines at Petersburg, for which he was brevetted major-general, United

States Army. He was wounded both at Spottsylvania and at Cedar Creek. He served through the war, and at its close returned to the engineer corps, of which he became chief in 1879. On June 14, 1865, the legislature of Connecticut, his native State, tendered to General Wright the thanks of the State for his eminent services in the war. In March, 1884, he was retired from active service.

WYOMING, a northwestern State of the United States, with an area of 97,890 square miles. Capital, Cheyenne. Wyoming became a State on July 10, 1890.

Mineralogy.—In the calendar year 1898 the State reached its maximum production of coal, and gained third place among the coal States west of the Mississippi and second among the Rocky Mountain States. The output was 2,863,812 short tons from 23 mines, valued at \$3,664,190, an increase of 265,926 short tons in a year. Nearly one-half of the entire production was from Sweetwater County, Uintah and Weston ranking second and third. The yield of the precious metals was, gold, 257 fine ounces, value \$5300, and silver, 100 fine ounces, coining value, \$129. A notable advance was made in copper-mining, because of recent discoveries, an output of 233,044 pounds being won. Quarrying yielded sandstone to the value of \$6382, and coking declined to a product of 18,350 short tons, valued at \$64,225. Toward the close of 1899 further discoveries of rich copper ore were made in Plumbago Cañon, at a point about 25 miles north of Laramie, and in the Owl Creek Mountains, about 100 miles northwest of Casper. A carload of ore from the first strike showed 50 to 75 per cent. copper and .8 ounces of silver to the ton; in the second strike the vein was found to be four feet wide. There was a rush of Colorado miners to both localities as soon as the strikes were made known. In December a company was organized in Chicago, with a capital of \$3,000,000, to establish a great coal and coke industry in Sweetwater County, a large tract was acquired, containing seven distinct veins of high-grade coal, and before the end of the month buildings for power plants, company stores, and cottages for workmen were in course of erection. Both marine and fresh-water jurassic beds are found to exist in Wyoming.

Agriculture.—With the co-operation of Charles U. Shepard, whose successful experiments in tea-growing at Pinehurst, S. C., are noted in the article on South Carolina, the United States Department of Agriculture took the first steps looking to the introduction of tea-growing into Wyoming in 1899. Professor Elwood Mead, of Cheyenne, expert in charge of the irrigation bureau of the department, was placed in immediate charge of the experiment, and the preliminary work will consist in the establishment of an effective system of irrigation.

Manufactures.—Wyoming is included in the internal revenue district of Colorado, and the details of its taxable manufactures are combined with those of that State. In the fiscal year ending June 30, 1899, the collections in Wyoming alone aggregated \$50,633.

Banks.—On October 31, 1899, there were 11 national banks in operation and 4 in liquidation. The active capital aggregated \$860,000; circulation, \$178,399; deposits, \$3,081,722; and reserve, \$1,048,820. The State banks, June 30, 1899, numbered 8, and had capital, \$152,000; deposits, \$433,255; and resources, \$648,483, and private banks, 11, with capital, \$189,517; deposits, \$1,066,465, and resources, \$1,290,146.

Railways.—The new railway construction in the calendar year 1898 was 6 miles, and in 1899, 53.69 miles, giving the State a total mileage of 1224.26.

Education.—No school census is taken in this State. At the end of the school year 1897-98 the school population was estimated at 23,950; the enrolment in the public schools was 13,042, and average daily attendance, about 8700. There were 536 teachers, 338 buildings used as school-houses, and public school property valued at \$441,460. The revenue was \$217,395; expenditure, \$213,291, of which \$160,222 was for teachers' salaries. There were 5 public high schools, with 12 secondary teachers, 307 secondary students, and 185 elementary pupils; one private secondary school, and a State university, with 14 professors and instructors, 168 students, 5750 volumes in the library, \$60,000 invested in scientific apparatus, and \$111,540 in grounds and buildings, and \$47,243 in total income. In 1899 there were 45 periodicals, of which 5 were dailies and 37 weeklies.

Finances.—The assessed valuations for 1899 aggregated \$35,578,806, the highest ever reached, and an increase of \$4,789,515 in a year; tax rate, \$6.25 per \$1000. The total debt, all bonded, February 1, 1899, was \$320,000, comprising Capitol Building bonds, \$150,000; insane asylum bonds, \$30,000; public building bonds, \$90,000, and university building bonds, \$50,000. On the aggregate, a total of \$32,000 is payable annually, beginning January 1, 1902.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 91,000.

Legislation.—Among the new boards created were: a State Board of Medical Examiners, no person hereafter to be allowed to practise without examination and license; and county, city and town boards of health, with extraordinary powers of investigation, regulation and eradication of all sources of disease, including the erec-

tion of pest houses and the destruction of infected property. The office of game warden was created, and game and fish are protected and preserved by very stringent laws. Bounties, both State and county, are given for the destruction of certain wild animals. An elaborate law was passed regarding the selection of jurors and the performance of jury duty. Woman suffrage obtains in Wyoming, but a juror must be a male citizen, able to understand the English language, whose name appears upon the last assessment roll. Husband and wife may be witnesses against each other in many cases in which hitherto they were barred. In cases where a husband spends his earnings for liquors or in gambling, and his wife and children are deprived of the common necessities of life, the wife may serve notice upon the liquor dealer not to furnish liquor to him, or the gambling house not to permit him to game, after which the keeper of the liquor or gaminghouse is liable for all damages to wife or children. Schools are to be furnished with free text books. Head-gear obstructing the view of any other person in a theatre must be removed or a fine paid. Persons who derail trains, board trains to rob, place explosives upon the track with intention to blow up or derail, or fire bridges or trestles with intent to wreck cars or trains, shall be punished with death or life imprisonment.

State Officers and National Representatives.—Governor, De Forest Richards; secretary of State, F. Chatterton; treasurer, G. E. Abbott; auditor, Leroy Grant; adjutant general, Frank A. Stitzer; attorney general, J. A. Van Orsdel; superintendent of Education, T. T. Tynan. Supreme Court: Chief justice, C. N. Potter; associate justices, Samuel T. Corn, Jesse Knight; clerk, R. C. Morris. The State legislature consists of 48 Republicans and 9 Democrats. Senators: Clarence D. Clark, from Evanston, and Francis E. Warren, from Cheyenne—both Republicans. Representative (at large), Frank W. Mondell (Rep.), from Newcastle.

X-RAYS. See ROENTGEN RAYS.

YACHTING. *The International Races*—The eleventh regatta for the America's Cup took place in October, at New York, under the auspices of the New York Yacht Club. The contest was won in three straight races by the American boat *Columbia*, owned by J. Pierpont Morgan, commodore of the N.Y.Y.C., and C. Oliver Iselin, managing director of the *Columbia*. The challenging boat, *Shamrock*, was owned by Sir Thomas Lipton, of the Royal Ulster Yacht Club. After seven successive failures, due to lack of wind, the first race was sailed on October 16 in a moderate breeze, over a course fifteen miles to windward and return. The defender won by more than a mile. On the following day the yachts started over a triangular course, each leg being ten miles. The *Shamrock*, when 25 minutes out, was put out of commission by the parting of her shroud, thereby breaking her top-mast and losing her club top-sail. The *Columbia*, according to agreement, sailed over the remainder of the course alone, being about even with the *Shamrock* when the crash came. *Shamrock* was repaired in the Erie Basin, 3300 pounds of lead were put on board, and the yacht was remeasured. The extra lead increased her water-line, and she gave an allowance to *Columbia* of 16.20 seconds. On the 19th there was again no wind. On October 20 there was a half-gale blowing, and the yachts made a spectacular race, 15 miles to leeward and return, through seas that swept the decks, the *Columbia* again proving herself the superior sailor. The summaries follow:

FIRST RACE.						
	Start	Outer(First) Mark.	Second Mark.	Finish.	Elapsed Time.	Corrected Time.
<i>Columbia</i>	H. M. S. 11:01:06	H. M. S. 1:48:19	H. M. S.	H. M. S. 3:54:50	H. M. S. 4:53:53	H. M. S. 4:53:53
<i>Shamrock</i>	11:01:03	1:58:06	4:05:10	5:04:07	5:04:01
SECOND RACE.						
<i>Columbia</i>	11:00:17	12:39:28	1:33:27	2:37:17	3:37:00	
<i>Shamrock</i>	11:00:15	Did not finish.				
THIRD RACE.						
<i>Columbia</i>	11:01:35	1:17:25	2:21:00	3:38:25	3:38:09
<i>Shamrock</i>	11:00:34	1:18:43	2:26:00	3:44:43	3:44:43

The cup races of 1899 were unusually well managed and the America's Cup was sailed for under perfect policing conditions. Still better, there was an entire absence of those elements of disagreement by which a former contest was unfortunately characterized. No challenger, perhaps, has so won the respect of the sport-loving public as Sir Thomas Lipton. A loving cup was presented to him by a committee of citizens at the time of his departure for England. In his acceptance he testified to his belief that the *Columbia* was the better boat and to his intention to try for the America's Cup again at the earliest opportunity.

Important Cruises and Regattas.—The annual cruise to Newport of the squadron of the New York Yacht Club, the oldest and most distinguished society of its kind in the country, took place in August, 1899, and was the most successful, in many respects, of the many runs over the famous Long Island Sound course. The omission of the 1898 cruise on account of the war with Spain heightened to a considerable degree the interest in the run of the succeeding year. The cruise was especially remarkable for the attendance of the two great cup-defenders *Columbia* and *Defender*, and their fight to determine the qualities of the new product of the Herreshoffs. There were present also many other famous boats among the two hundred or more yachts that gathered at the rendezvous at New London. They included the *Vigilant*, the *Mayflower*, the *Navahoe*, the *Gloriana*, and the old schooner *America*, still a staunch boat. In addition to these, the fleet was met off Narragansett Pier by the *Volunteer*, with the well-known skipper Hank Haff on board. There were numerous races among the various classes of boats, including steam-yachts, the great sloops and schooners, the thirty-footers, and even the launches and small boats. In the more important contests the old racers were prominent, and *America* held her own till disabled by an accident. The *Vigilant* on August 9 led the fleet by nearly a minute. This yacht won the rear commodore's cup. In the race for the Astor cups the *Columbia* won the cup for sloops, beating the *Defender*, and the *Amorita* won the cup for schooners. The latter won also the wind-up cup, given by Commodore Morgan, and the vice-commodore's cup, awarded for the greatest number of winning runs during the cruise. The Atlantic Yacht Club also had a successful cruise in 1899. The cruise finished with a magnificent ocean race from Shelter Island to Sandy Hook, an air distance of 138 nautical miles, but nearly three times as much over the course actually sailed. The schooner *Katrina* led almost to the finish, when she was passed by the *Ramona* and *Coronet*. As it was she won on time allowance. *Sachem* second, and took the Adams cup for schooners. The four competing boats finished the long race within five minutes. The Adams cup for sloops was won by the *Awa*. Later in the year the *Katrina* won the Gould cup for schooners. The Larchmont Yacht Club held a week of racing on Long Island Sound. Later in the year the *Colonia* won the Larchmont cup for schooners. See further SPORTS, INTERNATIONAL, for the Canada's Cup and the Seawanhaka-Corinthian trophy races.

YALE UNIVERSITY, at New Haven, Conn., completed its one hundredth and ninety-eighth year in June, 1899, when the resignation of President Dwight, who had served the university thirteen years in that capacity, went into effect, and the new president, Arthur T. Hadley, took up his work. On May 25 William W. Farnum, treasurer of the university since 1888, presented his resignation, and also Professor Franklin B. Dexter, secretary of the corporation since 1869. In March Professor James M. Hoppin, after twenty years' services, gratuitously rendered, resigned the chair of the History of Art. Professor George J. Brush was elected chairman of the Board of Trustees of the Peabody Museum, to fill the vacancy created by the death of Professor O. T. Marsh, and Professor Charles E. Beecher was appointed curator of the geological collection. A large number of valuable gifts were received by the university during the year. For the galleries of the art school Mrs. Nathan A. Baldwin presented a large and valuable Japanese cloisonné vase more than six feet in height. The anniversary of the art school occurred on the first of June, 1899, on which occasion three valuable gifts were made which will be especially useful and helpful to the school. Professor Charles E. Beecher gave to the Peabody Museum his entire scientific collections, comprising upward of 100,000 specimens, mostly of invertebrate fossils. Taken altogether, the gifts, with the contributions and subscriptions already made for the bi-centennial fund, amounted to more than \$500,000. For statistics see UNIVERSITIES AND COLLEGES.

YAQUIS. See MEXICO (paragraph the Yaqui Rebellion).

YATES, Colonel JOHN B., died October 18, 1899, at the age of 66 years. On the outbreak of the Civil War he enrolled a company of the First Michigan Engineers, and was successively commissioned captain, major, and colonel, 1864. As colonel of the Michigan engineers he was of great service to General Sherman in bridge-building during the march from Atlanta to the sea, a work of hard and constant labor and responsibility. He began life as an axeman in the engineer corps of the Utica and Schenectady Railroad. At the close of the war he was appointed by President John-

son military superintendent of railroads for the State of Tennessee, a position which he retained throughout the reconstruction period. He then returned to his native city and to the practice of his profession, civil engineering.

YELLOW FEVER. During September and the first part of October, 1899, an epidemic of yellow fever prevailed at Key West. The total number of cases reported up to December 22, 1899, at this place was 1320, with 66 reported deaths. At Miami, Fla., there were reported 133 cases with 10 deaths, and at Port Tampa City, Fla., 10 cases reported with 1 death. In New Orleans there was an epidemic beginning August 27. Up to December 22, 1899, there had been 115 cases reported with 20 deaths. Baltimore, Md., had 1 case, which died at quarantine station. From Mississippi were reported 90 cases, distributed as follows: Centreville, 2 cases; Jackson, 61 cases; Mississippi City, 27 cases, besides an unknown number of cases at Flora. There were 11 deaths reported in the State up to December 22, 1899. There were a few cases at Havana and Cabanas, but the epidemic in each instance was promptly controlled.

In Vera Cruz, Mexico, yellow fever of a malignant type prevailed during May, nearly half the cases proving fatal.

Two cases reached New York City, one of which died, and one fatal case reached Brooklyn. (See SERUM THERAPY.) On July 31 an outbreak of yellow fever was announced at the Soldiers' Home, at Hampton, Va. There were 44 cases and 11 deaths, the last case being found on August 7. Over 1500 men were transferred to tents, from the home, and their quarters were disinfected before their return.

On November 8, 1897, Past Assistant Surgeon (now Surgeon) Eugene Wasdin and Past Assistant Surgeon H. D. Geddings were detailed, by authority of the secretary of the treasury and the President, as a commission to investigate in Havana the nature of yellow fever. Their report, dated July 10, 1899, was published in the following month. The report embodies the work of the commission in fairly testing the claim of Professor Giuseppe Sanarelli, of Bologna, Italy, and the University of Montevideo, that the bacillus icteroides is the cause of yellow fever, and the conclusion is drawn that this famous scientist has isolated the true cause of the terrible scourge. Fourteen cases of undoubted yellow fever were examined in the well-equipped bacteriologic laboratory of the Marine Hospital Service in Havana. From 13 of these cases the commission isolated the organism of Sanarelli, the bacillus icteroides, and in the remaining case an independent observer isolated it from tube cultures taken at a necropsy conducted by the commission. From the living blood of 12 of the 14 cases, abstracted not earlier than the third day of the disease, the organism was isolated, and in the other two it was obtained post-mortem. The commission having preserved a number of cultures made at the isolation hospital in the city of New Orleans from cases seen during the epidemic of 1897, also isolated therefrom the bacillus icteroides in the proportion of 83.33 per cent. of the cases examined, the cultures having been made at necropsy. Thus the identity of the bacillus icteroides of our Southern States with that found in Cuba and that sent the commission by Professor Sanarelli, which was obtained in South America, was established. After a number of interesting experiments the commission arrived at the following conclusions: "1. The micro-organism discovered by Professor Giuseppe Sanarelli, of the University of Bologna, Italy, and by him named 'bacillus icteroides,' is the cause of yellow fever. 2. Yellow fever is naturally infectious to certain animals, the degree varying with the species; in some rodents local infection is very quickly followed by blood infection; and while in dogs and rabbits there is no evidence of this subsequent invasion of the blood, monkeys react to the infection the same as man. 3. Infection takes place by way of the respiratory tract, the primary colonization in this tract giving rise to the earlier manifestations of the disease. 4. In many cases of the disease, probably a majority, the primary infection, or colonization in the lungs, is followed by a "secondary infection," or a secondary colonization of this organism in the blood of the patient. This secondary infection may be complicated by the co-instantaneous passage of other organisms into the blood, or this complication may arise during the last hours of life. 5. There is no evidence to support the theory advanced by Professor Sanarelli that this disease is primarily a septicemia, inasmuch as cases do occur in which the bacillus icteroides cannot be found in the blood, or organs in which it might be deposited therefrom. 6. There exists no causal relationship between the bacillus 'x' of Sternberg and this highly infectious disease; and the bacillus 'x' is frequently found in the intestinal content of normal animals and of man, as well as in the urine and the bronchial secretion. 7. So far as the commission is aware, the bacillus icteroides has never been found in any body other than one infected with yellow fever; and whatever may be the cultural similarities between this and other micro-organisms, it is characterized by a specificity which is distinctive. 8. The bacillus icteroides is very susceptible to the influences injurious to bacterial life; and its ready control by the processes of disinfection, chemical and mechanical, is assured. 9. The bacillus icteroides produces *in vitro*, as

well as *in vita*, a toxin of the most marked potency; and, from our present knowledge, there exists a reasonable possibility of the ultimate production of an antiserum more potent than that of Professor Sanarelli." See SERUM THERAPY.

YOUNG, JOHN RUSSELL, librarian of Congress, died in Washington, D. C., January 17, 1899. He was born at Downingtown, Penn., November 20, 1841; was educated at the Harrison grammar school in Philadelphia and the high school in New Orleans. Upon leaving the latter institution at the age of sixteen he was employed on the *Philadelphia Press*, for which at the breaking out of the Civil War he went as correspondent with the Army of the Potomac, remaining with it until after the battle of Williamsburg. He won much credit for his report of the battle of Bull Run. In the spring of 1864 he served as correspondent for the *Press* with General Banks in the Red River expedition. The following year he went to New York and soon became a contributor to the *Tribune*, and in 1866 was appointed by Mr. Greeley to the managing editorship. After three years he resigned this position, and having meanwhile studied law was admitted to the New York bar. In 1870 Mr. Young established the *New York Standard*, which was not a financial success. This same year while in Europe on government business, he wrote a series of brilliant letters, including an account of the siege of Paris. He accepted an editorial position on the *New York Herald* in 1872, serving in London and Paris, where he had charge of the foreign news department. In 1877-78 he accompanied General Grant on his tour of the world, acting as correspondent; he subsequently published in two volumes *Around the World with General Grant*. Mr. Young resumed his work on the *Herald* in 1879, continuing until 1882, when he was appointed minister to China by President Arthur. After his return to the United States in 1885 he was not attached to any newspaper except the *Philadelphia Star*, in which he had a proprietary interest. In 1889 he declined the Chinese mission offered him by Secretary of State Blaine. He was president of the Union League Club of New York in 1893-94. In June, 1897, President McKinley appointed him librarian of Congress to succeed Mr. Ainsworth R. Spofford, who had resigned on account of age. In this position Mr. Young did excellent work. Under his supervision a reorganization of the library staff was effected, and the library itself was transferred from the capitol to the new building.

YOUNGHUSBAND, Lieutenant-general CHARLES WRIGHT, retired, British soldier and scientist, died in London on November 1, 1899. General Younghusband's active military career extended from 1837 to 1880, during which time he was appointed to more important and varied positions than falls to the lot of the average British officer. This was due in part to his scientific attainments, by which he won a reputation equal to that of his military career. He was born in Scotland in 1821, and was educated at the Royal Military Academy at Woolwich. His official life from the latter period may be summarized as follows: Joined Royal Artillery, 1837; appointed to Magnetic and Meteorological Observatory, Toronto, Canada, 1840-46; reducing magnetic and meteorological observations taken at the observatories at Cape of Good Hope, Toronto, etc., under the late Sir Edward Sabine, 1846-53; commanding company of Royal Artillery at Gibraltar, 1854; service in Crimea, winning (at Inkerman) medal with two clasps, 1854; secretary Royal Artillery Institution, 1854; superintending contracts for small arms, swords, bayonets, etc., in Belgium and Germany, 1857-63; ordnance select committee, 1863-67; commissioner in charge of war material, Paris Exposition, 1867; superintendent Royal Gunpowder and Gun-cotton Factory, Waltham Abbey, 1868-75; superintendent Royal Gun Factories, Royal Arsenal, Woolwich, 1875-80; retired 1880. Upon entering civil life he turned renewed attention to scientific studies, and devoted his time to contributing to magazines and scientific and military journals, and to the pursuit of various scientific experiments.

YOUNG MEN'S CHRISTIAN ASSOCIATION, founded by George Williams in 1844 as a religious society of clerks in the city of London, has now spread to every civilized country, having a total membership of over half a million. In America, where the first association was founded in 1851, there were in 1898 a membership of 228,568 in 1233 associations. These own property valued at \$19,341,272. In the Philippines, Cuba, and Puerto Rico the work of the Y.M.C.A. in elevating the morals of the soldiers met with good results in 1899, and branches have been opened in 15 regular army posts. In Great Britain there are 1490 associations and 105,196 members, 13,000 being in London. President, Sir George Williams; secretary, W. H. Mills, Exeter Hall, Strand, London. The international committee of Young Men's Christian Associations have headquarters at 3 West Twenty-ninth Street, New York City. Chairman, Lucien C. Warner; general secretary, Richard C. Morse.

YOUNG PEOPLE'S CHRISTIAN UNION (OF THE UNITED BRETHREN IN CHRIST), organized in 1890, had 1970 societies in 1899 with a membership of 74,942.

General meeting for 1900 at Lebanon, Penn., June 21-24. Publishes *The Watchword*. President, Professor J. P. Landis; secretary, Rev. H. F. Shupe, Dayton, O.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION OF THE CITY OF NEW YORK, founded in 1870, to promote the temporal, social, mental, moral, and religious welfare of young women dependent upon their own exertions for support, has main building on Fifteenth Street, New York City. Other branches of the association's work are carried on in the Margaret Louisa Home, on Sixteenth Street, the West Side Settlement, 453 West Forty-seventh Street, and the Seaside Home, at Asbury Park, N. J. The membership in 1899 was 773. President, Mrs. Clarence E. Beebe; corresponding secretary, Miss J. F. Bangs, 29 East Forty-fourth Street, New York City. An International Board of Women's and Young Women's Christian Associations in the United States and Canada held its fifteenth biennial conference at Memphis, Tenn., in November, 1899, and was incorporated in 1899. The conference for 1901 will be held in Cleveland, O. The international board publishes the *International Messenger*.

ZANGWILL, ISRAEL, author, was born in London, 1864. After some time spent in teaching, he became a journalist, and edited *Ariel*; his writings include poems, plays, novels, and essays; as a lecturer in his own and in this country, as well as in Holland and in Jerusalem, he has drawn large audiences. Publications: *The Premier and the Painter*, 1888; *The Bachelor's Club*, 1891; *The Big Bow Mystery*, 1892; *The Old Maid's Club*, 1892; *Children of the Ghetto*, 1892; *Merely Mary Ann*, 1893; *Ghetto Tragedies*, 1893; *The King of Schnorrers*, 1894; *The Master*, 1895; *Without Prejudice*, 1896; *Dreamers of the Ghetto*, 1898; and *They That Walk in Darkness*, 1899. He visited this country in 1899 to superintend the production of his four-act drama, *Children of the Ghetto*, founded on the book.

ZANZIBAR, PROTECTORATE OF, in British East Africa, consists principally of the island of Zanzibar, area 625 square miles, population 150,000, and the island of Pemba, area 360 square miles, population 50,000, and a small strip of mainland, and is governed by the sultan of Zanzibar under a British commissioner. The city of Zanzibar, on the island of the same name, is the largest town in East Africa, with a population estimated at about 100,000, made up of many races, including natives, Arabs, English, Germans, French, Italians, Portuguese, Hindoos, and a few Americans. It is also the most important port, while the island itself is an important way station, seat of production, and trading centre of eastern Africa. The principal products and exports are cloves, copra, coconuts, ivory, shells, hides, and goat skins; a large export trade from the mainland also passes through Zanzibar. Most of the latter is in bulk for through transportation, and consequently does not appear in the export statistics of the protectorate. The few industries of Zanzibar are chiefly devoted to the manufacture of bone, ebony and silver ornaments. The foreign import trade is considerable, including also transit trade bound for Africa. There is also quite a large internal trade. Foreign trade is chiefly with the following countries in the order named: India, Great Britain, Germany, America, Netherlands, France. In respect to goods exported from Zanzibar, the principal receiving countries are, in the order named, England, France, United States, and Germany. The value of exports to the United States amounted in 1898 to \$226,936, the principal items being ivory, cloves, and hides. The latest estimates give the tonnage of vessels clearing at the port of Zanzibar in 1898 as 286,209, which does not include the large coasting traffic with Bombay, Arabia, the Comoro Islands, and Madagascar. There were 88 German vessels, 62 British, 25 French, and 8 of other nationalities. Previous to 1899 a few stipulated articles of import were taxed 5 per cent ad valorem. In September, 1899, the rate was made to cover all imports except coins, coal, rubber, ivory, hippopotamus teeth, rhinoceros horns and hides, and tortoise shells; there are also small rates placed on certain exports. Imports to Pemba pay 5 per cent duty. The public revenue, derived from customs dues, water-supply, registration, rents of government property, port dues, shipping, and the post-office, yield about \$600,000 a year, and about equal the expenditures. There is no public debt.

In November, 1899, through the Samoan treaty (*q. v.*), Germany agreed to relinquish her extraterritorial rights in Zanzibar from such time as Great Britain should abolish similar rights there. The English exercise general control in the protectorate, having organized a regular government in 1891. An Englishman is the prime minister of the sultan, and a British agent has since 1892 held certain judicial authority, having the right to try all cases in which British subjects are involved, and having admiralty jurisdiction in regard to the slave trade. The accounts of the government must be always open to the inspection of the English representative, and no public expenditure can be undertaken without his consent. Slavery was abolished when Great Britain gained control, but the British and Foreign Anti-Slavery Society has since declared that the decree is a dead letter. A debate in the British Parliament in 1899 upon the decree of a district agent at Mombasa, who had

ordered three slaves back to their owner, brought to public notice the existence of slavery on the Zanzibar mainland. It is urged by those who favor the present system that the bestowal of liberty upon the Zanzibar negroes would be more harmful than helpful. There are no means of livelihood open to the 280,000 persons who are, technically speaking, slaves. However, they have their own houses, the tenure of their bondage is fixed, and they cannot be sold by their masters or separated from their wives and families. In 1899 the British agent and consul-general was Sir Arthur H. Hardinge, the commissioner of British East Africa.

ZEEMAN EFFECT. See PHYSICS.

ZINC. The corrected returns for the year 1898 give the production of spelter at 115,399 short tons. The last two years have witnessed an interesting struggle between the smelting plants of Missouri and Kansas which used coal fuel, and the newer works in Kansas, which lie in the natural gas fields. It is obvious that the advantage of free gas will bring about many economies in the course of the metallurgical operation and may result in the shutting down of the older works, and the establishment of a new productive centre. The zinc-mining industry of the Jopland district of Missouri has had an enormous boom during the year 1898, and also 1899. Much of the United States production is exported for the manufacture of the high-grade brass in Germany and other countries of Europe. At the same time much also is imported, this being especially true not only of spelter, but of zinc oxide, the foreign product being purer and whiter than the native material. The imports for 1898 or 1897 were as follows:

Block or pig-zinc.....	\$109,626
Sheet zinc, 1897.....	\$786
Manufactured zinc, 1897.....	\$11,459
Zinc oxide, 1897, dry.....	5,564,763 pounds
Zinc oxide in oil.....	502,357 pounds

The exports of zinc and zinc ores amounted in 1898 to \$1,475,761. The Joplin zinc region of Missouri has sprung into unusual prominence during the past year, and mining activity has been intense. This increase in the development and output of the region is said to be due to the greatly increased demand for spelter, the discovery of a wider market for the ores and also to the organization of the Missouri and Kansas Zinc Miners' Association.

ZOLA, ÉMILE. See FRENCH LITERATURE.

ZOOGEOGRAPHY. See ZOOLOGICAL LITERATURE (paragraph Special Treatises).

ZOOLOGICAL LITERATURE. The amount of zoological literature which has appeared during the year 1899 is probably greater than in any preceding year, but it is impossible to give any accurate estimate of it. We shall probably not exceed the limits of the truth, if we say that 10,000 papers, pamphlets, and books, dealing more or less with zoology, have appeared during the year. Of course, we can only touch on the more important of these.

Periodical Literature.—There have been a few changes in the publications given up wholly or in part to zoology, and among these the following may be noted: *Natural Science* suspended publication with its December issue, much to the regret of those who have had the privilege of enjoying it. In spite of the high standard which it set and maintained, it has not been enough of a financial success to warrant its further publication. The *American Naturalist* has changed editors, but has had a good year. Its numbers have nearly all been late in appearance, but the contents have been varied and of high quality, and a large share of them have dealt with zoological questions. One of the important features of the year has been the beginning of a series of papers dealing with the various groups of the North American fauna, and furnishing a key to the species. Several of these, dealing with certain groups of invertebrates, have already appeared. The *Zoological Bulletin*, which began its career in 1898, was changed in April of the past year to the *Biological Bulletin*, and is now published under the auspices of the Marine Biological Laboratory. Under its new title, it is intended to include general biology, botany, and physiology, as well as zoology.

General Treatises.—Beyond any question the most notable work on general zoology published in 1899 is *The Foundations of Zoology*, by Professor W. K. Brooks, of the Johns Hopkins University. The book is made up of 13 chapters, dealing with the fundamental topics of zoological science, such as "Nature and Nurture," "Zoology and the Philosophy of Evolution," "Natural Selection and the Antiquity of Life," "Natural Selection and Natural Theology," etc. It also treats of the views of nature held by such eminent zoologists as Lamarck, Huxley, Galton, Weismann, Darwin, and Agassiz, and by the philosophers Paley and Berkeley. The text of

most of the lectures is that "life is response to the order of nature." The contents of this book of some 340 pages consists of a series of lectures delivered at Columbia University, and they are now published as Volume V. of the *Columbia University Biological Series*. That the book will rank not only as the foremost zoological publication of the year, but as one of the most notable that has ever appeared in philosophical zoology, seems clear. President Jordan, of Leland Stanford Junior University, in a review published in *Science*, says: "Brooks's lectures on the *Foundations of Zoology* constitute a book that will live as a permanent addition to the common sense of science. It belongs to literature as well as science. . . . There is not an idea fundamental to biology that is not touched and made luminous by some of these sagacious paragraphs. . . . The hand of the master is seen in every line. The main lesson of the work is that to believe is not better or nobler or higher than to know. Belief adds nothing to certainty, and whatever is really true is the very best thing that could be true, else it had not been so. . . . The stones which Dr. Brooks has chosen as the foundations of zoology will remain there for centuries, most of them as long as human wisdom shall endure. The volume is a permanent contribution to human knowledge, the worthy crown of a life of wise thought as well as of hard work and patient investigation. If there are any errors in statement or conclusion from one end of the book to the other the present writer is not a-tute enough to find them out, and Dr. Brooks's logic may permit him at least to doubt their existence. The biologists of America have long since recognized Dr. Brooks as a master, and this volume, the modern and scientific sequel of Agassiz's *Essay on Classification*, places him in the line of succession from the great interpreter of nature, whose pupil and friend he was."

There is no other book in the same class with *The Foundations of Zoology*, but other books have been published in 1899 bearing on the same or similar subjects. Among these may be mentioned a volume embodying four lectures by Mr. F. W. Hutton, F.R.S., on *Darwinism and Lamarckism, Old and New*. These lectures were delivered at several years, and date from 1882 to 1898. They were delivered to mixed audiences, and were intended as a popular exposition of Darwinian doctrine; with the exception of perhaps one chapter they seem to perform their mission well. A book of a very different character from these, but dealing with general questions of biology, is Professor C. B. Davenport's *Experimental Morphology, Part Second*, a volume of 228 pages, devoted to a consideration of the phenomena of growth. Although most of the illustrations are from plant physiology, this is due chiefly to the fact that we know far more about the growth of plants than of animals. Growth is defined as "increase in volume," and from that point of view the subject is treated. The effects of chemical agents, of water, of density of medium, of molar agents, of gravity, of light, and of heat, are all treated in turn, but comparatively little space is given to some phenomena which influence growth, as, for example, electricity. On the whole, the book is a valuable summary of our knowledge of the subject up to the present time. Another volume of Professor Davenport's is *Statistical Methods, with Special Reference to Biological Variation*. The first fifty pages of the book are occupied with an outline of methods and formulæ, while the remaining one hundred pages are taken up with a great variety of numerical tables arranged in a convenient way for use. A very different book from these is Dr. James Weir's *Days of Reason*, a volume of 234 pages dealing with the mental processes of animals. Although psychological, it is a thoroughly zoological book, and contains a large amount of interesting matter, the result of much observation and some experiment. But the author is evidently an ardent partisan, and many of his observations, as well as his conclusions, are vitiated by his enthusiasm. It is enough to say that he states as facts the "intentional beautifying" of its web by a spider, the "fright" of Rhizopods and even their "amusement"! A new edition has appeared of Professor C. Lloyd Morgan's *Animal Biology*, a well-known book which first came out in 1887. The present edition has been revised and in part rewritten, and several illustrations now appear in the work for the first time.

Text-books.—The year has not been productive of text-books in zoology, the two preceding years having pretty well supplied the market. The most noteworthy publication of the year in this line is the completed translation of the well-known German *Text-book of Embryology*, by Professors Korscheldt and Heider, so that there is now easily accessible to English students and readers an admirable text-book of the comparative embryology of invertebrate animals. The only other text-book of any importance which has appeared in America in 1899 is a *Text-book of Vertebrate Zoology*, by Professor J. S. Kingsley, of Tufts College. This is a volume of some 440 pages, and is intended for the use of students in the laboratory, as well as for the class-room. In England, Mr. A. E. Shipley has published a text-book for students called *Zoology of the Invertebrata*, another volume in a field already richly supplied. In Italy, Professor Achille Griffini has published a large *Zoologia* of 400 pages. It is profusely, if not well, illustrated, but the text is not very original.

or otherwise notable. The book is designed for use in the public schools in accordance with the requirements of the state.

Systematic Zoology.—The literature of systematic zoology is most abundant in periodicals, and especially in the publications of societies and academies. During the past year this sort of literature has not shown any notable increase over the preceding year. About 4000 new species of animals have been described, of which nearly three-fourths have been insects. Of the remainder about one-fourth are *arthropods* (other than insects), and one-fourth are worms. About 200 species of vertebrates have been described, of which a third are birds. Of all classes of animals, the smallest number of new species have been described from the *echinoderms*. Aside from the periodical literature, a few noteworthy volumes have appeared dealing with systematic zoology. Doubtless the most important of these is the final part of Trouessart's *Catalogue of Mammals, Living and Fossil*. The completed work consists of 1358 pages, with an index of 109 pages and 16,827 entries. It recognizes 1840 genera and subgenera, and about 7500 species. The work is of the greatest value to every student of mammals and contains much information of interest even to those who are not specialists. Another work on vertebrates is Dr. Hans Gadow's *A Classification of Vertebrata, Recent and Extinct*, which has been described as "an exceedingly concentrated extract of a full text-book of the vertebrates." It is intended primarily for the student and includes only the larger subdivisions of the vertebrate phylum. Among systematic works on invertebrates, there are four which deserve to rank high as monographs on their respective groups. One of these is Ludwig von Graf's magnificent work on the *Triclad*s, not only cataloguing the species already known, but adding a very large number of new species to the group. It is one of those remarkable pieces of detailed work for which German zoologists are famous. Another valuable invertebrate list is by the well-known Norwegian zoologist, Professor G. O. Sars, and deals with the *Isopod Crustaceans of Norway*. It is the second volume in Professor Sars's great work on the Norwegian crustacea. The third volume to be mentioned is a monograph on the deep-sea *Ophiuroidea from the Indian Ocean*, by Professor R. Koehler, published by the trustees of the Indian Museum. The work is chiefly occupied with the description of forty new ophiurids collected by the Royal Indian Marine Survey-ship, *Investigator*. The monograph is elaborately illustrated by fourteen exquisite plates, photo-etched from the author's drawings. The fourth noteworthy monograph is by Alphonse Labbé, and bears the title *Das Thierreich Sporozoa*. This is one of the series of volumes now being published by the German Zoological Society in which are to be given recognizable descriptions of all known animals. The volume on the *sporozoa* contains not only the brief description of each species, but also a well-arranged list of the "hosts" of *sporozoa*, with the organs affected, and there is also a key to families, genera, and sometimes to species.

Special Treatises.—Under this head we may treat the published zoological results of certain scientific expeditions, as well as important publications concerning special animals or groups. Part II. of the *Zoological Results* of Dr. Willey's trip to New Guinea and the South Seas has appeared, and deals with the millepores, echinoderms, sipunculids, corals, fleshy corals, and earthworms. It is a pity that these very important papers have not all been published in some of the numerous scientific journals, where they could have had a wider circulation. The results of another scientific expedition also appeared during the year. This expedition, though not primarily zoological, did no little collecting, and yielded valuable zoological results. This was the *Second Bottego Expedition* which made explorations in Abyssinia in 1895-97, under the auspices of the Italian Geographical Society. The expedition proved disastrous to its leaders, as Bottego and Sacchi were killed, and those who finally escaped underwent terrible hardships. The present volume contains a summary of the zoological results which have previously appeared in a series of reports by specialists. During 1896-97, the United States government, through a commission, of which President D. S. Jordan, of Leland Stanford Junior University, was head, made investigations concerning the *Fur Seals and Fur Seal Islands of the North Pacific Ocean*, and the results have just been issued by the Treasury Department in four large volumes, the typography and illustrations of which are excellent. They contain 1637 pages of reading matter, and 250 plates, charts, and maps, and are doubtless the most important contribution to the literature of seals and sealing that has ever appeared. The volumes contain a great deal of zoological literature besides that which bears directly on the seals, for they exploit quite fully the land and marine fauna of the Pribilof Islands.

An important work on the geographical distribution of mammals has appeared from the pens of two of England's best known zoologists, Messrs. P. L. and W. L. Sclater. It is a volume of some 350 pages, called *The Geography of Mammals*. The book treats of the terrestrial and marine divisions of the globe, based on mammalian distribution, and of the distribution of the various orders of mammals. The remark-

able Patagonian mammal described last year as *neomylodon* has been the subject of several interesting and important papers during the past year, the most notable of which is called *The Mysterious Mammal of Patagonia*, and the authors are Drs. Hauthal, Roth, and Nitsche. They have made thorough investigations, and have reached the conclusion that *neomylodon* is an extinct edentate, previously described as *Grypotherium*, and the Patagonian form that has caused so much discussion is to be called *G. domesticum*, because these writers think it was domesticated by the Indians. Two other special treatises may be mentioned, the first of which deals with the frog, the second with *Ascidia*. The former is the third part of Gaupp's edition of Ecker on the *Anatomie des Frosches*, and deals solely with the anatomy of the vascular system. As the volume contains over 300 pages and is fully illustrated, the treatment of the subject may be said to be exhaustive. The volume entitled *Ascidia* is from the pen of Professor W. A. Herdman, and is published as a memoir of the Liverpool Marine Biology Committee. It contains about fifty pages and five plates, and is devoted to a thorough account of the anatomy of *ascidia*. It is notable because of the plan of the work and the auspices under which it is published.

Popular Books.—Popular books in zoology and natural history have been rare during 1899 and there are only a few to be mentioned. Mr. J. N. Baskett is the author of a recent book called *The Story of the Fishes*. While not always careful in its statements, the book is attractively written and well illustrated, and will prove useful to a beginner. A more satisfactory book in some ways is by Margaret W. Morley, and deals with the honey bees. It is called *The Honey Makers*, is well written and illustrated, and includes a great deal of a historical and literary nature concerning bees. Doubtless the best book of the year written for popular reading is Dr. Richard Semon's *In the Australian Bush and on the Coast of the Coral Sea: being the Experiences and Observations of a Naturalist in Australia, New Guinea, and the Moluccas*. This volume, of over 550 pages, with 4 maps, and 86 illustrations, is fascinatingly written and brimful of interest. Few men are better fitted than Dr. Semon to write such a book, and his natural enthusiasm and love of nature combine to make this volume exceptionally readable. See BIOLOGY; ENTOMOLOGY; FISHERIES; ORNITHOLOGY.

ZOOLOGICAL SOCIETIES. The meetings of zoological societies during 1899 seem to have been well attended, and of rather more than usual interest. To be sure there was no international congress of zoologists this year, and, excepting the Ornithological and Entomological Societies (*q. v.*), the meetings of zoologists have generally been in connection with some of the larger scientific bodies, such as the American or British Association. So far as any reports at hand show, the continental societies held very successful meetings. The French Association held its annual meeting in September at Boulogne, on the same days that the British Association was meeting at Dover. Several hundred men of science attended its meetings, and a large number visited the English scientists across the Channel. The seventy-first meeting of the Society of German Naturalists and Physicians was held in Munich, September 17-23. About 3500 members were in attendance, the general meetings being held in the Royal Theatre. The most interesting feature from a zoologist's point of view was the exhibition of the results of the German Deep Sea Expedition, explained by Professor Chun. Many of the results of this expedition were confirmatory of the results obtained by the *Challenger*, especially as regards life existing in the depths of the Antarctic Ocean. The anniversary meeting of the Royal Society of London, held November 30, was of interest to zoologists because of the conferring of one of two royal medals on Professor W. C. McIntosh for his important labors as a zoologist. His most notable work is a monograph of British annelids, which is still in progress, and being published by the Ray Society. But the honor is conferred on him not only as an investigator, but as "a notable teacher in Scotland" as well. The annual "Conversazione" of the Royal Society, held May 3, was also of interest to zoologists, because of a number of notable zoological exhibits. Chief among these were a selection of zoological specimens from Christmas Island, and portions of the skin of the extinct ground sloth of Patagonia.

The New York Academy of Sciences held its annual reception April 21, and though there were no unusually remarkable exhibits, there were many of great interest. In the zoological section, the beautiful case illustrating the nesting habits of the brown pelican seemed to attract the most attention. The National Academy of Sciences has held two very successful meetings, the annual meeting in Washington, April 18-20, and the autumn meeting in New York, November 14-15. At the latter, however, there were no zoological papers presented. At the spring meeting, 5 of the 14 papers were distinctly zoological, two of these being presented by Professor Brooks, and two by Professor Agassiz. (See BIOLOGY.) The New York Zoological Society, which now numbers nearly 800 members, has had a most successful year, the Zoological Gardens having been opened on November 8. The gardens are situated in South Bronx Park, and are the largest in the world, being five times the size of

those in Paris, and nearly eight times as large as those at Philadelphia, or the well-known Zoo in London. The cost of these gardens and their maintenance is shared by the city of New York and the New York Zoological Society, although the former does not furnish all the funds desired by the latter. There are now about 850 animals installed, and an illustrated guide has been published with a great deal of useful and interesting information regarding them. Although the American Microscopical Society is not strictly zoological, several of the papers presented at its twenty-first annual meeting in Columbus, O., in August, were chiefly of interest to zoologists, the most notable being Professor Eigenmann's paper on "the Eyes of Typhlomage from the Artesian Wells at San Marcos, Tex."

British Association for the Advancement of Science. Section D, Zoology.—The annual meeting of the British Association was held at Dover, September 14-21, and was attended by some 1400 members. It was an especially notable occasion, because of the visits from and to the French Association, which was meeting at Boulogne at the same time. The presidential address to the Zoological Section was delivered by Professor Adam Sedgwick, and was entitled "Variation and Some Phenomena Connected with Reproduction and Sex." This most important contribution to the question of heredity is extremely interesting. The author considers that one of the most important results of evolutionary change has been the gradual increase and perfection of heredity as a function of organisms, and the gradual elimination of variability. Some very striking conclusions may be drawn, if the truth of this fundamental proposition is conceded. The other fourteen papers were not as extensive, and few of them were specially noteworthy. Seven of them dealt with fish or fisheries, while only two dealt with invertebrates. Nine different committees submitted reports to the section, but only one of these was final, that on the zoology and botany of the West India Islands. The material still unworked has been presented to the British Museum. Aside from the presidential address, the chief interest of the section seemed to centre about Mr. Garstang's work in a biological survey of the British Channel, and in rearing young sea-fishes, in which he has been quite successful. At a meeting of the delegates of the Corresponding Societies, an interesting paper was read "On the Living Subterranean Fauna of Great Britain and Ireland." The paper led to quite an animated discussion, and it was finally recommended that the Corresponding Societies give special attention to the fauna of wells and caves.

The American Association for the Advancement of Science. Section F, Zoology.—The forty-eighth annual meeting of this society was held August 21-26, in the buildings of Ohio State University, at Columbus, O. There were 352 members in attendance, and the meetings were interesting and enjoyable. Of the 273 papers presented, 19 were before the zoological section. Two of the grants of money made are of special interest to zoologists, one being \$50 to Professor Davenport, of Harvard, for the quantitative study of variation, and the other, \$100, to Professor Eigenmann, of Indiana, for stocking pools with species of blind vertebrates, where they may be reared and studied in the light. The address of the chairman of the zoological section, Professor S. H. Gage, was on "The Importance and the Promise in the Study of the Domestic Animals." In this address, the speaker points out the great profit that has come to science and to mankind from the study of domesticated forms, and he urges young zoologists to give their attention to the "thorough investigation of a few forms from the ovum to youth, maturity, and old age." And he believes that "the greatest good to science, and thus to mankind, will result from a selection of domesticated forms for these thorough investigations." One of the most interesting papers read was also by Professor Gage on the "Brook Lamprey," in which it was shown that the brook lamprey is not a parasitic form like the lake lamprey, but it is almost certain it is descended from a parasitic form. Among the remaining papers, there were many of great scientific value, but the one that was perhaps of the most general interest was by Professor C. H. Eigenmann on "Cave Animals." Cave faunæ seem to be derived from those animals which are accustomed to seek their food under rocks and logs, and in other dark places. A gradually disappearing light leads to an increase in the size of the eyes, whereas the gradual disuse of the eyes decreases their size. The evidence seems to show that disuse effects are transmitted.

American Society of Naturalists. American Morphological Society.—The meeting of the "Naturalists" was held at New Haven on December 27-28, in the buildings of Yale University. One of the features of the meeting was the discussion of the theme, "The Position that Universities Should Take in Regard to Investigation." Zoology was represented by Professor William Patten, of Dartmouth, who took the ground that there was danger of too much emphasis on research work, and that the universities would not train properly equipped teachers. He urged reforms in the matter of requiring strictly original work for the thesis, and in making the thesis of less, the examinations of more account. The lecture by Professor A. E. Verrill on "The

Geology and Natural History of the Bermudas" was generally enjoyed. The subject was an interesting one in itself, but the interest was greatly increased by the large number of slides with which it was illustrated. The slides of many of the animals were drawn and colored for the purpose from living specimens, and many of the fishes and sea anemones of Bermuda are of extraordinary beauty. The meetings of the Morphological Society were attended by about 40 members. There was quite a falling off in the number of papers presented, only 33 being read. Of these, more than half dealt with the chordata, and half of the remainder with worms. Naturally the papers varied greatly in length and importance, though the fifteen-minute rule was pretty strictly enforced, not always to the satisfaction of the speaker. It is difficult to select from the list of titles the papers which proved the most interesting or that are the most worthy of note. Mention should be made, however, of Dr. Bashford Dean's paper on "The Embryology and Phylogeny of *Chimæra*," an elasmobranch fish of which we as yet know comparatively little; of Mr. P. M. Rea's "Notes on the Structure of *Alma Nilotica*, a Gilled Earthworm from Egypt," and of Messrs. Johnson's and Hall's "*Palamonetes* and Salinity, an Experimental Study in Evolution." See also ORNITHOLOGY and ENTOMOLOGY.

ZOOLOGICAL STATIONS. The year 1899 has been remarkable in the matter of zoological stations, because of the large number of scientific expeditions, which have either set out or returned within the limit of those twelve months. While, strictly speaking, these are not zoological stations, it is only fair to regard those which make zoological collections, and study the fauna of the regions which they explore, as a sort of moving station, and they may conveniently be considered under that head.

Permanent Stations.—First, however, it will be advisable to speak of those stations which have a more or less permanent abode, and are designated by some local name. Nothing very unusual seems to have occurred at any of the European stations; so far as any reports have been made, the season has been a prosperous one. The two principal English stations, at Plymouth and at Port Erin, have continued their admirable work, and proved their great value not only to English biologists, but to the British fisheries as well. The Japanese have established a station on the Inland Sea for the study of the fauna and flora of that most interesting body of water.

In our own country, the most important stations have enjoyed a prosperous year. The Hopkins Seaside Laboratory at Pacific Grove, Cal., is the centre for biologists on the Pacific coast, while in the East there is a division of interests. As in former years, the majority of workers have been at Woods Hole, where the facilities of the United States Fish Commission Laboratory offer unusual attractions. The Marine Biological Laboratory was attended by over 150 students, and the season was very successful. The Fish Commission Laboratory had its full quota of workers, and much of the work done there is to appear in the *Bulletin* of the commission. The *Fish Hawk* and the *Grampus* were at the disposal of the laboratory during July and August, and proved a great help. The commission operated two fish-traps throughout the season, one in Buzzards Bay and one in Vineyard Sound, and thus there was each day an abundance of fish, squid, etc., for the various workers who desired them. Some of the captures were of much interest, and a number of new species were added to the list of species known from Woods Hole. (See FISHERIES.) Besides its fine establishment at Woods Hole, the fish commission has during the past season had a laboratory open at Beaufort, N. C., and a fresh-water station at Put-in-Bay, O., on Lake Erie. The laboratory at Cold Spring Harbor, L. I., under the auspices of the Brooklyn Academy of Sciences, has had its most successful season, and bids fair to be a rival of Woods Hole in popularity. The work of the past summer has attracted unusual attention to this station, and some important and interesting results of the season's work have already been published. Of the fresh-water stations, that of Indiana University seems to have had the most notable season. This station is now located on Winona Lake, the well-known summer resort, the buildings having been given to the university by the Winona Assembly for a biological station. The surroundings seem to be peculiarly favorable for collecting and out-of-door study. The number of students in attendance the past summer was 91, and courses were given in zoology, botany, cytology, bacteriology, embryology, and survey-methods.

Foreign Expeditions.—Under the auspices of the German government, the *Valdivia* has been making explorations and collections in the Antarctic Ocean, but as yet not enough of her results have been made public to warrant any comments on her zoological work. It is worthy of note, however, that the Royal Society of London has succeeded in getting the British government so greatly interested in the Antarctic exploration, that they have been promised \$225,000 on condition that they raise a like sum, for the equipment of an expedition, which it is hoped to get under way next year. Another survey, more strictly zoological, which has been undertaken by Her Majesty's government (or, more properly, by the Egyptian government,

with the aid and support of the British Museum) is that of the Nile, with special reference to the fish, though other groups of animals are not to be neglected. It is expected the survey will require three years for its completion, and it will possibly be carried south, even to Albert Nyanza. Work has already begun on Lake Menzaleh. During the early part of 1899, a biological survey of the island of Socotra, which lies about 150 miles off the extreme eastern point of Africa, was carried on by the British Museum and Liverpool Museum working together. The expedition was a great success, the collection being large and containing many species of animals new to science. The full results are to be published in a special volume which is now in preparation. Another survey of considerable importance was carried on under the auspices of the British government in India, in the Bay of Bengal. Soundings and collections were made between the mainland and Andaman Islands, and a great deal of valuable zoological material was dredged, in some places at great depths.

American Expeditions.—Early in the spring, a committee from Philadelphia visited the east coast of Florida with a view to locating a marine biological station somewhere on Biscayne Bay. The collecting, however, proved unexpectedly poor, and the idea was finally given up for the present. New York University, for the third successive season, sent a party to the Bermuda Islands. They located on White's Island in Hamilton Harbor, and enjoyed a most successful season, exploring parts of the coast which they had not previously visited. A number of interesting fish were brought back alive to the New York Aquarium. Messrs. Hunt and Harrington, of Columbia University, again visited the Nile Valley, through the liberality of Charles H. Seuff, Esq., of New York City. The expedition was in search of the eggs of *Polypterus*, a curious Ganoid fish, and went far up the Nile, in the wake of the British army. Not only did the main object of the trip fail of fulfilment, but disaster came, in the sickness and death from fever of Mr. Harrington. He was a young man, a graduate of Williams College, just completing his graduate work at Columbia, and his attractive personality had made for him many friends wherever he had been. His sudden death, therefore, is a source of personal grief to many American zoologists. Another American university had collectors in the field in a remote part of the earth, but they met with more fortunate results. This was the third Patagonian expedition from Princeton University, and although it was chiefly for geological material, enough zoological collections were made to warrant a brief statement of the results. The party consisted of Messrs. J. B. Hatcher and O. A. Peterson, and they were gone over eight months. The zoological results of their three trips have been summarized thus by Mr. Hatcher: "A collection of more than 1000 skins, and skeletons of recent birds and mammals, embracing about 150 species of birds and 50 of mammals, and fairly representative of the mammalian and arian life. Extensive collections of fresh water, terrestrial, and littoral invertebrate life."

Harriman Expedition.—One of the two most important expeditions of the year was that known as the "Harriman Expedition to Alaska." Some forty scientists were invited by Mr. Edward Harriman, of New York City, to join him, at his expense, on a trip to Alaska. While not composed exclusively of zoologists, the party included a considerable number of them, and extensive collections, especially in ornithology, were made. The party sailed from Seattle, May 28, and arrived at Portland, Ore., on their return, August 2. They went as far north as Cook's Inlet and Kadiak Island, stopping first at Sitka, Yakutat, and Prince William Sound.

The Albatross Expedition.—The other of the two most important expeditions of the year is under the auspices of the United States Fish Commission and Professor Agassiz. The fish commission steamer, *Albatross*, carries the party, which is in charge of Professor Agassiz. She sailed from San Francisco about August 20 for Tahiti, Society Islands, touching at the Marquesas on the way. Tahiti has been her headquarters, while extensive explorations have been carried on in the Paumotu Islands, an archipelago some 600 miles long, the natural history of which is practically unknown. From Tahiti, the *Albatross* will go to the Tonga Islands, then to the Fijis, and then to the Marshalls, where six or seven weeks will be spent in exploration, as the fauna is almost unknown. She will return to the United States in April, via Honolulu, after a voyage of 20,000 miles. As she is one of the best equipped boats afloat for dredging, trawling and sounding, and is thoroughly fitted out for all sorts of collecting, the results of this expedition promise to be of extraordinary value. Six scientists are in the party besides Professor Agassiz and his son. The results will be published jointly by the fish commission and the Museum of Comparative Zoology. Since the party sailed in August, two long letters have been received from Professor Agassiz and published in *Science*. These deal chiefly with matters of soundings, geography, and geology, and contain little zoological news. The collecting in Paumotu Islands has been disappointing, as animal life is not nearly as abundant as in the Fijis, and some other South Pacific islands. The expedition is the best equipped that has ever been sent out by the United States gov-

ernment, and will undoubtedly rank in importance with the famous Wilkes Exploring Expedition of 1838-42. See ZOOLOGICAL LITERATURE.

ZULULAND is now a province of the British colony of Natal (*q. v.*), having been formally annexed, together with British Amatongaland, on December 31, 1897. It lies along the southeastern coast of Africa, between Natal and Portuguese East Africa, and is bounded on the west by the Transvaal. It has an area of about 12,500 square miles and a population of about 181,000, including somewhat over 1000 whites. The province is divided into twelve magisterial districts, and may send one member to the legislative council and two members to the legislative assembly of the colony. The natives follow agriculture and there is considerable mineral wealth, including gold, silver, lead, copper, tin, iron, asbestos, and coal, but there is little development in either branch of industry. With the exception of one district, which is open to whites, Zululand has been given over as a reserve for the natives. In 1899 the territory of the province was entered by Boer troops in connection with operations of the South African war.
